Introduction

This user manual describes the STSW-STM32137 demonstration firmware running on the STM32072B-EVAL evaluation board, which can be used to evaluate the capabilities of the STM32F072V8T6 microcontroller and on-board peripherals.

This demo contains many applications that can easily be reused, such as dual interface (I²C and RF) EEPROM application (ESL and DataLogger), HDMI-CEC, infrared RC5 and SIRC receiver and transmitter, RTC calendar, file system FAT implementation on SD Card, wave player using STM32 DAC peripheral, voice recording, touch sense controller (TSC), low power modes, temperature sensor interfacing and TFT LCD.

The STSW-STM32137 demonstration firmware and other firmware packages are available for download from the STMicroelectronics website: www.st.com.

1 Functional description

The STM32F072VBT6 microcontroller evaluation board provides a development and demonstration platform for STM32F072B-based applications. It has been designed to let the user try out the major functions of the STM32F072VBT6 microcontroller.

Due to the code size constraint, the STM32072B-EVAL demonstration firmware is provided with 2 configurations and the STM32072B-EVAL board is delivered with the demonstration config1 programmed in the internal Flash memory, and all the files needed by the demonstration are programmed in the MicroSD card. The demonstration is executed at each reset (board power-up, external reset, etc.).

In case the STM32072B-EVAL board was not factory-programmed or the demonstration application was erased or you need to change the STM32072B-EVAL board configuration, the Bootloader, IAP or STM32 STLink utility can be used to program this file. For more details, refer to Section 3: STM32072B-EVAL demonstration package and Section 4: STM32072B-EVAL demonstration programming.

Before you execute the demonstration, make sure that all EVAL board jumpers are correctly configured. For more details, refer to Section 1.9.12: STM32072B-EVAL board jumper configuration.

Figure 2 summarizes the main functional blocks of the evaluation board.
1.1 Power control

The evaluation board can be powered from an external 5 V supply or from the USB connector or ST-LINK/V2 connector. All other required voltages are provided by on-board voltage regulators.
1.2 **Clocking**

Two clock sources are available on the STM32072B-EVAL evaluation board for STM32F072VBT6 and embedded RTC.
- X1, 32KHz Crystal for embedded RTC
- X2, 8MHz Crystal with socket for STM32F072VBT6 Microcontroller, it can be removed from socket when internal RC clock is used.

1.3 **Reset control**

The reset can be generated by hardware or software:
- Reset button: activates the RESET input when pressed
- JTAG reset

1.4 **Debug JTAG interface**

Software debug is done via the standard ARM® JTAG connection: 20-pin IDC (insulation displacement connector) for connection to the standard ARM host interface.

1.5 **Serial wire debugger interface**

The Serial Wire Debug Port (SWD-DP) provides a 2-pin (clock + data) interface to the AHP-AP port.

1.6 **Embedded ST-LINK/V2**

An embedded ST-LINK/V2 is integrated on the board as an embedded in-circuit debugger and programmer for the STM32F072VBT6 MCU.

1.7 **Display devices**

1.7.1 **LCD**

A color LCD module is mounted on the STM32072B-EVAL board. It is interfaced through the embedded SPI peripheral.

1.7.2 **LEDs**

Four general-purpose LEDs are available. They are used as a display.

1.7.3 **LDR (Light Dependent Resistor)**

The $V_{DDA}$ is divided by the resistor bridge of LDR VT9ON1 & 8.2K resistor and connected to PA1.
1.8 Interfaces

1.8.1 RS-232 and RS-485 serial ports
The STM32F072B evaluation board (STM32072B-EVAL) provides on-board RS-232 and RS-485 serial ports. The RS-232 port (USART2) is accessed via CN10 connector.

1.8.2 IrDA communication
The STM32072B-EVAL evaluation board supports IrDA communication. The interface is mounted on USART2 (U1 interface).

1.9 Miscellaneous peripherals

1.9.1 Joystick
There is a 4-way joystick with a selection key.

1.9.2 Push-buttons
The following push-buttons are available:
- Tamper
- Joystick
- Wakeup (Joystick Sel): used to wake up the processor from low power mode.

1.9.3 12-bit analog-to-digital converter (ADC)
Varistor: ADC channel (ADC1_IN11) connected to an on-board variable resistor. The variable resistor provides a voltage in the range of 0 V to 3.3 V.

1.9.4 Audio
The STM32072B-EVAL evaluation board implements a dedicated audio amplifier to be interfaced with the STM32 DAC peripheral. For the audio output, an audio jack is available on the board and connected to the DAC.

1.9.5 MicroSD card
The STM32072B-EVAL evaluation board has a MicroSD card connector connected to the SPI1 peripheral.

1.9.6 Serial EEPROM
The STM32072B-EVAL evaluation board includes a serial EEPROM connected to the SPI1 peripheral.

1.9.7 RF EEPROM
The RF EEPROM daughter board implemented on the module is the M24LR64-R. The daughter board can be connected on CN2 to STM32F072VB via the I2C bus. The I2C
address of the RF EEPROM is 0b1010E2E1E0. E0-E2 values are determined by the RF EEPROM daughterboard.

1.9.8 IR LED and IR receiver
The IR receiver TSOP34836 is connected to PC6 of STM32F072VBT6 and a current around 100mA on IR LED is driven by PB9 through transistors T3 and T4 on the board.

1.9.9 HDMI CEC
Two HDMI connectors, CN3 and CN5, are available on the STM32072B-EVAL board.

1.9.10 Temperature sensor
The STM32072B-EVAL evaluation board includes an I²C temperature sensor connected to the I2C1 peripheral.

1.9.11 Touch keys
Touch slider is supported on the STM32072B-EVAL evaluation board and connected to 3 capacitive sensing channels (PD[12:14]) in group 8 with active shield being connected to 2 capacitive sensing channels (PE4 and PE5) in group 7.

1.9.12 STM32072B-EVAL board jumper configuration
To be able to run the STM32072B-EVAL demo correctly, configure the following STM32072B-EVAL board jumpers as follows:
- VDD Adjust: JP13 fitted pos VDD
- VDD Voltage: JP12 fitted pos 3.3 V
- VDD Analog: JP9 fitted
- VDD VBat: JP11 fitted pos VDD
- VDD MCU: JP7 fitted
- Audio Output: JP18 fitted
- LDR demo: jumper JP6 fitted
2 Running the demonstration

2.1 Main menu

The purpose of the demonstration is to bring out the capabilities of microcontroller and the on-chip peripherals. It runs only on the STM32072B-EVAL board. The demonstration contains the following applications. (refer to Figure 3)

The UP, DOWN, RIGHT and LEFT joystick directions allow the user to navigate between items in the main menu and the submenus. To enter a submenu, press the SEL push-button.

The SEL push-button designates the action of vertically pressing the top of the joystick, as opposed to moving it horizontally UP, DOWN, RIGHT or LEFT.

To exit a submenu, select the Return menu and press SEL.

Figure 3. Demonstration overview

2.1.1 Demo startup

After a board reset, at demo startup, the system checks if an SD card memory is already present in connector CN9. If no card is detected, the demo does not start and the message
shown in Figure 4 is displayed on the LCD screen.

**Figure 4. SD card check**

The demo continues only if an SD card is inserted.

Then, the demo graphic icons and bitmap files are checked in the MicroSD card (see Section 2.3.5: External memory organization). All the icons have to be correctly programmed in the MicroSD card for the demo to start, so if an icon is missing, the demo does not start and the message shown in Figure 5 is displayed on the LCD screen.

**Figure 5. Warning message**

However, if the icons are correctly loaded into the SD Card memory, the welcome screen is displayed and the ST logo appears on the LCD (see Figure 6).

**Figure 6. ST logo**

When the board is powered up for the first time, the user is prompted to set the time, year, month and day. The user may choose to ignore it by pressing any key except for the SEL
push-button to abort the configuration sequence. To set the time and date, the user must press SEL and follow the setting sequence.

The message shown in Figure 7 appears on the LCD screen.

**Figure 7. Time and date configuration**

```
Time and Date Config
Select: Press SEL
Abort: Press any Key
```

**Note:**
1. If the user chooses to configure the time and date, the Time Adjust and Date Adjust menus are displayed. Otherwise, the main menu is displayed and the user can set the time parameters in the Calendar menu. To set the time/date, use the UP/DOWN joystick and SEL push-button.

2. If the time configuration has already been done, then the number of elapsed days (higher than 1 day) from the last time the demo board was powered up appears on the LCD screen. It is soon followed by the current date.

Once the time/date have been set, the main menu appears. The main menu is displayed in the form of a set of icons. It shows all the submenus on the same screen. You can navigate using the UP, DOWN, RIGHT and LEFT joystick directions to select the required submenu. To enter a submenu, press the SEL joystick push-button, and the new submenu corresponding to the selected icon is displayed.

**Figure 8. Main menu**

```
APP Main Menu Name
```

**Note:** The icons shown in Figure 8 are taken from http://commons.wikimedia.org/wiki/Crystal_Clear.

Once a submenu has been selected, the name of the application is listed at the top of the display and all the corresponding submenus are listed below.
2.1.2 Navigation

The demonstration menu is based on circular navigation, submenu selection, item selection and back navigation as described in Figure 10.

The user navigates using the joystick push-buttons located on the evaluation board: RIGHT, LEFT, SEL, UP and DOWN.

- The UP, DOWN, RIGHT and LEFT push-buttons are used to perform circular navigation in the main menu and the current menu items.
- The SEL push-button selects the current item.
- The UP and DOWN push-buttons are used for vertical navigation in the submenus.
- To return to the upper menu, go to the Return line and press SEL.
2.2 Clock sources

2.2.1 Clock control

The STM32F072VBT6 internal clocks are derived from the HSE (clocked by the external 8 MHz crystal).

In this demo application, the various system clocks are configured as follows:
- System clock is set to 48 MHz: the PLL is used as the system clock source.
- HCLK frequency is set to 48 MHz.
- Timer clock (TIMCLK) is set to 48 MHz.
- ADC clock is set to 14 MHz.
- CEC clock is set to 32 KHz.
- PCLK is set to 48 MHz.

Only the RTC is clocked by a 32 kHz external oscillator.

Figure 11 illustrates the clock tree organization for this demo.
2.2.2 Clock failure

At any demo level, if no clock is present on OSC_IN (broken or disconnected crystal), the message shown in Figure 12 is displayed on the LCD screen.

If the 8 MHz crystal is not reconnected in the next few seconds, the MCU enters the Standby mode. If the 8 MHz crystal is reconnected within a few seconds, a system reset is generated.

**Note:** The clock security system (CSS) feeds the MCU with the MSI OSC used as an emergency clock if no clock is detected.

When a timeout occurs, the MCU enters the Standby mode and the message shown in Figure 13 is displayed on the LCD screen.

**Note:** The demo does not restart as long as the 8 MHz crystal is not present.

Connecting the 8 MHz crystal after reset may not restart the demo correctly. The crystal must be connected before starting the demo.
2.3 STM32F072VBT6 resources

The figure below shows the hardware requirements.

2.3.4 Internal memory size

Figure 15. Internal Flash memory organization

2.3.5 External memory organization

The STM32072B-EVAL demo is based on an embedded free FAT file system, FatFs. The file system is needed to read all media information from the on-board MicroSD card memory. The SD card memory is organized in three subdirectories:

- **STFILES**: this directory contains all the required demo media files (icons, waves and slides). User files located in this folder cannot be handled by demo; only default files are managed.

- **USER**: this is a user folder. The user can add his/her own files here to be played inside the demo menus (pictures and waves). This folder is used only by the Image Viewer and Wave Player submenus. For more details on the various files properties, please refer to Section 2.4.2: Image Viewer submenu and Section 2.4.3: Audio.

- **REC**: this directory contains the voice recorded wave file “Rec_wave.wav”. (This Folder will be created when the Voice Recording application is run).

The MicroSD card memory provided within STM32072B-EVAL board is already programmed with the media files required to run the demonstration. These files are also available within the demonstration firmware package under Project\STM32072B-EVAL\Binary\Media folder.

**Note**: The STFILES directory and its internal files are mandatory for demo startup. FatFs is a generic FAT file system module for small embedded systems. The FatFs is written in compliance with ANSI C and completely separated from the disk I/O layer. For more details, refer to the following link: http://elm-chan.org/fsw/ff/00index_e.html.

At any demo level, if the SD card is removed, the demo stops and the message shown in Figure 16 is displayed on the LCD screen.

Figure 16. SD card removal

```
Err: SDCard Removed
Please check SDCard

Press JoyStick UP to
Restart the demo ...
```
2.4 Demo applications

The following section provides a detailed description of each part of the demonstration.

Note: In the demonstration, the core runs at HCLK = 48 MHz.

Four LEDs (LD1, LD2, LD3 and LD4) flash throughout the demonstration at a frequency depending on the core clock.

2.4.1 Calendar

The STM32F072VB features a real-time clock (RTC) which is an independent BCD timer/counter. The RTC provides a time-of-day clock/calendar, two programmable alarm interrupts, and a periodic programmable wakeup flag with interrupt capability.

This submenu is used to configure the time, date and alarm. In any submenu, if the time and date parameters have not yet been configured, the message shown in Figure 17 is displayed on the LCD screen.

Figure 17. Setting the time and date

The user can choose to set or not the time, year, month and day. Press any key (except for SEL) to ignore the prompt and abort the configuration sequence. Press SEL and follow the setting sequence to set the time and date.

Time submenu

This submenu is divided into two items that allow the user to display or set the current time.

- **Time Adjust**: after the evaluation board is powered up, select this submenu to change the default time (00:00:00) to the current time. Once Time Adjust has been selected, the first digit of the hour field can be changed. Press the UP button to display the current value plus one. Press the DOWN button to display the previous digit value. After setting the digit value, press SEL, and the cursor automatically jumps to the next digit. When all the time digits have been set, the Time submenu appears. Some digit values are limited to a range of values depending on the field (hour, minutes or seconds). The following message (with the default time or the current time) is displayed on the LCD when this submenu is selected.
Running the demonstration

Figure 18. Time Adjust submenu

- **Time Show**: this item displays the current time. If time and date have not been configured before, a message is displayed, prompting the user to set the time and date or to exit to the upper submenu. When this submenu is selected, the message shown in *Figure 19* appears on the LCD. In the example, the time has not been set yet.

Figure 19. Time Show submenu

To exit the Time Show submenu, press the SEL push-button. To exit the Time submenu, select the Return line and press the SEL push-button.

**Date submenu**

This submenu is divided into two items that allow the user to display or set the current date.

- **Date Adjust**: select this item after each power-up in order to set the current date. If the time and date have not been configured before, a message is displayed, prompting the user to set the time and date or to exit to the upper submenu.

  The user is requested to set the current date to be stored in the application memory. The date is displayed as Year, Month, Week Nbr, Day Nbr (number of the day in the year) with the selected day shown in the month. There is no default date since the user has to set the date at least once.

  Once the submenu has been selected, the user starts by setting the Year, then the Month and the day of the selected month. The Month and the Year are selected using the UP or DOWN push-button. For the day, the UP, DOWN, RIGHT and LEFT push-
buttons can be used. Press the UP push-button to display the current value plus one; press the DOWN push-button to display the previous value. To confirm the selected month, press the SEL push-button. The display then jumps to the year configuration. The same procedure is applicable for the year configuration.

After configuring the day, press the SEL push-button to store the entered value and exit to the Date submenu. The current date value is then shown and you can change the setting if required. The messages shown in *Figure 20, Figure 21* and *Figure 22* are successively displayed on the LCD when this submenu is selected.

**Figure 20. Setting the year**

• **Date Show:** this item displays the current date. If the time and date have not been configured before, a message is displayed, prompting the user to set the time and date or to exit to the upper submenu. The message shown in **Figure 23** is displayed on the LCD when the submenu is selected (with the date already configured).

**Figure 23. Exiting the Date Show submenu**

To exit this submenu, press the SEL push-button. To exit the Date submenu, select the Return line and press the SEL push-button.

**Alarm submenu**

Using this submenu, the user can configure the alarm activation time. When the alarm time value is reached, all the LEDs (LED1 to LED4) start flashing together, and so for 30 seconds. This submenu is divided into two items that allow the user to display or set the current alarm.

• **Alarm Adjust:** the alarm time activation is set in the same way as the time is set in the Time Adjust submenu. The following messages are successively displayed on the LCD when this submenu is selected:
Figure 24. Setting the alarm activation time

- **Alarm Show**: this item displays the current alarm time. The default Alarm activation time displayed after power-up and before setting in the Alarm Adjust submenu is 00:00:00. If the time and date have not been configured before, a message shown in Figure 26 is displayed. Pressing SEL takes you back to the Alarm submenu. The message shown in Figure 25 is displayed on the LCD when this submenu is selected.

Figure 25. Alarm Show submenu

To exit the Alarm Show submenu, press the SEL push-button. To exit the Alarm submenu, select the Return line and press the SEL push-button.

Note: In the Alarm Adjust and Alarm Show menus, if the time and date have not yet been configured, the message shown in Figure 26 is displayed on the LCD screen.
2.4.2 Image Viewer submenu

The Image Viewer submenu is used to demonstrate the LCD control performance using the embedded SPI interface. The application is a successive display of stored images.

This application reads all bitmap pictures from the USER directory (see Section 4.1: Programming the media files) and displays only the .BMP files having the following format:

- Bit depth: 16 bits (RGB)
- Size: 240x320

Select Image Viewer to display the submenu shown in Figure 27.

![Figure 27. Image Viewer submenu](image)

When Image Viewer is selected, a list box of images is displayed as shown in Figure 28.

Using the UP, DOWN and SEL push-buttons, the user can select and view any image from the list box.

The user can also select and view any image from the list box using the slider mounted on the evaluation board.
When Image Viewer is selected, the corresponding image is displayed and then the user can use the RIGHT and LEFT push-buttons to go to the next/previous image stored in the USER folder on the MicroSD card. If the DOWN push-button is pressed, the Image Viewer is stopped and the submenu shown in Figure 28 is displayed.

The supported image size is 240x320. The defined maximum number of images that can be read from the MicroSD card is 4 images, selected in alphabetic order.

### 2.4.3 Audio

#### Wave Player submenu

The STM32F072VBT6 microcontroller has an embedded DAC which can be used to generate output signals.

In this demo, any wave file stored under the USER folder in the MicroSD card can be opened using the file system FATFS and transferred to the internal SRAM by block (512 bytes) using the SPI interface. Timer 6 (TIM6) triggers the DAC to generate the wave signal. The voice sampling period is read from the Wave File Header. An audio amplifier is connected to the DAC interface to play the stored wave files.

This application reads all wave files from “USER” directory (See Section 4.1: Programming the Media files) and displays only the WAV files having the following format:

- **Audio Format**: PCM (an uncompressed wave data format in which each value represents the amplitude of the signal at the time of sampling.)
- **Sample rate**: may be 8000, 11025, 22050 or 44100 Hz.
- **Bits Per Sample**: 16-bit (Audio sample data values are in the range [0-1023]).
- **Number of Channels**: 2 (Stereo)

The maximum wave files number that can be read from the MicroSD card is 4 files selected in alphabetic order.

By selecting Wave Player, the submenu shown in Figure 29 is displayed.
When Wave Player is selected again, the wave player file names are displayed as a list box, as shown in Figure 30.

In Figure 30, the active push-buttons and their functions are displayed as below. For example, at start-up, pressing the SEL JoyStick push-button causes the file to be played through the embedded speaker, whereas pressing the DOWN push-button causes to exit the Wave Player submenu.

The user can also select the desired wave file using the Touch keys; keep pressing on the touch keys causes the selected wave file to be played through the embedded speaker.

Once the command is prompted, the submenu shown in Figure 31 is displayed.
The Progress bar is displayed at the bottom of the view. The Progress bar is updated every ~1% of the audio file duration.

At this application level, pressing:

- the SEL push-button pauses the audio stream
- the LEFT push-button or Touch Key(0) decrements the audio stream and the RIGHT push-button or Touch Key(1) increments the audio stream.
- the DOWN push-button exits the Wave Player submenu

When the audio stream is paused, the menu in *Figure 32* is displayed.

*Figure 32. Pause submenu*

![Wave Player](image)

To resume playing, press the SEL push-button and the menu shown in *Figure 31* is displayed.

When the audio stream is stopped, the stream position is reset and the menu shown in *Figure 30* is displayed.

*Note:* The audio files provided within this package are based on a free music download from www.DanoSongs.com website.

**Wave Record**

The STM32F072VBT6 microcontroller has an embedded ADC and an embedded DAC which can be used to record a voice (signal coming from the U22 microphone).

In this demo, the recorded wave buffers can be transferred from the internal SRAM by block (512 bytes) and stored under the REC folder in the MicroSD card using the FatFs file system and based on DMA and SPI1. Timer3 (TIM3) triggers the ADC to generate the sampling frequency.

When the Wave Record submenu is selected, the message shown in *Figure 33* is displayed on the LCD.
If the Record submenu has been selected by pressing the SEL push-button, the Voice Recording interface is displayed as shown in Figure 34.

Once the record command is activated (by pressing on SEL push button), the submenu shown in Figure 35 is displayed.
The recorded wave file properties at the right side of the Wave Record submenu. When the DOWN push-button is pressed, the menu in Figure 33 is displayed.

If the Wave Player submenu has been selected by pressing the SEL push-button, the wave player interface is displayed as shown in Figure 30.

Once the record command is activated (by pressing the SEL push-button), the submenu shown in Figure 31 is displayed.

The Progress bar is updated every ~1% of the audio file duration.

2.4.4 Low-power modes

The STM32F072VBT6 microcontroller provides different operating modes in which the power consumption is reduced. The purpose of this menu is to show the behavior of the microcontroller in different low-power modes. The Stop and Standby modes are taken as examples.

Stop mode menu

This menu allows the user to put the STM32F072VBT6 in the Stop mode. The software performs the specific instruction sequence needed to enter the Stop mode.

In this application, the STM32F072VBT6 can exit the Stop mode in two ways, as shown in Figure 36.

- In the first case, The EXTI Key button is used to make the MCU exit the Stop mode. Once the Stop mode submenu has been selected, the red LEDs keep blinking until the SEL push-button is pressed, and the system enters the Stop mode. When the MCU is in the Stop mode, the message shown in Figure 37 is displayed on the LCD.
The MCU remains in the Stop mode until the Tamper push-button is pressed and the message shown in Figure 38 is displayed on the LCD screen.

Once the Tamper push-button has been pressed, the MCU exits the Stop mode. The system clock is then set to 48 MHz and the application resumes execution.

**Figure 38. MCU in the Stop mode Exit EXTI**

Note: if an RTC Alarm is generated while the MCU is in the Stop mode and the message shown in Figure 38 is displayed (which means that the Key push-button needs to be pressed to exit the Stop mode), the RTC Alarm causes the MCU to exit the Stop mode. The message shown in Figure 39 is then displayed.

**Figure 39. RTC Alarm causes the MCU to exit the Stop mode**

- In the second case, the RTC Alarm wakes up the MCU from the Stop mode after the programmed time has elapsed. When selecting this submenu, the user has to set the alarm to the time when the MCU is to exit the Stop mode. Figure 40 shows how to set the wakeup time.

**Figure 40. Setting the Wakeup time**

Once the alarm has been configured, the red LEDs stop blinking and the system enters the Stop mode. The message shown in Figure 41 is displayed on the LCD.
After the programmed time has elapsed, the system exits the Stop mode. The system clock is then set to 48 MHz and the application resumes execution. The message shown in Figure 42 is displayed on the LCD screen.

**Figure 42. RTC Alarm wakeup**

After the programmed time has elapsed, the system exits the Stop mode. The system clock is then set to 48 MHz and the application resumes execution. The message shown in Figure 42 is displayed on the LCD screen.

**Note:** if the Time and Date have not been set, the message shown in Figure 43 is displayed on the LCD screen.

**Figure 43. Time and Date configuration prompt**
Standby mode menu

This menu allows the user to put the STM32F072VBT6 in the Standby mode. The software runs the specific instruction sequence needed by the STM32F072VBT6 to enter the Standby mode.

In this application, the STM32F072VBT6 can exit the Standby mode in two ways, as shown in Figure 44.

Figure 44. Entering the Standby mode

- In the first case, the Wakeup push-button is used to wake up the MCU from the Standby mode.

  Once the Standby mode submenu has been selected, the red LEDs keep blinking until the SEL push-button is pressed, and the system enters the Standby mode. When the MCU is in Standby mode, the message shown in Figure 45 is displayed on the LCD.

Figure 45. MCU in Standby mode

The MCU remains in Standby mode until the Wakeup push-button is pressed. Once the Wakeup push-button has been pressed, the MCU exits the Standby mode and the system reset signal is generated.

Note: if an RTC Alarm is generated while the MCU is in Standby mode and the message shown in Figure 45 is displayed (which means that the Wakeup push-button needs to be pressed to exit the Standby mode), the RTC Alarm causes the MCU to exit the Standby mode and a system reset signal is generated.
Running the demonstration

Figure 46. RTC Alarm causes the MCU to exit the Standby mode

- In the second case, the RTC Alarm wakes up the MCU from the Standby mode after
  the programmed time has elapsed. When selecting this submenu, the user has to set
  the alarm to the time when the MCU is to exit the Standby mode. Figure 47 shows how
  to set the wakeup time.

Figure 47. Setting the wakeup time

Once the alarm has been configured, The LEDs stop blinking and the system enters the
Standby mode. The message shown in Figure 48 is then displayed on the LCD.

Figure 48. RTC Alarm wakeup configured

After the programmed timing has elapsed, the system exits the Standby mode and a system
reset signal is generated.

Note: if the Time and Date have not been set, the message shown in Figure 49 is displayed on the
LCD screen.
2.4.5 Thermometer

The STM32F072VBT6 microcontroller has two embedded I2C peripherals that can be connected to any device supporting the I2C protocol including the system management bus (SMBus) mode. An STLM75 (or a compatible device) I2C temperature sensor is mounted on the STM32072B-EVAL board and used to capture the external temperature (-55°C to +125°C).

When the Thermometer submenu is selected, the message shown in Figure 50 is displayed on the LCD.

Once the Temperature submenu has been selected by pressing the SEL push-button, the temperature value is displayed in Celsius and Fahrenheit as shown in Figure 51.

Press any key to return to the Thermometer submenu.
The temperature variations can be monitored easily using the STM32 I2C SMBus feature. This is managed by the SMBus Alert, which generates a dedicated interrupt informing the system that the temperature is out of the selected ranges. This can be very useful when a higher temperature needs an emergency action, as is the case in critical systems (motor control, medical...).

If the temperature exceeds the over-limit high (TEMPERATURE_TOS: Over Limit Temperature), the SMBus alert interrupt is generated and the warning message shown in Figure 52 is displayed on the LCD screen.

![Figure 52. Warning temperature display](image)

The messages shown in Figure 51 are displayed on the LCD screen when the temperature goes under the over limit low (TEMPERATURE_THYS: Hysteresis Temperature).

The user can configure the TOS and THYS using dedicated define values in the code. By default, the STM32072B-EVAL demo sets them to (see menu.c file):

```c
#define TEMPERATURE_THYS 31
#define TEMPERATURE_TOS 32
```

Press any key to return to the Thermometer submenu.

*Note:* Any hardware trouble with the temperature sensor is detected by a test. In such a case, the message shown in Figure 53 is displayed.

![Figure 53. Temperature sensor error](image)

### 2.4.6 HDMI™ CEC submenu

The STM32F072VBT6 microcontroller features an HDMI-CEC peripheral. The demonstration shows how to configure this peripheral and how to create a CEC network providing a high level communication between different devices using CEC protocol messages.
For more details, refer to application note AN4066: “Developing an HDMI-CEC network using an STM32F0xx microcontroller”. This application note provides a full description of the STM32F072VBT6 embedded HDMI-CEC Controller and a step by step firmware description of the CEC peripheral configuration. An advanced demonstration firmware communicating in a real multimedia and HDMI environment is also provided to build easily the CEC applications.

When the **HDMI CEC** submenu is selected, the message shown in Figure 54 is displayed on the LCD.

**Figure 54. HDMI CEC submenu selected**

Once you select the **HDMI CEC** submenu, if no CEC error is generated, the device is configured as Tuner and the physical and logical addresses are displayed on the LCD as shown in Figure 55. To enter the CEC menu, press the SEL push-button.

**Figure 55. HDMI CEC configuration submenu**

The LCD screen is divided into two parts as shown in Figure 56:
- a subscreen that shows the CEC receive information: receive status, sender address
- a subscreen that allows to select the follower address and the command to send

**Figure 56. CEC menu**
After selecting the follower address, select the command to be sent to the selected follower address using the LEFT, RIGHT and SEL buttons. After selecting the command, the CEC device sends this command to the selected follower address and displays the status of transmission as shown in Figure 57.

You can also send the command from the remote control by the CEC device. After selecting the address, the user presses the remote control and the message is displayed in the receiver field.

**Note:**
1. Phillips RC5 protocol was integrated in the HDMI-CEC application. Each RC5 command has a corresponding HDMI-CEC User Control Code.
2. For more details, refer to Section 2.4.9: InfraRed.

![Figure 57. Select CEC command](image)

When receiving a new message, the following information can be displayed on the LCD:
- Receive status
- Sender address
- Number of bytes (including the sender address)
- Opcode message
- Data (operands)

*Figure 58* shows that the device has correctly received the frame from the sender with the address: 0x5, the number of bytes received: 0x3 (header + opcode + data), the message opcode: 0x44 and data: 0x41.

![Figure 58. Receive subscreen information](image)

Normally, for the Standby command, the device is in stop mode and can wake up only when it receives a new command. If you press the Tamper button, the HDMI CEC demo stops and the menu shown in *Figure 54* is displayed.
Note: The STM32F072VBT6 CEC device responds only to the following commands. For other commands it sends feature abort:
- Standby
- Get CEC version
- Give physical address
- Give OSD name

2.4.7 Dual interface EEPROM (RF/I²C)

The STM32F072VBT6 microcontroller has two embedded I2C peripherals that can be connected to any device supporting the I2C protocol. An ANT7-M24LR-A dual interface RF EEPROM daughter board can be connected on CN2 to STM32072B-EVAL via the I2C interface.

Note: For more details about the Dual Interface EEPROM daughter board, please refer to the ANT7-M24LR-A databrief.

Figure 59. ANT7-M24LR-A dual interface EEPROM daughter board

The M24LR64-R device is a dual-interface, electrically erasable programmable memory (EEPROM). It features an I2C interface and can be operated from a VCC power supply. It is also a contactless memory powered by the received carrier electromagnetic wave at 13.56 MHZ. The M24LR64-R is organized as 8192 \times 8 \text{ bits} in the I2C mode and as 2048 \times 32 \text{ bits} in the ISO 15693 and ISO 18000-3 mode 1 RF mode.
Running the demonstration

**Figure 60. M24LR64-R block diagram**

Note: For more details on the M24LR64 EEPROM, please refer to the datasheet.

Select the Dual Interface (RF/I²C) EEPROM menu by pressing SEL from the main menu. Two applications can be selected, as shown in Figure 61.

**Figure 61. Dual Interface EEPROM applications menu**

**ESL application**

The Electronic Shelf Labeling (ESL) consists of reading (using I2C interface) the content of the dual interface EEPROM and displaying the information on the LCD screen, as shown in Figure 62.
All this information (product name, price, logo, price trend...) is programmed in the M24LR64 dual interface EEPROM in RF mode and can be updated any time using the CR95HF RFID reader/writer connected to the USB port of a PC host, with the associated M24LRxx_Application_Software PC software.

Using this PC software application, several parameters can be set to configure the ESL device and update the LCD display mounted on the STM32072B-EVAL:

**French / English Logo**: Check the French (PROMO) or English (DISCOUNT) to indicate that a special price is proposed. Check the blank logo if no special price is applied.

**Orientation arrow**: Check the up or down arrow to indicate if the price has been increased or decreased, or the blank arrow if no indication is required.

**Price**: Display the product price.
Ascii Text line 1 and Line 2: Display the name and a brief description of the product. The transfer data to your ESL button of the PC ESL demo software allows to program ESL parameters in RF mode using the CR95HF RFID reader/writer demo board.

ESL data can be read from the M24LR64 dual interface EEPROM using the read ESL configuration button of the PC ESL demo software application. When done, ESL data written into the M24LR64 is displayed in the ESL panel of the PC ESL demo application.

Note: For more details about this PC Software, please refer to user manual UM0853.

ESL parameters mapping into the M24LR64 dual interface EEPROM are shown in Table 4: M24LR64 memory organization (ESL application).

DataLogger application

This dual interface EEPROM (RF/I²C) application presents a practical application for the M24LR64. It is able to record and store a 64-Kbit temperature data using the M24LR64-R dual interface EEPROM. The DataLogger microcontroller is an STM32F072VBT6 which communicates with the M24LR64-R using its I²C serial interface and controls an STLM75 digital temperature sensor.
Temperature acquisition parameters (temperature acquisition Start/Stop, temperature acquisition period) are stored into the M24LR64 dual interface EEPROM. Changing these values and controlling the temperature acquisition is done in RF mode using the CR95HF RFID reader/writer demo board. During the temperature acquisition, data from the STLM75 digital temperature sensor is written into the M24LR64 by the STM32F072VB microcontroller in I²C mode and displayed on the STM32072B-EVAL eval board LCD screen.

Temperature data can be read in the same time in RF mode using the CR95HF RFID reader/writer demo board and be displayed in the PC DataLogger software application.

For more details about this application, please refer to the application note AN3109 “Developing your M24LR64-R datalogger application for temperature acquisition”.

How to run the application:

1. From the STM32072B evaluation board, select the DataLogger submenu and then press the SEL push-button.

When the application starts, the data has been stored in the dual interface EEPROM and this temperature data has been displayed as a real-time curve on the TFT-LCD mounted on the evaluation board and also on the PC software interface.
2.4.8 Applications

The STM32F072VBT6 microcontroller has a new embedded RTC Version 2 which can be used for many applications like Stopwatch and Timer.

Select Applications to display the submenu shown in Figure 67.

Stopwatch application

This application simulates a precise chronometer with 5 record time possibilities. For this application, an interactive human interface is developed using STM32072B-EVAL LCD and push-buttons to allow the user to use StopWatch with real time display.
After startup, a default 00:00:00:000 chronometer counter is displayed on the LCD; it correspond to [Hours]:[minutes]:[seconds]:[milliseconds].

The user can manipulate the chronometer features using the joystick LEFT, RIGHT and DOWN push-buttons:

- press the joystick LEFT button to start counter.
- press the joystick RIGHT button to save trials in the backup registers (max 5 actions).
- Press the joystick DOWN button to exit.
- press and hold the Tamper button for 1 sec to reset all the backup registers.

**LDR application**

The STM32F072VBT6 microcontroller has an embedded comparator which can be used in combination with the DAC peripheral for more applications, such as the measuring of light intensity (using the LDR sensor).

When the LDR submenu is selected, the message shown in Figure 69 is displayed.

According to the light intensity level, the icons are changed and also the progress bar.

**2.4.9 InfraRed**

The infrared technology offers important advantages as a form of wireless communication. Nowadays, almost all audio and video equipment can be controlled using an infrared remote control.
There are many popular infrared protocols used to transmit data via infrared light, such as RC5, SIRC,...

The purpose of this demo is to provide a generic solution for implementing an IR transmitter and receiver in software using an STM32F072VBT6 microcontroller. An example of a software implementation is provided for the free RC5 and SIRC protocol specification. Other protocols can be supported upon request (for further information, contact your local STMicroelectronics sales office).

For more details, refer to application note AN4099: "Implementing transmitters and receivers for infrared remote control protocols using STM32F0xx microcontrollers".

Note: The infrared protocol implementation is based on free RC5 and SIRC specifications download from:

The STM32F072VBT6 microcontroller has embedded Timers which can be used as follows:
- One 32-bit and one 16-bit timer, with up to 4 IC/OC, usable for IR control decoding
- Two 16-bit timers, each with IC/OC and OCN, dead time generation, emergency stop and modulator gate for IR encoder.

Select InfraRed to display the submenu shown in Figure 70.

**Figure 70. InfraRed menu**

![InfraRed menu](image)

**Infrared transmitter**

On the STM32F072B-EVAL board, the IR LED is driven by PB9 directly with 20mA current. When the IR Transmitter submenu is selected, the message shown in Figure 71 is displayed.

**Figure 71. IR Transmitter menu**

![IR Transmitter menu](image)
When a protocol has been selected from the list, the adequate submenu shown in Figure 72 is displayed.

**Figure 72. IR transmitter command menu**

![IR transmitter command menu](image)

The user can manipulate the InfraRed transmitter features using the joystick LEFT, RIGHT, DOWN, UP and SEL buttons:

- press the joystick DOWN button to switch between device type and command.
- press the joystick LEFT button to go to the previously defined device/command.
- press the joystick RIGHT button to go to the next defined device/command.
- press the joystick SEL button to send the selected device command code.

When the joystick UP button is pressed, the infrared transmitter demo is exited and the menu shown in Figure 71 is displayed.

**Infrared receiver**

TSOP34836 IR receiver is connected to PB3 of STM32F072VBT6 on the STM32F072B-EVAL board.

At the receiving end, a receiver detects the light pulses, which are processed to retrieve/decode the information they contain.

When the IR Receiver submenu is selected, the message shown in Figure 73 is displayed.

**Figure 73. IR receiver menu**

![IR receiver menu](image)
When a protocol has been selected from the list, the adequate submenu shown in Figure 74 is displayed.

Figure 74. IR receiver application menu

When an IR frame is sent using a remote control or using the IR transmitter application running on another STM32F072B-EVAL board, this IR frame will be decoded using the IR receiver. If the protocol is compliant with the selected IR protocol, the device and the command will be displayed on the LCD screen Figure 75.

Figure 75. IR receiver command menu

Note: For more details on the infrared receiver implementation, refer to AN3174 application note: “implementing infrared remote protocols receiver with the STM32F10xx microcontrollers”. This application note provides a full description of the IR decoding.
2.4.10 Mouse Application

A USB mouse (human interface device –HID– class) is a simple example of a complete USB application. The joystick mouse uses only one interrupt endpoint (endpoint 1 in the IN direction). After normal enumeration, the host requests the HID report descriptor of the mouse.

To get the mouse pointer position the host requests four bytes of data with the format shown in Figure below.

![Figure 76. IR receiver menu](image)

The purpose of the mouse demo is to set the X and Y values according to the user actions with a joystick button. The JoyState() function gets the user actions and returns the direction of the mouse pointer.

When the Mouse Application submenu is selected, the message shown in figure below is displayed.

2.4.11 Help

This submenu can help the user to configure the jumpers on the STM32F072B-EVAL evaluation board and to navigate between the menus and submenus available in the firmware demo.

Select the Help menu by pressing SEL from the main menu. The message shown in Figure 77 is then displayed on the LCD screen.

Figure 77. Help menu

If the Menu Navigation submenu is selected, the message shown in Figure 78 is displayed.

Figure 78. Navigation menu-1

When any joystick button is pressed, the second navigation interface is displayed as shown in Figure 79.

Figure 79. Navigation menu-2
Once the joystick push-button has been pressed again, the MCU exits the navigation submenu and the message shown in Figure 77 is displayed on the LCD screen.

- If the Jumpers config submenu is selected, the message shown in Figure 80 is displayed.

Figure 80. Jumpers config menu-1

Press RIGHT and LEFT to go to the next/previous slide and UP to exit. The following messages shown in Figure 81, Figure 82 and Figure 82 are displayed sequentially on the LCD screen.

Figure 81. Jumpers config menu-2

Once the SEL joystick push-button has been pressed, the MCU exits the Jumpers config submenu and the message shown in Figure 77 is displayed on the LCD screen.

Figure 82. Jumpers config menu-3
2.4.12 About submenu

This submenu shows the version of the STM32F072VBT6 demo firmware. When the About submenu is selected, the message shown in Figure 83 is displayed on the LCD screen.

Figure 83. About submenu

Pressing SEL then displays a message showing the STM32F072B-EVAL demo version on the LCD screen.
3 STM32072B-EVAL demonstration package

The STM32072B-EVAL demonstration is supplied in one single zip file. The extraction of the zip file generates one folder, `STM32072B-EVAL_FW_VX.Y.Z`, which contains the subfolders shown in *Figure 84* and described below.

*Figure 84. STM32072B-EVAL demo package directory tree*

1. **Libraries**: contains the Hardware Abstraction Layer (HAL) for STM32F0xx devices.
2. **Project\STM32072B-EVAL**
   - **Binary**: contains the binary image (*.hex) of the demonstration that can be used with any in-system programming tool or the embedded Bootloader to reprogram
the demonstration. It contains also the media files (*.bmp and *.wav) required to run the demonstration (under 'Media subfolder).

- EWARM: contains preconfigured projects for the EWARM toolchain
- MDK-ARM: contains preconfigured projects for the MDK-ARM toolchain
- TrueSTUDIO: contains preconfigured projects for the Atollic toolchain
- inc: contains the demonstration header files
- src: contains the demonstration source files

3. Utilities
- STM32F072B-EVAL: contains STM32072B-EVAL board drivers
4 STM32072B-EVAL demonstration programming

4.1 Programming the media files

The STM32072B-EVAL board comes with a MicroSD card memory preprogrammed with Audio and Image resources used by the demonstration. However, you can load your own image (*.bmp) and audio (*.wav) files in the USER directory, respectively, provided that these file formats are supported by the demonstration. For more details, please refer to Section 2.4.2: Image Viewer submenu and Section 2.4.3: Audio.

Figure 85. SD Card directory organization

The default content of the media files (STFILES and USER directories) can be retrieved from the Binary\Media folder. If the user wants to reprogram the MicroSD card, he/she can copy the content of the Binary\Media folder to his/her own SD memory.

4.2 Programming the demo

You can program the demonstration using two methods.

4.2.1 Using Bootloader

To program the demonstration’s binary image into the internal Flash memory, you have to use the \stm32072B-eval\fw\vx.y.z\configx.hex file located under Project\STM32072B-EVAL\Binary with embedded Bootloader. For more details, please refer to Bootloader application note AN2606: STM32™ microcontroller system memory boot mode.

4.2.2 Using preconfigured projects

- Select the folder corresponding to your preferred toolchain (MDK-ARM, EWARM, RIDE or TrueSTUDIO).
- Open the STM32F072B-EVAL_Demo project and rebuild all sources.
- Load the project image through your debugger.
- Restart the evaluation board (press B1: reset button).
