Introduction

The STM8L-DISCOVERY helps you to discover the STM8L ultralow power features and to develop and share your applications. It is based on an STM8L152C6T6 and includes an ST-Link embedded debug tool interface, LCD (24 segments, 4 commons), LEDs and push buttons.

1 Quick start

The STM8L-DISCOVERY is a low-cost and easy-to-use development kit to quickly evaluate and start a development with an STM8L ultralow power microcontroller.

For more information on the STM8L-DISCOVERY and for demonstration software visit www.st.com/stm8l-discovery.

1.1 Getting started

1. Check jumper positions on the board, JP1 and CN3 ON (Discovery selected).
2. Connect the STM8L-DISCOVERY board to a PC with a USB cable to power the board. Red LED LD2 (PWR) then lights up.
3. Function 1 is executed and each click on user button B2 changes the executed function as described in Table 1.

To study or modify the DISCOVER project related to this demo, visit www.st.com/stm8l-discovery and follow the tutorial. Discover the STM8L features, download and execute programs proposed in the list of projects. This site also contains examples from which you can develop your own applications.

1.2 System requirements

- Windows PC (2000, XP, Vista)
- A/Mini-B USB cable
1.3 Development toolchain
- IAR, Embedded Workbench® for STM8
- STMicroelectronics, ST Visual Develop (STVD)

1.4 Demonstration software
Demonstration software is preloaded in the board’s Flash memory. This demonstration uses the built-in IDD measurement feature of the STM8L-DISCOVERY to automatically measure and display on the LCD the consumption of the MCU in run and low power modes. The latest versions of this demonstration source code and associated documentation can be downloaded from www.st.com/stm8l-discovery.

1.5 Order code
To order the STM8L ultralow power Discovery, use the order code STM8L-DISCOVERY.
2 Features

The STM8L-DISCOVERY offers the following features:

- STM8L152C6T6 microcontroller, 32 KB Flash, 2 KB RAM, 1 KB EEPROM in 48-pin LQFP
- On-board ST-Link with selection mode switch to use the kit as a stand-alone ST-Link (with SWIM connector for programming and debugging)
- Two red LEDs; LD1 for USB communication, LD2 for 3.3 V power on
- Designed to be powered by USB or an external supply of 5 V or 3.3 V
- Can supply target application with 5 volts and 3 volts
- Two user LEDs, LD3 and LD4 (green and blue)
- Two push buttons (User and Reset)
- \( I_{DD} \) current measurement
- LCD 28-pin DIP (24 segments, 4 commons)
- Extension header for all QFP48 I/Os for quick connection to prototyping board for easy probing
3 Hardware and layout

The STM8L-DISCOVERY is designed around the STM8L152C6T6 microcontroller in a 48-pin LQFP package.

Figure 2 illustrates the connections between the STM8L152C6T6 and its peripherals (ST-Link, push button, LED, LCD and connectors).

Figure 3 and Figure 4 help you to locate these features on the STM8L-DISCOVERY.

3.1 STM8L152C6T6 microcontroller

This 8-bit ultralow power MCU has 32 KB Flash, 2 KB RAM, 1 KB data EEPROM, RTC, LCD, timers, USART, I2C, SPI, ADC, DAC and comparators.

**Figure 5. STM8L152C6T6 package**

The STM8L152C6T6 8-bit microcontroller offers:
- 32 Kbytes of Flash memory
- 2 Kbytes RAM
- 1 Kbytes EEPROM

This device provides the following benefits:

- Ultralow power proprietary 130 nm technology:
  Speed and power consumption independent of MCU power supply, Ultralow leakage

- Ultralow power design (clock gating, low-power Flash with power-off capability):
  Reduced overall Run and Wait mode current consumption by turning off clocks of unused peripherals or Flash

- Sub 1 µA hardware RTC and AWU system unit:
  Ultralow power modes for applications requesting regular wake up

- Range of Low power modes (up to 4):
  Suitable for many applications from complete switch off to continuous monitoring at ultralow frequency

- Advanced and flexible clock system (multiple internal and external clock sources):
  Switch and adjust frequency and clock sources on the fly depending on application needs

- Direct memory access on board (4-channel DMA):
  Autonomy for peripherals, independent from core; can switch off Flash memory and CPU (large current consumption contributors) while keeping peripherals active

- Ultralow power and ultrasafe reset system POR/PDR; additional optional activation BOR:
  Integrated safety and security for application

- Ultrafast wakeup from lowest Low power mode (4 µs):
  Fast switching from Static and Dynamic power modes

- Analog functional down to 1.8 V, programming down to 1.65 V:
  Full functionality over the complete V_DD range

For more information see the STM8L152C6T6 datasheet (Doc ID 15962) on the ST website.

3.2 **Embedded ST-Link**

The ST-Link programming and debugging tool is integrated on the STM8L-DISCOVERY. The embedded ST-Link can be used in 2 different ways according to the jumper states (see Table 2):

- to program/debug the MCU on board,
- to program/debug an MCU in an external application board using a cable connected to SWIM connector CN2.

For information about debugging and programming features refer to ST-Link UM0627.

**Note:** UM0627 contains information about all the ST-Link features. Usage in this situation is restricted to STM8 devices and SWIM support.

**Figure 7. Typical configuration**

![Typical configuration](image)

**Table 2. Jumper states**

<table>
<thead>
<tr>
<th>Jumper state</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

<td>ST-Link functions enabled for external application through CN2 connector (SWIM supported).</td>
</tr>
</tbody>
</table>
3.2.1 Using the ST-Link to program/debug the STM8L on board

To program the STM8L on board, simply plug in the two jumpers on CN3, as shown in Figure 8 in red, but do not use the CN2 connector as that could disturb communication with the STM8L152C6T6 of the STM8L-DISCOVERY.

Figure 8. STM8L-DISCOVERY connections image

3.2.2 Using the ST-Link to program/debug an external STM8L application

It is very easy to use the ST-Link to program the STM8L on an external application. Simply remove the 2 jumpers from CN3 as shown in Figure 9, and connect your application to the CN2 debug connector according to Table 3.

3.3 Power supply and power selection

The power supply is provided either by the host PC through the USB cable, or by external power supply (5 V or 3.3 V). The D1 and D2 protection diodes allow the 5V and 3V3 pins to be used independently as input or output power supplies (see Figure 3). The 5V and 3V3 pins can be used as an output power supply for use by an application board connected on pin headers (P1 to P3). In such a case, the 3V3 pin provides only a 3V power supply and the power consumption must be lower than 100 mA. The 5V and 3V3 pins can also be used as an input power supply for the board when the USB connector is not connected to the PC.

**Note:** If an external power supply is used, it must conform to EN 60950-1 SELV (safety extra low voltage) LPS (limited power source) definitions.

If the 5V and 3V3 pins are used as an input power supply, the STM8L-DISCOVERY board must be powered by a power supply unit or auxiliary equipment complying with standard EN-60950-1: 2006+A11/2009, and must be safety extra low voltage (SELV) with limited power capability.

3.4 LEDs

- LD1 COM: Red LED indicates communication in progress between PC and ST-Link.
- LD2 PWR: Red LED indicates that the board is powered.
- LD3 PE7: Green LED is a user LED connected to the I/O PE7 of the STM8L152C6T6.
- LD4 PC7: Blue LED is a user LED connected to the I/O PC7 of the STM8L152C6T6.

3.5 Push buttons

- B1 RST: Push button is used to RESET the STM8L152C6T6.
- B2 USER: User push button connected to the I/O PC1 of the STM8L152C6T6.
3.6 **Built-in IDD measurement circuit**

The STM8L-DISCOVERY built-in $I_{DD}$ measurement circuit allows the consumption of the STM8L152C6T6 to be measured and displayed on the LCD Glass while the MCU is in Run or Low power saving modes.

- JP1 in ON position: STM8L152C6T6 is powered through $I_{DD}$ measurement circuit (default).
- JP1 in OFF position: STM8L152C6T6 is powered directly by +3V3, $I_{DD}$ measurement circuit is bypassed.

*Note:* When jumper JP1 is removed the current consumption of the STM8L152C6T6 can be measured by connecting an ammeter between jumper JP1 pin 1 and pin 2.

For $I_{DD}$ measurement by the MCU itself, the circuit below is implemented on the STM8L-DISCOVERY. Solder bridges SB11, SB12 and SB14 must be closed and a jumper must be plugged between JP1 pin 2 and pin 3.

**Figure 10. STM8L-DISCOVERY $I_{DD}$ measurement circuit**

3.6.1 **Run mode**

In Run mode, $I_{DD}$ current is measured using the operational amplifier MAX9938FEUK+ (U4) connected to the 2 $\Omega$ shunt resistor (R20). In this case IDD_CNT_EN remains high during measurement, so R21 remains in short-circuit during the measurement because of transistor T1 which remains ON permanently. The jumper JP1 must be connected between pins 2 and 3 of JP1. The measurement range in this case can be up to 30 mA.

3.6.2 **Low power mode**

In Low power modes (Halt or Active halt), $I_{DD}$ current is measured using the operational amplifier MAX9938FEUK+ (U4) connected to the 2K$\Omega$ shunt resistor (R21), controlled by the analogue switch STT5PF20V (T1). In this case the counter 74HC4060 (U3) enabled by IDD_CNT_EN manages the measurement timing according to **Figure 11.** The measurement range in this case can be up to 30 $\mu$A.
3.6.3 Low power mode \( I_{DD} \) measurement principle

The principle used to measure a current when the STM8L152C6T6 is in Low power mode is:

1. Configure ADC to measure voltage on the \( I_{DD} \) Measurement pin.
2. Configure PE6 to serve as wakeup pin.
3. Enter Low power mode after setting \( I_{DD\_CNT\_EN} \) (PC4) signal low.
4. \( I_{DD\_WAKEUP} \) rising edge wakes up the MCU after around 300 ms.
5. Start ADC conversion as soon as possible after wakeup in order to measure the voltage corresponding to Low power mode on capacitor C11.
6. Reset the counter by programming \( I_{DD\_CNT\_EN} \) high (in less than 70 ms after the wakeup) to avoid the R21 2 K\( \Omega \) resistor being connected later in Run mode.

The measurement timing is given in Figure 11. In Low power modes, the 2 K\( \Omega \) resistor is connected when T1 goes off after entering Low power mode. Q13 output of the counter allows connection of the 2 K\( \Omega \) resistor when the current \( I_{DD} \) becomes very low.

Figure 11 shows how the counter and T1 ensure that, 150 ms after \( I_{DD\_CNT\_EN} \) falling edge, the shunt resistor R21 is connected between VDD_MCU and the power supply in order to reduce the measurement range to 30 \( \mu \)A full scale (instead of 30 mA in Run mode). Then after another 150 ms for current stabilization, R21 is shorted, the \( I_{DD} \) measurement is stored in C11, and the MCU is woken up. After wakeup the MCU can measure the \( I_{DD} \) current corresponding to the Low power mode stored in C11.

Figure 11. STM8L-DISCOVERY \( I_{DD} \) Low power mode measurement timing diagram
3.6.4 Ibias current measurement procedure

In Low power mode the bias current of operational amplifier input (U4 pin 4) is not negligible compared to $I_{DD}$ current (typical Ibias is ~240 nA). To obtain a reliable STM8L152 $I_{DD}$ measurement it is mandatory to subtract the bias current from the $I_{DD}$ low power measurement since this current is not sinked by the MCU. Ibias is measured during production test and stored in the MCU EPROM. The demonstration software, Discover, uses this value to display the correct $I_{DD}$. The Ibias measurement procedure is part of the demonstration software and can be launched if required.

The procedure for Ibias measurement (implemented in the Demo) is:

1. Power off the board (disconnect the USB cable).
2. Set jumper JP1 to OFF position (pins 1 and 2).
3. Push down B2 (USER button), power on the board from the USB.
4. Wait at least 1 second before releasing B2, the LCD displays the Ibias measurement.
5. Power off the board (disconnect the USB cable).
6. Set jumper JP1 to ON position (pins 2 and 3). The Ibias value is now stored. The bias current is then subtracted from the $I_{DD}$ measurement performed in Low power mode.

1. Default state is in **bold** type.
3.8 LCD (24 segments, 4 commons)

This LCD allows the STM8L152C6T6 to display any information on six 14-segment digits and 4 BARs, using all COMs. (See the LCD segment mapping in Figure 12 and pin connections in Table 5.)

Note: This LCD also supports six 8-segment digits by only using COM0 and COM1. This configuration allows COM2 and COM3 to be used as I/O ports. In this case the 2 LCD pins must not be plugged into the LCD socket. To proceed with this configuration, remove the LCD carefully, slightly open the COM2 and COM3 pins (pin 13 and pin 14) of the LCD, then replug it in the socket.

Characteristics overview:
- 24 segments and 4 commons
- Drive method: multiplexed 1/4 duty, 1/3 bias
- Operating voltage: 3 V
- Operating temperature: 0 to 50°C
- Connector: 28-pin DIL 2.54 mm pitch

Note: When the LCD is plugged, all I/O ports listed in Table 5 are unavailable. To use one of these as I/O, you must remove the LCD.

4 Extension connection

Male headers P1, P2 and P3 can connect the STM8L-DISCOVERY to a standard prototyping/wrapping board. All GPI/Os of STM8L152C6T6 are available on it. P1, P2 and P3 can also be probed by an oscilloscope, logical analyzer or voltmeter.
