Description of STM32U5 HAL and low-layer drivers

Introduction

STM32Cube is an STMicroelectronics original initiative to significantly improve developer productivity by reducing development effort, time and cost. STM32Cube covers the STM32 portfolio.

STM32Cube includes:

- STM32CubeMX, a graphical software configuration tool that allows the generation of C initialization code using graphical wizards.
- A comprehensive embedded software platform, delivered per Series (such as STM32CubeU5 for STM32U5 devices)
  - The STM32Cube HAL, STM32 abstraction layer embedded software ensuring maximized portability across the STM32 portfolio. HAL APIs are available for all peripherals.
  - Low-layer APIs (LL) offering a fast light-weight expert-oriented layer which is closer to the hardware than the HAL. LL APIs are available only for a set of peripherals.
  - A consistent set of middleware components such as Azure® RTOS ThreadX, USBX and ST Network library.
  - All embedded software utilities, delivered with a full set of examples.

The HAL driver layer provides a simple, generic multi-instance set of APIs (application programming interfaces) to interact with the upper layer (application, libraries and stacks). The HAL driver APIs are split into two categories: generic APIs, which provide common and generic functions for all the STM32 series and extension APIs, which include specific and customized functions for a given line or part number. The HAL drivers include a complete set of ready-to-use APIs that simplify the user application implementation. For example, the communication peripherals contain APIs to initialize and configure the peripheral, manage data transfers in polling mode, handle interrupts or DMA, and manage communication errors. The HAL drivers are feature-oriented instead of IP-oriented. For example, the timer APIs are split into several categories following the IP functions, such as basic timer, capture and pulse width modulation (PWM). The HAL driver layer implements run-time failure detection by checking the input values of all functions. Such dynamic checking enhances the firmware robustness. Run-time detection is also suitable for user application development and debugging.

The LL drivers offer hardware services based on the available features of the STM32 peripherals. These services reflect exactly the hardware capabilities, and provide atomic operations that must be called by following the programming model described in the product line reference manual. As a result, the LL services are not based on standalone processes and do not require any additional memory resources to save their states, counter or data pointers. All operations are performed by changing the content of the associated peripheral registers. Unlike the HAL, LL APIs are not provided for peripherals for which optimized access is not a key feature, or for those requiring heavy software configuration and/or a complex upper-level stack (such as USB).

The HAL and LL are complementary and cover a wide range of application requirements:

- The HAL offers high-level and feature-oriented APIs with a high-portability level. These hide the MCU and peripheral complexity from the end-user.
- The LL offers low-level APIs at register level, with better optimization but less portability. These require deep knowledge of the MCU and peripheral specifications.

The HAL- and LL-driver source code is developed in Strict ANSI-C, which makes it independent of the development tools. It is checked with the Coverity static analysis tool. It is fully documented.

It is compliant with MISRA C®:2012 standard.

This user manual is structured as follows:
- Overview of HAL drivers
- Overview of low-layer drivers
- Cohabiting of HAL and LL drivers
- Detailed description of each peripheral driver: configuration structures, functions, and how to use the given API to build your application

1 General information

The STM32CubeU5 MCU Package runs on STM32U5 32-bit microcontrollers based on the Arm® Cortex®-M processor with Arm® TrustZone® technology.

Note: Arm and TrustZone are registered trademarks of Arm Limited (or its subsidiaries) in the US and/or elsewhere.

2 Acronyms and definitions

Table 1. **Acronyms and definitions**

Acronym	Definition
ADC	Analog-to-digital converter
AES	Advanced encryption standard
ANSI	American national standards institute
API	Application programming interface
BSP	Board support package
CAN	Controller area network
CMSIS	Cortex microcontroller software interface standard
COMP	Comparator
CORDIC	Trigonometric calculation unit
CPU	Central processing unit
CRC	CRC calculation unit
CRYP	Cryptographic processor
CSS	Clock security system
DAC	Digital to analog converter
DLYB	Delay block
DCMI	Digital camera interface
DMA	Direct memory access
DMAMUX	Direct memory access request multiplexer
DSI	Display serial interface
EXTI	External interrupt/event controller
FDCAN	Flexible data-rate controller area network unit
FLASH	Flash memory
FMAC	Filtering mathematical calculation unit
FMC	Flexible memory controller
GFXMMU	Graphical oriented memory management unit (Chrom-GRC)
GFXTIM	Graphic timer
GPIO	General-purpose I/Os
GPU2D	Graphic processing unit (Neo-Chrom)
GTZC	Global TrustZone® controller
GTZC-MPCBB	GTZC block-based memory protection controller
GTZC-MPCWM	GTZC watermark memory protection controller
GTZC-TZIC	TrustZone® illegal access controller
GTZC-TZSC	TrustZone® security controller
HAL	Hardware abstraction layer
HASH	Hash processor
HCD	USB host controller driver
I2C	Inter-integrated circuit
I2S	Inter-integrated sound

Acronym	Definition
ICACHE	Instruction cache
IRDA	Infrared data association
IWDG	Independent watchdog
JPEG	Joint photographic experts group
LCD	Liquid crystal display controller
LTDC	Liquid crystal display - thin film transistor display controller
LPTIM	Low-power timer
LPUART	Low-power universal asynchronous receiver/transmitter
MCO	Microcontroller clock output
MDIOS	Management data input/output (MDIO) slave
MDMA	Master direct memory access
MMC	MultiMediaCard
MPU	Memory protection unit
MSP	MCU specific package
NAND	NAND Flash memory
NOR	NOR Flash memory
NVIC	Nested vectored interrupt controller
OCTOSPI	Octo-SPI interface
OPAMP	Operational amplifier
OTFDEC	On-the-fly decryption engine
PKA	Public key accelerator
PCD	USB peripheral controller driver
PPP	STM32 peripheral or block
PSSI	Parallel synchronous slave interface
PWR	Power controller
RCC	Reset and clock controller
RNG	Random number generator
RTC	Real-time clock
SAI	Serial audio interface
SD	Secure digital
SDMMC	SD/SDIO/MultiMediaCard card host interface
SMARTCARD	Smartcard IC
SMBUS	System management bus
SPI	Serial peripheral interface
SRAM	SRAM external memory
SysTick	System tick timer
TIM	Advanced-control, general-purpose or basic timer
TSC	Touch sensing controller
UART	Universal asynchronous receiver/transmitter
UCPD	USB Type-C® and Power Delivery interface
USART	Universal synchronous receiver/transmitter

Acronym	Definition
USB	Universal serial bus
VREFBUF	Voltage reference buffer
WWDG	Window watchdog

3 Overview of HAL drivers

The HAL drivers are designed to offer a rich set of APIs and to interact easily with the application upper layers.

Each driver consists of a set of functions covering the most common peripheral features. The development of each driver is driven by a common API which standardizes the driver structure, the functions and the parameter names.

The HAL drivers include a set of driver modules, each module being linked to a standalone peripheral. However, in some cases, the module is linked to a peripheral functional mode. As an example, several modules exist for the USART peripheral: UART driver module, USART driver module, SMARTCARD driver module and IRDA driver module.

The HAL main features are the following:

- Cross-family portable set of APIs covering the common peripheral features as well as extension APIs in case of specific peripheral features.
- Three API programming models: polling, interrupt and DMA.
- APIs are RTOS compliant:
  - Fully reentrant APIs
  - Systematic usage of timeouts in polling mode
- Support of peripheral multi-instance allowing concurrent API calls for multiple instances of a given peripheral (such as USART1 or USART2)
- All HAL APIs implement user-callback functions mechanism:
  - Peripheral Init/DeInit HAL APIs can call user-callback functions to perform peripheral system level Initialization/De-Initialization (clock, GPIOs, interrupt, DMA)
  - Peripherals interrupt events
  - Error events
- Object locking mechanism: safe hardware access to prevent multiple spurious accesses to shared resources.
- Timeout used for all blocking processes: the timeout can be a simple counter or a timebase.

3.1 HAL and user-application files

3.1.1 HAL driver files

HAL drivers are composed of the following set of files:

Table 2. HAL driver files

File	Description
stm32u5xx_hal_ppp.c	Main peripheral/module driver file It includes the APIs that are common to all STM32 devices. *Example: stm32u5xx_hal_adc.c, stm32u5xx_hal_irda.c.*
stm32u5xx_hal_ppp.h	Header file of the main driver C file It includes common data, handle and enumeration structures, define statements and macros, as well as the exported generic APIs. *Example:stm32u5xx_hal_adc.h,stm32u5xx_hal_irda.h.*
stm32u5xx_hal_ppp_ex.c	Extension file of a peripheral/module driver. It includes the specific APIs for a given part number or family, as well as the newly defined APIs that overwrite the default generic APIs if the internal process is implemented in different way. *Example:stm32u5xx_hal_adc_ex.c,stm32u5xx_hal_flash_ex.c.*
stm32u5xx_hal_ppp_ex.h	Header file of the extension C file It includes the specific data and enumeration structures, define statements and macros, as well as the exported device part number specific APIs *Example: stm32u5xx_hal_adc_ex.h,stm32u5xx_hal_flash_ex.h.*
stm32u5xx_hal.c	This file is used for HAL initialization and contains DBGMCU, Remap and Time Delay based on SysTick APIs.
stm32u5xx_hal.h	stm32u5xx_hal.c header file
stm32u5xx_hal_msp_template.c	Template file to be copied to the user application folder It contains the MSP initialization and de-initialization (main routine and callbacks) of the peripheral used in the user application.
stm32u5xx_hal_conf_template.h	Template file allowing to customize the drivers for a given application
stm32u5xx_hal_def.h	Common HAL resources such as common define statements, enumerations, structures and macros

3.1.2 User-application files

The minimum files required to build an application using the HAL are listed in the table below:

Table 3. User-application files

File	Description
system_stm32u5xx.c	When TrustZone® security is disabled, this file contains SystemInit() that is called at startup just after reset and before branching to the main program. It allows relocating the vector table in internal Flash memory or internal SRAM.
system_stm32u5xx_ns.c	When TrustZone® security is enabled, this file is part of the non-secure application. It contains SystemInit() that is called by the secure application before branching to the non-secure main program. It allows relocating the vector table in internal Flash memory or internal SRAM.
startup_stm32u5xx.s	Toolchain specific file that contains reset handler and exception vectors. For some toolchains, it allows adapting the stack/heap size to fit the application requirements.

File	Description
stm32u5xx_flash.icf/ stm32u5xx_flash.icf	When TrustZone® security is disabled, this file is the linker file for EWARM toolchain. Its main function is the adaptation of the stack/heap size to fit the application requirements.
stm32u5xx_flash_s.icf/ stm32u5xx_flash_s.icf	When TrustZone® security is enabled, this file is the linker file for EWARM toolchain. Its main function is the adaptation of the stack/heap size to fit the secure application requirements.
stm32u5xx_flash_ns.icf/ stm32u5xx_flash_ns.icf	When TrustZone® security is enabled, this file is the linker file for EWARM toolchain. Its main function is the adaptation of the stack/heap size to fit the non-secure application requirements.
stm32u5xx_RAMxspi1_ROMxspi2.icf	This file is the linker file for EWARM toolchain. Its main function is to describe the memory mapping (internal and external memories) available on the STM32H7S78-DK board.
stm32u5xx_hal_msp.c	This file contains the MSP initialization and de-initialization (main routine and callbacks) of the peripheral used in the user application.
stm32u5xx_hal_conf.h	This file allows the user to customize the HAL drivers for a specific application. It is not mandatory to modify this configuration. The application can use the default configuration without any modification.
stm32u5xx_it.c/.h	This file contains the exceptions handler and peripherals interrupt service routine, and calls HAL_IncTick() at regular time intervals to increment a local variable (declared in *stm32u5xx*_hal.c) used as HAL timebase. By default, this function is called each 1ms in SysTick ISR. The PPP_IRQHandler() routine must call HAL_PPP_IRQHandler() if an interrupt based process is used within the application.
main.c/.h	This file contains the main program routine, mainly: • Call to HAL_Init() • assert_failed() implementation • system clock configuration • peripheral HAL initialization and user application code.

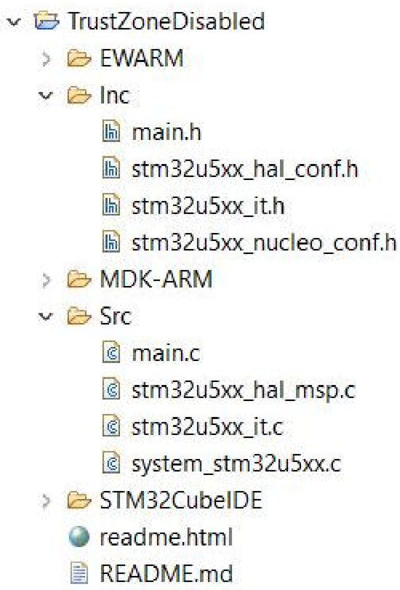
The STM32Cube package comes with ready-to-use project templates, one for each supported board. Each project contains the files listed above and a preconfigured project for the supported toolchains.

Each project template provides empty main loop function and can be used as a starting point to get familiar with project settings for STM32Cube. Its features are the following:

- It contains the sources of HAL, CMSIS and BSP drivers which are the minimal components to develop a code on a given board.
- It contains the include paths for all the firmware components.
- It defines the STM32 device supported, and allows configuring the CMSIS and HAL drivers accordingly.
- It provides ready to use user files preconfigured as defined below:
  - HAL is initialized
  - SysTick ISR implemented for HAL_GetTick()
  - System clock configured with the selected device frequency.

Note: If an existing project is copied to another location, then include paths must be updated.

Figure 1. Example of project template



3.2 HAL data structures

Each HAL driver can contain the following data structures:

- Peripheral handle structures
- Initialization and configuration structures
- Specific process structures.

3.2.1 Peripheral handle structures

The APIs have a modular generic multi-instance architecture that enables working with several IP instances simultaneously.

PPP_HandleTypeDef *handle is the main structure that is implemented in the HAL drivers. It handles the peripheral/module configuration and registers and embeds all the structures and variables needed to follow the peripheral device flow.

The peripheral handle is used for the following purposes:

- Multi-instance support: each peripheral/module instance has its own handle. As a result instance resources are independent.
- Peripheral process intercommunication: the handle is used to manage shared data resources between the process routines.
  Example: global pointers, DMA handles, state machine.
- Storage : this handle is used also to manage global variables within a given HAL driver.

An example of peripheral structure is shown below:

```
typedef struct
{
USART_TypeDef *Instance; /* USART registers base address */
USART_InitTypeDef Init; /* Usart communication parameters */
uint8_t *pTxBuffPtr;/* Pointer to Usart Tx transfer Buffer */
uint16_t TxXferSize; /* Usart Tx Transfer size */
__IO uint16_t TxXferCount;/* Usart Tx Transfer Counter */
uint8_t *pRxBuffPtr;/* Pointer to Usart Rx transfer Buffer */
uint16_t RxXferSize; /* Usart Rx Transfer size */
__IO uint16_t RxXferCount; /* Usart Rx Transfer Counter */
DMA_HandleTypeDef *hdmatx; /* Usart Tx DMA Handle parameters */
DMA_HandleTypeDef *hdmarx; /* Usart Rx DMA Handle parameters */
HAL_LockTypeDef Lock; /* Locking object */
__IO HAL_USART_StateTypeDef State; /* Usart communication state */
```

```
__IO HAL_USART_ErrorTypeDef ErrorCode;/* USART Error code */
}USART_HandleTypeDef;
```

Note:

1. *The multi-instance feature implies that all the APIs used in the application are reentrant and avoid using global variables because subroutines can fail to be reentrant if they rely on a global variable to remain unchanged but that variable is modified when the subroutine is recursively invoked. For this reason, the following rules are respected:*
   – *Reentrant code does not hold any static (or global) non-constant data: reentrant functions can work with global data. For example, a reentrant interrupt service routine can grab a piece of hardware status to work with (for example serial port read buffer) which is not only global, but volatile. Still, typical use of static variables and global data is not advised, in the sense that only atomic read-modify-write instructions should be used in these variables. It should not be possible for an interrupt or signal to occur during the execution of such an instruction.*
   – *Reentrant code does not modify its own code.*
2. *When a peripheral can manage several processes simultaneously using the DMA (full duplex case), the DMA interface handle for each process is added in the PPP_HandleTypeDef.*
3. *For the shared and system peripherals, no handle or instance object is used. The peripherals concerned by this exception are the following:*
   – *GPIO*
   – *SYSTICK*
   – *NVIC*
   – *PWR*
   – *RCC*
   – *FLASH*

3.2.2 Initialization and configuration structure

These structures are defined in the generic driver header file when it is common to all part numbers. When they can change from one part number to another, the structures are defined in the extension header file for each part number.

```
typedef struct
{
  uint32_t BaudRate;       /*!< This member configures the Usart communication baud rate.
                                The baud rate is computed using the following formula:
                                Baud Rate Register[15:4] = ((2 * fclk_pres) /
                                ((huart->Init.BaudRate)))[15:4]
                                Baud Rate Register[3]    = 0
                                Baud Rate Register[2:0]  =  (((2 * fclk_pres) /
                                ((huart->Init.BaudRate)))[3:0]) >> 1
                                where fclk_pres is the USART input clock frequency (fclk)
                                divided by a prescaler.
                                @note  Oversampling by 8 is systematically applied to
                                achieve high baud rates. */
  uint32_t WordLength;          /*!< Specifies the number of data bits
                                transmitted or received in a frame.This
              parameter can be a value of                                               USAR
TEx_Word_Length. */
  uint32_t StopBits;            /*!< Specifies the number of stop bits transmitted.
                                This parameter can be a value of USART_Stop_Bits. */
  uint32_t Parity;              /*!< Specifies the parity mode.
                                This parameter can be a value of USART_Parity
                                @note When parity is enabled, the computed parity is inserted
                                at the MSB position of the transmitted data (9th bit when
                                the word length is set to 9 data bits; 8th bit when the
                                word length is set to 8 data bits). */
  uint32_t Mode;                /*!< Specifies whether the Receive or
              Transmit mode is enabled or disabled.
                                This parameter can be a value of
              USART_Mode. */
  uint32_t CLKPolarity;         /*!< Specifies the steady state of the serial clock.
                                This parameter can be a value of USART_Clock_Polarity. */
  uint32_t CLKPhase;            /*!< Specifies the clock transition on
              which the bit capture is made.
                                This parameter can be a value of USART_Clock_Phase. */
  uint32_t CLKLastBit;          /*!< Specifies whether the clock pulse
              corresponding to the last transmitted data                              bit
(MSB) has to be output on the SCLK pin                              in synchronous mode.
                                This parameter can be a value of USART_Last_Bit. */
  uint32_t ClockPrescaler;      /*!< Specifies the prescaler value used to
              divide the USART clock source.
                                This parameter can be a value of USART_ClockPrescaler. */
} USART_InitTypeDef;
```

Note: The config structure is used to initialize the sub-modules or sub-instances. See below example:

```
HAL_ADC_ConfigChannel (ADC_HandleTypeDef* hadc, ADC_ChannelConfTypeDef* sConfig)
```

3.2.3 Specific process structures

The specific process structures are used for specific process (common APIs). They are defined in the generic driver header file.

Example:

```
HAL_PPP_Process (PPP_HandleTypeDef* hadc,PPP_ProcessConfig* sConfig)
```

3.3 API classification

The HAL APIs are classified into the following categories:

- **Generic APIs:** common generic APIs applying to all STM32 devices. These APIs are consequently present in the generic HAL driver files of all STM32 microcontrollers.

```
HAL_StatusTypeDef HAL_ADC_Init(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_DeInit(ADC_HandleTypeDef *hadc);
HAL_StatusTypeDef HAL_ADC_Start(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_Stop(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_Start_IT(ADC_HandleTypeDef* hadc);
HAL_StatusTypeDef HAL_ADC_Stop_IT(ADC_HandleTypeDef* hadc);
void HAL_ADC_IRQHandler(ADC_HandleTypeDef* hadc);
```

- **Extension APIs:**
  This set of API is divided into two sub-categories :
  - **Family specific APIs**: APIs applying to a given family. They are located in the extension HAL driver file (see example below related to the ADC).

```
HAL_StatusTypeDef HAL_ADCEx_Calibration_Start(ADC_HandleTypeDef* hadc, uint32_t Si
ngleDiff);
uint32_t HAL_ADCEx_Calibration_GetValue(ADC_HandleTypeDef* hadc, uint32_t SingleDi
ff);
```

  - **Device part number specific APIs:**These APIs are implemented in the extension file and delimited by specific define statements relative to a given part number.

Note: The data structure related to the specific APIs is delimited by the device part number define statement. It is located in the corresponding extension header C file.

The following table summarizes the location of the different categories of HAL APIs in the driver files.

Table 4. API classification

	Generic file	Extension file
Common APIs	X	X
Family specific APIs	-	X
Device specific APIs	-	X

Note: Family specific APIs are only related to a given family. This means that if a specific API is implemented in another family, and the arguments of this latter family are different, additional structures and arguments might need to be added.

The IRQ handlers are used for common and family specific processes.

3.4 Devices supported by HAL/LL drivers

Table 5. List of devices supported by HAL/LL drivers

Name	STM32U575xx	STM32U585xx	STM32U535xx	STM32U545xx	STM32U595xx	STM32U599xx	STM32U5A5xx	STM32U5A9xx	STM32U5G9xx	STM32U5F9xx	STM32U5G7xx	STM32U5F7xx

3.5 HAL driver rules

3.5.1 HAL API naming rules

The following naming rules are used in HAL drivers:

Table 6. **HAL API naming rules**

	Generic	Family specific APIs	Device specific APIs
File names	*stm32u5xx_hal_ppp (c/h)*	*stm32u5xx_hal_ppp_ex (c/h)*	*stm32u5xx_ hal_ppp_ex (c/h)*
Module name	*HAL_PPP_ MODULE*		
Function name	*HAL_PPP_Function* *HAL_PPP_FeatureFunction_MODE*	*HAL_PPPEx_Function* *HAL_PPPEx_FeatureFunction_MODE*	*HAL_PPPEx_Function* *HAL_PPPEx_FeatureFunction_MODE*
Handle name	*PPP_HandleTypedef*	*NA*	*NA*
Init structure name	*PPP_InitTypeDef*	*NA*	*PPP_InitTypeDef*
Enum name	*HAL_PPP_StructnameTypeDef*	*NA*	*NA*

- The **PPP** prefix refers to the peripheral functional mode and not to the peripheral itself. For example, if the USART, PPP can be USART, IRDA, UART or SMARTCARD depending on the peripheral mode.
- The constants used in one file are defined within this file. A constant used in several files is defined in a header file. All constants are written in uppercase, except for peripheral driver function parameters.
- typedef variable names should be suffixed with _TypeDef.
- Registers are considered as constants. In most cases, their name is in uppercase and uses the same acronyms as in the STM32U5 reference manuals.
- Peripheral registers are declared in the PPP_TypeDef structure (for example ADC_TypeDef) in the stm32u5xxx.h header file:
  stm32u5xxx.h corresponds to stm32u535xx.h, stm32u545xx, stm32u575xx.h, stm32u585xx,stm32u595xx.h, stm32u5A5xx.h, stm32u599xx.h and stm32u5A9xx.h.
- Peripheral function names are prefixed by HAL_, then the corresponding peripheral acronym in uppercase followed by an underscore. The first letter of each word is in uppercase (for example HAL_UART_Transmit()). Only one underscore is allowed in a function name to separate the peripheral acronym from the rest of the function name.
- The structure containing the PPP peripheral initialization parameters are named PPP_InitTypeDef (for example ADC_InitTypeDef).
- The structure containing the Specific configuration parameters for the PPP peripheral are named PPP_xxxxConfTypeDef (for example ADC_ChannelConfTypeDef).
- Peripheral handle structures are named PPP_HandleTypedef (e.g DMA_HandleTypeDef)
- The functions used to initialize the PPP peripheral according to parameters specified in PPP_InitTypeDef are named HAL_PPP_Init (for example HAL_TIM_Init()).
- The functions used to reset the PPP peripheral registers to their default values are named HAL_PPP_DeInit (for example HAL_TIM_DeInit()).
- The **MODE** suffix refers to the process mode, which can be polling, interrupt or DMA. As an example, when the DMA is used in addition to the native resources, the function should be called: *HAL_PPP_Function_DMA()*.
- The **Feature** prefix should refer to the new feature.
  Example: *HAL_ADCEx_InjectedStart()*() refers to the injection mode.

3.5.2 HAL general naming rules

- For the shared and system peripherals, no handle or instance object is used. This rule applies to the following peripherals:
  - GPIO
  - SYSTICK
  - NVIC
  - RCC
  - FLASH

Example: The *HAL_GPIO_Init()* requires only the GPIO address and its configuration parameters.

```
HAL_StatusTypeDef HAL_GPIO_Init (GPIO_TypeDef* GPIOx, GPIO_InitTypeDef *Init)
{
/*GPIO Initialization body */
}
```

- The macros that handle interrupts and specific clock configurations are defined in each peripheral/module driver. These macros are exported in the peripheral driver header files so that they can be used by the extension file. The list of these macros is defined below:

Note: This list is not exhaustive and other macros related to peripheral features can be added, so that they can be used in the user application.

Table 7. Macros handling interrupts and specific clock configurations

Macros	Description
__HAL_PPP_ENABLE_IT(__HANDLE__, __INTERRUPT__)	Enables a specific peripheral interrupt
__HAL_PPP_DISABLE_IT(__HANDLE__, __INTERRUPT__)	Disables a specific peripheral interrupt
__HAL_PPP_GET_IT (__HANDLE__, __ INTERRUPT __)	Gets a specific peripheral interrupt status
__HAL_PPP_CLEAR_IT (__HANDLE__, __ INTERRUPT __)	Clears a specific peripheral interrupt status
__HAL_PPP_GET_FLAG (__HANDLE__, __FLAG__)	Gets a specific peripheral flag status
__HAL_PPP_CLEAR_FLAG (__HANDLE__, __FLAG__)	Clears a specific peripheral flag status
__HAL_PPP_ENABLE(__HANDLE__)	Enables a peripheral
__HAL_PPP_DISABLE(__HANDLE__)	Disables a peripheral
__HAL_PPP_XXXX (__HANDLE__, __PARAM__)	Specific PPP HAL driver macro
__HAL_PPP_GET_ IT_SOURCE (__HANDLE__, __ INTERRUPT __)	Checks the source of specified interrupt

- NVIC and SYSTICK are two Arm® Cortex® core features. The APIs related to these features are located in the stm32u5xx_hal_cortex.c file.
- The PPP handles are valid before using the HAL_PPP_Init() API. The init function performs a check before modifying the handle fields.

```
 HAL_PPP_Init(PPP_HandleTypeDef)
if(hppp == NULL)
 {
 return HAL_ERROR;
 }
```

- The macros defined below are used:
  - Conditional macro:

```
#define ABS(x) (((x) > 0) ? (x) : -(x))
```

  - Pseudo-code macro (multiple instructions macro):

```
#define __HAL_LINKDMA(__HANDLE__, __PPP_DMA_FIELD_, __DMA_HANDLE_) \
do{ \
(__HANDLE__)->__PPP_DMA_FIELD_ = &(__DMA_HANDLE_); \
(__DMA_HANDLE_).Parent = (__HANDLE__); \
} while(0)
```

3.5.3 HAL interrupt handler and callback functions

Besides the APIs, HAL peripheral drivers include:

- HAL_PPP_IRQHandler() peripheral interrupt handler that should be called from stm32u5xx_it.c
- User callback functions.

The user callback functions are defined as empty functions with “weak” attribute. They have to be defined in the user code.

There are three types of user callbacks functions:

- Peripheral system level initialization/ de-Initialization callbacks: HAL_PPP_MspInit() and HAL_PPP_MspDeInit
- Process complete callbacks : HAL_PPP_ProcessCpltCallback
- Error callback: HAL_PPP_ErrorCallback.

Table 8. **Callback functions**

Callback functions	Example
HAL_PPP_MspInit() / _DeInit()	Example: HAL_USART_MspInit() Called from HAL_PPP_Init() API function to perform peripheral system level initialization (GPIOs, clock, DMA, interrupt)
HAL_PPP_ProcessCpltCallback	Example: HAL_USART_TxCpltCallback Called by peripheral or DMA interrupt handler when the process completes
HAL_PPP_ErrorCallback	Example: HAL_USART_ErrorCallback Called by peripheral or DMA interrupt handler when an error occurs

3.6 HAL generic APIs

The generic APIs provide common generic functions applying to all STM32 devices. They are composed of four APIs groups:

- **Initialization and de-initialization functions:**HAL_PPP_Init(), HAL_PPP_DeInit()
- **IO operation functions**: HAL_PPP_Read(), HAL_PPP_Write(),HAL_PPP_Transmit(), HAL_PPP_Receive()
- **Control functions**: HAL_PPP_Set (), HAL_PPP_Get ().
- **State and Errors functions**: HAL_PPP_GetState (), HAL_PPP_GetError ().

For some peripheral/module drivers, these groups are modified depending on the peripheral/module implementation.

Example: in the timer driver, the API grouping is based on timer features (such as PWM, OC and IC).

The initialization and de-initialization functions allow initializing a peripheral and configuring the low-level resources, mainly clocks, GPIO, alternate functions (AF) and possibly DMA and interrupts. The *HAL_DeInit()* function restores the peripheral default state, frees the low-level resources and removes any direct dependency with the hardware.

The IO operation functions perform a row access to the peripheral payload data in write and read modes.

The control functions are used to change dynamically the peripheral configuration and set another operating mode.

The peripheral state and errors functions allow retrieving in run time the peripheral and data flow states, and identifying the type of errors that occurred. The example below is based on the ADC peripheral. The list of generic APIs is not exhaustive. It is only given as an example.

Table 9. HAL generic APIs

Function group	Common API name	Description
Initialization group	*HAL_ADC_Init()*	This function initializes the peripheral and configures the low -level resources (clocks, GPIO, AF..)
	HAL_ADC_DeInit()	This function restores the peripheral default state, frees the low-level resources and removes any direct dependency with the hardware.
IO operation group	*HAL_ADC_Start ()*	This function starts ADC conversions when the polling method is used
	HAL_ADC_Stop ()	This function stops ADC conversions when the polling method is used
	HAL_ADC_PollForConversion()	This function allows waiting for the end of conversions when the polling method is used. In this case, a timout value is specified by the user according to the application.
	HAL_ADC_Start_IT()	This function starts ADC conversions when the interrupt method is used
	HAL_ADC_Stop_IT()	This function stops ADC conversions when the interrupt method is used
	HAL_ADC_IRQHandler()	This function handles ADC interrupt requests
	HAL_ADC_ConvCpltCallback()	Callback function called in the IT subroutine to indicate the end of the current process or when a DMA transfer has completed
	HAL_ADC_ErrorCallback()	Callback function called in the IT subroutine if a peripheral error or a DMA transfer error occurred
Control group	*HAL_ADC_ConfigChannel()*	This function configures the selected ADC regular channel, the corresponding rank in the sequencer and the sample time
	HAL_ADC_AnalogWDGConfig	This function configures the analog watchdog for the selected ADC
State and Errors group	*HAL_ADC_GetState()*	This function allows getting in run time the peripheral and the data flow states.
	HAL_ADC_GetError()	This fuction allows getting in run time the error that occurred during IT routine

3.7 HAL extension APIs

3.7.1 HAL extension model overview

The extension APIs provide specific functions or overwrite modified APIs for a specific family (series) or specific part number within the same family.

The extension model consists of an additional file, stm32u5xx_hal_ppp_ex.c, that includes all the specific functions and define statements (stm32u5xx_hal_ppp_ex.h) for a given part number.

Below an example based on the ADC peripheral:

Table 10. HAL extension APIs

Function group	Common API name
HAL_ADCEx_CalibrationStart()	This function is used to start the automatic ADC calibration
HAL_ADCEx_InjectedStart	This function is used to start the conversion of injected groups.

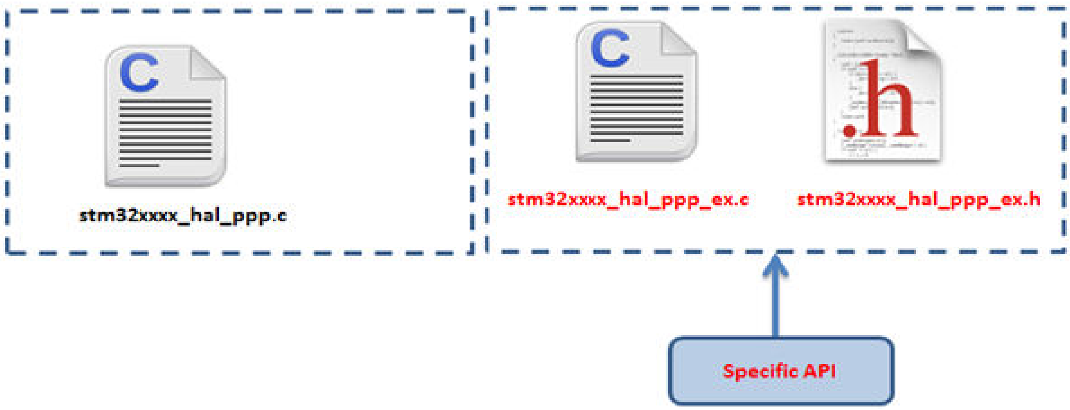
3.7.2 HAL extension model cases

The specific peripheral features can be handled by the HAL drivers in five different ways. They are described below.

Adding a part number-specific function

When a new feature specific to a given device is required, the new APIs are added in the stm32u5xx_hal_ppp_ex.c extension file. They are named HAL_PPPEx_Function().

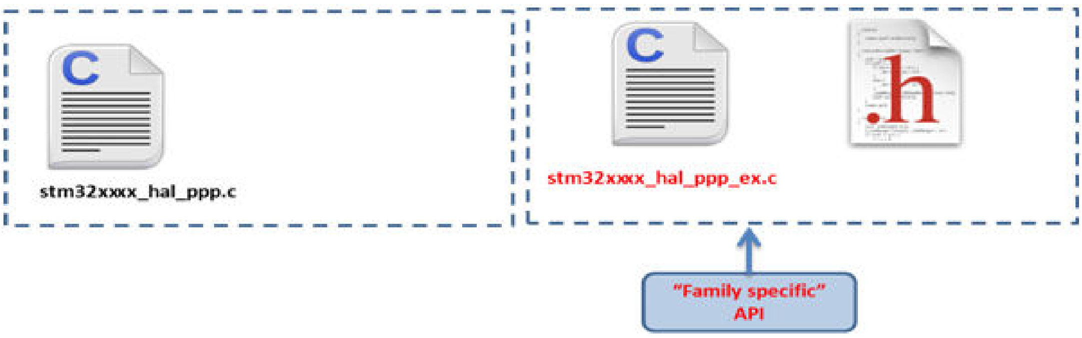
Figure 2. Adding device-specific functions



Adding a family-specific function

In this case, the API is added in the extension driver C file and named HAL_PPPEx_Function ().

Figure 3. Adding family-specific functions

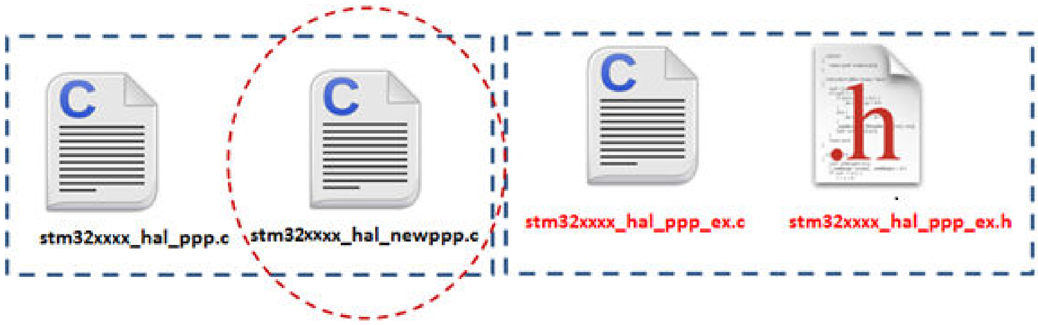


Adding a new peripheral (specific to a device belonging to a given family)

When a peripheral which is available only in a specific device is required, the APIs corresponding to this new peripheral/module (newPPP) are added in a new stm32u5xx_hal_newppp.c. However the inclusion of this file is selected in the stm32u5xx_hal_conf.h using the macro:

```
#define HAL_NEWPPP_MODULE_ENABLED
```

Figure 4. Adding new peripherals

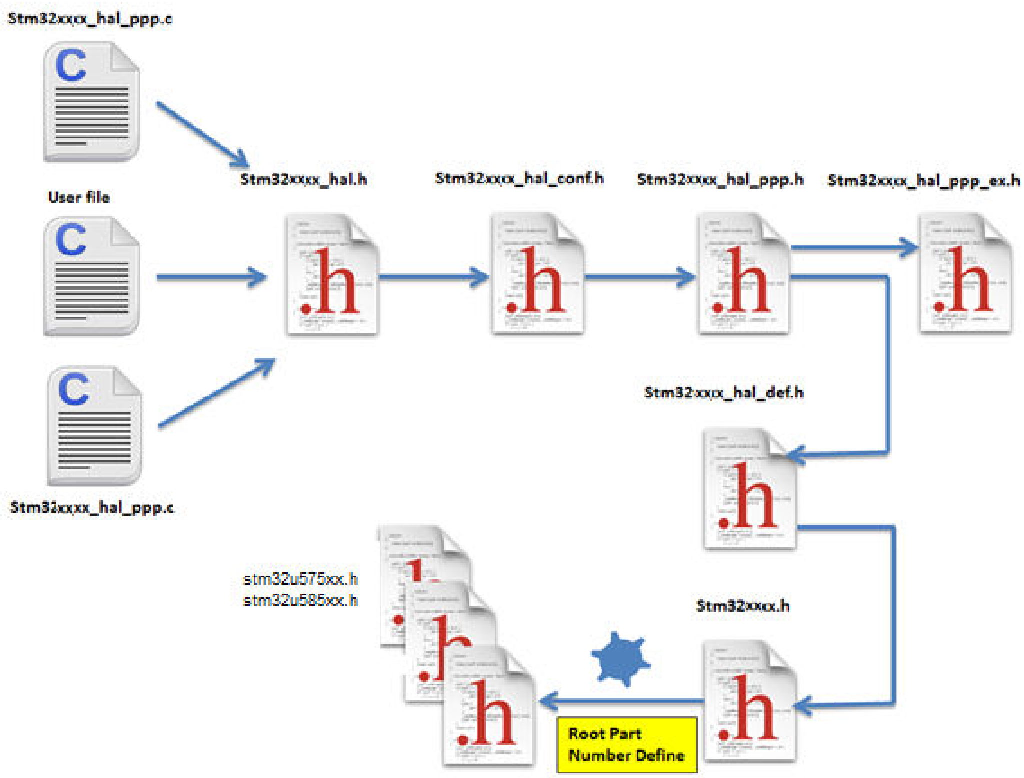


Example: stm32u5xx_hal_adc.c/h

3.8 File inclusion model

The header of the common HAL driver file (stm32u5xx_hal.h) includes the common configurations for the whole HAL library. It is the only header file that is included in the user sources and the HAL C sources files to be able to use the HAL resources.

Figure 5. File inclusion model



A PPP driver is a standalone module which is used in a project. The user must enable the corresponding USE_HAL_PPP_MODULE define statement in the configuration file.

```
/*********************************************************************
* @file stm32u5xx_hal_conf.h
* @author MCD Application Team
* @brief   HAL configuration file.
*********************************************************************
(…)
#define HAL_USART_MODULE_ENABLED
#define HAL_IRDA_MODULE_ENABLED
#define HAL_DMA_MODULE_ENABLED
#define HAL_RCC_MODULE_ENABLED
(…)
```

3.9 HAL common resources

The common HAL resources, such as common define enumerations, structures and macros, are defined in *stm32u5xx_hal_def.h.*The main common define enumeration is *HAL_StatusTypeDef*.

- **HAL Status**
  The HAL status is used by almost all HAL APIs, except for boolean functions and IRQ handler. It returns the status of the current API operations. It has four possible values as described below:

```
Typedef enum
{
HAL_OK = 0x00,
HAL_ERROR = 0x01,
HAL_BUSY = 0x02,
HAL_TIMEOUT = 0x03
} HAL_StatusTypeDef;
```

- **HAL Locked**
  The HAL lock is used by all HAL APIs to prevent accessing by accident shared resources.

```
typedef enum
{
HAL_UNLOCKED = 0x00, /*!<Resources unlocked */
HAL_LOCKED = 0x01 /*!< Resources locked */
} HAL_LockTypeDef;
```

  In addition to common resources, the stm32u5xx_hal_def.h file calls the stm32u5xx.h file in CMSIS library to get the data structures and the address mapping for all peripherals:
  – Declarations of peripheral registers and bits definition.
  – Macros to access peripheral registers hardware (such as Write register or Read register).
- **Common macros**
  – Macro defining HAL_MAX_DELAY

```
#define HAL_MAX_DELAY 0xFFFFFFFF
```

  – Macro linking a PPP peripheral to a DMA structure pointer:

```
#define __HAL_LINKDMA(__HANDLE__, __PPP_DMA_FIELD_, __DMA_HANDLE_) \
do{ \
 (__HANDLE__)->__PPP_DMA_FIELD_ = &(__DMA_HANDLE_); \
 (__DMA_HANDLE_).Parent = (__HANDLE__); \
} while(0)
```

3.10 HAL configuration

The configuration file, stm32u5xx_hal_conf.h, allows customizing the drivers for the user application. Modifying this configuration is not mandatory: the application can use the default configuration without any modification.

To configure these parameters, the user should enable, disable or modify some options by uncommenting, commenting or modifying the values of the related define statements as described in the table below:

Table 11. Define statements used for HAL configuration

Configuration item	Description	Default Value
HSE_VALUE	Defines the value of the external oscillator (HSE) expressed in Hz. The user must adjust this define statement when using a different crystal value.	16 000 000 Hz
HSE_STARTUP_TIMEOUT	Timeout for HSE start-up, expressed in ms	100 ms
HSI_VALUE	Defines the value of the internal oscillator (HSI) expressed in Hz.	16 000 000 Hz
HSI48_VALUE	Value of the internal high speed oscillator for USB FS/SDMMC/RNG expressed in Hz. The real value may vary depending on manufacturing process.	48000000 Hz
MSI_VALUE	Defines the default value of the Multiplespeed internal oscillator (MSI) expressed in Hz.	4 000 000 Hz

Configuration item	Description	Default Value
LSI_VALUE	Defines the default value of the Low-speed internal oscillator (LSI) expressed in Hz.	32000 Hz
LSI_STARTUP_TIMEOUT	Timeout for LSI startup, expressed in ms	130 ms
LSE_VALUE	Defines the value of the external oscillator (LSE) expressed in Hz. The user must adjust this define statement when using a different crystal value.	32768 Hz
LSE_STARTUP_TIMEOUT	Timeout for LSE start-up, expressed in ms	5000 Hz
VDD_VALUE	V_{DD} value	3300 mV
USE_RTOS	Enables the use of RTOS	FALSE (for future use)
PREFETCH_ENABLE	Enables prefetch	TRUE

Note: *The stm32u5xx_hal_conf_template.h file is located in the HAL drivers Inc folder. It should be copied to the user folder, renamed and modified as described above.*

By default, the values defined in the stm32u5xx_hal_conf_template.h file are the same as the ones used for the examples and demonstrations. All HAL include files are enabled so that they can be used in the user code without modifications.

3.11 HAL system peripheral handling

This section gives an overview of how the system peripherals are handled by the HAL drivers. The full API list is provided within each peripheral driver description section.

3.11.1 Clocks

Two main functions can be used to configure the system clock:

- HAL_RCC_OscConfig (RCC_OscInitTypeDef *RCC_OscInitStruct). This function configures/enables multiple clock sources (HSE, HSI, HSI48, MSI, LSE, LSI, PLL).
- HAL_RCC_ClockConfig (RCC_ClkInitTypeDef *RCC_ClkInitStruct, uint32_t FLatency). This function
  - selects the system clock source
  - configures AHB, APB1, and APB2 clock dividers
  - configures the number of Flash memory wait states
  - updates the SysTick configuration when HCLK clock changes.

Some peripheral clocks are not derived from the system clock (such as RTC, USB). In this case, the clock configuration is performed by an extended API defined in stm32u5xx_hal_rcc_ex.c: *HAL_RCCEx_PeriphCLKConfig(RCC_PeriphCLKInitTypeDef *PeriphClkInit)*.

Additional RCC HAL driver functions are available:

- HAL_RCC_DeInit() Clock de-initialization function that returns clock configuration to reset state
- Get clock functions that allow retreiving various clock configurations (such as system clock, HCLK, PCLK1 or PCLK2)
- MCO and CSS configuration functions

A set of macros are defined in stm32u5xx_hal_rcc.h and stm32u5xx_hal_rcc_ex.h. They allow executing elementary operations on RCC block registers, such as peripherals clock gating/reset control:

- __HAL_PPP_CLK_ENABLE/__HAL_PPP_CLK_DISABLE to enable/disable the peripheral clock.
- __HAL_PPP_FORCE_RESET/__HAL_PPP_RELEASE_RESET to force/release peripheral reset
- __HAL_PPP_CLK_SLEEP_ENABLE/__HAL_PPP_CLK_SLEEP_DISABLE to enable/disable the peripheral clock during Sleep mode.
- __HAL_PPP_IS_CLK_ENABLED/__HAL_PPP_IS_CLK_DISABLED to query about the enabled/disabled status of the peripheral clock.
- __HAL_PPP_IS_CLK_SLEEP_ENABLED/__HAL_PPP_IS_CLK_SLEEP_DISABLED to query about the enabled/disabled status of the peripheral clock during Sleep mode.

3.11.2 GPIOs

GPIO HAL APIs are the following:

- HAL_GPIO_Init() / HAL_GPIO_DeInit()
- HAL_GPIO_ReadPin() / HAL_GPIO_WritePin()
- HAL_GPIO_TogglePin ().
- HAL_GPIO_LockPin()
- HAL_GPIO_EnableHighSPeedLowVoltage()/HAL_GPIO_DisableHighSPeedLowVoltage()

In addition to standard GPIO modes (input, output, analog), the pin mode can be configured as EXTI with interrupt or event generation.

When selecting EXTI mode with interrupt generation, the user must call HAL_GPIO_EXTI_IRQHandler() from stm32u5xx_it.c and implement HAL_GPIO_EXTI_Callback().

The table below describes the GPIO_InitTypeDef structure field.

Table 12. Description of GPIO_InitTypeDef structure

Structure field	Description
Pin	Specifies the GPIO pins to be configured. Possible values: GPIO_PIN_x or GPIO_PIN_All, where x[0..15]
Mode	Specifies the operating mode for the selected pins: GPIO mode or EXTI mode. Possible values are: • GPIO mode – GPIO_MODE_INPUT : Input floating – GPIO_MODE_OUTPUT_PP : Output push-pull – GPIO_MODE_OUTPUT_OD : Output open drain – GPIO_MODE_AF_PP : Alternate function push-pull – GPIO_MODE_AF_OD : Alternate function open drain – GPIO_MODE_ANALOG : Analog mode – GPIO_MODE_ANALOG_ADC_CONTROL: ADC analog mode • External Interrupt mode – GPIO_MODE_IT_RISING : Rising edge trigger detection – GPIO_MODE_IT_FALLING : Falling edge trigger detection – GPIO_MODE_IT_RISING_FALLING : Rising/Falling edge trigger detection • External Event mode – GPIO_MODE_EVT_RISING : Rising edge trigger detection – GPIO_MODE_EVT_FALLING : Falling edge trigger detection – GPIO_MODE_EVT_RISING_FALLING: Rising/Falling edge trigger detection
Pull	Specifies the Pull-up or Pull-down activation for the selected pins. Possible values are: GPIO_NOPULL GPIO_PULLUP GPIO_PULLDOWN
Speed	Specifies the speed for the selected pins Possible values are: GPIO_SPEED_FREQ_LOW GPIO_SPEED_FREQ_MEDIUM GPIO_SPEED_FREQ_HIGH GPIO_SPEED_FREQ_VERY_HIGH

Please find below typical GPIO configuration examples:

- Configuring GPIOs as output push-pull to drive external LEDs:

```
GPIO_InitStruct.Pin = GPIO_PIN_12 | GPIO_PIN_13 | GPIO_PIN_14 | GPIO_PIN_15;
GPIO_InitStruct.Mode = GPIO_MODE_OUTPUT_PP;
GPIO_InitStruct.Pull = GPIO_PULLUP;
GPIO_InitStruct.Speed = GPIO_SPEED_FREQ_MEDIUM;
HAL_GPIO_Init(GPIOD, &GPIO_InitStruct);
```

- Configuring PA0 as external interrupt with falling edge sensitivity:

```
GPIO_InitStructure.Mode = GPIO_MODE_IT_FALLING;
GPIO_InitStructure.Pull = GPIO_NOPULL;
GPIO_InitStructure.Pin = GPIO_PIN_0;
HAL_GPIO_Init(GPIOA, &GPIO_InitStructure);
```

3.11.3 Cortex® NVIC and SysTick timer

The Cortex® HAL driver, stm32u5xx_hal_cortex.c, provides APIs to handle NVIC and SysTick. The supported APIs include:

- HAL_NVIC_SetPriority()/ HAL_NVIC_SetPriorityGrouping()
- HAL_NVIC_GetPriority() / HAL_NVIC_GetPriorityGrouping()
- HAL_NVIC_EnableIRQ()/HAL_NVIC_DisableIRQ()
- HAL_NVIC_SystemReset()
- HAL_SYSTICK_IRQHandler()
- HAL_NVIC_GetPendingIRQ() / HAL_NVIC_SetPendingIRQ () / HAL_NVIC_ClearPendingIRQ()
- HAL_NVIC_GetActive(IRQn)
- HAL_SYSTICK_Config()
- HAL_SYSTICK_CLKSourceConfig()
- HAL_SYSTICK_Callback()
- HAL_MPU_Enable()
- HAL_MPU_Enable_NS()
- HAL_MPU_Disable()
- HAL_MPU_Disable_NS()
- HAL_MPU_ConfigRegion()
- HAL_MPU_ConfigRegion_NS()
- HAL_MPU_ConfigMemoryAttributes()
- HAL_MPU_ConfigMemoryAttributes_NS()
- MPU_ConfigRegion()
- MPU_ConfigMemoryAttributes()

3.11.4 PWR

The PWR HAL driver handles power management. The features shared between all STM32 Series are listed below:

- PVD configuration, enabling/disabling and interrupt handling
  - HAL_PWR_ConfigPVD()
  - HAL_PWR_EnablePVD() / HAL_PWR_DisablePVD()
  - HAL_PWR_PVD_IRQHandler()
  - HAL_PWR_PVDCallback()
- Wakeup pin configuration
  - HAL_PWR_EnableWakeUpPin() / HAL_PWR_DisableWakeUpPin()

- Low-power mode entry
  – HAL_PWR_EnterSLEEPMode()
  – HAL_PWR_EnterSTOPMode() (kept for compatibility with other families)
  – HAL_PWR_EnterSTANDBYMode()

  STM32U5 low-power management features:
  – HAL_PWREx_EnterSTOP0Mode()
  – HAL_PWREx_EnterSTOP1Mode()
  – HAL_PWREx_EnterSTOP2Mode()
  – HAL_PWREx_EnterSHUTDOWNMode()
  – HAL_PWR_EnableSleepOnExit() / HAL_PWR_DisableSleepOnExit: (low-power management Sleep-on-entry)
  – HAL_PWR_EnableSEVOnPend() / HAL_PWR_DisableSEVOnPend (low-power management Cortex-SEV-on-pend)

3.11.5 EXTI

The EXTI is not considered as a standalone peripheral but rather as a service used by other peripheral, that are handled through EXTI HAL APIs. In addition, each peripheral HAL driver implements the associated EXTI configuration and function as macros in its header file.

The first 16 EXTI lines connected to the GPIOs, are managed within the GPIO driver. The GPIO_InitTypeDef structure allows configuring an I/O as external interrupt or external event.

The EXTI lines connected internally to the PVD, RTC, USB, and Ethernet, are configured within the HAL drivers of these peripheral through the macros given in the table below.

The EXTI internal connections depend on the targeted STM32 microcontroller (refer to the product datasheet for more details):

Table 13. **Description of EXTI configuration macros**

Macros	Description
__HAL_PPP_{SUBLOCK}__EXTI_ENABLE_IT()	Enables a given EXTI line interrupt Example: __HAL_PWR_PVD_EXTI_ENABLE_IT()
__HAL_PPP_{SUBLOCK}__EXTI_DISABLE_IT()	Disables a given EXTI line. Example: __HAL_PWR_PVD_EXTI_DISABLE_IT()
__HAL_ PPP_{SUBLOCK}__EXTI_GET_FLAG()	Gets a given EXTI line interrupt flag pending bit status. Example: __HAL_PWR_PVD_EXTI_GET_FLAG()
__HAL_ PPP_{SUBLOCK}_EXTI_CLEAR_FLAG()	Clears a given EXTI line interrupt flag pending bit. Example; __HAL_PWR_PVD_EXTI_CLEAR_FLAG()
__HAL_ PPP_{SUBLOCK}_EXTI_GENERATE_SWIT()	Generates a software interrupt for a given EXTI line. Example: __HAL_PWR_PVD_EXTI_ GENERATE_SWIT ()
__HAL_PPP_SUBBLOCK_EXTI_ENABLE_EVENT()	Enable a given EXTI line event Example: __HAL_RTC_WAKEUP_EXTI_ENABLE_EVENT()
__HAL_PPP_SUBBLOCK_EXTI_DISABLE_EVENT()	Disable a given EXTI line event Example: __HAL_RTC_WAKEUP_EXTI_DISABLE_EVENT()

Macros	Description
__HAL_ PPP_SUBBLOCK_EXTI_ENABLE_RISING_EDGE()	Configure an EXTI Interrupt or Event on rising edge
__HAL_ PPP_SUBBLOCK_EXTI_ENABLE_FALLING_EDGE()	Enable an EXTI Interrupt or Event on Falling edge
__HAL_ PPP_SUBBLOCK_EXTI_DISABLE_RISING_EDGE()	Disable an EXTI Interrupt or Event on rising edge
__HAL_ PPP_SUBBLOCK_EXTI_DISABLE_FALLING_EDGE()	Disable an EXTI Interrupt or Event on Falling edge
__HAL_ PPP_SUBBLOCK_EXTI_ENABLE_RISING_FALLING_EDGE()	Enable an EXTI Interrupt or Event on Rising/Falling edge
__HAL_ PPP_SUBBLOCK_EXTI_DISABLE_RISING_FALLING_EDGE()	Disable an EXTI Interrupt or Event on Rising/Falling edge

If the EXTI interrupt mode is selected, the user application must call HAL_PPP_FUNCTION_IRQHandler() (for example HAL_PWR_PVD_IRQHandler()), from stm32u5xx_it.c file, and implement HAL_PPP_FUNCTIONCallback() callback function (for example HAL_PWR_PVDCallback().

3.11.6 DMA

DMA transfer modes are divided into two main categories:

- Normal transfers (as for legacy Series)
- Linked-list transfers

In addition to linked-list capability, all the advanced DMA features are managed and configured via the extended API as extensions to Normal mode. The advanced features are repeated block, trigger and data handling.

For a given channel, enable and configure the peripheral to be connected to the DMA channel (except for internal SRAM and Flash memories for which no initialization is required). Refer to the device reference manuals for details on the connection between peripherals and DMA requests.

The Normal transfer mode is initialized via the standard API while the Linked-list mode is configured via the extended API.

Alternatively to the Normal programming mode, a DMA channel can be programmed by a list of transfers, also known as linked-list (list of node items), each node being defined by its data structure and specifying a standalone DMA channel. When enabled, the DMA channel fetches the first linked-list node from SRAM (also known as head node). When the execution is complete, it fetches and executes the next linked-list node. This operation is repeated until the end of the linked-list queue. The linked-list can be linear or circular:

- Linear linked-list:
  The last linked-list queue node is not linked to another queue node. The DMA channel fetches and executes the whole DMA linked-list queue from the first node (head node) to the last (tail node). When the last node execution is complete, the DMA channel remains in idle state and another transfer can be launched.
- Circular linked-list:
  The last linked-list node can be linked to any linked-list queue node. The DMA channel fetches and executes the whole DMA linked-list queue from the first node to the last. When the last node is executed, the DMA channel fetches again the first circular node and repeats the same sequence in an infinite loop (circular transfer). An abort operation is required to stop the DMA channel. The Circular linked-list mode replaces the legacy Circular transfer mode.

To reduce linked-list queue execution time and power consumption, the DMA channel supports dynamic linked-list execution in two types of formats, static and dynamic:

- Static linked-list format: this format refers to the full linked-list node where all DMA channel parameters are fetched and executed independently of the redundancy of information.
- Dynamic linked-list: this format refers to the customized linked-list node where only the necessary DMA channel parameters are fetched and executed (for example, no update is required if data size = 20 on previous node, and data size = 20 on the current node).

For linked-list transfers, the DMA channel can execute the linked-list queue node by node. This feature is named link-step mode. When activated, enabling the DMA channel for the first time fetches the head node from memory and stops. Another DMA channel enable is then required to execute the node. After that, the DMA channel must remain enabled to execute each node until the end of the linked-list queue. When the linked-list queue is circular, the DMA channel must be enabled in an infinite loop to keep the DMA channel running. This feature is useful for debug purposes or for executing queue nodes asynchronously.

Each DMA channel transfer (normal or linked-list) can be configured depending on the DMA channel instance embedded in the devices. The configurations are the following:

- Repeated block configuration:
  This feature is also named two-dimension addressing transfer. If it is supported, the DMA channel can perform repeated transfers of programmed blocks (the size of the block transfer is the legacy data size). In addition to the block repeat count, the DMA channel addresses can jump at burst or block level. The jump length is a programmable parameter defined in the user application:
  – Jump at burst level: the DMA channel keeps an empty area between two consecutive transmitted bursts.
  – Jump at block level; the DMA channel keeps an empty area between two consecutive transmitted blocks .
- Trigger configuration:
  The DMA channel transfers can be triggered on the rising or falling edge of a given signal (hardware triggers). The trigger condition can be applied at single/burst level, block level, repeated block level or node level.
  The DMA channel can report a trigger overrun when more than two trigger signal events are detected before executing the current transfer.
- Data handling:
  The data handling feature is based on a FIFO capability that can be:
  – Padding pattern: the padding pattern (zero padding or sign extension) is selected when the source data width is smaller than the destination data width.
  – Truncation: the source data is truncated when the source data width is bigger than the destination data width.
  – Pack/unpack: a set of data can be packed when the source data width is smaller than the destination data width or unpacked when the source data width is bigger than the destination data width.
  – Exchange: data can be exchanged at byte and half-word level on the destination, and byte level on the source.

Each ongoing DMA channel transfer (normal or linked-list) can be suspended and resumed at run time by the application. When trying to suspend an ongoing transfer, the DMA channel is not suspended instantly. Instead, the ongoing single/burst transfer completes and then stops.

When the DMA channel is suspended, the current transfer can be resumed instantly.

The DMA channel that supports the FIFO can report in real time the number of beats remaining on the destination FIFO ((output).

Two operating modes are available:

- Polling mode I/O operation
  1. Use HAL_DMA_Start() to start DMA transfer when the source and destination addresses and the Length of data to be transferred have been configured.
  2. Use HAL_DMA_PollForTransfer() to poll for the end of current transfer. In this case a fixed timeout can be configured depending on the user application.
- Interrupt mode I/O operation
  1. Configure the DMA interrupt priority using HAL_NVIC_SetPriority().
  2. Enable the DMA IRQ handler using HAL_NVIC_EnableIRQ().
  3. Use HAL_DMA_Start_IT() to start DMA transfer when the source and destination addresses and the length of data to be transferred have been configured. In this case the DMA interrupt is configured.
  4. Use HAL_DMA_IRQHandler() called under DMA_IRQHandler() Interrupt subroutine.
  5. When data transfer is complete, HAL_DMA_IRQHandler() function is executed and a user function can be called by customizing XferCpltCallback and XferErrorCallback function pointer (that is a member of DMA handle structure).

Additional functions and macros are available to ensure efficient DMA management:

- Use HAL_DMA_GetState() function to return the DMA state and HAL_DMA_GetError() in case of error detection.
- Use HAL_DMA_Abort() function to abort the current transfer.

The most used DMA HAL driver macros are the following:

- __HAL_DMA_ENABLE: enables the specified DMA channel

- __HAL_DMA_DISABLE: disables the specified DMA channel
- __HAL_DMA_GET_FLAG: gets the DMA channel pending flags
- __HAL_DMA_CLEAR_FLAG: clears the DMA channel pending flags
- __HAL_DMA_ENABLE_IT: enables the specified DMA channel interrupts
- __HAL_DMA_DISABLE_IT: disables the specified DMA channel interrupts
- __HAL_DMA_GET_IT_SOURCE: checks whether the specified DMA channel interrupt has been enabled or not

To correctly use the DMA linked-list feature, apply the following call sequences:

- Linear transfer:
  - Linked-list queue building
    - HAL_DMAEx_List_BuildNode()
    - HAL_DMAEx_List_InsertNode_Tail()
    - HAL_DMAEx_List_BuildNode()
    - HAL_DMAEx_List_InsertNode_Tail()
    - HAL_DMAEx_List_ConvertQToDynamic()
  - Linked-list queue execution
    - HAL_DMAEx_List_Init()
    - HAL_DMAEx_List_LinkQ()
    - HAL_DMAEx_List_Start() / HAL_DMAEx_List_Start_IT()
    - HAL_DMAEx_List_UnLinkQ()
    - HAL_DMAEx_List_DeInit()
- Circular transfer:
  - Linked-list queue building
    - HAL_DMAEx_List_BuildNode()
    - HAL_DMAEx_List_InsertNode_Tail()
    - HAL_DMAEx_List_BuildNode()
    - HAL_DMAEx_List_InsertNode_Tail()
    - HAL_DMAEx_List_SetCircularModeConfig()/HAL_DMAEx_List_SetCircularMode()
    - HAL_DMAEx_List_ConvertQToDynamic()
  - Linked-list queue execution
    - HAL_DMAEx_List_Init()
    - HAL_DMAEx_List_LinkQ()
    - HAL_DMAEx_List_Start() / HAL_DMAEx_List_Start_IT()
    - HAL_DMA_Abort() / HAL_DMA_Abort_IT()
    - HAL_DMAEx_List_UnLinkQ()
    - HAL_DMAEx_List_DeInit()

Note: *When a peripheral is used in DMA mode, the DMA initialization must be done in the HAL_PPP_MspInit() callback. In addition, the user application must associate the DMA handle to the PPP handle (refer to section “HAL IO operation functions”).*

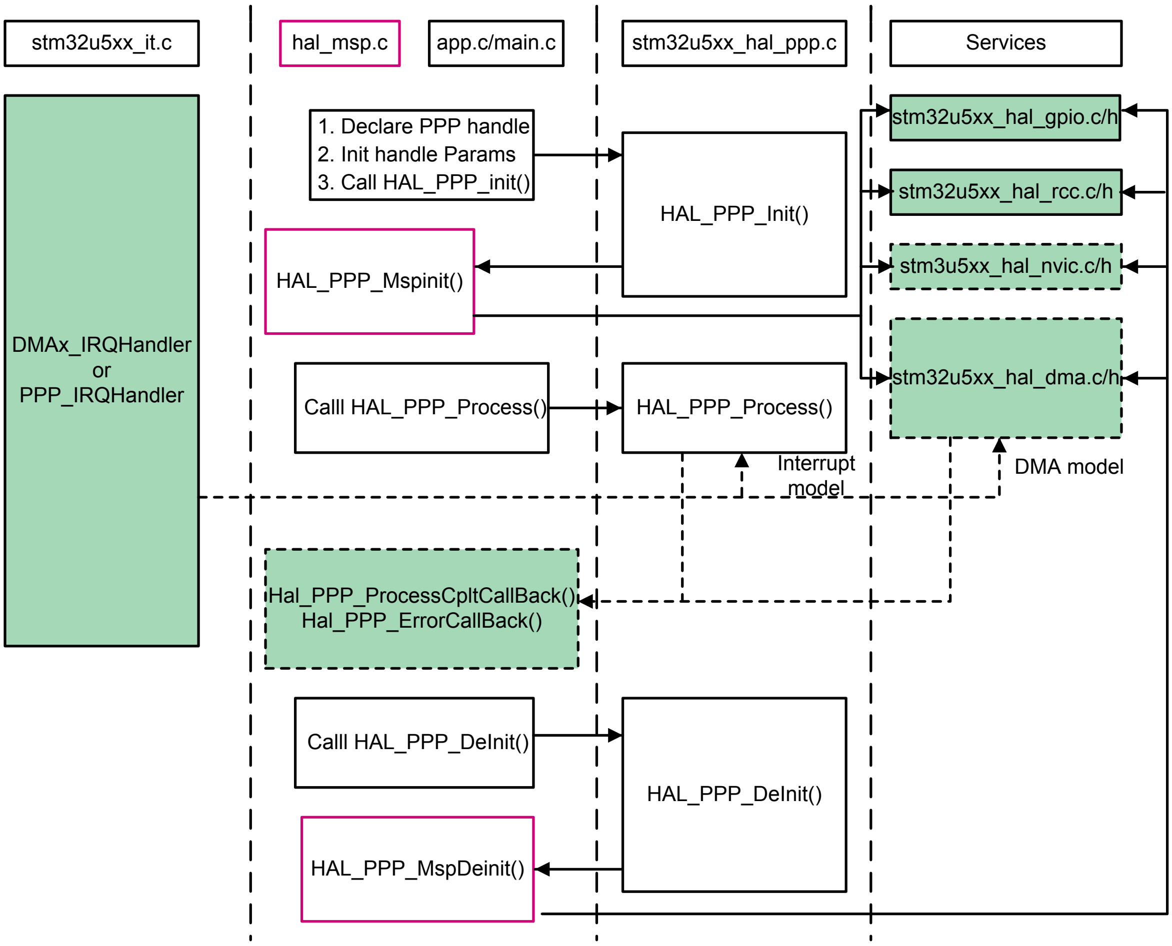
Note: *DMA channel callbacks need to be initialized by the user application only in case of memory-to-memory transfer. However when peripheral-to-memory transfers are used, these callbacks are automatically initialized by calling a process API function that uses the DMA.*

3.12 How to use HAL drivers

3.12.1 HAL usage models

The following figure shows the typical use of the HAL driver and the interaction between the application user, the HAL driver and the interrupts.

Figure 6. HAL driver model



Note: The functions implemented in the HAL driver are shown in green, the functions called from interrupt handlers in dotted lines, and the msp functions implemented in the user application in red. Non-dotted lines represent the interactions between the user application functions.

Basically, the HAL driver APIs are called from user files and optionally from interrupt handlers file when the APIs based on the DMA or the PPP peripheral dedicated interrupts are used.

When DMA or PPP peripheral interrupts are used, the PPP process complete callbacks are called to inform the user about the process completion in real-time event mode (interrupts). Note that the same process completion callbacks are used for DMA in interrupt mode.

3.12.2 HAL initialization

3.12.2.1 *HAL global initialization*

In addition to the peripheral initialization and de-initialization functions, a set of APIs are provided to initialize the HAL core implemented in file stm32u5xx_hal.c.

- HAL_Init(): this function must be called at application startup to
  - initialize data/instruction cache and pre-fetch queue
  - set SysTick timer to generate an interrupt each 1ms (based on HSI clock) with the lowest priority
  - call HAL_MspInit() user callback function to perform system level initializations (Clock, GPIOs, DMA, interrupts). HAL_MspInit() is defined as “weak” empty function in the HAL drivers.
- HAL_DeInit()
  - resets all peripherals
  - calls function HAL_MspDeInit() which is a user callback function to do system level De-Initalizations.

- HAL_GetTick(): this function gets current SysTick counter value (incremented in SysTick interrupt) used by peripherals drivers to handle timeouts.
- HAL_Delay(). this function implements a delay (expressed in milliseconds) using the SysTick timer.
  Care must be taken when using HAL_Delay() since this function provides an accurate delay (expressed in milliseconds) based on a variable incremented in SysTick ISR. This means that if HAL_Delay() is called from a peripheral ISR, then the SysTick interrupt must have highest priority (numerically lower) than the peripheral interrupt, otherwise the caller ISR is blocked.

3.12.2.2 *System clock initialization*

The clock configuration is done at the beginning of the user code. However the user can change the configuration of the clock in his own code.

Below the typical clock configuration sequence to reach the maximum clock frequency of 80 MHz based on the HSE clock.

```
 void SystemClock_Config(void)
{
   RCC_ClkInitTypeDef clkinitstruct = {0};
   RCC_OscInitTypeDef oscinitstruct = {0};
/* Configure PLLs------------------------------------------------------*/
/* PLL configuration: PLLCLK =  (HSE/PLLM * PLLN) / PLLR = (16/1 * 20) / 2 = 80 MHz*/
/* Enable HSE Oscillator and activate PLL with HSE as source */
   oscinitstruct.OscillatorType =  RCC_OSCILLATORTYPE_HSE;
   oscinitstruct.HSEState =   RCC_HSE_ON;
   oscinitstruct.PLL.PLLState = RCC_PLL_ON;
   oscinitstruct.PLL.PLLSource =   RCC_PLLSOURCE_HSE;
   oscinitstruct.PLL.PLLM = 1;
   oscinitstruct.PLL.PLLN = 20;
   oscinitstruct.PLL.PLLR = 2;
   oscinitstruct.PLL.PLLL = 7;
   oscinitstruct.PLL.PLLQ = 4;
   if   (HAL_RCC_OscConfig(&oscinitstruct)!= HAL_OK)
   {
    /* Initialization Error */
       while(1);
   }
   /* Select PLL as system clock source and configure the HCLK, PCLK1 and PCLK2   clock divid
ers    */
   clkinitstruct.ClockType = (RCC_CLOCKTYPE_SYSCLK I   RCC_CLOCKTYPE_HCLK I RCC_CLOCKTYPE_PCL
K1 I RCC_CLOCKTYPE_PCLK2);
   clkinitstruct.SYSCLKSource = RCC_SYSCLKSOURCE_PLLCLK;
   clkinitstruct.AHBCLKDivider = RCC_SYSCLK_DIV1;
   clkinitstruct.APB2CLKDivider =   RCC_HCLK_DIV1;
   clkinitstruct.APB1CLKDivider = RCC_HCLK_DIV1;
   if
      (HAL_RCC_ClockConfig(&clkinitstruct,FLASH_LATENCY_4)!= HAL_OK)
    {
      /*   Initialization Error */
     while(1);
    }
 }
```

3.12.2.3 *HAL MSP initialization process*

The peripheral initialization is done through *HAL_PPP_Init()* while the hardware resources initialization used by a peripheral (PPP) is performed during this initialization by calling MSP callback function *HAL_PPP_MspInit().*

The MspInit callback performs the low level initialization related to the different additional hardware resources: RCC, GPIO, NVIC and DMA.

All the HAL drivers with handles include two MSP callbacks for initialization and de-initialization:

```
/**
* @brief Initializes the PPP MSP.
* @param hppp: PPP handle
* @retval None */
void __weak HAL_PPP_MspInit(PPP_HandleTypeDef *hppp) {
/* NOTE : This function Should not be modified, when the callback is needed,
the HAL_PPP_MspInit could be implemented in the user file */
}
/**
* @brief DeInitializes PPP MSP.
* @param hppp: PPP handle
* @retval None */
void __weak HAL_PPP_MspDeInit(PPP_HandleTypeDef *hppp) {
/* NOTE : This function Should not be modified, when the callback is needed,
the HAL_PPP_MspDeInit could be implemented in the user file */
}
```

The MSP callbacks are declared empty as weak functions in each peripheral driver. The user can use them to set the low level initialization code or omit them and use his own initialization routine.

The HAL MSP callback is implemented inside the *stm32u5xx_hal_msp.c* file in the user folders. An *stm32u5xx_hal_msp.c* file template is located in the HAL folder and should be copied to the user folder. It can be generated automatically by STM32CubeMX tool and further modified. Note that all the routines are declared as weak functions and could be overwritten or removed to use user low level initialization code.

stm32u5xx_hal_msp.c file contains the following functions:

Table 14. **MSP functions**

Routine	Description
void HAL_MspInit()	Global MSP initialization routine
void HAL_MspDeInit()	Global MSP de-initialization routine
void HAL_PPP_MspInit()	PPP MSP initialization routine
void HAL_PPP_MspDeInit()	PPP MSP de-initialization routine

By default, if no peripheral needs to be de-initialized during the program execution, the whole MSP initialization is done in *Hal_MspInit()* and MSP De-Initialization in the *Hal_MspDeInit().* In this case the *HAL_PPP_MspInit()* and *HAL_PPP_MspDeInit()* are not implemented.

When one or more peripherals needs to be de-initialized in run time and the low level resources of a given peripheral need to be released and used by another peripheral, HAL_PPP_MspDeInit() and *HAL_PPP_MspInit()* are implemented for the concerned peripheral and other peripherals initialization and de-Initialization are kept in the global *HAL_MspInit()* and the *HAL_MspDeInit().*

If there is nothing to be initialized by the global *HAL_MspInit()* and *HAL_MspDeInit()*, the two routines can simply be omitted.

3.12.3 HAL I/O operation process

The HAL functions with internal data processing like transmit, receive, write and read are generally provided with three data processing modes as follows:

- Polling mode
- Interrupt mode
- DMA mode

3.12.3.1 Polling mode

In Polling mode, the HAL functions return the process status when the data processing in blocking mode is complete. The operation is considered complete when the function returns the HAL_OK status, otherwise an error status is returned. The user can get more information through the *HAL_PPP_GetState()* function. The data processing is handled internally in a loop. A timeout (expressed in ms) is used to prevent process hanging.

The example below shows the typical Polling mode processing sequence :

```
HAL_StatusTypeDef HAL_PPP_Transmit ( PPP_HandleTypeDef * phandle, uint8_t pData,
int16_tSize,uint32_tTimeout)
{
if((pData == NULL ) || (Size == 0))
{
return HAL_ERROR;
}
(…) while (data processing is running)
{
if( timeout reached )
{
return HAL_TIMEOUT;
}
}
(…)
return HAL_OK; }
```

3.12.3.2 *Interrupt mode*

In Interrupt mode, the HAL function returns the process status after starting the data processing and enabling the appropriate interruption. The end of the operation is indicated by a callback declared as a weak function. It can be customized by the user to be informed in real-time about the process completion. The user can also get the process status through the *HAL_PPP_GetState()* function.

In Interrupt mode, four functions are declared in the driver:

- *HAL_PPP_Process_IT()*: launches the process
- *HAL_PPP_IRQHandler()*: global PPP peripheral interruption
- *__weak HAL_PPP_ProcessCpltCallback ()*: callback relative to the process completion.
- *__weak HAL_PPP_ProcessErrorCallback()*: callback relative to the process Error.

To use a process in Interrupt mode, *HAL_PPP_Process_IT()* is called in the user file and HAL_PPP_IRQHandler in *stm32u5xx_it.c.*

The *HAL_PPP_ProcessCpltCallback()* function is declared as weak function in the driver. This means that the user can declare it again in the application. The function in the driver is not modified.

An example of use is illustrated below:

main.c file:

```
UART_HandleTypeDef UartHandle;
int main(void)
{
/* Set User Parameters */
UartHandle.Init.BaudRate = 9600;
UartHandle.Init.WordLength = UART_DATABITS_8;
UartHandle.Init.StopBits = UART_STOPBITS_1;
UartHandle.Init.Parity = UART_PARITY_NONE;
UartHandle.Init.HwFlowCtl = UART_HWCONTROL_NONE;
UartHandle.Init.Mode = UART_MODE_TX_RX;
UartHandle.Init.Instance = USART1;
HAL_UART_Init(&UartHandle);
HAL_UART_SendIT(&UartHandle, TxBuffer, sizeof(TxBuffer));
while (1);
}
void HAL_UART_TxCpltCallback(UART_HandleTypeDef *huart)
{
}
void HAL_UART_ErrorCallback(UART_HandleTypeDef *huart)
{
}
```

*stm32u5xx_it.c*file:

3.12.3.3 DMA mode

In DMA mode, the HAL function returns the process status after starting the data processing through the DMA and after enabling the appropriate DMA interruption. The end of the operation is indicated by a callback declared as a weak function and can be customized by the user to be informed in real-time about the process completion. The user can also get the process status through the *HAL_PPP_GetState()* function. For the DMA mode, three functions are declared in the driver:

- *HAL_PPP_Process_DMA()*: launch the process
- *HAL_PPP_DMA_IRQHandler()*: the DMA interruption used by the PPP peripheral
- *__weak HAL_PPP_ProcessCpltCallback()*: the callback relative to the process completion.
- *__weak HAL_PPP_ErrorCpltCallback()*: the callback relative to the process Error.

To use a process in DMA mode, *HAL_PPP_Process_DMA()* is called in the user file and the *HAL_PPP_DMA_IRQHandler()* is placed in the *stm32u5xx_it.c*. When DMA mode is used, the DMA initialization is done in the *HAL_PPP_MspInit()* callback. The user should also associate the DMA handle to the PPP handle. For this purpose, the handles of all the peripheral drivers that use the DMA must be declared as follows:

```
typedef struct
{
PPP_TypeDef *Instance; /* Register base address */
PPP_InitTypeDef Init; /* PPP communication parameters */
HAL_StateTypeDef State; /* PPP communication state */
(…)
DMA_HandleTypeDef *hdma; /* associated DMA handle */
} PPP_HandleTypeDef;
```

The initialization is done as follows (UART example):

```
int main(void)
{
/* Set User Parameters */
UartHandle.Init.BaudRate = 9600;
UartHandle.Init.WordLength = UART_DATABITS_8;
UartHandle.Init.StopBits = UART_STOPBITS_1;
UartHandle.Init.Parity = UART_PARITY_NONE;
UartHandle.Init.HwFlowCtl = UART_HWCONTROL_NONE;
UartHandle.Init.Mode = UART_MODE_TX_RX;
UartHandle.Init.Instance = UART1;
HAL_UART_Init(&UartHandle);
(..)
}
void HAL_USART_MspInit (UART_HandleTypeDef * huart)
{
static DMA_HandleTypeDef hdma_tx;
static DMA_HandleTypeDef hdma_rx;
(…)
__HAL_LINKDMA(UartHandle, DMA_Handle_tx, hdma_tx);
__HAL_LINKDMA(UartHandle, DMA_Handle_rx, hdma_rx);
(…)
}
```

The *HAL_PPP_ProcessCpltCallback()* function is declared as weak function in the driver that means, the user can declare it again in the application code. The function in the driver should not be modified.

An example of use is illustrated below:

main.c file:

stm32u5xx_it.c file:

```
extern UART_HandleTypeDef UartHandle;
void DMAx_IRQHandler(void)
{
HAL_DMA_IRQHandler(&UartHandle.DMA_Handle_tx);
}
```

HAL_USART_TxCpltCallback() and *HAL_USART_ErrorCallback()* should be linked in the *HAL_PPP_Process_DMA()* function to the DMA transfer complete callback and the DMA transfer Error callback by using the following statement:

```
HAL_PPP_Process_DMA (PPP_HandleTypeDef *hppp, Params….)
{
(…)
hppp->DMA_Handle->XferCpltCallback = HAL_UART_TxCpltCallback ;
hppp->DMA_Handle->XferErrorCallback = HAL_UART_ErrorCallback ;
(…)
}
```

3.12.4 Timeout and error management

3.12.4.1 Timeout management

The timeout is often used for the APIs that operate in Polling mode. It defines the delay during which a blocking process should wait till an error is returned. An example is provided below:

```
HAL_StatusTypeDef HAL_DMA_PollForTransfer(DMA_HandleTypeDef *hdma, uint32_t CompleteLevel, ui
nt32_t Timeout)
```

The timeout possible values are the following:

Table 15. Timeout values

Timeout value	Description
0	No poll : Immediate process check and exit
1 ... (HAL_MAX_DELAY -1) [(1)]	Timeout in ms
HAL_MAX_DELAY	Infinite poll till process is successful

1. *HAL_MAX_DELAY is defined in the stm32u5xx_hal_def.h as 0xFFFFFFFF*

However, in some cases, a fixed timeout is used for system peripherals or internal HAL driver processes. In these cases, the timeout has the same meaning and is used in the same way, except when it is defined locally in the drivers and cannot be modified or introduced as an argument in the user application.

Example of fixed timeout:

```
#define LOCAL_PROCESS_TIMEOUT 100
HAL_StatusTypeDef HAL_PPP_Process(PPP_HandleTypeDef *hppp)
{
  (…)
  tickstart = HAL_GetTick();
  (…)
 while (ProcessOngoing)
  {
    (…)
   if ((HAL_GetTick() – tickstart) > LOCAL_PROCESS_TIMEOUT)
    {
      hppp->ErrorCode |= HAL_PPP_ERROR_TIMEOUT;
      hppp->State= HAL_PPP_STATE_READY;
      return HAL_ERROR;
    }
  }
  (…)
}
```

The following example shows how to use the timeout inside the polling functions:

```
HAL_StatusTypeDef HAL_PPP_Poll(PPP_HandleTypeDef *hppp, uint32_t Timeout)
{
  (…)
  tickstart = HAL_GetTick();
  (…)
 while (ProcessOngoing)
  {
    (…)
   if (((HAL_GetTick() – tickstart) > Timeout) || (Timeout == 0))
    {
      hppp->ErrorCode |= HAL_PPP_ERROR_TIMEOUT;
```

```
      hppp->State= HAL_PPP_STATE_READY;
      return HAL_ERROR;
    }
  }
  (…)
}
```

3.12.4.2 Error management

The HAL drivers implement a check on the following items:

- Valid parameters: for some process the used parameters should be valid and already defined, otherwise the system may crash or go into an undefined state. These critical parameters are checked before being used (see example below).

```
HAL_StatusTypeDef HAL_PPP_Process(PPP_HandleTypeDef* hppp, uint32_t *pdata, uint32 Size
)
{
if ((pData == NULL ) || (Size == 0))
{
return HAL_ERROR;
}
}
```

- Valid handle: the PPP peripheral handle is the most important argument since it keeps the PPP driver vital parameters. It is always checked in the beginning of the *HAL_PPP_Init()* function.

```
HAL_StatusTypeDef HAL_PPP_Init(PPP_HandleTypeDef* hppp)
{
if (hppp == NULL) //the handle should be already allocated
{
return HAL_ERROR;
}
}
```

- Timeout error: the following statement is used when a timeout error occurs:

```
while (Process ongoing)
{
timeout = HAL_GetTick() + Timeout; while (data processing is running)
{
if(timeout) { return HAL_TIMEOUT;
}
}
```

When an error occurs during a peripheral process, *HAL_PPP_Process ()* returns with a *HAL_ERROR* status. The HAL PPP driver implements the *HAL_PPP_GetError ()* to allow retrieving the origin of the error.

```
HAL_PPP_ErrorTypeDef HAL_PPP_GetError (PPP_HandleTypeDef *hppp);
```

In all peripheral handles, a *HAL_PPP_ErrorTypeDef* is defined and used to store the last error code.

```
typedef struct
{
PPP_TypeDef * Instance; /* PPP registers base address */
PPP_InitTypeDef Init; /* PPP initialization parameters */
HAL_LockTypeDef Lock; /* PPP locking object */
__IO HAL_PPP_StateTypeDef State; /* PPP state */
__IO HAL_PPP_ErrorTypeDef ErrorCode; /* PPP Error code */
(…)
/* PPP specific parameters */
}
PPP_HandleTypeDef;
```

The error state and the peripheral global state are always updated before returning an error:

```
PPP->State = HAL_PPP_READY;  /* Set the peripheral ready */
PP->ErrorCode = HAL_ERRORCODE ; /* Set the error code */
_HAL_UNLOCK(PPP) ; /* Unlock the PPP resources */
return HAL_ERROR;  /*return with HAL error */
```

HAL_PPP_GetError () must be used in interrupt mode in the error callback:

```
void HAL_PPP_ProcessCpltCallback(PPP_HandleTypeDef *hspi)
{
ErrorCode = HAL_PPP_GetError (hppp); /* retreive error code */
}
```

3.12.4.3 *Run-time checking*

The HAL implements run-time failure detection by checking the input values of all HAL driver functions. The run-time checking is achieved by using an *assert_param* macro. This macro is used in all the HAL driver functions which have an input parameter. It allows verifying that the input value lies within the parameter allowed values.

To enable the run-time checking, use the *assert_param* macro, and leave the define ***USE_FULL_ASSERT*** uncommented in *stm32u5xx_hal_conf.h* file.

```
void HAL_UART_Init(UART_HandleTypeDef *huart)
{
(..) /* Check the parameters */
assert_param(IS_UART_INSTANCE(huart->Instance));
assert_param(IS_UART_BAUDRATE(huart->Init.BaudRate));
assert_param(IS_UART_WORD_LENGTH(huart->Init.WordLength));
assert_param(IS_UART_STOPBITS(huart->Init.StopBits));
assert_param(IS_UART_PARITY(huart->Init.Parity));
assert_param(IS_UART_MODE(huart->Init.Mode));
assert_param(IS_UART_HARDWARE_FLOW_CONTROL(huart->Init.HwFlowCtl));
(..)
```

```
/** @defgroup UART_Word_Length *
@{
*/
#define UART_WORDLENGTH_8B ((uint32_t)0x00000000)
#define UART_WORDLENGTH_9B ((uint32_t)USART_CR1_M)
#define IS_UART_WORD_LENGTH(LENGTH) (((LENGTH) == UART_WORDLENGTH_8B) ||
\ ((LENGTH) == UART_WORDLENGTH_9B))
```

If the expression passed to the assert_param macro is false, the*assert_failed* function is called and returns the name of the source file and the source line number of the call that failed. If the expression is true, no value is returned.

The *assert_param* macro is implemented in stm32u5xx_hal_conf.h:

```
/* Exported macro ------------------------------------------------------------*/
#ifdef USE_FULL_ASSERT
/**
* @brief The assert_param macro is used for function's parameters check.
* @param expr: If expr is false, it calls assert_failed function
* which reports the name of the source file and the source
* line number of the call that failed.
* If expr is true, it returns no value.
* @retval None */
#define assert_param(expr) ((expr)?(void)0:assert_failed((uint8_t *)__FILE__, __LINE__))
/* Exported functions --------------------------------------*/
void assert_failed(uint8_t* file, uint32_t line);
#else
#define assert_param(expr)((void)0)
#endif /* USE_FULL_ASSERT */
```

The *assert_failed* function is implemented in the main.c file or in any other user C file:

```
#ifdef USE_FULL_ASSERT /**
* @brief Reports the name of the source file and the source line number
* where the assert_param error has occurred.
* @param file: pointer to the source file name
* @param line: assert_param error line source number
* @retval None */
void assert_failed(uint8_t* file, uint32_t line)
{
/* User can add his own implementation to report the file name and line number,
ex: printf("Wrong parameters value: file %s on line %d\r\n", file, line) */
/* Infinite loop */
while (1)
{
```

```
}
}
```

Attention: ***Because of the overhead run-time checking introduces, it is recommended to use it during application code development and debugging, and to remove it from the final application to improve code size and speed.***

4 Overview of low-layer drivers

The low-layer (LL) drivers are designed to offer a fast light-weight expert-oriented layer which is closer to the hardware than the HAL. Contrary to the HAL, LL APIs are not provided for peripherals where optimized access is not a key feature, or those requiring heavy software configuration and/or complex upper-level stack (such as USB).

The LL drivers feature:

- A set of functions to initialize peripheral main features according to the parameters specified in data structures
- A set of functions used to fill initialization data structures with the reset values of each field
- Functions to perform peripheral de-initialization (peripheral registers restored to their default values)
- A set of inline functions for direct and atomic register access
- Full independence from HAL since LL drivers can be used either in standalone mode (without HAL drivers) or in mixed mode (with HAL drivers)
- Full coverage of the supported peripheral features

The low-layer drivers provide hardware services based on the available features of the STM32 peripherals. These services reflect exactly the hardware capabilities and provide one-shot operations that must be called following the programming model described in the microcontroller line reference manual. As a result, the LL services do not implement any processing and do not require any additional memory resources to save their states, counter or data pointers: all the operations are performed by changing the associated peripheral registers content.

4.1 Low-layer files

The low-layer drivers are built around header/C files (one per each supported peripheral) plus five header files for some System and Cortex related features.

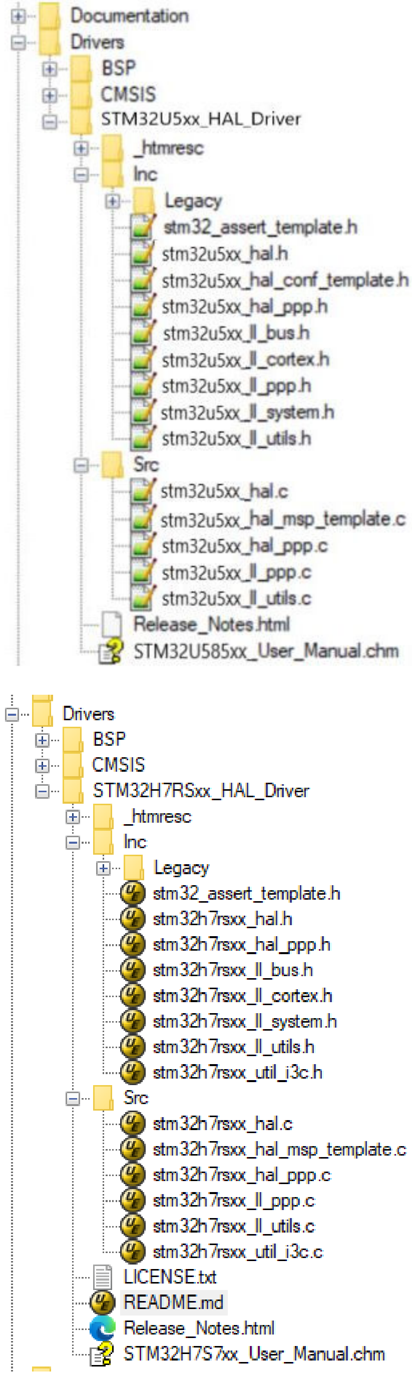
Table 16. **LL driver files**

File	Description
stm32u5xx_ll_bus.h	This is the h-source file for core bus control and peripheral clock activation and deactivation *Example: LL_AHB2_GRP1_EnableClock*
stm32u5xx_ll_ppp.h/.c	stm32u5xx_ll_ppp.c provides peripheral initialization functions such as LL_PPP_Init(), LL_PPP_StructInit(), LL_PPP_DeInit(). All the other APIs are defined within stm32u5xx_ll_ppp.h file. The low-layer PPP driver is a standalone module. To use it, the application must include it in the stm32u5xx_ll_ppp.h file.
stm32u5xx_ll_cortex.h	Cortex-M related register operation APIs including the Systick, Low power (such as LL_SYSTICK_xxxxx and LL_LPM_xxxxx "Low Power Mode")
stm32u5xx_ll_utils.h/.c	This file covers the generic APIs: • Read of device unique ID and electronic signature • Timebase and delay management • System clock configuration.
stm32u5xx_ll_system.h	System related operations. Example: LL_SYSCFG_xxx, LL_DBGMCU_xxx and LL_FLASH_xxx
stm32_assert_template.h	Template file allowing to define the assert_param macro, that is used when run-time checking is enabled. This file is required only when the LL drivers are used in standalone mode (without calling the HAL APIs). It should be copied to the application folder and renamed to stm32_assert.h.

Note: There is no configuration file for the LL drivers.

The low-layer files are located in the same HAL driver folder.

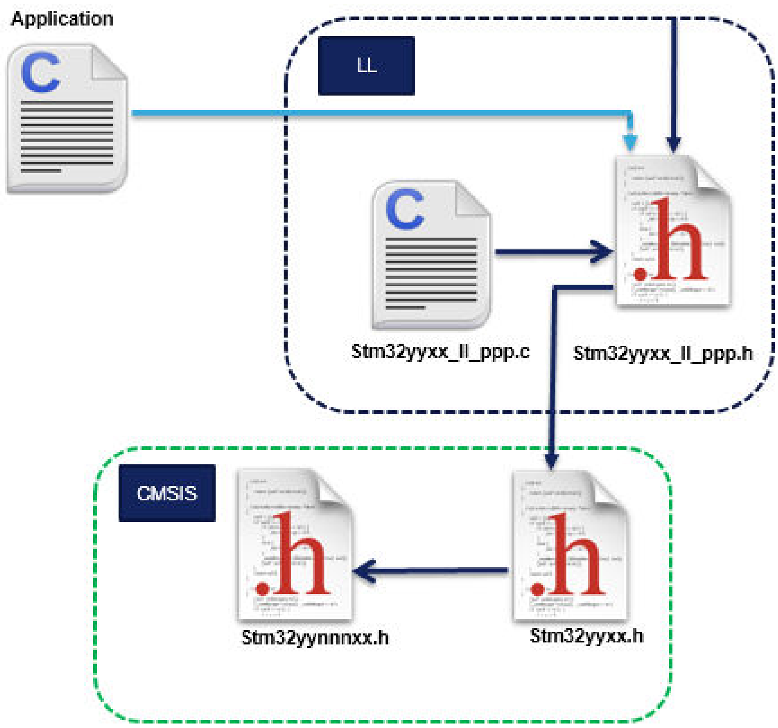
Figure 7. Low-layer driver folders



In general, low-layer drivers include only the STM32 CMSIS device file.

```
#include "stm32yyxx.h"
```

Figure 8. **Low-layer driver CMSIS files**



Application files have to include only the used low-layer driver header files.

4.2 Overview of low-layer APIs and naming rules

4.2.1 Peripheral initialization functions

The LL drivers offer three sets of initialization functions. They are defined in stm32u5xx_ll_ppp.c file:

- Functions to initialize peripheral main features according to the parameters specified in data structures
- A set of functions used to fill initialization data structures with the reset values of each field
- Function for peripheral de-initialization (peripheral registers restored to their default values)

The definition of these LL initialization functions and associated resources (structure, literals and prototypes) is conditioned by a compilation switch: *USE_FULL_LL_DRIVER*. To use these functions, this switch must be added in the toolchain compiler preprocessor or to any generic header file which is processed before the LL drivers.

The below table shows the list of the common functions provided for all the supported peripherals:

Table 17. Common peripheral initialization functions

Functions	Return Type	Parameters	Description
LL_PPP_Init	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP_InitTypeDef* PPP_InitStruct*	Initializes the peripheral main features according to the parameters specified in PPP_InitStruct. Example: LL_USART_Init(USART_TypeDef *USARTx, LL_USART_InitTypeDef *USART_InitStruct)
LL_PPP_StructInit	*void*	• *LL_PPP_InitTypeDef* PPP_InitStruct*	Fills each PPP_InitStruct member with its default value. Example. LL_USART_StructInit(LL_USART_InitTypeDef *USART_InitStruct)
LL_PPP_DeInit	*ErrorStatus*	• *PPP_TypeDef* PPPx*	De-initializes the peripheral registers, that is restore them to their default reset values. Example. LL_USART_DeInit(USART_TypeDef *USARTx)

Additional functions are available for some peripherals (refer to Table 18. Optional peripheral initialization functions).

Table 18. Optional peripheral initialization functions

Functions	Return Type	Parameters	Examples
LL_PPP{_CATEGORY}_Init	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP{_CATEGORY}_InitTypeDef* PPP{_CATEGORY}_InitStruct*	Initializes peripheral features according to the parameters specified in PPP_InitStruct. Example: LL_ADC_INJ_Init(ADC_TypeDef *ADCx, LL_ADC_INJ_InitTypeDef *ADC_INJ_InitStruct) LL_RTC_TIME_Init(RTC_TypeDef *RTCx, uint32_t RTC_Format, LL_RTC_TimeTypeDef *RTC_TimeStruct) LL_RTC_DATE_Init(RTC_TypeDef *RTCx, uint32_t RTC_Format, LL_RTC_DateTypeDef *RTC_DateStruct) LL_TIM_IC_Init(TIM_TypeDef* TIMx, uint32_t Channel, LL_TIM_IC_InitTypeDef* TIM_IC_InitStruct) LL_TIM_ENCODER_Init(TIM_TypeDef* TIMx, LL_TIM_ENCODER_InitTypeDef* TIM_EncoderInitStruct)
LL_PPP{_CATEGORY}_StructInit	*void*	*LL_PPP{_CATEGORY}_InitTypeDef* PPP{_CATEGORY}_InitStruct*	Fills each *PPP{_CATEGORY}_InitStruct* member with its default value. Example: LL_ADC_INJ_StructInit(LL_ADC_INJ_InitTypeDef *ADC_INJ_InitStruct)
LL_PPP_CommonInit	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP_CommonInitTypeDef* PPP_CommonInitStruct*	Initializes the common features shared between different instances of the same peripheral. Example: LL_ADC_CommonInit(ADC_Common_TypeDef *ADCxy_COMMON, LL_ADC_CommonInitTypeDef *ADC_CommonInitStruct)
LL_PPP_CommonStructInit	*void*	*LL_PPP_CommonInitTypeDef* PPP_CommonInitStruct*	Fills each *PPP_CommonInitStruct* member with its default value Example: LL_ADC_CommonStructInit(LL_ADC_CommonInitTypeDef *ADC_CommonInitStruct)
LL_PPP_ClockInit	*ErrorStatus*	• *PPP_TypeDef* PPPx* • *LL_PPP_ClockInitTypeDef* PPP_ClockInitStruct*	Initializes the peripheral clock configuration in synchronous mode. Example: LL_USART_ClockInit(USART_TypeDef *USARTx, LL_USART_ClockInitTypeDef *USART_ClockInitStruct)

Functions	Return Type	Parameters	Examples
LL_PPP_ClockStructInit	*void*	*LL_PPP_ClockInitTypeDef* PPP_ClockInitStruct*	Fills each *PPP_ClockInitStruct* member with its default value Example: LL_USART_ClockStructInit(LL_USART_ClockInitTypeDef *USART_ClockInitStruct)

4.2.1.1 *Run-time checking*

Like HAL drivers, LL initialization functions implement run-time failure detection by checking the input values of all LL driver functions. For more details, refer to Section 3.12.4.3: Run-time checking.

When using the LL drivers in standalone mode (without calling HAL functions), the following actions are required to use run-time checking:

1. Copy stm32_assert_template.h to the application folder and rename it to stm32_assert.h. This file defines the assert_param macro which is used when run-time checking is enabled.
2. Include stm32_assert.h file within the application main header file.
3. Add the USE_FULL_ASSERT compilation switch in the toolchain compiler preprocessor or in any generic header file which is processed before the stm32_assert.h driver.

Note: *Run-time checking is not available for LL inline functions.*

4.2.2 Peripheral register-level configuration functions

On top of the peripheral initialization functions, the LL drivers offer a set of inline functions for direct atomic register access. Their format is as follows:

```
__STATIC_INLINE return_type LL_PPP_Function (PPPx_TypeDef *PPPx, args)
```

The “Function” naming is defined depending to the action category:

- **Specific Interrupt, DMA request and status flags management**: Set/Get/Clear/Enable/Disable flags on interrupt and status registers

Table 19. Specific Interrupt, DMA request and status flags management

Name	Examples
LL_PPP_{_CATEGORY}_ActionItem_BITNAME *LL_PPP{_CATEGORY}_IsItem_BITNAME_Action*	• LL_RCC_IsActiveFlag_LSIRDY • LL_RCC_IsActiveFlag_FWRST() • LL_ADC_ClearFlag_EOC(ADC1) • LL_DMA_ClearFlag_TCx(DMA_TypeDef* DMAx)

Table 20. Available function formats

Item	Action	Format
Flag	Get	*LL_PPP_IsActiveFlag_BITNAME*
	Clear	*LL_PPP_ClearFlag_BITNAME*
Interrupts	Enable	*LL_PPP_EnableIT_BITNAME*
	Disable	*LL_PPP_DisableIT_BITNAME*
	Get	*LL_PPP_IsEnabledIT_BITNAME*
DMA	Enable	*LL_PPP_EnableDMAReq_BITNAME*
	Disable	*LL_PPP_DisableDMAReq_BITNAME*
	Get	*LL_PPP_IsEnabledDMAReq_BITNAME*

Note: *BITNAME refers to the peripheral register bit name as described in the product line reference manual.*

- **Peripheral clock activation/deactivation management**: Enable/Disable/Reset a peripheral clock

Table 21. **Peripheral clock activation/deactivation management**

Name	Examples
LL_BUS_GRPx_ActionClock{Mode}	• *LL_AHB2_GRP1_EnableClock (LL_AHB2_GRP1_PERIPH_GPIOA| LL_AHB2_GRP1_PERIPH_GPIOB)* • *LL_APB1_GRP1_EnableClockSleep (LL_APB1_GRP1_PERIPH_DAC1)*

Note: 'x' corresponds to the group index and refers to the index of the modified register on a given bus. 'bus' corresponds to the bus name.

- ***Peripheral activation/deactivation management*** : Enable/disable a peripheral or activate/deactivate specific peripheral features

Table 22. **Peripheral activation/deactivation management**

Name	Examples
LL_PPP{_CATEGORY}_Action{Item} *LL_PPP{_CATEGORY}_IsItemAction*	• *LL_ADC_Enable ()* • *LL_ADC_StartCalibration();* • *LL_ADC_IsCalibrationOnGoing;* • *LL_RCC_HSI_Enable ()* • *LL_RCC_HSI_IsReady()*

- ***Peripheral configuration management*** : Set/get a peripheral configuration settings

Table 23. **Peripheral configuration management**

Name	Examples
LL_PPP{_CATEGORY}_Set{ or Get}ConfigItem	*LL_USART_SetBaudRate (USART2, Clock, LL_USART_BAUDRATE_9600)*

- ***Peripheral register management*** : Write/read the content of a register/retrun DMA relative register address

Table 24. **Peripheral register management**

Name
LL_PPP_WriteReg(__INSTANCE__, __REG__, __VALUE__)
LL_PPP_ReadReg(__INSTANCE__, __REG__)
*LL_PPP_DMA_GetRegAddr (PPP_TypeDef *PPPx,{Sub Instance if any ex: Channel} , {uint32_t Propriety})*

Note: The Propriety is a variable used to identify the DMA transfer direction or the data register type.

5 Cohabiting of HAL and LL

The low-ayer APIs are designed to be used in standalone mode or combined with the HAL. They cannot be automatically used with the HAL for the same peripheral instance. If you use the LL APIs for a specific instance, you can still use the HAL APIs for other instances. Be careful that the low-layer APIs might overwrite some registers which content is mirrored in the HAL handles.

5.1 Low-layer driver used in Standalone mode

The low-layer APIs can be used without calling the HAL driver services. This is done by simply including stm32u5xx_ll_ppp.h in the application files. The LL APIs for a given peripheral are called by executing the same sequence as the one recommended by the programming model in the corresponding product line reference manual. In this case the HAL drivers associated to the used peripheral can be removed from the workspace. However the STM32CubeU5 framework should be used in the same way as in the HAL drivers case which means that System file, startup file and CMSIS should always be used.

Note: When the BSP drivers are included, the used HAL drivers associated with the BSP functions drivers should be included in the workspace, even if they are not used by the application layer.

5.2 Mixed use of low-layer APIs and HAL drivers

In this case the low-layer APIs are used in conjunction with the HAL drivers to achieve direct and register level based operations.

Mixed use is allowed, however some consideration should be taken into account:

- It is recommended to avoid using simultaneously the HAL APIs and the combination of low-layer APIs for a given peripheral instance. If this is the case, one or more private fields in the HAL PPP handle structure should be updated accordingly.
- For operations and processes that do not alter the handle fields including the initialization structure, the HAL driver APIs and the low-layer services can be used together for the same peripheral instance.
- The low-layer drivers can be used without any restriction with all the HAL drivers that are not based on handle objects (RCC, common HAL, Flash and GPIO).

Several examples showing how to use HAL and LL in the same application are provided within stm32u5 firmware package (refer to Examples_MIX projects).

Note:

1. *When the HAL Init/DeInit APIs are not used and are replaced by the low-layer macros, the InitMsp() functions are not called and the MSP initialization should be done in the user application.*
2. *When process APIs are not used and the corresponding function is performed through the low-layer APIs, the callbacks are not called and post processing or error management should be done by the user application.*
3. *When the LL APIs is used for process operations, the IRQ handler HAL APIs cannot be called and the IRQ should be implemented by the user application. Each LL driver implements the macros needed to read and clear the associated interrupt flags.*

6 HAL System Driver

6.1 HAL Firmware driver API description

The following section lists the various functions of the HAL library.

6.1.1 How to use this driver

The common HAL driver contains a set of generic and common APIs that can be used by the PPP peripheral drivers and the user to start using the HAL.

The HAL contains two APIs' categories:

- Common HAL APIs
- Services HAL APIs

6.1.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initializes the Flash interface the NVIC allocation and initial clock configuration. It initializes the systick also when timeout is needed and the backup domain when enabled.
- De-Initializes common part of the HAL.
- Configure The time base source to have 1ms time base with a dedicated Tick interrupt priority.
  - SysTick timer is used by default as source of time base, but user can eventually implement his proper time base source (a general purpose timer for example or other time source), keeping in mind that Time base duration should be kept 1ms since PPP_TIMEOUT_VALUEs are defined and handled in milliseconds basis.
  - Time base configuration function (HAL_InitTick ()) is called automatically at the beginning of the program after reset by HAL_Init() or at any time when clock is configured, by HAL_RCC_ClockConfig().
  - Source of time base is configured to generate interrupts at regular time intervals. Care must be taken if HAL_Delay() is called from a peripheral ISR process, the Tick interrupt line must have higher priority (numerically lower) than the peripheral interrupt. Otherwise the caller ISR process will be blocked.
  - functions affecting time base configurations are declared as __weak to make override possible in case of other implementations in user file.

This section contains the following APIs:

- *HAL_Init()*
- *HAL_DeInit()*
- *HAL_MspInit()*
- *HAL_MspDeInit()*
- *HAL_InitTick()*

6.1.3 HAL Control functions

This section provides functions allowing to:

- Provide a tick value in millisecond
- Provide a blocking delay in millisecond
- Suspend the time base source interrupt
- Resume the time base source interrupt
- Get the HAL API driver version
- Get the device identifier
- Get the device revision identifier
- Enable/Disable Debug module during SLEEP mode
- Enable/Disable Debug module during STOP mode
- Enable/Disable Debug module during STANDBY mode

This section contains the following APIs:
- *HAL_IncTick()*
- *HAL_GetTick()*
- *HAL_GetTickPrio()*
- *HAL_SetTickFreq()*
- *HAL_GetTickFreq()*
- *HAL_Delay()*
- *HAL_SuspendTick()*
- *HAL_ResumeTick()*
- *HAL_GetHalVersion()*
- *HAL_GetREVID()*
- *HAL_GetDEVID()*
- *HAL_GetUIDw0()*
- *HAL_GetUIDw1()*
- *HAL_GetUIDw2()*

6.1.4 HAL Debug functions

This section provides functions allowing to:
- Enable/Disable Debug module during STOP0/STOP1/STOP2 modes
- Enable/Disable Debug module during STANDBY mode

This section contains the following APIs:
- *HAL_DBGMCU_EnableDBGStopMode()*
- *HAL_DBGMCU_DisableDBGStopMode()*
- *HAL_DBGMCU_EnableDBGStandbyMode()*
- *HAL_DBGMCU_DisableDBGStandbyMode()*

6.1.5 HAL SYSCFG configuration functions

This section provides functions allowing to:
- Configure the Voltage reference buffer
- Enable/Disable the Voltage reference buffer
- Enable/Disable the I/O analog switch voltage booster

This section contains the following APIs:
- *HAL_SYSCFG_VREFBUF_VoltageScalingConfig()*
- *HAL_SYSCFG_VREFBUF_HighImpedanceConfig()*
- *HAL_SYSCFG_VREFBUF_TrimmingConfig()*
- *HAL_SYSCFG_EnableVREFBUF()*
- *HAL_SYSCFG_DisableVREFBUF()*
- *HAL_SYSCFG_EnableIOAnalogSwitchBooster()*
- *HAL_SYSCFG_DisableIOAnalogSwitchBooster()*
- *HAL_SYSCFG_EnableIOAnalogSwitchVoltageSelection()*
- *HAL_SYSCFG_DisableIOAnalogSwitchVoltageSelection()*
- *HAL_SYSCFG_EnableSRAMCached()*
- *HAL_SYSCFG_DisableSRAMCached()*
- *HAL_SYSCFG_EnableVddCompensationCell()*
- *HAL_SYSCFG_EnableVddIO2CompensationCell()*
- *HAL_SYSCFG_EnableVddHSPICompensationCell()*
- *HAL_SYSCFG_DisableVddCompensationCell()*
- *HAL_SYSCFG_DisableVddIO2CompensationCell()*
- *HAL_SYSCFG_DisableVddHSPICompensationCell()*

- *HAL_SYSCFG_SRAM2Erase()*
- *HAL_SYSCFG_SetOTGPHYReferenceClockSelection()*
- *HAL_SYSCFG_SetOTGPHYPowerDownConfig()*
- *HAL_SYSCFG_EnableOTGPHY()*
- *HAL_SYSCFG_SetOTGPHYDisconnectThreshold()*
- *HAL_SYSCFG_SetOTGPHYSquelchThreshold()*
- *HAL_SYSCFG_SetOTGPHYPreemphasisCurrent()*

6.1.6 SYSCFG lock functions

This section contains the following APIs:

- *HAL_SYSCFG_Lock()*
- *HAL_SYSCFG_GetLock()*

6.1.7 SYSCFG attributes functions

This section contains the following APIs:

- *HAL_SYSCFG_ConfigAttributes()*
- *HAL_SYSCFG_GetConfigAttributes()*

6.1.8 Detailed description of functions

HAL_Init

Function name

HAL_StatusTypeDef HAL_Init (void)

Function description

Configure the Flash prefetch, the time base source, NVIC and any required global low level hardware by calling the HAL_MspInit() callback function to be optionally defined in user file stm32u5xx_hal_msp.c.

Return values

- **HAL:** status

Notes

- HAL_Init() function is called at the beginning of program after reset and before the clock configuration.
- In the default implementation the System Timer (SysTick) is used as source of time base. The SysTick configuration is based on MSI clock, as MSI is the clock used after a system Reset and the NVIC configuration is set to Priority group 4. Once done, time base tick starts incrementing: the tick variable counter is incremented each 1ms in the SysTick_Handler() interrupt handler.

HAL_DeInit

Function name

HAL_StatusTypeDef HAL_DeInit (void)

Function description

This function de-Initializes common part of the HAL and stops the systick.

Return values

- **HAL:** status

HAL_MspInit

Function name

void HAL_MspInit (void)

Function description

Initializes the MSP.

Return values

- **None:**

HAL_MspDeInit

Function name

void HAL_MspDeInit (void)

Function description

DeInitializes the MSP.

Return values

- **None:**

HAL_InitTick

Function name

HAL_StatusTypeDef HAL_InitTick (uint32_t TickPriority)

Function description

This function configures the source of the time base.

Parameters

- **TickPriority:** Tick interrupt priority.

Return values

- **HAL:** status

Notes

- This function is called automatically at the beginning of program after reset by HAL_Init() or at any time when clock is reconfigured by HAL_RCC_ClockConfig().
- In the default implementation, SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals. Care must be taken if HAL_Delay() is called from a peripheral ISR process, The SysTick interrupt must have higher priority (numerically lower) than the peripheral interrupt. Otherwise the caller ISR process will be blocked. The function is declared as __weak to be overwritten in case of other implementation in user file.

HAL_IncTick

Function name

void HAL_IncTick (void)

Function description

This function is called to increment a global variable "uwTick" used as application time base.

Return values

- **None:**

Notes

- In the default implementation, this variable is incremented each 1ms in SysTick ISR.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_Delay

Function name

void HAL_Delay (uint32_t Delay)

Function description

This function provides minimum delay (in milliseconds) based on variable incremented.

Parameters

- **Delay:** specifies the delay time length, in milliseconds.

Return values

- **None:**

Notes

- In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals where uwTick is incremented.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_GetTick

Function name

uint32_t HAL_GetTick (void)

Function description

Provides a tick value in millisecond.

Return values

- **tick:** value

Notes

- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_GetTickPrio

Function name

uint32_t HAL_GetTickPrio (void)

Function description

This function returns a tick priority.

Return values

- **tick:** priority

HAL_SetTickFreq

Function name

HAL_StatusTypeDef HAL_SetTickFreq (HAL_TickFreqTypeDef Freq)

Function description

Set new tick Freq.

Return values

- **Status:**

HAL_GetTickFreq

Function name

HAL_TickFreqTypeDef HAL_GetTickFreq (void)

Function description

Return tick frequency.

Return values

- **Tick:** frequency. Value of HAL_TickFreqTypeDef.

HAL_SuspendTick

Function name

void HAL_SuspendTick (void)

Function description

Suspend Tick increment.

Return values

- **None:**

Notes

- In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals. Once HAL_SuspendTick() is called, the SysTick interrupt will be disabled and so Tick increment is suspended.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_ResumeTick

Function name

void HAL_ResumeTick (void)

Function description

Resume Tick increment.

Return values

- **None:**

Notes

- In the default implementation , SysTick timer is the source of time base. It is used to generate interrupts at regular time intervals. Once HAL_ResumeTick() is called, the SysTick interrupt will be enabled and so Tick increment is resumed.
- This function is declared as __weak to be overwritten in case of other implementations in user file.

HAL_GetHalVersion

Function name

uint32_t HAL_GetHalVersion (void)

Function description

Returns the HAL revision.

Return values

- **version:** : 0xXYZR (8bits for each decimal, R for RC)

HAL_GetREVID

Function name

uint32_t HAL_GetREVID (void)

Function description

Returns the device revision identifier.

Return values

- **Device:** revision identifier

HAL_GetDEVID

Function name

uint32_t HAL_GetDEVID (void)

Function description

Returns the device identifier.

Return values

- **Device:** identifier

HAL_GetUIDw0

Function name

uint32_t HAL_GetUIDw0 (void)

Function description

Return the first word of the unique device identifier (UID based on 96 bits)

Return values

- **Device:** identifier

HAL_GetUIDw1

Function name

uint32_t HAL_GetUIDw1 (void)

Function description

Return the second word of the unique device identifier (UID based on 96 bits)

Return values

- **Device:** identifier

HAL_GetUIDw2

Function name

uint32_t HAL_GetUIDw2 (void)

Function description

Return the third word of the unique device identifier (UID based on 96 bits)

Return values

- **Device:** identifier

HAL_DBGMCU_EnableDBGStopMode

Function name

void HAL_DBGMCU_EnableDBGStopMode (void)

Function description

Enable the Debug Module during STOP0/STOP1/STOP2 modes.

Return values

- **None:**

HAL_DBGMCU_DisableDBGStopMode

Function name

void HAL_DBGMCU_DisableDBGStopMode (void)

Function description

Disable the Debug Module during STOP0/STOP1/STOP2 modes.

Return values

- **None:**

HAL_DBGMCU_EnableDBGStandbyMode

Function name

void HAL_DBGMCU_EnableDBGStandbyMode (void)

Function description

Enable the Debug Module during STANDBY mode.

Return values

- **None:**

HAL_DBGMCU_DisableDBGStandbyMode

Function name

void HAL_DBGMCU_DisableDBGStandbyMode (void)

Function description

Disable the Debug Module during STANDBY mode.

Return values

- **None:**

HAL_SYSCFG_SRAM2Erase

Function name

void HAL_SYSCFG_SRAM2Erase (void)

Function description

HAL_SYSCFG_VREFBUF_VoltageScalingConfig

Function name

void HAL_SYSCFG_VREFBUF_VoltageScalingConfig (uint32_t VoltageScaling)

Function description

Configure the internal voltage reference buffer voltage scale.

Parameters

- **VoltageScaling:** specifies the output voltage to achieve This parameter can be one of the following values:
  - SYSCFG_VREFBUF_VOLTAGE_SCALE0: VREF_OUT1 around 1.5 V. This requires VDDA equal to or higher than 1.8 V.
  - SYSCFG_VREFBUF_VOLTAGE_SCALE1: VREF_OUT1 around 1.8 V. This requires VDDA equal to or higher than 2.1 V.
  - SYSCFG_VREFBUF_VOLTAGE_SCALE2: VREF_OUT1 around 2.048 V. This requires VDDA equal to or higher than 2.4 V.
  - SYSCFG_VREFBUF_VOLTAGE_SCALE3: VREF_OUT1 around 2.5 V. This requires VDDA equal to or higher than 2.8 V.

Return values

- **None:**

HAL_SYSCFG_VREFBUF_HighImpedanceConfig

Function name

void HAL_SYSCFG_VREFBUF_HighImpedanceConfig (uint32_t Mode)

Function description

Configure the internal voltage reference buffer high impedance mode.

Parameters

- **Mode:** specifies the high impedance mode This parameter can be one of the following values:
  - SYSCFG_VREFBUF_HIGH_IMPEDANCE_DISABLE: VREF+ pin is internally connect to VREFINT output.
  - SYSCFG_VREFBUF_HIGH_IMPEDANCE_ENABLE: VREF+ pin is high impedance.

Return values

- **None:**

HAL_SYSCFG_VREFBUF_TrimmingConfig

Function name

void HAL_SYSCFG_VREFBUF_TrimmingConfig (uint32_t TrimmingValue)

Function description

Tune the Internal Voltage Reference buffer (VREFBUF).

Return values

- **None:**

HAL_SYSCFG_EnableVREFBUF

Function name

HAL_StatusTypeDef HAL_SYSCFG_EnableVREFBUF (void)

Function description

Enable the Internal Voltage Reference buffer (VREFBUF).

Return values

- **HAL_OK/HAL_TIMEOUT:**

HAL_SYSCFG_DisableVREFBUF

Function name

void HAL_SYSCFG_DisableVREFBUF (void)

Function description

Disable the Internal Voltage Reference buffer (VREFBUF).

Return values

- **None:**

HAL_SYSCFG_SetOTGPHYReferenceClockSelection

Function name

void HAL_SYSCFG_SetOTGPHYReferenceClockSelection (uint32_t RefClkSelection)

Function description

Set the OTG PHY reference clock selection.

Parameters

- **RefClkSelection:** Defines the OTG PHY reference clock selection. This parameter can be one of the OTG PHY Reference Clock Selection

Return values

- **None:**

HAL_SYSCFG_SetOTGPHYPowerDownConfig

Function name

void HAL_SYSCFG_SetOTGPHYPowerDownConfig (uint32_t PowerDownConfig)

Function description

Set the OTG PHY Power Down config.

Parameters

- **PowerDownConfig:** Defines the OTG PHY Power down configuration. This parameter can be one of OTG PHY Power Down

Return values

- **None:**

HAL_SYSCFG_EnableOTGPHY

Function name

void HAL_SYSCFG_EnableOTGPHY (uint32_t OTGPHYConfig)

Function description

Enable the OTG PHY .

Parameters

- **OTGPHYConfig:** Defines the OTG PHY configuration. This parameter can be one of OTG PHY Enable

Return values

- **None:**

HAL_SYSCFG_SetOTGPHYDisconnectThreshold

Function name

void HAL_SYSCFG_SetOTGPHYDisconnectThreshold (uint32_t DisconnectThreshold)

Function description

Set the OTG PHY Disconnect Threshold.

Parameters

- **DisconnectThreshold:** Defines the voltage level for the threshold used to detect a disconnect event. This parameter can be one of the OTG PHYTUNER Disconnect Threshold

Return values

- **None:**

HAL_SYSCFG_SetOTGPHYSquelchThreshold

Function name

void HAL_SYSCFG_SetOTGPHYSquelchThreshold (uint32_t SquelchThreshold)

Function description

Adjust the voltage level for the threshold used to detect valid high speed data.

Parameters

- **SquelchThreshold:** Defines the voltage level. This parameter can be onez of the OTG PHYTUNER Squelch Threshold

Return values

- **None:**

HAL_SYSCFG_SetOTGPHYPreemphasisCurrent

Function name

void HAL_SYSCFG_SetOTGPHYPreemphasisCurrent (uint32_t PreemphasisCurrent)

Function description

Set the OTG PHY Current config.

Parameters

- **PreemphasisCurrent:** Defines the current configuration. This parameter can be one of the OTG PHYTUNER Preemphasis Current

Return values

- **None:**

HAL_SYSCFG_EnableIOAnalogSwitchBooster

Function name

void HAL_SYSCFG_EnableIOAnalogSwitchBooster (void)

Function description

Enable the I/O analog switch voltage booster.

Return values

- **None:**

HAL_SYSCFG_DisableIOAnalogSwitchBooster

Function name

void HAL_SYSCFG_DisableIOAnalogSwitchBooster (void)

Function description

Disable the I/O analog switch voltage booster.

Return values

- **None:**

HAL_SYSCFG_EnableIOAnalogSwitchVoltageSelection

Function name

void HAL_SYSCFG_EnableIOAnalogSwitchVoltageSelection (void)

Function description

Enable the I/O analog switch voltage selection.

Return values

- **None:**

HAL_SYSCFG_DisableIOAnalogSwitchVoltageSelection

Function name

void HAL_SYSCFG_DisableIOAnalogSwitchVoltageSelection (void)

Function description

Disable the I/O analog switch voltage selection.

Return values

- **None:**

HAL_SYSCFG_EnableSRAMCached

Function name

void HAL_SYSCFG_EnableSRAMCached (void)

Function description

Enable the Cacheability of internal SRAMx by DCACHE2.

Return values

- **None:**

HAL_SYSCFG_DisableSRAMCached

Function name

void HAL_SYSCFG_DisableSRAMCached (void)

Function description

Disable the Cacheability of internal SRAMx by DCACHE2.

Return values

- **None:**

HAL_SYSCFG_EnableVddCompensationCell

Function name

void HAL_SYSCFG_EnableVddCompensationCell (void)

Function description

Enable the Compensation Cell of GPIO supplied by VDD.

Return values

- **None:**

Notes

- The vdd compensation cell can be used only when the device supply voltage ranges from 1.71 to 3.6 V

Reference Manual to LL API cross reference:

- CCCSR EN1 HAL_SYSCFG_EnableVddCompensationCell

HAL_SYSCFG_EnableVddIO2CompensationCell

Function name

void HAL_SYSCFG_EnableVddIO2CompensationCell (void)

Function description

Enable the Compensation Cell of GPIO supplied by VDDIO2.

Return values

- **None:**

Notes

- The Vdd I/O compensation cell can be used only when the device supply voltage ranges from 1.08 to 3.6 V

Reference Manual to LL API cross reference:

- CCCSR EN2 HAL_SYSCFG_EnableVddIO2CompensationCell

HAL_SYSCFG_EnableVddHSPICompensationCell

Function name

void HAL_SYSCFG_EnableVddHSPICompensationCell (void)

Function description

Enable the Compensation Cell of HSPI IO supplied by VDD.

Return values

- **None:**

Reference Manual to LL API cross reference:

- CCCSR EN3 HAL_SYSCFG_EnableVddHSPICompensationCell

HAL_SYSCFG_DisableVddCompensationCell

Function name

void HAL_SYSCFG_DisableVddCompensationCell (void)

Function description

Disable the Compensation Cell of GPIO supplied by VDD.

Return values

- **None:**

Notes

- The Vdd compensation cell can be used only when the device supply voltage ranges from 1.71 to 3.6 V

Reference Manual to LL API cross reference:

- CCCSR EN1 HAL_SYSCFG_DisableVddCompensationCell

HAL_SYSCFG_DisableVddIO2CompensationCell

Function name

void HAL_SYSCFG_DisableVddIO2CompensationCell (void)

Function description

Disable the Compensation Cell of GPIO supplied by VDDIO2.

Return values

- **None:**

Notes

- The Vdd I/O compensation cell can be used only when the device supply voltage ranges from 1.08 to 3.6 V

Reference Manual to LL API cross reference:

- CCCSR EN2 HAL_SYSCFG_DisableVddIO2CompensationCell

HAL_SYSCFG_DisableVddHSPICompensationCell

Function name

void HAL_SYSCFG_DisableVddHSPICompensationCell (void)

Function description

Disable the Compensation Cell of HSPI IO supplied by VDD.

Return values

- **None:**

Reference Manual to LL API cross reference:

- CCCSR EN3 HAL_SYSCFG_DisableVddHSPICompensationCell

HAL_SYSCFG_Lock

Function name

void HAL_SYSCFG_Lock (uint32_t Item)

Function description

Lock the SYSCFG item(s).

Parameters

- **Item:** Item(s) to set lock on. This parameter can be a combination of SYSCFG Lock items

Return values

- **None:**

Notes

- Setting lock(s) depends on privilege mode in secure/non-secure code Lock(s) cleared only at system reset

HAL_SYSCFG_GetLock

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetLock (uint32_t * pItem)

Function description

Get the lock state of SYSCFG item.

Parameters

- **pItem:** pointer to return locked items the return value can be a combination of SYSCFG Lock items

Return values

- **HAL:** status

Notes

- Getting lock(s) depends on privilege mode in secure/non-secure code

HAL_SYSCFG_ConfigAttributes

Function name

void HAL_SYSCFG_ConfigAttributes (uint32_t Item, uint32_t Attributes)

Function description

Configure the SYSCFG item attribute(s).

Parameters

- **Item:** Item(s) to set attributes on. This parameter can be a one or a combination of SYSCFG Attributes items
- **Attributes:** specifies the secure/non-secure attributes.

Return values

- **None:**

Notes

- Available attributes are to secure SYSCFG items, so this function is only available in secure

HAL_SYSCFG_GetConfigAttributes

Function name

HAL_StatusTypeDef HAL_SYSCFG_GetConfigAttributes (uint32_t Item, uint32_t * pAttributes)

Function description

Get the attribute of a SYSCFG item.

Parameters

- **Item:** Single item to get secure/non-secure attribute from.
- **pAttributes:** pointer to return the attribute.

Return values

- **HAL:** status

Notes

- Available attributes are to secure SYSCFG items, so this function is only available in secure

6.2 HAL Firmware driver defines

HAL FDCAN Error Code

HAL_FDCAN_ERROR_NONE

No error

HAL_FDCAN_ERROR_TIMEOUT

Timeout error

HAL_FDCAN_ERROR_NOT_INITIALIZED

Peripheral not initialized

HAL_FDCAN_ERROR_NOT_READY

Peripheral not ready

HAL_FDCAN_ERROR_NOT_STARTED

Peripheral not started

HAL_FDCAN_ERROR_NOT_SUPPORTED

Mode not supported

HAL_FDCAN_ERROR_PARAM

Parameter error

HAL_FDCAN_ERROR_PENDING

Pending operation

HAL_FDCAN_ERROR_RAM_ACCESS

Message RAM Access Failure

HAL_FDCAN_ERROR_FIFO_EMPTY

Put element in full FIFO

HAL_FDCAN_ERROR_FIFO_FULL

Get element from empty FIFO

HAL_FDCAN_ERROR_LOG_OVERFLOW

Overflow of CAN Error Logging Counter

HAL_FDCAN_ERROR_RAM_WDG

Message RAM Watchdog event occurred

HAL_FDCAN_ERROR_PROTOCOL_ARBT

Protocol Error in Arbitration Phase (Nominal Bit Time is used)

HAL_FDCAN_ERROR_PROTOCOL_DATA

Protocol Error in Data Phase (Data Bit Time is used)

HAL_FDCAN_ERROR_RESERVED_AREA

Access to Reserved Address

HAL_FDCAN_ERROR_INVALID_CALLBACK

Invalid Callback error

HAL state definition

HAL_SMBUS_STATE_RESET

SMBUS not yet initialized or disabled

HAL_SMBUS_STATE_READY

SMBUS initialized and ready for use

HAL_SMBUS_STATE_BUSY

SMBUS internal process is ongoing

HAL_SMBUS_STATE_MASTER_BUSY_TX

Master Data Transmission process is ongoing

HAL_SMBUS_STATE_MASTER_BUSY_RX

Master Data Reception process is ongoing

HAL_SMBUS_STATE_SLAVE_BUSY_TX

Slave Data Transmission process is ongoing

HAL_SMBUS_STATE_SLAVE_BUSY_RX

SYSCFG Exported Macros

__HAL_SYSCFG_FPU_INTERRUPT_ENABLE

Description:

- Floating Point Unit interrupt enable/disable macros.

Parameters:

- __INTERRUPT__: This parameter can be a value of

__HAL_SYSCFG_FPU_INTERRUPT_DISABLE

__HAL_SYSCFG_BREAK_ECC_LOCK

Notes:

- The selected configuration is locked and can be unlocked only by system reset.

Enable and lock the connection of Flash ECC error connection to TIM1/8/15/16/17 Break input.

__HAL_SYSCFG_BREAK_LOCKUP_LOCK

Notes:

- The selected configuration is locked and can be unlocked only by system reset.

Enable and lock the connection of Cortex-M33 LOCKUP (Hardfault) output to TIM1/8/15/16/17 Break input.

__HAL_SYSCFG_BREAK_PVD_LOCK

Notes:

- The selected configuration is locked and can be unlocked only by system reset.

Enable and lock the PVD connection to Timer1/8/15/16/17 Break input, as well as the PVDE and PLS[2:0] in the PWR_CR2 register.

__HAL_SYSCFG_BREAK_SRAM2PARITY_LOCK

Notes:

- The selected configuration is locked and can be unlocked by system reset.

Enable and lock the SRAM2 parity error signal connection to TIM1/8/15/16/17 Break input.

__HAL_SYSCFG_GET_FLAG

Description:

- Check SYSCFG flag is set or not.

Parameters:

- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - SYSCFG_FLAG_SRAM2_PE SRAM2 Parity Error Flag
  - SYSCFG_FLAG_SRAM2_BUSY SRAM2 Erase Ongoing

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).

__HAL_SYSCFG_CLEAR_FLAG

__HAL_SYSCFG_FASTMODEPLUS_ENABLE

Description:

- Fast-mode Plus driving capability enable/disable macros.

Parameters:

- __FASTMODEPLUS__: This parameter can be a value of :
  - SYSCFG_FASTMODEPLUS_PB6 Fast-mode Plus driving capability activation on PB6
  - SYSCFG_FASTMODEPLUS_PB7 Fast-mode Plus driving capability activation on PB7
  - SYSCFG_FASTMODEPLUS_PB8 Fast-mode Plus driving capability activation on PB8
  - SYSCFG_FASTMODEPLUS_PB9 Fast-mode Plus driving capability activation on PB9

__HAL_SYSCFG_FASTMODEPLUS_DISABLE

Fast-mode Plus on GPIO

SYSCFG_FASTMODEPLUS_PB6

Enable Fast-mode Plus on PB6

SYSCFG_FASTMODEPLUS_PB7

Enable Fast-mode Plus on PB7

SYSCFG_FASTMODEPLUS_PB8

Enable Fast-mode Plus on PB8

SYSCFG_FASTMODEPLUS_PB9

Enable Fast-mode Plus on PB9

Flags

SYSCFG_FLAG_SRAM2_PE

SRAM2 parity error

SYSCFG_FLAG_SRAM2_BUSY

SRAM2 busy by erase operation

FPU Interrupts

SYSCFG_IT_FPU_IOC

Floating Point Unit Invalid operation Interrupt

SYSCFG_IT_FPU_DZC

Floating Point Unit Divide-by-zero Interrupt

SYSCFG_IT_FPU_UFC

Floating Point Unit Underflow Interrupt

SYSCFG_IT_FPU_OFC

Floating Point Unit Overflow Interrupt

SYSCFG_IT_FPU_IDC

Floating Point Unit Input denormal Interrupt

SYSCFG_IT_FPU_IXC

Floating Point Unit Inexact Interrupt

SYSCFG Lock items

SYSCFG_MPU_NSEC

Non-secure MPU lock (privileged secure or non-secure only)

SYSCFG_VTOR_NSEC

Non-secure VTOR lock (privileged secure or non-secure only)

SYSCFG_SAU

SAU lock (privileged secure code only)

SYSCFG_MPU_SEC

Secure MPU lock (privileged secure code only)

SYSCFG_VTOR_AIRCR_SEC

VTOR_S and AIRCR lock (privileged secure code only)

SYSCFG_LOCK_ALL

All

OTG PHYTUNER Disconnect Threshold

SYSCFG_OTG_HS_PHY_DISCONNECT_5_9PERCENT

+5.9% (recommended value)

SYSCFG_OTG_HS_PHY_DISCONNECT_0PERCENT

0% (default value)

OTG PHYTUNER Preemphasis Current

SYSCFG_OTG_HS_PHY_PREEMP_DISABLED

HS transmitter preemphasis circuit disabled

SYSCFG_OTG_HS_PHY_PREEMP_1X

HS transmitter preemphasis circuit sources 1x preemphasis current

SYSCFG_OTG_HS_PHY_PREEMP_2X

HS transmitter preemphasis circuit sources 2x preemphasis current

SYSCFG_OTG_HS_PHY_PREEMP_3X

HS transmitter preemphasis circuit sources 3x preemphasis current

OTG PHYTUNER Squelch Threshold

SYSCFG_OTG_HS_PHY_SQUELCH_15PERCENT

+15% (recommended value)

SYSCFG_OTG_HS_PHY_SQUELCH_0PERCENT

0% (default value)

OTG PHY Enable

SYSCFG_OTG_HS_PHY_UNDERRESET

PHY under reset

SYSCFG_OTG_HS_PHY_ENABLE

PHY enabled

OTG PHY Power Down

SYSCFG_OTG_HS_PHY_POWER_ON

PHY state machine, bias and OTG PHY PLL are powered down

SYSCFG_OTG_HS_PHY_POWER_DOWN

PHY state machine, bias and OTG PHY PLL remain powered

OTG PHY Reference Clock Selection

SYSCFG_OTG_HS_PHY_CLK_SELECT_1

16Mhz

SYSCFG_OTG_HS_PHY_CLK_SELECT_2

19.2Mhz

SYSCFG_OTG_HS_PHY_CLK_SELECT_3

20Mhz

SYSCFG_OTG_HS_PHY_CLK_SELECT_4

24Mhz

SYSCFG_OTG_HS_PHY_CLK_SELECT_5

26Mhz

SYSCFG_OTG_HS_PHY_CLK_SELECT_6

32Mhz

VREFBUF High Impedance

SYSCFG_VREFBUF_HIGH_IMPEDANCE_DISABLE

VREF_plus pin is internally connected to Voltage reference buffer output

SYSCFG_VREFBUF_HIGH_IMPEDANCE_ENABLE

VREF_plus pin is high impedance

VREFBUF Voltage Scale

SYSCFG_VREFBUF_VOLTAGE_SCALE0

Voltage reference scale 0 (VREF_OUT1)

SYSCFG_VREFBUF_VOLTAGE_SCALE1

Voltage reference scale 1 (VREF_OUT2)

SYSCFG_VREFBUF_VOLTAGE_SCALE2

Voltage reference scale 2 (VREF_OUT3)

SYSCFG_VREFBUF_VOLTAGE_SCALE3

Voltage reference scale 3 (VREF_OUT4)

7 HAL ADC Generic Driver

7.1 ADC Firmware driver registers structures

7.1.1 ADC_OversamplingTypeDef

ADC_OversamplingTypeDef is defined in the stm32u5xx_hal_adc.h

Data Fields

- ***uint32_t Ratio***
- ***uint32_t RightBitShift***
- ***uint32_t TriggeredMode***
- ***uint32_t OversamplingStopReset***

Field Documentation

- ***uint32_t ADC_OversamplingTypeDef::Ratio***
  Configures the oversampling ratio. In case of ADC1 or ADC2 (if available), this parameter can be in the range from 0 to 1023 In case of ADC4, this parameter can be a value of ***ADC_HAL_EC_OVS_RATIO***
- ***uint32_t ADC_OversamplingTypeDef::RightBitShift***
  Configures the division coefficient for the Oversampler. This parameter can be a value of ***ADC_HAL_EC_OVS_SHIFT***
- ***uint32_t ADC_OversamplingTypeDef::TriggeredMode***
  Selects the regular triggered oversampling mode. This parameter can be a value of ***ADC_HAL_EC_OVS_DISCONT_MODE***
- ***uint32_t ADC_OversamplingTypeDef::OversamplingStopReset***
  Selects the regular oversampling mode. The oversampling is either temporary stopped or reset upon an injected sequence interruption. If oversampling is enabled on both regular and injected groups, this parameter is discarded and forced to setting "ADC_REGOVERSAMPLING_RESUMED_MODE" (the oversampling buffer is zeroed during injection sequence). This parameter can be a value of ***ADC_HAL_EC_OVS_SCOPE_REG*** Note: This parameter is not applicable for ADC4

7.1.2 ADC_InitTypeDef

ADC_InitTypeDef is defined in the stm32u5xx_hal_adc.h

Data Fields

- ***uint32_t ClockPrescaler***
- ***uint32_t Resolution***
- ***uint32_t GainCompensation***
- ***uint32_t ScanConvMode***
- ***uint32_t DataAlign***
- ***uint32_t EOCSelection***
- ***FunctionalState LowPowerAutoWait***
- ***uint32_t LowPowerAutoPowerOff***
- ***FunctionalState ContinuousConvMode***
- ***uint32_t NbrOfConversion***
- ***FunctionalState DiscontinuousConvMode***
- ***uint32_t NbrOfDiscConversion***
- ***uint32_t ExternalTrigConv***
- ***uint32_t ExternalTrigConvEdge***
- ***uint32_t ConversionDataManagement***
- ***FunctionalState DMAContinuousRequests***
- ***uint32_t Overrun***
- ***uint32_t SamplingTimeCommon1***
- ***uint32_t SamplingTimeCommon2***

- ***uint32_t LeftBitShift***
- ***FunctionalState OversamplingMode***
- ***ADC_OversamplingTypeDef Oversampling***
- ***uint32_t TriggerFrequencyMode***
- ***uint32_t VrefProtection***

Field Documentation

- ***uint32_t ADC_InitTypeDef::ClockPrescaler***
  Select ADC clock source (synchronous clock derived from APB clock or asynchronous clock derived from system clock or PLL (Refer to reference manual for list of clocks available)) and clock prescaler. This parameter can be a value of ***ADC_HAL_EC_COMMON_CLOCK_SOURCE***. Note: The ADC clock configuration is common to all ADC instances. Note: In case of usage of channels on injected group, ADC frequency should be lower than AHB clock frequency /4 for resolution 12 or 10 bits, AHB clock frequency /3 for resolution 8 bits, AHB clock frequency /2 for resolution 6 bits. Note: In case of synchronous clock mode based on HCLK/1, the configuration must be enabled only if the system clock has a 50% duty clock cycle (APB prescaler configured inside RCC must be bypassed and PCLK clock must have 50% duty cycle). Refer to reference manual for details. Note: In case of usage of asynchronous clock, the selected clock must be preliminarily enabled at RCC top level. Note: This parameter can be modified only if all ADC instances are disabled.
- ***uint32_t ADC_InitTypeDef::Resolution***
  Configure the ADC resolution. This parameter can be a value of ***ADC_HAL_EC_RESOLUTION***
- ***uint32_t ADC_InitTypeDef::GainCompensation***
  Specify the ADC gain compensation coefficient to be applied to ADC raw conversion data, based on following formula: DATA = DATA(raw) * (gain compensation coef) / 4095 14 bit format, unsigned: 2 bits exponents / 14 bits mantissa Gain step is 1/4095 = 0.000244 Gain range is 0.0000 to 3.999756 This parameter value can be 0 Gain compensation will be disabled and coefficient set to 0 1 -> 0x3FFF Gain compensation will be enabled and coefficient set to specified value
- ***uint32_t ADC_InitTypeDef::ScanConvMode***
  Configure the sequencer of ADC groups regular and injected. This parameter can be associated to parameter 'DiscontinuousConvMode' to have main sequence subdivided in successive parts. For ADC1 or ADC2 instances, this parameter could be enabled or disabled. If disabled: Conversion is performed in single mode (one channel converted, the one defined in rank 1). Parameters 'NbrOfConversion' and 'InjectedNbrOfConversion' are discarded (equivalent to set to 1). If enabled: Conversions are performed in sequence mode (multiple ranks defined by 'NbrOfConversion' or 'InjectedNbrOfConversion' and rank of each channel in sequencer). Scan direction is upward: from rank 1 to rank 'n'. For ADC4 instance, this parameter could be "fully configurable" or "not fully configurable":
  - sequencer configured to fully configurable: sequencer length and each rank affectation to a channel are configurable.
    - Sequence length: Set number of ranks in the scan sequence.
    - Sequence direction: Unless specified in parameters, sequencer scan direction is forward (from rank 1 to rank n).
  - sequencer configured to not fully configurable: sequencer length and each rank affectation to a channel are fixed by channel HW number.
    - Sequence length: Number of ranks in the scan sequence is defined by number of channels set in the sequence, rank of each channel is fixed by channel HW number. (channel 0 fixed on rank 0, channel 1 fixed on rank1, ...).
    - Sequence direction: Unless specified in parameters, sequencer scan direction is forward (from lowest channel number to highest channel number). This parameter can be a value of ***ADC_Scan_mode***
- ***uint32_t ADC_InitTypeDef::DataAlign***
  Specify ADC data alignment in conversion data register (right or left). Refer to reference manual for alignments formats versus resolutions. This parameter can be a value of ***ADC_HAL_EC_DATA_ALIGN***
- ***uint32_t ADC_InitTypeDef::EOCSelection***
  Specify which EOC (End Of Conversion) flag is used for conversion by polling and interruption: end of unitary conversion or end of sequence conversions. This parameter can be a value of ***ADC_EOCSelection***.

- ***FunctionalState ADC_InitTypeDef::LowPowerAutoWait***
  Select the dynamic low power Auto Delay: new conversion start only when the previous conversion (for ADC group regular) or previous sequence (for ADC group injected) has been retrieved by user software, using function **HAL_ADC_GetValue()** or **HAL_ADCEx_InjectedGetValue()**. This feature automatically adapts the frequency of ADC conversions triggers to the speed of the system that reads the data. Moreover, this avoids risk of overrun for low frequency applications. This parameter can be set to ENABLE or DISABLE. Note: It is not recommended to use with interruption or DMA (**HAL_ADC_Start_IT()**, **HAL_ADC_Start_DMA()**) since these modes have to clear immediately the EOC flag (by CPU to free the IRQ pending event or by DMA). Auto wait will work but fort a very short time, discarding its intended benefit (except specific case of high load of CPU or DMA transfers which can justify usage of auto wait). Do use with polling: 1. Start conversion with **HAL_ADC_Start()**, 2. Later on, when ADC conversion data is needed: use **HAL_ADC_GetValue()** to retrieve conversion result and trig another conversion start. (in case of usage of ADC group injected, use the equivalent functions HAL_ADCExInjected_Start(), **HAL_ADCEx_InjectedGetValue()**, ...).
- ***uint32_t ADC_InitTypeDef::LowPowerAutoPowerOff***
  Select the auto-off low power mode: the ADC automatically powers-off after a conversion and automatically wakes-up when a new conversion is triggered. This feature can be combined with automatic wait mode ('LowPowerAutoWait'). This parameter can be value of ***ADC_HAL_LowPower_DPD***. Note: If activated, this feature also turns off the ADC dedicated 16 MHz RC oscillator (HSI16). Note: This parameter can be used for ADC4 only.
- ***FunctionalState ADC_InitTypeDef::ContinuousConvMode***
  Specify whether the conversion is performed in single mode (one conversion) or continuous mode for ADC group regular, after the first ADC conversion start trigger occurred (software start or external trigger). This parameter can be set to ENABLE or DISABLE.
- ***uint32_t ADC_InitTypeDef::NbrOfConversion***
  Specify the number of ranks that will be converted within the regular group sequencer. This parameter is dependent on ADC instance. If ADC1 or ADC2 instances: To use the regular group sequencer and convert several ranks, parameter 'ScanConvMode' must be enabled. This parameter must be a number between Min_Data = 1 and Max_Data = 16. If ADC4 instance: This parameter is dependent on ScanConvMode:
  – sequencer configured to fully configurable: Number of ranks in the scan sequence is configurable using this parameter. Note: After the first call of '**HAL_ADC_Init()**', each rank corresponding to parameter "NbrOfConversion" must be set using '**HAL_ADC_ConfigChannel()**'. Afterwards, when all needed sequencer ranks are set, parameter 'NbrOfConversion' can be updated without modifying configuration of sequencer ranks (sequencer ranks above 'NbrOfConversion' are discarded).
  – sequencer configured to not fully configurable: Number of ranks in the scan sequence is defined by number of channels set in the sequence. This parameter is discarded. This parameter must be a number between Min_Data = 1 and Max_Data = 8. Note: This parameter must be modified when no conversion is on going on regular group (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***FunctionalState ADC_InitTypeDef::DiscontinuousConvMode***
  Specify whether the conversions sequence of ADC group regular is performed in Complete-sequence/ Discontinuous-sequence (main sequence subdivided in successive parts). Discontinuous mode is used only if sequencer is enabled (parameter 'ScanConvMode'). If sequencer is disabled, this parameter is discarded. Discontinuous mode can be enabled only if continuous mode is disabled. If continuous mode is enabled, this parameter setting is discarded. This parameter can be set to ENABLE or DISABLE.
- ***uint32_t ADC_InitTypeDef::NbrOfDiscConversion***
  Specifies the number of discontinuous conversions in which the main sequence of ADC group regular (parameter NbrOfConversion) will be subdivided. If parameter 'DiscontinuousConvMode' is disabled, this parameter is discarded. This parameter must be a number between Min_Data = 1 and Max_Data = 8.
- ***uint32_t ADC_InitTypeDef::ExternalTrigConv***
  Select the external event source used to trigger ADC group regular conversion start. If set to ADC_SOFTWARE_START, external triggers are disabled and software trigger is used instead. This parameter can be a value of ***ADC_regular_external_trigger_source***. Caution: external trigger source is common to all ADC instances.
- ***uint32_t ADC_InitTypeDef::ExternalTrigConvEdge***
  Select the external event edge used to trigger ADC group regular conversion start. If trigger source is set to ADC_SOFTWARE_START, this parameter is discarded. This parameter can be a value of ***ADC_regular_external_trigger_edge***

- ***uint32_t ADC_InitTypeDef::ConversionDataManagement***
  Specifies whether the Data conversion data is managed: using the DMA (oneshot or circular), or stored in the DR register or transferred to MDF register. Note: In continuous mode, DMA must be configured in circular mode. Otherwise an overrun will be triggered when DMA buffer maximum pointer is reached. This parameter can be a value of ***ADC_ConversionDataManagement***. Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***FunctionalState ADC_InitTypeDef::DMAContinuousRequests***
  Specify whether the DMA requests are performed in one shot mode (DMA transfer stops when number of conversions is reached) or in continuous mode (DMA transfer unlimited, whatever number of conversions). This parameter can be set to ENABLE or DISABLE. Note: In continuous mode, DMA must be configured in circular mode. Otherwise an overrun will be triggered when DMA buffer maximum pointer is reached.
- ***uint32_t ADC_InitTypeDef::Overrun***
  Select the behavior in case of overrun: data overwritten or preserved (default). This parameter applies to ADC group regular only. This parameter can be a value of ***ADC_HAL_EC_REG_OVR_DATA_BEHAVIOR***. Note: In case of overrun set to data preserved and usage with programming model with interruption (HAL_Start_IT()): ADC IRQ handler has to clear end of conversion flags, this induces the release of the preserved data. If needed, this data can be saved in function **HAL_ADC_ConvCpltCallback()**, placed in user program code (called before end of conversion flags clear). Note: Error reporting with respect to the conversion mode:
  – Usage with ADC conversion by polling for event or interruption: Error is reported only if overrun is set to data preserved. If overrun is set to data overwritten, user can willingly not read all the converted data, this is not considered as an erroneous case.
  – Usage with ADC conversion by DMA: Error is reported whatever overrun setting (DMA is expected to process all data from data register).
- ***uint32_t ADC_InitTypeDef::SamplingTimeCommon1***
  Set sampling time common to a group of channels. Unit: ADC clock cycles. This parameter is applied for ADC4. Conversion time is the addition of sampling time and processing time (12.5 ADC clock cycles at ADC resolution 12 bits, 10.5 cycles at 10 bits, 8.5 cycles at 8 bits). Note: On this STM32 family, two different sampling time settings are available, each channel can use one of these two settings. On some other STM32 devices, this parameter in channel wise and is located into ADC channel initialization structure. This parameter can be a value of ***ADC_HAL_EC_CHANNEL_SAMPLINGTIME*** Note: In case of usage of internal measurement channels (VrefInt/Vbat/TempSensor), sampling time constraints must be respected (sampling time can be adjusted in function of ADC clock frequency and sampling time setting). Refer to device datasheet for timings values, parameters TS_vrefint, TS_vbat, TS_temp (values rough order: few tens of microseconds).
- ***uint32_t ADC_InitTypeDef::SamplingTimeCommon2***
  Set sampling time common to a group of channels, second common setting possible. Unit: ADC clock cycles This parameter is applied for ADC4. Conversion time is the addition of sampling time and processing time (12.5 ADC clock cycles at ADC resolution 12 bits, 10.5 cycles at 10 bits, 8.5 cycles at 8 bits). Note: On this STM32 family, two different sampling time settings are available, each channel can use one of these two settings. On some other STM32 devices, this parameter in channel wise and is located into ADC channel initialization structure. This parameter can be a value of ***ADC_HAL_EC_CHANNEL_SAMPLINGTIME*** Note: In case of usage of internal measurement channels (VrefInt/Vbat/TempSensor), sampling time constraints must be respected (sampling time can be adjusted in function of ADC clock frequency and sampling time setting) Refer to device datasheet for timings values, parameters TS_vrefint, TS_vbat, TS_temp (values rough order: few tens of microseconds).
- ***uint32_t ADC_InitTypeDef::LeftBitShift***
  Configures the left shifting applied to the final result with or without oversampling. This parameter can be a value of ***ADCEx_Left_Bit_Shift***
- ***FunctionalState ADC_InitTypeDef::OversamplingMode***
  Specify whether the oversampling feature is enabled or disabled. This parameter can be set to ENABLE or DISABLE. Note: This parameter can be modified only if there is no conversion is ongoing on ADC groups regular and injected
- ***ADC_OversamplingTypeDef ADC_InitTypeDef::Oversampling***
  Specify the Oversampling parameters. Caution: this setting overwrites the previous oversampling configuration if oversampling is already enabled.

- ***uint32_t ADC_InitTypeDef::TriggerFrequencyMode***
  Set ADC trigger frequency mode. This parameter can be a value of ***ADC_HAL_EC_REG_TRIGGER_FREQ***. Note: ADC trigger frequency mode must be set to low frequency when a duration is exceeded before ADC conversion start trigger event (between ADC enable and ADC conversion start trigger event or between two ADC conversion start trigger event). Duration value: Refer to device datasheet, parameter "tIdle". Note: When ADC trigger frequency mode is set to low frequency, some rearm cycles are inserted before performing ADC conversion start, inducing a delay of 2 ADC clock cycles.
- ***uint32_t ADC_InitTypeDef::VrefProtection***
  Select the Vref protection mode: specify VREF+ protection mode when multiple ADCs are working simultaneously. This parameter can be value of ***ADC_HAL_VrefProt***. Note: This parameter can be used for ADC4 only.

7.1.3 ADC_ChannelConfTypeDef

ADC_ChannelConfTypeDef is defined in the stm32u5xx_hal_adc.h

Data Fields

- ***uint32_t Channel***
- ***uint32_t Rank***
- ***uint32_t SamplingTime***
- ***uint32_t SingleDiff***
- ***uint32_t OffsetNumber***
- ***uint32_t Offset***
- ***FunctionalState OffsetRightShift***
- ***FunctionalState OffsetSignedSaturation***
- ***FunctionalState OffsetSaturation***
- ***uint32_t OffsetSign***

Field Documentation

- ***uint32_t ADC_ChannelConfTypeDef::Channel***
  Specify the channel to configure into ADC regular group. This parameter can be a value of ***ADC_HAL_EC_CHANNEL*** Note: Depending on devices and ADC instances, some channels may not be available on device package pins. Refer to device datasheet for channels availability.
- ***uint32_t ADC_ChannelConfTypeDef::Rank***
  Specify the rank in the regular group sequencer. This parameter is depending on ADC instances. If ADC1 or ADC2 instances, this parameter specify the rank in the sequencer. Note: to disable a channel or change order of conversion sequencer, rank containing a previous channel setting can be overwritten by the new channel setting (or parameter number of conversions adjusted) If ADC4 instance, this parameter allows to add or remove the channel from the ADC regular group sequencer and specify its conversion rank. This parameter is depending on ScanConvMode:
  – sequencer configured to fully configurable: Channels ordering into each rank of scan sequence: whatever channel can be placed into whatever rank.
  – sequencer configured to not fully configurable: rank of each channel is fixed by channel HW number. (channel 0 fixed on rank 0, channel 1 fixed on rank1, ...). Despite the channel rank is fixed, this parameter allow an additional possibility: to remove the selected rank (selected channel) from sequencer. This parameter can be a value of ***ADC_HAL_EC_REG_SEQ_RANKS***
- ***uint32_t ADC_ChannelConfTypeDef::SamplingTime***
  Sampling time value to be set for the selected channel. Unit: ADC clock cycles Conversion time is the addition of sampling time and processing time (14.5 ADC clock cycles at ADC resolution 14 bits, 12.5 cycles at 12 bits, 10.5 cycles at 10 bits, 8.5 cycles at 8 bits, 6.5 cycles at 6 bits). For ADC1 and 2 (if available): This parameter can be a value of ***ADC_HAL_EC_CHANNEL_SAMPLINGTIME***. Caution: This parameter applies to a channel that can be used into regular and/or injected group. It overwrites the last setting. For ADC4: This parameter can be a value of ***ADC_HAL_EC_SAMPLINGTIME_COMMON***. Note: On this STM32 family, two different sampling time settings are available (refer to parameters "SamplingTimeCommon1" and "SamplingTimeCommon2"), each channel can use one of these two settings. Note: In case of usage of internal measurement channels (VrefInt/Vbat/TempSensor), sampling time constraints must be respected (sampling time can be adjusted in function of ADC clock frequency and sampling time setting) Refer to device datasheet for timings values.

- ***uint32_t ADC_ChannelConfTypeDef::SingleDiff***
  Select single-ended or differential input. In differential mode: Differential measurement is carried out between the selected channel 'i' (positive input) and channel 'i+1' (negative input). Only channel 'i' has to be configured, channel 'i+1' is configured automatically. This parameter must be a value of ***ADC_HAL_EC_CHANNEL_SINGLE_DIFF_ENDING*** Caution: This parameter applies to a channel that can be used in a regular and/or injected group. It overwrites the last setting. Note: Refer to Reference Manual to ensure the selected channel is available in differential mode. Note: When configuring a channel 'i' in differential mode, the channel 'i+1' is not usable separately. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion). If ADC is enabled, this parameter setting is bypassed without error reporting (as it can be the expected behavior in case of another parameter update on the fly)
- ***uint32_t ADC_ChannelConfTypeDef::OffsetNumber***
  Select the offset number This parameter can be a value of ***ADC_HAL_EC_OFFSET_NB*** Caution: Only one offset is allowed per channel. This parameter overwrites the last setting.
- ***uint32_t ADC_ChannelConfTypeDef::Offset***
  Define the offset to be subtracted from the raw converted data. Offset value must be a positive number. Depending of ADC resolution selected (14, 12, 10, 8 or 6 bits), this parameter must be a number between Min_Data = 0x000 and Max_Data = 0x3FFF, 0xFFF, 0x3FF, 0xFF or 0x3F respectively. Note: This parameter must be modified when no conversion is on going on without both regular and injected groups (ADC disabled, or ADC enabled continuous mode or external trigger that could launch a conversion).
- ***FunctionalState ADC_ChannelConfTypeDef::OffsetRightShift***
  Define the Right-shift data after Offset correction. This parameter is applied only for 14-bit or 8-bit resolution. This parameter can be set to ENABLE or DISABLE.
- ***FunctionalState ADC_ChannelConfTypeDef::OffsetSignedSaturation***
  Specify whether the Signed saturation feature is used or not. This parameter is only applied when OffsetSaturation is ENABLE. This parameter is applied only for 14-bit or 8-bit resolution. This parameter can be set to ENABLE or DISABLE. Note:
  – If OffsetSignedSaturation is set to DISABLE the unsigned saturation feature is used
- ***FunctionalState ADC_ChannelConfTypeDef::OffsetSaturation***
  Define if the offset should be saturated upon under or over flow. This parameter value can be ENABLE or DISABLE. Note:
  – This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
  – Applicable for ADC1
- ***uint32_t ADC_ChannelConfTypeDef::OffsetSign***
  Define if the offset should be subtracted (negative sign) or added (positive sign) from or to the raw converted data. This parameter can be a value of ***ADCEx_OffsetSign***. Note:
  – This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
  – Applicable for ADC1

7.1.4 ADC_AnalogWDGConfTypeDef

ADC_AnalogWDGConfTypeDef is defined in the stm32u5xx_hal_adc.h

Data Fields

- ***uint32_t WatchdogNumber***
- ***uint32_t WatchdogMode***
- ***uint32_t Channel***
- ***FunctionalState ITMode***
- ***uint32_t HighThreshold***
- ***uint32_t LowThreshold***
- ***uint32_t FilteringConfig***

Field Documentation

- ***uint32_t ADC_AnalogWDGConfTypeDef::WatchdogNumber***
  Select which ADC analog watchdog is monitoring the selected channel. For Analog Watchdog 1: Only 1 channel can be monitored (or overall group of channels by setting parameter 'WatchdogMode'). For Analog Watchdog 2 and 3: Several channels can be monitored (by successive calls of '**HAL_ADC_AnalogWDGConfig()**' for each channel) This parameter can be a value of ***ADC_HAL_EC_AWD_NUMBER***.
- ***uint32_t ADC_AnalogWDGConfTypeDef::WatchdogMode***
  Configure the ADC analog watchdog mode: single/all/none channels. For Analog Watchdog 1: Configure the ADC analog watchdog mode: single channel or all channels, ADC groups regular and-or injected. For Analog Watchdog 2 and 3: Several channels can be monitored by applying successively the AWD init structure. For ADC1/ADC2, channels on ADC group regular and injected are not differentiated: Set value 'ADC_ANALOGWATCHDOG_SINGLE_xxx' to monitor 1 channel, value 'ADC_ANALOGWATCHDOG_ALL_xxx' to monitor all channels, value 'ADC_ANALOGWATCHDOG_NONE' to monitor no channel. This parameter can be a value of ***ADC_analog_watchdog_mode***.
- ***uint32_t ADC_AnalogWDGConfTypeDef::Channel***
  Select which ADC channel to monitor by analog watchdog. For Analog Watchdog 1: this parameter has an effect only if parameter 'WatchdogMode' is configured on single channel (only 1 channel can be monitored). For Analog Watchdog 2 and 3: Several channels can be monitored. To use this feature, call successively the function **HAL_ADC_AnalogWDGConfig()** for each channel to be added (or removed with value 'ADC_ANALOGWATCHDOG_NONE'). Note: 'ORING' channels is not supported. For Analog watchdog 2 and 3 and for multiple channels monitoring it's mandatory to recall successively the function **HAL_ADC_AnalogWDGConfig()** to add monitored channel for each call. This parameter can be a value of ***ADC_HAL_EC_CHANNEL***.
- ***FunctionalState ADC_AnalogWDGConfTypeDef::ITMode***
  Specify whether the analog watchdog is configured in interrupt or polling mode. This parameter can be set to ENABLE or DISABLE
- ***uint32_t ADC_AnalogWDGConfTypeDef::HighThreshold***
  Configure the ADC analog watchdog High threshold value. Depending of ADC resolution selected (14, 12, 10, 8 or 6 bits), this parameter must be a number between Min_Data = 0x000 and Max_Data = 0x3FFF, 0xFFF, 0x3FF, 0xFF or 0x3F respectively. Note: Analog watchdog 2 and 3 are limited to a resolution of 8 bits:
  - if ADC resolution is 12 bits the 4 LSB are ignored,
  - if ADC resolution is 10 bits the 2 LSB are ignored. Note: If ADC oversampling is enabled, ADC analog watchdog thresholds are impacted: the comparison of analog watchdog thresholds is done on oversampling intermediate computation (after ratio, before shift application): intermediate register bitfield [32:7] (26 most significant bits).
- ***uint32_t ADC_AnalogWDGConfTypeDef::LowThreshold***
  Configures the ADC analog watchdog Low threshold value. Depending of ADC resolution selected (14, 12, 10, 8 or 6 bits), this parameter must be a number between Min_Data = 0x000 and Max_Data = 0x3FFF, 0xFFF, 0x3FF, 0xFF or 0x3F respectively. Note: Analog watchdog 2 and 3 are limited to a resolution of 8 bits:
  - if ADC resolution is 12 bits the 4 LSB are ignored,
  - if ADC resolution is 10 bits the 2 LSB are ignored. Note: If ADC oversampling is enabled, ADC analog watchdog thresholds are impacted: the comparison of analog watchdog thresholds is done on oversampling intermediate computation (after ratio, before shift application): intermediate register bitfield [32:7] (26 most significant bits).
- ***uint32_t ADC_AnalogWDGConfTypeDef::FilteringConfig***
  Specify whether filtering should be use and the number of samples to consider. Before setting flag or raising interrupt, analog watchdog can wait to have several consecutive out-of-window samples. This parameter allows to configure this number. This parameter only applies to Analog watchdog 1. For others, use value ADC_AWD_FILTERING_NONE. Note: This parameter is applicable for ADC1/ADC2 on this device. This parameter can be a value of ***ADC_analog_watchdog_filtering_config***.

7.1.5 ADC_InjectionConfigTypeDef

ADC_InjectionConfigTypeDef is defined in the stm32u5xx_hal_adc.h

Data Fields

- ***uint32_t ContextQueue***
- ***uint32_t ChannelCount***

Field Documentation

- ***uint32_t ADC_InjectionConfigTypeDef::ContextQueue***
  Injected channel configuration context: build-up over each **HAL_ADCEx_InjectedConfigChannel()** call to finally initialize JSQR register at **HAL_ADCEx_InjectedConfigChannel()** last call
- ***uint32_t ADC_InjectionConfigTypeDef::ChannelCount***
  Number of channels in the injected sequence

7.1.6 __ADC_HandleTypeDef

__ADC_HandleTypeDef is defined in the stm32u5xx_hal_adc.h

Data Fields

- ***ADC_TypeDef * Instance***
- ***ADC_InitTypeDef Init***
- ***DMA_HandleTypeDef * DMA_Handle***
- ***HAL_LockTypeDef Lock***
- ***__IO uint32_t State***
- ***__IO uint32_t ErrorCode***
- ***ADC_InjectionConfigTypeDef InjectionConfig***
- ***uint32_t ADCGroupRegularSequencerRanks***
- ***void(* ConvCpltCallback***
- ***void(* ConvHalfCpltCallback***
- ***void(* LevelOutOfWindowCallback***
- ***void(* ErrorCallback***
- ***void(* InjectedConvCpltCallback***
- ***void(* InjectedQueueOverflowCallback***
- ***void(* LevelOutOfWindow2Callback***
- ***void(* LevelOutOfWindow3Callback***
- ***void(* EndOfSamplingCallback***
- ***void(* CalibrationCpltCallback***
- ***void(* VoltageRegulatorCallback***
- ***void(* ADCReadyCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***ADC_TypeDef* __ADC_HandleTypeDef::Instance***
  Register base address
- ***ADC_InitTypeDef __ADC_HandleTypeDef::Init***
  ADC initialization parameters and regular conversions setting
- ***DMA_HandleTypeDef* __ADC_HandleTypeDef::DMA_Handle***
  Pointer DMA Handler
- ***HAL_LockTypeDef __ADC_HandleTypeDef::Lock***
  ADC locking object
- ***__IO uint32_t __ADC_HandleTypeDef::State***
  ADC communication state (bitmap of ADC states)
- ***__IO uint32_t __ADC_HandleTypeDef::ErrorCode***
  ADC Error code
- ***ADC_InjectionConfigTypeDef __ADC_HandleTypeDef::InjectionConfig***
  ADC injected channel configuration build-up structure
- ***uint32_t __ADC_HandleTypeDef::ADCGroupRegularSequencerRanks***
  ADC group regular sequencer memorization of ranks setting, used in mode "fully configurable" (refer to parameter 'ScanConvMode')
- ***void(* __ADC_HandleTypeDef::ConvCpltCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC conversion complete callback

- ***void(* __ADC_HandleTypeDef::ConvHalfCpltCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC conversion DMA half-transfer callback
- ***void(* __ADC_HandleTypeDef::LevelOutOfWindowCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC analog watchdog 1 callback
- ***void(* __ADC_HandleTypeDef::ErrorCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC error callback
- ***void(* __ADC_HandleTypeDef::InjectedConvCpltCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC group injected conversion complete callback
- ***void(* __ADC_HandleTypeDef::InjectedQueueOverflowCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC group injected context queue overflow callback
- ***void(* __ADC_HandleTypeDef::LevelOutOfWindow2Callback)(struct __ADC_HandleTypeDef *hadc)***
  ADC analog watchdog 2 callback
- ***void(* __ADC_HandleTypeDef::LevelOutOfWindow3Callback)(struct __ADC_HandleTypeDef *hadc)***
  ADC analog watchdog 3 callback
- ***void(* __ADC_HandleTypeDef::EndOfSamplingCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC end of sampling callback
- ***void(* __ADC_HandleTypeDef::CalibrationCpltCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC end of calibration callback
- ***void(* __ADC_HandleTypeDef::VoltageRegulatorCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC voltage regulator (LDO) Ready callback
- ***void(* __ADC_HandleTypeDef::ADCReadyCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC Ready callback
- ***void(* __ADC_HandleTypeDef::MspInitCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC Msp Init callback
- ***void(* __ADC_HandleTypeDef::MspDeInitCallback)(struct __ADC_HandleTypeDef *hadc)***
  ADC Msp DeInit callback

7.2 ADC Firmware driver API description

The following section lists the various functions of the ADC library.

7.2.1 ADC peripheral features

- 14-bit, 12-bit, 10-bit or 8-bit configurable resolution.
- Interrupt generation at the end of regular conversion and in case of analog watchdog or overrun events.
- Single and continuous conversion modes.
- Scan mode for conversion of several channels sequentially.
- Data alignment with in-built data coherency.
- Programmable sampling time (channel wise)
- External trigger (timer or EXTI) with configurable polarity
- DMA request generation for transfer of conversions data of regular group.
- Configurable delay between conversions in Dual interleaved mode.
- ADC channels selectable single/differential input.
- ADC offset shared on 4 offset instances.
- ADC calibration
- ADC conversion of regular group.
- ADC supply requirements: 1.62 V to 3.6 V.
- ADC input range: from Vref- (connected to Vssa) to Vref+ (connected to Vdda or to an external voltage reference).

7.2.2 How to use this driver

Configuration of top level parameters related to ADC

1. Enable the ADC interface
   - As prerequisite, ADC clock must be configured at RCC top level.
   - Two clock settings are mandatory:
     - ADC clock (core clock, also possibly conversion clock).
     - ADC clock (conversions clock). Six possible clock sources: synchronous clock derived from AHB clock or asynchronous clock derived from system clock, the PLL2, the HSE, the HSI or the MSIK.
     - Example: Into HAL_ADC_MspInit() (recommended code location) or with other device clock parameters configuration:
     - __HAL_RCC_ADC_CLK_ENABLE(); (mandatory) RCC_ADCCLKSOURCE_PLL2 enable: (optional: if asynchronous clock selected)
     - RCC_PeriphClkInitTypeDef RCC_PeriphClkInit;
     - PeriphClkInit.PeriphClockSelection = RCC_PERIPHCLK_ADCDAC;
     - PeriphClkInit.AdcDacClockSelection = RCC_ADCDACCLKSOURCE_PLL2;
     - HAL_RCCEx_PeriphCLKConfig(&PeriphClkInit);
   - ADC clock source and clock prescaler are configured at ADC level with parameter "ClockPrescaler" using function HAL_ADC_Init().
2. ADC pins configuration
   - Enable the clock for the ADC GPIOs using macro __HAL_RCC_GPIOx_CLK_ENABLE()
   - Configure these ADC pins in analog mode using function HAL_GPIO_Init()
3. Optionally, in case of usage of ADC with interruptions:
   - Configure the NVIC for ADC using function HAL_NVIC_EnableIRQ(ADCx_IRQn)
   - Insert the ADC interruption handler function HAL_ADC_IRQHandler() into the function of corresponding ADC interruption vector ADCx_IRQHandler().
4. Optionally, in case of usage of DMA:
   - Configure the DMA (DMA channel, mode normal or circular, ...) using function HAL_DMA_Init().
   - Configure the NVIC for DMA using function HAL_NVIC_EnableIRQ(DMAx_Channelx_IRQn)
   - Insert the ADC interruption handler function HAL_ADC_IRQHandler() into the function of corresponding DMA interruption vector DMAx_Channelx_IRQHandler().

Configuration of ADC, group regular, channels parameters

1. Configure the ADC parameters (resolution, data alignment, ...) and regular group parameters (conversion trigger, sequencer, ...) using function HAL_ADC_Init().
2. Configure the channels for regular group parameters (channel number, channel rank into sequencer, ..., into regular group) using function HAL_ADC_ConfigChannel().
3. Optionally, configure the analog watchdog parameters (channels monitored, thresholds, ...) using function HAL_ADC_AnalogWDGConfig().

Execution of ADC conversions

1. Optionally, perform an automatic ADC calibration to improve the conversion accuracy using function HAL_ADCEx_Calibration_Start().

2. ADC driver can be used among three modes: polling, interruption, transfer by DMA.
   – ADC conversion by polling:
     ◦ Activate the ADC peripheral and start conversions using function HAL_ADC_Start()
     ◦ Wait for ADC conversion completion using function HAL_ADC_PollForConversion()
     ◦ Retrieve conversion results using function HAL_ADC_GetValue()
     ◦ Stop conversion and disable the ADC peripheral using function HAL_ADC_Stop()
   – ADC conversion by interruption:
     ◦ Activate the ADC peripheral and start conversions using function HAL_ADC_Start_IT()
     ◦ Wait for ADC conversion completion by call of function HAL_ADC_ConvCpltCallback() (this function must be implemented in user program)
     ◦ Retrieve conversion results using function HAL_ADC_GetValue()
     ◦ Stop conversion and disable the ADC peripheral using function HAL_ADC_Stop_IT()
   – ADC conversion with transfer by DMA:
     ◦ Activate the ADC peripheral and start conversions using function HAL_ADC_Start_DMA()
     ◦ Wait for ADC conversion completion by call of function HAL_ADC_ConvCpltCallback() or HAL_ADC_ConvHalfCpltCallback() (these functions must be implemented in user program)
     ◦ Conversion results are automatically transferred by DMA into destination variable address.
     ◦ Stop conversion and disable the ADC peripheral using function HAL_ADC_Stop_DMA()

Note: Callback functions must be implemented in user program:
- *HAL_ADC_ErrorCallback()*
- *HAL_ADC_LevelOutOfWindowCallback() (callback of analog watchdog)*
- *HAL_ADC_ConvCpltCallback()*
- *HAL_ADC_ConvHalfCpltCallback*

Deinitialization of ADC

1. Disable the ADC interface
   – ADC clock can be hard reset and disabled at RCC top level.
   – Hard reset of ADC peripherals using macro __HAL_RCC_ADCx_FORCE_RESET(), __HAL_RCC_ADCx_RELEASE_RESET().
   – ADC clock disable using the equivalent macro/functions as configuration step.
     ◦ Example: Into HAL_ADC_MspDeInit() (recommended code location) or with other device clock parameters configuration:
     ◦ __HAL_RCC_ADC_CLK_DISABLE(); (if not used anymore) RCC_ADCDACCLKSOURCE_HSI restore: (optional)
     ◦ RCC_PeriphClkInitTypeDef RCC_PeriphClkInit;
     ◦ PeriphClkInit.PeriphClockSelection = RCC_PERIPHCLK_ADCDAC;
     ◦ PeriphClkInit.AdcDacClockSelection = RCC_ADCDACCLKSOURCE_HSI;
     ◦ HAL_RCCEx_PeriphCLKConfig(&PeriphClkInit);
2. ADC pins configuration
   – Disable the clock for the ADC GPIOs using macro __HAL_RCC_GPIOx_CLK_DISABLE()
3. Optionally, in case of usage of ADC with interruptions:
   – Disable the NVIC for ADC using function HAL_NVIC_EnableIRQ(ADCx_IRQn)
4. Optionally, in case of usage of DMA:
   – Deinitialize the DMA using function HAL_DMA_Init().
   – Disable the NVIC for DMA using function HAL_NVIC_EnableIRQ(DMAx_Channelx_IRQn)

Callback registration

The compilation flag USE_HAL_ADC_REGISTER_CALLBACKS, when set to 1, allows the user to configure dynamically the driver callbacks. Use Functions @ref HAL_ADC_RegisterCallback() to register an interrupt callback.

Function @ref HAL_ADC_RegisterCallback() allows to register following callbacks:

- ConvCpltCallback : ADC conversion complete callback
- ConvHalfCpltCallback : ADC conversion DMA half-transfer callback
- LevelOutOfWindowCallback : ADC analog watchdog 1 callback
- ErrorCallback : ADC error callback
- InjectedConvCpltCallback : ADC group injected conversion complete callback
- InjectedQueueOverflowCallback : ADC group injected context queue overflow callback
- LevelOutOfWindow2Callback : ADC analog watchdog 2 callback
- LevelOutOfWindow3Callback : ADC analog watchdog 3 callback
- EndOfSamplingCallback : ADC end of sampling callback
- MspInitCallback : ADC Msp Init callback
- MspDeInitCallback : ADC Msp DeInit callback This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function @ref HAL_ADC_UnRegisterCallback to reset a callback to the default weak function.

@ref HAL_ADC_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- ConvCpltCallback : ADC conversion complete callback
- ConvHalfCpltCallback : ADC conversion DMA half-transfer callback
- LevelOutOfWindowCallback : ADC analog watchdog 1 callback
- ErrorCallback : ADC error callback
- InjectedConvCpltCallback : ADC group injected conversion complete callback
- InjectedQueueOverflowCallback : ADC group injected context queue overflow callback
- LevelOutOfWindow2Callback : ADC analog watchdog 2 callback
- LevelOutOfWindow3Callback : ADC analog watchdog 3 callback
- EndOfSamplingCallback : ADC end of sampling callback
- MspInitCallback : ADC Msp Init callback
- MspDeInitCallback : ADC Msp DeInit callback

By default, after the @ref HAL_ADC_Init() and when the state is @ref HAL_ADC_STATE_RESET all callbacks are set to the corresponding weak functions: examples @ref HAL_ADC_ConvCpltCallback(), @ref HAL_ADC_ErrorCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the @ref HAL_ADC_Init()/ @ref HAL_ADC_DeInit() only when these callbacks are null (not registered beforehand).

If MspInit or MspDeInit are not null, the @ref HAL_ADC_Init()/ @ref HAL_ADC_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in @ref HAL_ADC_STATE_READY state only. Exception done MspInit/ MspDeInit functions that can be registered/unregistered in @ref HAL_ADC_STATE_READY or @ref HAL_ADC_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit.

Then, the user first registers the MspInit/MspDeInit user callbacks using @ref HAL_ADC_RegisterCallback() before calling @ref HAL_ADC_DeInit() or @ref HAL_ADC_Init() function.

When the compilation flag USE_HAL_ADC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

7.2.3 Peripheral Control functions

This section provides functions allowing to:

- Configure channels on regular group
- Configure the analog watchdog

This section contains the following APIs:

- *HAL_ADC_ConfigChannel()*
- *HAL_ADC_AnalogWDGConfig()*

7.2.4 Peripheral state and errors functions

This subsection provides functions to get in run-time the status of the peripheral.

- Check the ADC state
- Check the ADC error code

This section contains the following APIs:
- *HAL_ADC_GetState()*
- *HAL_ADC_GetError()*

7.2.5 Detailed description of functions

HAL_ADC_Init

Function name

HAL_StatusTypeDef HAL_ADC_Init (ADC_HandleTypeDef * hadc)

Function description

Initialize the ADC peripheral and regular group according to parameters specified in structure "ADC_InitTypeDef".

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- As prerequisite, ADC clock must be configured at RCC top level (refer to description of RCC configuration for ADC in header of this file).
- Possibility to update parameters on the fly: This function initializes the ADC MSP (HAL_ADC_MspInit()) only when coming from ADC state reset. Following calls to this function can be used to reconfigure some parameters of ADC_InitTypeDef structure on the fly, without modifying MSP configuration. If ADC MSP has to be modified again, HAL_ADC_DeInit() must be called before HAL_ADC_Init(). The setting of these parameters is conditioned to ADC state. For parameters constraints, see comments of structure "ADC_InitTypeDef".
- This function configures the ADC within 2 scopes: scope of entire ADC and scope of regular group. For parameters details, see comments of structure "ADC_InitTypeDef".
- Parameters related to common ADC registers (ADC clock mode) are set only if all ADCs are disabled. If this is not the case, these common parameters setting are bypassed without error reporting: it can be the intended behaviour in case of update of a parameter of ADC_InitTypeDef on the fly, without disabling the other ADCs.

HAL_ADC_DeInit

Function name

HAL_StatusTypeDef HAL_ADC_DeInit (ADC_HandleTypeDef * hadc)

Function description

Deinitialize the ADC peripheral registers to their default reset values, with deinitialization of the ADC MSP.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- For devices with several ADCs: reset of ADC common registers is done only if all ADCs sharing the same common group are disabled. (function "HAL_ADC_MspDeInit()" is also called under the same conditions: all ADC instances use the same core clock at RCC level, disabling the core clock reset all ADC instances). If this is not the case, reset of these common parameters reset is bypassed without error reporting: it can be the intended behavior in case of reset of a single ADC while the other ADCs sharing the same common group is still running.
- By default, HAL_ADC_DeInit() set ADC in mode deep power-down: this saves more power by reducing leakage currents and is particularly interesting before entering MCU low-power modes.

HAL_ADC_MspInit

Function name

void HAL_ADC_MspInit (ADC_HandleTypeDef * hadc)

Function description

Initialize the ADC MSP.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_MspDeInit

Function name

void HAL_ADC_MspDeInit (ADC_HandleTypeDef * hadc)

Function description

DeInitialize the ADC MSP.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

Notes

- All ADC instances use the same core clock at RCC level, disabling the core clock reset all ADC instances).

HAL_ADC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_ADC_RegisterCallback (ADC_HandleTypeDef * hadc, HAL_ADC_CallbackIDTypeDef CallbackID, pADC_CallbackTypeDef pCallback)

Function description

Register a User ADC Callback To be used instead of the weak predefined callback.

Parameters

- **hadc:** Pointer to a ADC_HandleTypeDef structure that contains the configuration information for the specified ADC.
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_ADC_CONVERSION_COMPLETE_CB_ID ADC conversion complete callback ID
  - HAL_ADC_CONVERSION_HALF_CB_ID ADC conversion DMA half-transfer callback ID
  - HAL_ADC_LEVEL_OUT_OF_WINDOW_1_CB_ID ADC analog watchdog 1 callback ID
  - HAL_ADC_ERROR_CB_ID ADC error callback ID
  - HAL_ADC_INJ_CONVERSION_COMPLETE_CB_ID ADC group injected conversion complete callback ID
  - HAL_ADC_INJ_QUEUE_OVEFLOW_CB_ID ADC group injected context queue overflow callback ID
  - HAL_ADC_LEVEL_OUT_OF_WINDOW_2_CB_ID ADC analog watchdog 2 callback ID
  - HAL_ADC_LEVEL_OUT_OF_WINDOW_3_CB_ID ADC analog watchdog 3 callback ID
  - HAL_ADC_END_OF_SAMPLING_CB_ID ADC end of sampling callback ID
  - HAL_ADC_END_OF_CALIBRATION_CB_ID ADC end of calibration callback ID
  - HAL_ADC_VOLTAGE_REGULATOR_CB_ID ADC voltage regulator (LDO) Ready callback ID
  - HAL_ADC_ADC_READY_CB_ID ADC Ready callback ID
  - HAL_ADC_MSPINIT_CB_ID ADC Msp Init callback ID
  - HAL_ADC_MSPDEINIT_CB_ID ADC Msp DeInit callback ID
  - HAL_ADC_MSPINIT_CB_ID MspInit callback ID
  - HAL_ADC_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_ADC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_ADC_UnRegisterCallback (ADC_HandleTypeDef * hadc, HAL_ADC_CallbackIDTypeDef CallbackID)

Function description

Unregister a ADC Callback ADC callback is redirected to the weak predefined callback.

Parameters

- **hadc:** Pointer to a ADC_HandleTypeDef structure that contains the configuration information for the specified ADC.
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  – HAL_ADC_CONVERSION_COMPLETE_CB_ID ADC conversion complete callback ID
  – HAL_ADC_CONVERSION_HALF_CB_ID ADC conversion DMA half-transfer callback ID
  – HAL_ADC_LEVEL_OUT_OF_WINDOW_1_CB_ID ADC analog watchdog 1 callback ID
  – HAL_ADC_ERROR_CB_ID ADC error callback ID
  – HAL_ADC_INJ_CONVERSION_COMPLETE_CB_ID ADC group injected conversion complete callback ID
  – HAL_ADC_INJ_QUEUE_OVEFLOW_CB_ID ADC group injected context queue overflow callback ID
  – HAL_ADC_LEVEL_OUT_OF_WINDOW_2_CB_ID ADC analog watchdog 2 callback ID
  – HAL_ADC_LEVEL_OUT_OF_WINDOW_3_CB_ID ADC analog watchdog 3 callback ID
  – HAL_ADC_END_OF_SAMPLING_CB_ID ADC end of sampling callback ID
  – HAL_ADC_END_OF_CALIBRATION_CB_ID ADC end of calibration callback ID
  – HAL_ADC_VOLTAGE_REGULATOR_CB_ID ADC voltage regulator (LDO) Ready callback ID
  – HAL_ADC_ADC_READY_CB_ID ADC Ready callback ID
  – HAL_ADC_MSPINIT_CB_ID ADC Msp Init callback ID
  – HAL_ADC_MSPDEINIT_CB_ID ADC Msp DeInit callback ID
  – HAL_ADC_MSPINIT_CB_ID MspInit callback ID
  – HAL_ADC_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_ADC_Start

Function name

HAL_StatusTypeDef HAL_ADC_Start (ADC_HandleTypeDef * hadc)

Function description

Enable ADC, start conversion of regular group.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- Interruptions enabled in this function: None.
- Case of multimode enabled (when multimode feature is available): if ADC is Slave, ADC is enabled but conversion is not started, if ADC is master, ADC is enabled and multimode conversion is started.

HAL_ADC_Stop

Function name

HAL_StatusTypeDef HAL_ADC_Stop (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of regular group (and injected channels in case of auto_injection mode), disable ADC peripheral.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- : ADC peripheral disable is forcing stop of potential conversion on injected group. If injected group is under use, it should be preliminarily stopped using HAL_ADCEx_InjectedStop function.

HAL_ADC_PollForConversion

Function name

HAL_StatusTypeDef HAL_ADC_PollForConversion (ADC_HandleTypeDef * hadc, uint32_t Timeout)

Function description

Wait for regular group conversion to be completed.

Parameters

- **hadc:** ADC handle
- **Timeout:** Timeout value in millisecond.

Return values

- **HAL:** status

Notes

- ADC conversion flags EOS (end of sequence) and EOC (end of conversion) are cleared by this function, with an exception: if low power feature "LowPowerAutoWait" is enabled, flags are not cleared to not interfere with this feature until data register is read using function HAL_ADC_GetValue().
- This function cannot be used in a particular setup: ADC configured in DMA mode and polling for end of each conversion (ADC init parameter "EOCSelection" set to ADC_EOC_SINGLE_CONV). In this case, DMA resets the flag EOC and polling cannot be performed on each conversion. Nevertheless, polling can still be performed on the complete sequence (ADC init parameter "EOCSelection" set to ADC_EOC_SEQ_CONV).

HAL_ADC_PollForEvent

Function name

HAL_StatusTypeDef HAL_ADC_PollForEvent (ADC_HandleTypeDef * hadc, uint32_t EventType, uint32_t Timeout)

Function description

Poll for ADC event.

Parameters

- **hadc:** ADC handle
- **EventType:** the ADC event type. This parameter can be one of the following values:
  - ADC_EOSMP_EVENT ADC End of Sampling event
  - ADC_AWD1_EVENT ADC Analog watchdog 1 event (main analog watchdog, present on all STM32 devices)
  - ADC_AWD2_EVENT ADC Analog watchdog 2 event (additional analog watchdog, not present on all STM32 families)
  - ADC_AWD3_EVENT ADC Analog watchdog 3 event (additional analog watchdog, not present on all STM32 families)
  - ADC_OVR_EVENT ADC Overrun event
- **Timeout:** Timeout value in millisecond.

Return values

- **HAL:** status

Notes

- The relevant flag is cleared if found to be set, except for ADC_FLAG_OVR. Indeed, the latter is reset only if hadc->Init.Overrun field is set to ADC_OVR_DATA_OVERWRITTEN. Otherwise, data register may be potentially overwritten by a new converted data as soon as OVR is cleared. To reset OVR flag once the preserved data is retrieved, the user can resort to macro __HAL_ADC_CLEAR_FLAG(hadc, ADC_FLAG_OVR);

HAL_ADC_Start_IT

Function name

HAL_StatusTypeDef HAL_ADC_Start_IT (ADC_HandleTypeDef * hadc)

Function description

Enable ADC, start conversion of regular group with interruption.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- Interruptions enabled in this function according to initialization setting : EOC (end of conversion), EOS (end of sequence), OVR overrun. Each of these interruptions has its dedicated callback function.
- Case of multimode enabled (when multimode feature is available): HAL_ADC_Start_IT() must be called for ADC Slave first, then for ADC Master. For ADC Slave, ADC is enabled only (conversion is not started). For ADC Master, ADC is enabled and multimode conversion is started.
- To guarantee a proper reset of all interruptions once all the needed conversions are obtained, HAL_ADC_Stop_IT() must be called to ensure a correct stop of the IT-based conversions.
- By default, HAL_ADC_Start_IT() does not enable the End Of Sampling interruption. If required (e.g. in case of oversampling with trigger mode), the user must: 1. first clear the EOSMP flag if set with macro __HAL_ADC_CLEAR_FLAG(hadc, ADC_FLAG_EOSMP) 2. then enable the EOSMP interrupt with macro __HAL_ADC_ENABLE_IT(hadc, ADC_IT_EOSMP) before calling HAL_ADC_Start_IT().

HAL_ADC_Stop_IT

Function name

HAL_StatusTypeDef HAL_ADC_Stop_IT (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of regular group (and injected group in case of auto_injection mode), disable interrution of end-of-conversion, disable ADC peripheral.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

HAL_ADC_Start_DMA

Function name

HAL_StatusTypeDef HAL_ADC_Start_DMA (ADC_HandleTypeDef * hadc, const uint32_t * pData, uint32_t Length)

Function description

Enable ADC, start conversion of regular group and transfer result through DMA.

Parameters

- **hadc:** ADC handle
- **pData:** Destination Buffer address.
- **Length:** Number of data to be transferred from ADC peripheral to memory

Return values

- **HAL:** status.

Notes

- Interruptions enabled in this function: overrun (if applicable), DMA half transfer, DMA transfer complete. Each of these interruptions has its dedicated callback function.
- Case of multimode enabled (when multimode feature is available): HAL_ADC_Start_DMA() is designed for single-ADC mode only. For multimode, the dedicated HAL_ADCEx_MultiModeStart_DMA() function must be used.

HAL_ADC_Stop_DMA

Function name

HAL_StatusTypeDef HAL_ADC_Stop_DMA (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of regular group (and injected group in case of auto_injection mode), disable ADC DMA transfer, disable ADC peripheral.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- : ADC peripheral disable is forcing stop of potential conversion on ADC group injected. If ADC group injected is under use, it should be preliminarily stopped using HAL_ADCEx_InjectedStop function.
- Case of multimode enabled (when multimode feature is available): HAL_ADC_Stop_DMA() function is dedicated to single-ADC mode only. For multimode, the dedicated HAL_ADCEx_MultiModeStop_DMA() API must be used.

HAL_ADC_GetValue

Function name

uint32_t HAL_ADC_GetValue (const ADC_HandleTypeDef * hadc)

Function description

Get ADC regular group conversion result.

Parameters

- **hadc:** ADC handle

Return values

- **ADC:** group regular conversion data

Notes

- Reading register DR automatically clears ADC flag EOC (ADC group regular end of unitary conversion).
- This function does not clear ADC flag EOS (ADC group regular end of sequence conversion). Occurrence of flag EOS rising: If sequencer is composed of 1 rank, flag EOS is equivalent to flag EOC.If sequencer is composed of several ranks, during the scan sequence flag EOC only is raised, at the end of the scan sequence both flags EOC and EOS are raised. To clear this flag, either use function: in programming model IT: HAL_ADC_IRQHandler(), in programming model polling: HAL_ADC_PollForConversion() or __HAL_ADC_CLEAR_FLAG(&hadc, ADC_FLAG_EOS).

HAL_ADC_IRQHandler

Function name

void HAL_ADC_IRQHandler (ADC_HandleTypeDef * hadc)

Function description

Handle ADC interrupt request.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_ConvCpltCallback

Function name

void HAL_ADC_ConvCpltCallback (ADC_HandleTypeDef * hadc)

Function description

Conversion complete callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_ConvHalfCpltCallback

Function name

void HAL_ADC_ConvHalfCpltCallback (ADC_HandleTypeDef * hadc)

Function description

Conversion DMA half-transfer callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_LevelOutOfWindowCallback

Function name

void HAL_ADC_LevelOutOfWindowCallback (ADC_HandleTypeDef * hadc)

Function description

Analog watchdog 1 callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_ErrorCallback

Function name

void HAL_ADC_ErrorCallback (ADC_HandleTypeDef * hadc)

Function description

ADC error callback in non-blocking mode (ADC conversion with interruption or transfer by DMA).

Parameters

- **hadc:** ADC handle

Return values

- **None:**

Notes

- In case of error due to overrun when using ADC with DMA transfer (HAL ADC handle parameter "ErrorCode" to state "HAL_ADC_ERROR_OVR"): Reinitialize the DMA using function "HAL_ADC_Stop_DMA()".If needed, restart a new ADC conversion using function "HAL_ADC_Start_DMA()" (this function is also clearing overrun flag)

HAL_ADC_CalibrationCpltCallback

Function name

void HAL_ADC_CalibrationCpltCallback (ADC_HandleTypeDef * hadc)

Function description

Calibration complete callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_VoltageRegulatorCallback

Function name

void HAL_ADC_VoltageRegulatorCallback (ADC_HandleTypeDef * hadc)

Function description

Voltage Regulator (LDO) Ready callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_ADCReadyCallback

Function name

void HAL_ADC_ADCReadyCallback (ADC_HandleTypeDef * hadc)

Function description

ADC Ready callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADC_ConfigChannel

Function name

HAL_StatusTypeDef HAL_ADC_ConfigChannel (ADC_HandleTypeDef * hadc, ADC_ChannelConfTypeDef * pConfig)

Function description

Configure a channel to be assigned to ADC group regular.

Parameters

- **hadc:** ADC handle
- **pConfig:** Structure of ADC channel assigned to ADC group regular.

Return values

- **HAL:** status

Notes

- In case of usage of internal measurement channels: Vbat/VrefInt/TempSensor. These internal paths can be disabled using function HAL_ADC_DeInit().
- Possibility to update parameters on the fly: This function initializes channel into ADC group regular, following calls to this function can be used to reconfigure some parameters of structure "ADC_ChannelConfTypeDef" on the fly, without resetting the ADC. The setting of these parameters is conditioned to ADC state: Refer to comments of structure "ADC_ChannelConfTypeDef".

HAL_ADC_AnalogWDGConfig

Function name

HAL_StatusTypeDef HAL_ADC_AnalogWDGConfig (ADC_HandleTypeDef * hadc, ADC_AnalogWDGConfTypeDef * pAnalogWDGConfig)

Function description

Configure the analog watchdog.

Parameters

- **hadc:** ADC handle
- **pAnalogWDGConfig:** Structure of ADC analog watchdog configuration

Return values

- **HAL:** status

Notes

- Possibility to update parameters on the fly: This function initializes the selected analog watchdog, successive calls to this function can be used to reconfigure some parameters of structure "ADC_AnalogWDGConfTypeDef" on the fly, without resetting the ADC. The setting of these parameters is conditioned to ADC state. For parameters constraints, see comments of structure "ADC_AnalogWDGConfTypeDef".

HAL_ADC_GetState

Function name

uint32_t HAL_ADC_GetState (const ADC_HandleTypeDef * hadc)

Function description

Return the ADC handle state.

Parameters

- **hadc:** ADC handle

Return values

- **ADC:** handle state (bitfield on 32 bits)

Notes

- ADC state machine is managed by bitfields, ADC status must be compared with states bits. For example: " if ((HAL_ADC_GetState(hadc1) & HAL_ADC_STATE_REG_BUSY) != 0UL) " " if ((HAL_ADC_GetState(hadc1) & HAL_ADC_STATE_AWD1) != 0UL) "

HAL_ADC_GetError

Function name

uint32_t HAL_ADC_GetError (const ADC_HandleTypeDef * hadc)

Function description

Return the ADC error code.

Parameters

- **hadc:** ADC handle

Return values

- **ADC:** error code (bitfield on 32 bits)

ADC_ConversionStop

Function name

HAL_StatusTypeDef ADC_ConversionStop (ADC_HandleTypeDef * hadc, uint32_t ConversionGroup)

Function description

Stop ADC conversion.

Parameters

- **hadc:** ADC handle
- **ConversionGroup:** ADC group regular and/or injected. This parameter can be one of the following values:
  – ADC_REGULAR_GROUP ADC regular conversion type.
  – ADC_INJECTED_GROUP ADC injected conversion type.
  – ADC_REGULAR_INJECTED_GROUP ADC regular and injected conversion type.

Return values

- **HAL:** status.

ADC_Enable

Function name

HAL_StatusTypeDef ADC_Enable (ADC_HandleTypeDef * hadc)

Function description

Enable the selected ADC.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- Prerequisite condition to use this function: ADC must be disabled and voltage regulator must be enabled (done into HAL_ADC_Init()).

ADC_Disable

Function name

HAL_StatusTypeDef ADC_Disable (ADC_HandleTypeDef * hadc)

Function description

Disable the selected ADC.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- Prerequisite condition to use this function: ADC conversions must be stopped.

ADC_DMAConvCplt

Function name

void ADC_DMAConvCplt (DMA_HandleTypeDef * hdma)

Function description

DMA transfer complete callback.

Parameters

- **hdma:** pointer to DMA handle.

Return values

- **None:**

ADC_DMAHalfConvCplt

Function name

void ADC_DMAHalfConvCplt (DMA_HandleTypeDef * hdma)

Function description

DMA half transfer complete callback.

Parameters

- **hdma:** pointer to DMA handle.

Return values

- **None:**

ADC_DMAError

Function name

void ADC_DMAError (DMA_HandleTypeDef * hdma)

Function description

DMA error callback.

Parameters

- **hdma:** pointer to DMA handle.

Return values

- **None:**

ADC_ConfigureBoostMode

Function name

void ADC_ConfigureBoostMode (ADC_HandleTypeDef * hadc)

Function description

7.3 ADC Firmware driver defines

The following section lists the various define and macros of the module.

7.3.1 ADC

ADC

ADC Analog Watchdog filtering configuration

ADC_AWD_FILTERING_NONE

ADC analog watchdog no filtering, one out-of-window sample is needed to raise flag or interrupt

ADC_AWD_FILTERING_2SAMPLES

ADC analog watchdog 2 consecutives out-of-window samples are needed to raise flag or interrupt

ADC_AWD_FILTERING_3SAMPLES

ADC analog watchdog 3 consecutives out-of-window samples are needed to raise flag or interrupt

ADC_AWD_FILTERING_4SAMPLES

ADC analog watchdog 4 consecutives out-of-window samples are needed to raise flag or interrupt

ADC_AWD_FILTERING_5SAMPLES

ADC analog watchdog 5 consecutives out-of-window samples are needed to raise flag or interrupt

ADC_AWD_FILTERING_6SAMPLES

ADC analog watchdog 6 consecutives out-of-window samples are needed to raise flag or interrupt

ADC_AWD_FILTERING_7SAMPLES

ADC analog watchdog 7 consecutives out-of-window samples are needed to raise flag or interrupt

ADC_AWD_FILTERING_8SAMPLES

ADC analog watchdog 8 consecutives out-of-window samples are needed to raise flag or interrupt

ADC Analog Watchdog Mode

ADC_ANALOGWATCHDOG_NONE

No analog watchdog selected

ADC_ANALOGWATCHDOG_SINGLE_REG

Analog watchdog applied to a regular group single channel

ADC_ANALOGWATCHDOG_SINGLE_INJEC

Analog watchdog applied to an injected group single channel

ADC_ANALOGWATCHDOG_SINGLE_REGINJEC

Analog watchdog applied to a regular and injected groups single channel

ADC_ANALOGWATCHDOG_ALL_REG

Analog watchdog applied to regular group all channels

ADC_ANALOGWATCHDOG_ALL_INJEC

Analog watchdog applied to injected group all channels

ADC_ANALOGWATCHDOG_ALL_REGINJEC

Analog watchdog applied to regular and injected groups all channels

ADCx CFGR fields

ADC_CFGR_FIELDS

ADCx CFGR sub fields

ADC_CFGR_FIELDS_2

ADC Conversion Data Management

ADC_CONVERSIONDATA_DR

Regular Conversion data stored in DR register only

ADC_CONVERSIONDATA_MDF

MDF mode selected

ADC_CONVERSIONDATA_DMA_ONESHOT

DMA one shot mode selected

ADC_CONVERSIONDATA_DMA_CIRCULAR

DMA circular mode selected

ADC sequencer end of unitary conversion or sequence conversions

ADC_EOC_SINGLE_CONV

End of unitary conversion flag

ADC_EOC_SEQ_CONV

End of sequence conversions flag

ADC Error Code

HAL_ADC_ERROR_NONE

No error

HAL_ADC_ERROR_INTERNAL

ADC peripheral internal error (problem of clocking, enable/disable, erroneous state, ...)

HAL_ADC_ERROR_OVR

Overrun error

HAL_ADC_ERROR_DMA

DMA transfer error

HAL_ADC_ERROR_INVALID_CALLBACK

Invalid Callback error

ADC Event type

ADC_EOSMP_EVENT

ADC End of Sampling event

ADC_AWD1_EVENT

ADC Analog watchdog 1 event (main analog watchdog, present on all STM32 series)

ADC_AWD2_EVENT

ADC Analog watchdog 2 event (additional analog watchdog, not present on all STM32 series)

ADC_AWD3_EVENT

ADC Analog watchdog 3 event (additional analog watchdog, not present on all STM32 series)

ADC_OVR_EVENT

ADC overrun event

ADC Exported Constants

ADC_AWD_EVENT

ADC Analog watchdog 1 event: Naming for compatibility with other STM32 devices having only one analog watchdog

ADC flags definition

ADC_FLAG_RDY

ADC Ready flag

ADC_FLAG_EOSMP

ADC End of Sampling flag

ADC_FLAG_EOC

ADC End of Regular Conversion flag

ADC_FLAG_EOS

ADC End of Regular sequence of Conversions flag

ADC_FLAG_OVR

ADC overrun flag

ADC_FLAG_JEOC

ADC End of Injected Conversion flag

ADC_FLAG_JEOS

ADC End of Injected sequence of Conversions flag

ADC_FLAG_AWD1

ADC Analog watchdog 1 flag (main analog watchdog)

ADC_FLAG_AWD2

ADC Analog watchdog 2 flag (additional analog watchdog)

ADC_FLAG_AWD3

ADC Analog watchdog 3 flag (additional analog watchdog)

ADC_FLAG_EOCAL

ADC End of Calibration flag

ADC_FLAG_LDORDY

ADC Voltage Regulator (LDO) Ready flag

Analog watchdog - Analog watchdog number

ADC_ANALOGWATCHDOG_1

ADC analog watchdog number 1

ADC_ANALOGWATCHDOG_2

ADC analog watchdog number 2

ADC_ANALOGWATCHDOG_3

ADC analog watchdog number 3

ADC instance - Channel number

ADC_CHANNEL_0

ADC external channel (channel connected to GPIO pin) ADCx_IN0

ADC_CHANNEL_1

ADC external channel (channel connected to GPIO pin) ADCx_IN1

ADC_CHANNEL_2

ADC external channel (channel connected to GPIO pin) ADCx_IN2

ADC_CHANNEL_3

ADC external channel (channel connected to GPIO pin) ADCx_IN3

ADC_CHANNEL_4

ADC external channel (channel connected to GPIO pin) ADCx_IN4

ADC_CHANNEL_5

ADC external channel (channel connected to GPIO pin) ADCx_IN5

ADC_CHANNEL_6

ADC external channel (channel connected to GPIO pin) ADCx_IN6

ADC_CHANNEL_7

ADC external channel (channel connected to GPIO pin) ADCx_IN7

ADC_CHANNEL_8

ADC external channel (channel connected to GPIO pin) ADCx_IN8

ADC_CHANNEL_9

ADC external channel (channel connected to GPIO pin) ADCx_IN9

ADC_CHANNEL_10

ADC external channel (channel connected to GPIO pin) ADCx_IN10

ADC_CHANNEL_11

ADC external channel (channel connected to GPIO pin) ADCx_IN11

ADC_CHANNEL_12

ADC external channel (channel connected to GPIO pin) ADCx_IN12

ADC_CHANNEL_13

ADC external channel (channel connected to GPIO pin) ADCx_IN13

ADC_CHANNEL_14

ADC external channel (channel connected to GPIO pin) ADCx_IN14

ADC_CHANNEL_15

ADC external channel (channel connected to GPIO pin) ADCx_IN15

ADC_CHANNEL_16

ADC external channel (channel connected to GPIO pin) ADCx_IN16

ADC_CHANNEL_17

ADC external channel (channel connected to GPIO pin) ADCx_IN17

ADC_CHANNEL_18

ADC external channel (channel connected to GPIO pin) ADCx_IN18

ADC_CHANNEL_19

ADC external channel (channel connected to GPIO pin) ADCx_IN19

ADC_CHANNEL_20

ADC external channel (channel connected to GPIO pin) ADCx_IN20

ADC_CHANNEL_21

ADC external channel (channel connected to GPIO pin) ADCx_IN21

ADC_CHANNEL_22

ADC external channel (channel connected to GPIO pin) ADCx_IN22

ADC_CHANNEL_23

ADC external channel (channel connected to GPIO pin) ADCx_IN23

ADC_CHANNEL_VREFINT

ADC internal channel connected to VrefInt: Internal voltage reference.

ADC_CHANNEL_TEMPSENSOR

ADC internal channel connected to Temperature sensor.

ADC_CHANNEL_VBAT

ADC internal channel connected to Vbat/4: Vbat voltage through a divider ladder of factor 1/4 to have Vbat always below Vdda.

ADC_CHANNEL_DAC1CH1_ADC4

ADC internal channel connected to DAC1 channel 1, channel specific to ADC4

ADC_CHANNEL_DAC1CH2_ADC4

ADC internal channel connected to DAC1 channel 2, channel specific to ADC4

ADC4_CHANNEL_TEMPSENSOR

ADC internal channel connected to Temperature sensor, channel specific to ADC4.

ADC4_CHANNEL_VBAT

ADC internal channel connected to Vbat/4: Vbat voltage through a divider ladder of factor 1/4 to have Vbat always below Vdda, channel specific to ADC4.

ADC_CHANNEL_VCORE

ADC internal channel connected to Vcore, channel specific to ADC4.

Channel - Sampling time

ADC_SAMPLETIME_5CYCLES

Sampling time 5 ADC clock cycles

ADC_SAMPLETIME_6CYCLES

Sampling time 6 ADC clock cycles

ADC_SAMPLETIME_12CYCLES

Sampling time 12 ADC clock cycles

ADC_SAMPLETIME_20CYCLES

Sampling time 20 ADC clock cycles

ADC_SAMPLETIME_36CYCLES

Sampling time 36 ADC clock cycles

ADC_SAMPLETIME_68CYCLES

Sampling time 68 ADC clock cycles

ADC_SAMPLETIME_391CYCLES

Sampling time 391 ADC clock cycles

ADC_SAMPLETIME_814CYCLES

Sampling time 814 ADC clock cycles

ADC4_SAMPLETIME_1CYCLE_5

Sampling time 1.5 ADC clock cycle

ADC4_SAMPLETIME_3CYCLES_5

Sampling time 3.5 ADC clock cycles

ADC4_SAMPLETIME_7CYCLES_5

Sampling time 7.5 ADC clock cycles

ADC4_SAMPLETIME_12CYCLES_5

Sampling time 12.5 ADC clock cycles

ADC4_SAMPLETIME_19CYCLES_5

Sampling time 19.5 ADC clock cycles

ADC4_SAMPLETIME_39CYCLES_5

Sampling time 39.5 ADC clock cycles

ADC4_SAMPLETIME_79CYCLES_5

Sampling time 79.5 ADC clock cycles

ADC4_SAMPLETIME_814CYCLES_5

Sampling time 814.5 ADC clock cycles

Channel - Single or differential ending

ADC_SINGLE_ENDED

ADC channel ending set to single ended (literal also used to set calibration mode)

ADC_DIFFERENTIAL_ENDED

ADC channel ending set to differential (literal also used to set calibration mode)

ADC common - Clock source

ADC_CLOCK_ASYNC_DIV1

ADC asynchronous clock without prescaler

ADC_CLOCK_ASYNC_DIV2

ADC asynchronous clock with prescaler division by 2

ADC_CLOCK_ASYNC_DIV4

ADC asynchronous clock with prescaler division by 4

ADC_CLOCK_ASYNC_DIV6

ADC asynchronous clock with prescaler division by 6

ADC_CLOCK_ASYNC_DIV8

ADC asynchronous clock with prescaler division by 8

ADC_CLOCK_ASYNC_DIV10

ADC asynchronous clock with prescaler division by 10

ADC_CLOCK_ASYNC_DIV12

ADC asynchronous clock with prescaler division by 12

ADC_CLOCK_ASYNC_DIV16

ADC asynchronous clock with prescaler division by 16

ADC_CLOCK_ASYNC_DIV32

ADC asynchronous clock with prescaler division by 32

ADC_CLOCK_ASYNC_DIV64

ADC asynchronous clock with prescaler division by 64

ADC_CLOCK_ASYNC_DIV128

ADC asynchronous clock with prescaler division by 128

ADC_CLOCK_ASYNC_DIV256

ADC asynchronous clock with prescaler division by 256

ADC conversion data alignment

ADC_DATAALIGN_RIGHT

ADC conversion data alignment: right aligned (alignment on data register LSB bit 0)

ADC_DATAALIGN_LEFT

ADC conversion data alignment: left aligned (alignment on data register MSB bit 15)

ADC instance - Groups

ADC_REGULAR_GROUP

ADC group regular (available on all STM32 devices)

ADC_INJECTED_GROUP

ADC group injected (not available on all STM32 devices)

ADC_REGULAR_INJECTED_GROUP

ADC both groups regular and injected

Multimode - DMA transfer mode depending on ADC resolution

ADC_DMAACCESSMODE_DISABLED

DMA multimode disabled: each ADC uses its own DMA channel

ADC_DMAACCESSMODE_12_10_BITS

DMA multimode enabled (one DMA channel for both ADC, DMA of ADC master) for 12 and 10 bits resolution

ADC_DMAACCESSMODE_8_6_BITS

DMA multimode enabled (one DMA channel for both ADC, DMA of ADC master) for 8 and 6 bits resolution

Multimode - Mode

ADC_MODE_INDEPENDENT

ADC dual mode disabled (ADC independent mode)

ADC_DUALMODE_REGSIMULT

ADC dual mode enabled: group regular simultaneous

ADC_DUALMODE_INTERL

ADC dual mode enabled: Combined group regular interleaved

ADC_DUALMODE_INJECSIMULT

ADC dual mode enabled: group injected simultaneous

ADC_DUALMODE_ALTERTRIG

ADC dual mode enabled: group injected alternate trigger. Works only with external triggers (not internal SW start)

ADC_DUALMODE_REGSIMULT_INJECSIMULT

ADC dual mode enabled: Combined group regular simultaneous + group injected simultaneous

ADC_DUALMODE_REGSIMULT_ALTERTRIG

ADC dual mode enabled: Combined group regular simultaneous + group injected alternate trigger

ADC_DUALMODE_REGINTERL_INJECSIMULT

ADC dual mode enabled: Combined group regular interleaved + group injected simultaneous

Multimode - Delay between two sampling phases

ADC_TWOSAMPLINGDELAY_1CYCLE

ADC multimode delay between two sampling phases: 1 ADC clock cycle

ADC_TWOSAMPLINGDELAY_2CYCLES

ADC multimode delay between two sampling phases: 2 ADC clock cycles

ADC_TWOSAMPLINGDELAY_3CYCLES

ADC multimode delay between two sampling phases: 3 ADC clock cycles

ADC_TWOSAMPLINGDELAY_4CYCLES

ADC multimode delay between two sampling phases: 4 ADC clock cycles

ADC_TWOSAMPLINGDELAY_5CYCLES

ADC multimode delay between two sampling phases: 5 ADC clock cycles

ADC_TWOSAMPLINGDELAY_6CYCLES

ADC multimode delay between two sampling phases: 6 ADC clock cycles

ADC_TWOSAMPLINGDELAY_7CYCLES

ADC multimode delay between two sampling phases: 7 ADC clock cycles

ADC_TWOSAMPLINGDELAY_8CYCLES

ADC multimode delay between two sampling phases: 8 ADC clock cycles

ADC_TWOSAMPLINGDELAY_9CYCLES

ADC multimode delay between two sampling phases: 9 ADC clock cycles

ADC_TWOSAMPLINGDELAY_10CYCLES

ADC multimode delay between two sampling phases: 10 ADC clock cycles

ADC_TWOSAMPLINGDELAY_11CYCLES

ADC multimode delay between two sampling phases: 11 ADC clock cycles

ADC_TWOSAMPLINGDELAY_12CYCLES

ADC multimode delay between two sampling phases: 12 ADC clock cycles

ADC_TWOSAMPLINGDELAY_13CYCLES

ADC multimode delay between two sampling phases: 13 ADC clock cycles

ADC_TWOSAMPLINGDELAY_14CYCLES

ADC multimode delay between two sampling phases: 14 ADC clock cycles

ADC_TWOSAMPLINGDELAY_15CYCLES

ADC multimode delay between two sampling phases: 15 ADC clock cycles

ADC_TWOSAMPLINGDELAY_16CYCLES

ADC multimode delay between two sampling phases: 16 ADC clock cycles

ADC instance - Offset number

ADC_OFFSET_NONE

ADC offset disabled: no offset correction for the selected ADC channel

ADC_OFFSET_1

ADC offset number 1: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

ADC_OFFSET_2

ADC offset number 2: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

ADC_OFFSET_3

ADC offset number 3: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

ADC_OFFSET_4

ADC offset number 4: ADC channel and offset level to which the offset programmed will be applied (independently of channel mapped on ADC group regular or group injected)

Oversampling - Discontinuous mode

ADC_TRIGGEREDMODE_SINGLE_TRIGGER

ADC oversampling discontinuous mode: continuous mode (all conversions of oversampling ratio are done from 1 trigger)

ADC_TRIGGEREDMODE_MULTI_TRIGGER

ADC oversampling discontinuous mode: discontinuous mode (each conversion of oversampling ratio needs a trigger)

Oversampling - Ratio

ADC_OVERSAMPLING_RATIO_2

ADC oversampling ratio of 2 (2 ADC conversions are performed, sum of these conversions data is computed to result as the ADC oversampling conversion data (before potential shift)

ADC_OVERSAMPLING_RATIO_4

ADC oversampling ratio of 4 (4 ADC conversions are performed, sum of these conversions data is computed to result as the ADC oversampling conversion data (before potential shift)

ADC_OVERSAMPLING_RATIO_8

ADC oversampling ratio of 8 (8 ADC conversions are performed, sum of these conversions data is computed to result as the ADC oversampling conversion data (before potential shift)

ADC_OVERSAMPLING_RATIO_16

ADC oversampling ratio of 16 (16 ADC conversions are performed, sum of these conversions data is computed to result as the ADC oversampling conversion data (before potential shift)

ADC_OVERSAMPLING_RATIO_32

ADC oversampling ratio of 32 (32 ADC conversions are performed, sum of these conversions data is computed to result as the ADC oversampling conversion data (before potential shift)

ADC_OVERSAMPLING_RATIO_64

ADC oversampling ratio of 64 (64 ADC conversions are performed, sum of these conversions data is computed to result as the ADC oversampling conversion data (before potential shift)

ADC_OVERSAMPLING_RATIO_128

ADC oversampling ratio of 128 (128 ADC conversions are performed, sum of these conversions data is computed to result as the ADC oversampling conversion data (before potential shift)

ADC_OVERSAMPLING_RATIO_256

ADC oversampling ratio of 256 (256 ADC conversions are performed, sum of these conversions data is computed to result as the ADC oversampling conversion data (before potential shift)

Oversampling - Oversampling scope for ADC group regular

ADC_REGOVERSAMPLING_CONTINUED_MODE

Oversampling buffer maintained during injection sequence

ADC_REGOVERSAMPLING_RESUMED_MODE

Oversampling buffer zeroed during injection sequence

Oversampling - Data shift

ADC_RIGHTBITSHIFT_NONE

ADC oversampling no shift (sum of the ADC conversions data is not divided to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_1

ADC oversampling shift of 1 (sum of the ADC conversions data is divided by 2 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_2

ADC oversampling shift of 2 (sum of the ADC conversions data is divided by 4 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_3

ADC oversampling shift of 3 (sum of the ADC conversions data is divided by 8 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_4

ADC oversampling shift of 4 (sum of the ADC conversions data is divided by 16 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_5

ADC oversampling shift of 5 (sum of the ADC conversions data is divided by 32 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_6

ADC oversampling shift of 6 (sum of the ADC conversions data is divided by 64 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_7

ADC oversampling shift of 7 (sum of the ADC conversions data is divided by 128 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_8

ADC oversampling shift of 8 (sum of the ADC conversions data is divided by 256 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_9

ADC oversampling shift of 9 (sum of the ADC conversions data is divided by 512 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_10

ADC oversampling shift of 10 (sum of the ADC conversions data is divided by 1024 to result as the ADC oversampling conversion data)

ADC_RIGHTBITSHIFT_11

ADC oversampling shift of 11 (sum of the ADC conversions data is divided by 2048 to result as the ADC oversampling conversion data)

ADC group regular - Overrun behavior on conversion data

ADC_OVR_DATA_PRESERVED

ADC group regular behavior in case of overrun: data preserved

ADC_OVR_DATA_OVERWRITTEN

ADC group regular behavior in case of overrun: data overwritten

ADC group regular - Sequencer ranks

ADC_REGULAR_RANK_1

ADC group regular sequencer rank 1

ADC_REGULAR_RANK_2

ADC group regular sequencer rank 2

ADC_REGULAR_RANK_3

ADC group regular sequencer rank 3

ADC_REGULAR_RANK_4

ADC group regular sequencer rank 4

ADC_REGULAR_RANK_5

ADC group regular sequencer rank 5

ADC_REGULAR_RANK_6

ADC group regular sequencer rank 6

ADC_REGULAR_RANK_7

ADC group regular sequencer rank 7

ADC_REGULAR_RANK_8

ADC group regular sequencer rank 8

ADC_REGULAR_RANK_9

ADC group regular sequencer rank 9

ADC_REGULAR_RANK_10

ADC group regular sequencer rank 10

ADC_REGULAR_RANK_11

ADC group regular sequencer rank 11

ADC_REGULAR_RANK_12

ADC group regular sequencer rank 12

ADC_REGULAR_RANK_13

ADC group regular sequencer rank 13

ADC_REGULAR_RANK_14

ADC group regular sequencer rank 14

ADC_REGULAR_RANK_15

ADC group regular sequencer rank 15

ADC_REGULAR_RANK_16

ADC group regular sequencer rank 16

ADC4_RANK_CHANNEL_NUMBER

Setting relevant if parameter "ScanConvMode" is set to sequencer not fully configurable: Enable the rank of the selected channels. Number of ranks in the sequence is defined by number of channels enabled, rank of each channel is defined by channel number (channel 0 fixed on rank 0, channel 1 fixed on rank1, ...)

ADC4_RANK_NONE

Setting relevant if parameter "ScanConvMode" is set to sequencer not fully configurable: Disable the selected rank (selected channel) from sequencer

ADC4_REGULAR_RANK_1

ADC group regular sequencer rank 1

ADC4_REGULAR_RANK_2

ADC group regular sequencer rank 2

ADC4_REGULAR_RANK_3

ADC group regular sequencer rank 3

ADC4_REGULAR_RANK_4

ADC group regular sequencer rank 4

ADC4_REGULAR_RANK_5

ADC group regular sequencer rank 5

ADC4_REGULAR_RANK_6

ADC group regular sequencer rank 6

ADC4_REGULAR_RANK_7

ADC group regular sequencer rank 7

ADC4_REGULAR_RANK_8

ADC group regular sequencer rank 8

ADC group regular - Trigger frequency mode

ADC_TRIGGER_FREQ_HIGH

ADC trigger frequency mode set to high frequency. Note: ADC trigger frequency mode must be set to low frequency when a duration is exceeded before ADC conversion start trigger event (between ADC enable and ADC conversion start trigger event or between two ADC conversion start trigger event). Duration value: Refer to device datasheet, parameter "tIdle".

ADC_TRIGGER_FREQ_LOW

ADC trigger frequency mode set to low frequency. Note: ADC trigger frequency mode must be set to low frequency when a duration is exceeded before ADC conversion start trigger event (between ADC enable and ADC conversion start trigger event or between two ADC conversion start trigger event). Duration value: Refer to device datasheet, parameter "tIdle".

ADC instance - Resolution

ADC_RESOLUTION_14B

ADC resolution 14 bits (ADC1, ADC2 only)

ADC_RESOLUTION_12B

ADC resolution 12 bits

ADC_RESOLUTION_10B

ADC resolution 10 bits

ADC_RESOLUTION_8B

ADC resolution 8 bits

ADC_RESOLUTION_6B

ADC resolution 6 bits (ADC4 only)

ADC4_RESOLUTION_12B

ADC4_RESOLUTION_10B

ADC4_RESOLUTION_8B

ADC4_RESOLUTION_6B

ADC instance - Sampling time common to a group of channels

ADC4_SAMPLINGTIME_COMMON_1

Set sampling time common to a group of channels: sampling time nb 1

ADC4_SAMPLINGTIME_COMMON_2

Set sampling time common to a group of channels: sampling time nb 2

HAL ADC macro to manage HAL ADC handle, IT and flags.

__HAL_ADC_RESET_HANDLE_STATE

Description:

- Reset ADC handle state.

Parameters:

- __HANDLE__: ADC handle

Return value:

- None

__HAL_ADC_ENABLE_IT

Description:

- Enable ADC interrupt.

Parameters:

- __HANDLE__: ADC handle
- __INTERRUPT__: ADC Interrupt This parameter can be one of the following values:
  - ADC_IT_RDY ADC Ready interrupt source
  - ADC_IT_EOSMP ADC End of Sampling interrupt source
  - ADC_IT_EOC ADC End of Regular Conversion interrupt source
  - ADC_IT_EOS ADC End of Regular sequence of Conversions interrupt source
  - ADC_IT_OVR ADC overrun interrupt source
  - ADC_IT_JEOC ADC End of Injected Conversion interrupt source
  - ADC_IT_JEOS ADC End of Injected sequence of Conversions interrupt source
  - ADC_IT_AWD1 ADC Analog watchdog 1 interrupt source (main analog watchdog)
  - ADC_IT_AWD2 ADC Analog watchdog 2 interrupt source (additional analog watchdog)
  - ADC_IT_AWD3 ADC Analog watchdog 3 interrupt source (additional analog watchdog)
  - ADC_IT_EOCAL ADC End of Calibration interrupt source
  - ADC_IT_LDORDY ADC Voltage Regulator (LDO) Ready interrupt source

Return value:

- None

__HAL_ADC_DISABLE_IT

Description:

- Disable ADC interrupt.

Parameters:

- __HANDLE__: ADC handle
- __INTERRUPT__: ADC Interrupt This parameter can be one of the following values:
  – ADC_IT_RDY ADC Ready interrupt source
  – ADC_IT_EOSMP ADC End of Sampling interrupt source
  – ADC_IT_EOC ADC End of Regular Conversion interrupt source
  – ADC_IT_EOS ADC End of Regular sequence of Conversions interrupt source
  – ADC_IT_OVR ADC overrun interrupt source
  – ADC_IT_JEOC ADC End of Injected Conversion interrupt source
  – ADC_IT_JEOS ADC End of Injected sequence of Conversions interrupt source
  – ADC_IT_AWD1 ADC Analog watchdog 1 interrupt source (main analog watchdog)
  – ADC_IT_AWD2 ADC Analog watchdog 2 interrupt source (additional analog watchdog)
  – ADC_IT_AWD3 ADC Analog watchdog 3 interrupt source (additional analog watchdog)
  – ADC_IT_EOCAL ADC End of Calibration interrupt source
  – ADC_IT_LDORDY ADC Voltage Regulator (LDO) Ready interrupt source

Return value:

- None

__HAL_ADC_GET_IT_SOURCE

Description:

- Checks if the specified ADC interrupt source is enabled or disabled.

Parameters:

- __HANDLE__: ADC handle
- __INTERRUPT__: ADC interrupt source to check This parameter can be one of the following values:
  – ADC_IT_RDY ADC Ready interrupt source
  – ADC_IT_EOSMP ADC End of Sampling interrupt source
  – ADC_IT_EOC ADC End of Regular Conversion interrupt source
  – ADC_IT_EOS ADC End of Regular sequence of Conversions interrupt source
  – ADC_IT_OVR ADC overrun interrupt source
  – ADC_IT_JEOC ADC End of Injected Conversion interrupt source
  – ADC_IT_JEOS ADC End of Injected sequence of Conversions interrupt source
  – ADC_IT_AWD1 ADC Analog watchdog 1 interrupt source (main analog watchdog)
  – ADC_IT_AWD2 ADC Analog watchdog 2 interrupt source (additional analog watchdog)
  – ADC_IT_AWD3 ADC Analog watchdog 3 interrupt source (additional analog watchdog)
  – ADC_IT_EOCAL ADC End of Calibration interrupt source
  – ADC_IT_LDORDY ADC Voltage Regulator (LDO) Ready interrupt source

Return value:

- State: of interruption (SET or RESET)

__HAL_ADC_GET_FLAG

Description:

- Check whether the specified ADC flag is set or not.

Parameters:

- __HANDLE__: ADC handle
- __FLAG__: ADC flag This parameter can be one of the following values:
  - ADC_FLAG_RDY ADC Ready flag
  - ADC_FLAG_EOSMP ADC End of Sampling flag
  - ADC_FLAG_EOC ADC End of Regular Conversion flag
  - ADC_FLAG_EOS ADC End of Regular sequence of Conversions flag
  - ADC_FLAG_OVR ADC overrun flag
  - ADC_FLAG_JEOC ADC End of Injected Conversion flag
  - ADC_FLAG_JEOS ADC End of Injected sequence of Conversions flag
  - ADC_FLAG_AWD1 ADC Analog watchdog 1 flag (main analog watchdog)
  - ADC_FLAG_AWD2 ADC Analog watchdog 2 flag (additional analog watchdog)
  - ADC_FLAG_AWD3 ADC Analog watchdog 3 flag (additional analog watchdog)
  - ADC_FLAG_EOCAL ADC End of Calibration flag
  - ADC_FLAG_LDORDY ADC Voltage Regulator (LDO) Ready flag

Return value:

- State: of flag (TRUE or FALSE).

__HAL_ADC_CLEAR_FLAG

Description:

- Clear the specified ADC flag.

Parameters:

- __HANDLE__: ADC handle
- __FLAG__: ADC flag This parameter can be one of the following values:
  - ADC_FLAG_RDY ADC Ready flag
  - ADC_FLAG_EOSMP ADC End of Sampling flag
  - ADC_FLAG_EOC ADC End of Regular Conversion flag
  - ADC_FLAG_EOS ADC End of Regular sequence of Conversions flag
  - ADC_FLAG_OVR ADC overrun flag
  - ADC_FLAG_JEOC ADC End of Injected Conversion flag
  - ADC_FLAG_JEOS ADC End of Injected sequence of Conversions flag
  - ADC_FLAG_AWD1 ADC Analog watchdog 1 flag (main analog watchdog)
  - ADC_FLAG_AWD2 ADC Analog watchdog 2 flag (additional analog watchdog)
  - ADC_FLAG_AWD3 ADC Analog watchdog 3 flag (additional analog watchdog)
  - ADC_FLAG_EOCAL ADC End of Calibration flag
  - ADC_FLAG_LDORDY ADC Voltage Regulator (LDO) Ready flag

Return value:

- None

HAL ADC helper macro

__HAL_ADC_CHANNEL_TO_DECIMAL_NB

Description:

- Helper macro to get ADC channel number in decimal format from literals ADC_CHANNEL_x.

Parameters:

- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_0 (3)
  - ADC_CHANNEL_1 (3)
  - ADC_CHANNEL_2 (3)
  - ADC_CHANNEL_3 (3)
  - ADC_CHANNEL_4 (3)
  - ADC_CHANNEL_5 (3)
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_VREFINT (1)
  - ADC_CHANNEL_TEMPSENSOR (1)
  - ADC_CHANNEL_VBAT (1)
  - ADC_CHANNEL_DAC1CH1_ADC4 (2)
  - ADC_CHANNEL_DAC1CH2_ADC4 (2)

Return value:

- Value: between Min_Data=0 and Max_Data=18

Notes:

- Example: __HAL_ADC_CHANNEL_TO_DECIMAL_NB(ADC_CHANNEL_4) will return decimal number "4". The input can be a value from functions where a channel number is returned, either defined with number or with bitfield (only one bit must be set).

__HAL_ADC_DECIMAL_NB_TO_CHANNEL

Description:

- Helper macro to get ADC channel in literal format ADC_CHANNEL_x from number in decimal format.

Parameters:

- __DECIMAL_NB__: Value between Min_Data=0 and Max_Data=18

Return value:

- Returned: value can be one of the following values:
  – ADC_CHANNEL_0 (3)
  – ADC_CHANNEL_1 (3)
  – ADC_CHANNEL_2 (3)
  – ADC_CHANNEL_3 (3)
  – ADC_CHANNEL_4 (3)
  – ADC_CHANNEL_5 (3)
  – ADC_CHANNEL_6
  – ADC_CHANNEL_7
  – ADC_CHANNEL_8
  – ADC_CHANNEL_9
  – ADC_CHANNEL_10
  – ADC_CHANNEL_11
  – ADC_CHANNEL_12
  – ADC_CHANNEL_13
  – ADC_CHANNEL_14
  – ADC_CHANNEL_15
  – ADC_CHANNEL_16
  – ADC_CHANNEL_17
  – ADC_CHANNEL_18
  – ADC_CHANNEL_VREFINT (1)
  – ADC_CHANNEL_TEMPSENSOR (1)
  – ADC_CHANNEL_VBAT (1)
  – ADC_CHANNEL_DAC1CH1_ADC4 (2)
  – ADC_CHANNEL_DAC1CH2_ADC4 (2)
  – ADC4_CHANNEL_TEMPSENSOR (2)
  – ADC4_CHANNEL_VBAT (2)
  – ADC_CHANNEL_VCORE (2)

Notes:

- Example: __HAL_ADC_DECIMAL_NB_TO_CHANNEL(4) will return a data equivalent to "ADC_CHANNEL_4".

__HAL_ADC_IS_CHANNEL_INTERNAL

Description:

- Helper macro to determine whether the selected channel corresponds to literal definitions of driver.

Parameters:

- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_0 (3)
  - ADC_CHANNEL_1 (3)
  - ADC_CHANNEL_2 (3)
  - ADC_CHANNEL_3 (3)
  - ADC_CHANNEL_4 (3)
  - ADC_CHANNEL_5 (3)
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_VREFINT (1)
  - ADC_CHANNEL_TEMPSENSOR (1)
  - ADC_CHANNEL_VBAT (1)
  - ADC_CHANNEL_DAC1CH1_ADC4 (2)
  - ADC_CHANNEL_DAC1CH2_ADC4 (2)
  - ADC4_CHANNEL_TEMPSENSOR (2)
  - ADC4_CHANNEL_VBAT (2)
  - ADC_CHANNEL_VCORE (2)

Return value:

- Value: "0" if the channel corresponds to a parameter definition of a ADC external channel (channel connected to a GPIO pin). Value "1" if the channel corresponds to a parameter definition of a ADC internal channel.

Notes:

- The different literal definitions of ADC channels are: ADC internal channel: ADC_CHANNEL_VREFINT, ADC_CHANNEL_TEMPSENSOR, ...ADC external channel (channel connected to a GPIO pin): ADC_CHANNEL_1, ADC_CHANNEL_2, ... The channel parameter must be a value defined from literal definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ADC_CHANNEL_TEMPSENSOR, ...), ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...), must not be a value from functions where a channel number is returned from ADC registers, because internal and external channels share the same channel number in ADC registers. The differentiation is made only with parameters definitions of driver.

__HAL_ADC_CHANNEL_INTERNAL_TO_EXTERNAL

Description:

- Helper macro to convert a channel defined from parameter definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ADC_CHANNEL_TEMPSENSOR, ...), to its equivalent parameter definition of a ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...).

Parameters:

- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_0 (3)
  - ADC_CHANNEL_1 (3)
  - ADC_CHANNEL_2 (3)
  - ADC_CHANNEL_3 (3)
  - ADC_CHANNEL_4 (3)
  - ADC_CHANNEL_5 (3)
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18
  - ADC_CHANNEL_VREFINT (1)
  - ADC_CHANNEL_TEMPSENSOR (1)
  - ADC_CHANNEL_VBAT (1)
  - ADC_CHANNEL_DAC1CH1_ADC4 (2)
  - ADC_CHANNEL_DAC1CH2_ADC4 (2)
  - ADC4_CHANNEL_TEMPSENSOR (2)
  - ADC4_CHANNEL_VBAT (2)
  - ADC_CHANNEL_VCORE (2)

Return value:

- Returned: value can be one of the following values:
  - ADC_CHANNEL_0
  - ADC_CHANNEL_1
  - ADC_CHANNEL_2
  - ADC_CHANNEL_3
  - ADC_CHANNEL_4
  - ADC_CHANNEL_5
  - ADC_CHANNEL_6
  - ADC_CHANNEL_7
  - ADC_CHANNEL_8
  - ADC_CHANNEL_9
  - ADC_CHANNEL_10
  - ADC_CHANNEL_11
  - ADC_CHANNEL_12
  - ADC_CHANNEL_13
  - ADC_CHANNEL_14
  - ADC_CHANNEL_15
  - ADC_CHANNEL_16
  - ADC_CHANNEL_17
  - ADC_CHANNEL_18

Notes:

- The channel parameter can be, additionally to a value defined from parameter definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ADC_CHANNEL_TEMPSENSOR, ...), a value defined from parameter definition of ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...) or a value from functions where a channel number is returned from ADC registers.

__HAL_ADC_IS_CHANNEL_INTERNAL_AVAILABLE

Description:

- Helper macro to determine whether the internal channel selected is available on the ADC instance selected.

Parameters:

- __ADC_INSTANCE__: ADC instance
- __CHANNEL__: This parameter can be one of the following values:
  - ADC_CHANNEL_VREFINT (1)
  - ADC_CHANNEL_TEMPSENSOR (1)
  - ADC_CHANNEL_VBAT (1)
  - ADC_CHANNEL_DAC1CH1_ADC4 (2)
  - ADC_CHANNEL_DAC1CH2_ADC4 (2)
  - ADC4_CHANNEL_TEMPSENSOR (2)
  - ADC4_CHANNEL_VBAT (2)
  - ADC_CHANNEL_VCORE (2)

Return value:

- Value: "0" if the internal channel selected is not available on the ADC instance selected. Value "1" if the internal channel selected is available on the ADC instance selected.

Notes:

- The channel parameter must be a value defined from parameter definition of a ADC internal channel (ADC_CHANNEL_VREFINT, ADC_CHANNEL_TEMPSENSOR, ...), must not be a value defined from parameter definition of ADC external channel (ADC_CHANNEL_1, ADC_CHANNEL_2, ...) or a value from functions where a channel number is returned from ADC registers, because internal and external channels share the same channel number in ADC registers. The differentiation is made only with parameters definitions of driver.

__HAL_ADC_MULTI_CONV_DATA_MASTER_SLAVE

Description:

- Helper macro to get the ADC multimode conversion data of ADC master or ADC slave from raw value with both ADC conversion data concatenated.

Parameters:

- __ADC_MULTI_MASTER_SLAVE__: This parameter can be one of the following values:
  – LL_ADC_MULTI_MASTER
  – LL_ADC_MULTI_SLAVE
- __ADC_MULTI_CONV_DATA__: Value between Min_Data=0x000 and Max_Data=0xFFF

Return value:

- Value: between Min_Data=0x000 and Max_Data=0xFFF

Notes:

- This macro is intended to be used when multimode transfer by DMA is enabled: refer to function LL_ADC_SetMultiDMATransfer(). In this case the transferred data need to processed with this macro to separate the conversion data of ADC master and ADC slave.

__HAL_ADC_COMMON_INSTANCE

Description:

- Helper macro to select the ADC common instance to which is belonging the selected ADC instance.

Parameters:

- __ADCx__: ADC instance

Return value:

- ADC: common register instance

Notes:

- ADC common register instance can be used for: Set parameters common to several ADC instancesMultimode (for devices with several ADC instances) Refer to functions having argument "ADCxy_COMMON" as parameter.

__HAL_ADC_IS_ENABLED_ALL_COMMON_INSTANCE

Description:

- Helper macro to check if all ADC instances sharing the same ADC common instance are disabled.

Parameters:

- __ADCXY_COMMON__: ADC common instance (can be set directly from CMSIS definition or by using helper macro

Return value:

- Value: "0" if all ADC instances sharing the same ADC common instance are disabled. Value "1" if at least one ADC instance sharing the same ADC common instance is enabled.

Notes:

- This check is required by functions with setting conditioned to ADC state: All ADC instances of the ADC common group must be disabled. Refer to functions having argument "ADCxy_COMMON" as parameter. On devices with only 1 ADC common instance, parameter of this macro is useless and can be ignored (parameter kept for compatibility with devices featuring several ADC common instances).

__HAL_ADC_DIGITAL_SCALE

Description:

- Helper macro to define the ADC conversion data full-scale digital value corresponding to the selected ADC resolution.

Parameters:

- __ADC_RESOLUTION__: This parameter can be one of the following values:
  - ADC_RESOLUTION_14B
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B
  - ADC_RESOLUTION_6B

Return value:

- ADC: conversion data full-scale digital value

Notes:

- ADC conversion data full-scale corresponds to voltage range determined by analog voltage references Vref+ and Vref- (refer to reference manual).

__HAL_ADC_CONVERT_DATA_RESOLUTION

Description:

- Helper macro to convert the ADC conversion data from a resolution to another resolution.

Parameters:

- __ADCx__: ADC instance
- __DATA__: ADC conversion data to be converted
- __ADC_RESOLUTION_CURRENT__: Resolution of to the data to be converted This parameter can be one of the following values:
  - ADC_RESOLUTION_14B (1)
  - ADC_RESOLUTION_12B (1)(2)
  - ADC_RESOLUTION_10B (1)(2)
  - ADC_RESOLUTION_8B (1)(2)
  - ADC_RESOLUTION_6B (2)
- __ADC_RESOLUTION_TARGET__: Resolution of the data after conversion This parameter can be one of the following values:
  - ADC_RESOLUTION_14B (1)
  - ADC_RESOLUTION_12B (1)(2)
  - ADC_RESOLUTION_10B (1)(2)
  - ADC_RESOLUTION_8B (1)(2)
  - ADC_RESOLUTION_6B (2)

Return value:

- ADC: conversion data to the requested resolution

__HAL_ADC_CALC_DATA_TO_VOLTAGE

Description:

- Helper macro to calculate the voltage (unit: mVolt) corresponding to a ADC conversion data (unit: digital value).

Parameters:

- __ADCx__: ADC instance
- __VREFANALOG_VOLTAGE__: Analog reference voltage (unit: mV)
- __ADC_DATA__: ADC conversion data (resolution 12 bits) (unit: digital value).
- __ADC_RESOLUTION__: This parameter can be one of the following values:
  - ADC_RESOLUTION_14B (1)
  - ADC_RESOLUTION_12B (1)(2)
  - ADC_RESOLUTION_10B (1)(2)
  - ADC_RESOLUTION_8B (1)(2)
  - ADC_RESOLUTION_6B (2)

Return value:

- ADC: conversion data equivalent voltage value (unit: mVolt)

Notes:

- Analog reference voltage (Vref+) must be either known from user board environment or can be calculated using ADC measurement and ADC helper macro __LL_ADC_CALC_VREFANALOG_VOLTAGE().

__HAL_ADC_CALC_DIFF_DATA_TO_VOLTAGE

Description:

- Helper macro to calculate the voltage (unit: mVolt) corresponding to a ADC conversion data (unit: digital value) in differential ended mode.

Parameters:

- __ADCx__: ADC instance
- __VREFANALOG_VOLTAGE__: Analog reference voltage (unit: mV)
- __ADC_DATA__: ADC conversion data (resolution 12 bits) (unit: digital value).
- __ADC_RESOLUTION__: This parameter can be one of the following values:
  - ADC_RESOLUTION_14B
  - ADC_RESOLUTION_12B
  - ADC_RESOLUTION_10B
  - ADC_RESOLUTION_8B

Return value:

- ADC: conversion data equivalent voltage value (unit: mVolt)

Notes:

- On STM32U5, this feature is available on ADC instances: ADC1, ADC2. Analog reference voltage (Vref+) must be either known from user board environment or can be calculated using ADC measurement and ADC helper macro __LL_ADC_CALC_VREFANALOG_VOLTAGE().

__HAL_ADC_CALC_VREFANALOG_VOLTAGE

Description:

- Helper macro to calculate analog reference voltage (Vref+) (unit: mVolt) from ADC conversion data of internal voltage reference VrefInt.

Parameters:

- __ADCx__: ADC instance
- __VREFINT_ADC_DATA__: ADC conversion data (resolution 12 bits) of internal voltage reference VrefInt (unit: digital value).
- __ADC_RESOLUTION__: This parameter can be one of the following values:
  – ADC_RESOLUTION_14B (1)
  – ADC_RESOLUTION_12B (1)(2)
  – ADC_RESOLUTION_10B (1)(2)
  – ADC_RESOLUTION_8B (1)(2)
  – ADC_RESOLUTION_6B (2)

Return value:

- Analog: reference voltage (unit: mV)

Notes:

- Computation is using VrefInt calibration value stored in system memory for each device during production. This voltage depends on user board environment: voltage level connected to pin Vref+. On devices with small package, the pin Vref+ is not present and internally bonded to pin Vdda. On this STM32 series, calibration data of internal voltage reference VrefInt corresponds to a resolution of 12 bits, this is the recommended ADC resolution to convert voltage of internal voltage reference VrefInt. Otherwise, this macro performs the processing to scale ADC conversion data to 12 bits.

__HAL_ADC_CALC_TEMPERATURE

Description:

- Helper macro to calculate the temperature (unit: degree Celsius) from ADC conversion data of internal temperature sensor.

Parameters:

- __ADCx__: ADC instance
- __VREFANALOG_VOLTAGE__: Analog reference voltage (unit: mV)
- __TEMPSENSOR_ADC_DATA__: ADC conversion data of internal temperature sensor (unit: digital value).
- __ADC_RESOLUTION__: ADC resolution at which internal temperature sensor voltage has been measured. This parameter can be one of the following values:
  - ADC_RESOLUTION_14B (1)
  - ADC_RESOLUTION_12B (1)(2)
  - ADC_RESOLUTION_10B (1)(2)
  - ADC_RESOLUTION_8B (1)(2)
  - ADC_RESOLUTION_6B (2)

Return value:

- Temperature: (unit: degree Celsius)

Notes:

- Computation is using temperature sensor calibration values stored in system memory for each device during production. Calculation formula: Temperature = ((TS_ADC_DATA - TS_CAL1) * (TS_CAL2_TEMP - TS_CAL1_TEMP)) / (TS_CAL2 - TS_CAL1) + TS_CAL1_TEMP with TS_ADC_DATA = temperature sensor raw data measured by ADC Avg_Slope = (TS_CAL2 - TS_CAL1) / (TS_CAL2_TEMP - TS_CAL1_TEMP) TS_CAL1 = equivalent TS_ADC_DATA at temperature TEMP_DEGC_CAL1 (calibrated in factory) TS_CAL2 = equivalent TS_ADC_DATA at temperature TEMP_DEGC_CAL2 (calibrated in factory) Caution: Calculation relevancy under reserve that calibration parameters are correct (address and data). To calculate temperature using temperature sensor datasheet typical values (generic values less, therefore less accurate than calibrated values), use helper macro __LL_ADC_CALC_TEMPERATURE_TYP_PARAMS(). As calculation input, the analog reference voltage (Vref+) must be defined as it impacts the ADC LSB equivalent voltage. Analog reference voltage (Vref+) must be either known from user board environment or can be calculated using ADC measurement and ADC helper macro __LL_ADC_CALC_VREFANALOG_VOLTAGE(). On this STM32 series, calibration data of temperature sensor corresponds to a resolution of 12 bits, this is the recommended ADC resolution to convert voltage of temperature sensor. Otherwise, this macro performs the processing to scale ADC conversion data to 12 bits.

__HAL_ADC_CALC_TEMPERATURE_TYP_PARAMS

Description:

- Helper macro to calculate the temperature (unit: degree Celsius) from ADC conversion data of internal temperature sensor.

Parameters:

- __ADCx__: ADC instance
- __TEMPSENSOR_TYP_AVGSLOPE__: Device datasheet data: Temperature sensor slope typical value (unit: uV/DegCelsius). On STM32U5, refer to device datasheet parameter "Avg_Slope".
- __TEMPSENSOR_TYP_CALX_V__: Device datasheet data: Temperature sensor voltage typical value (at temperature and Vref+ defined in parameters below) (unit: mV). Refer to device datasheet parameter "V30" (corresponding to TS_CAL1).
- __TEMPSENSOR_CALX_TEMP__: Device datasheet data: Temperature at which temperature sensor voltage (see parameter above) is corresponding (unit: mV)
- __VREFANALOG_VOLTAGE__: Analog voltage reference (Vref+) voltage (unit: mV)
- __TEMPSENSOR_ADC_DATA__: ADC conversion data of internal temperature sensor (unit: digital value).
- __ADC_RESOLUTION__: ADC resolution at which internal temperature sensor voltage has been measured. This parameter can be one of the following values:
  - ADC_RESOLUTION_14B (1)
  - ADC_RESOLUTION_12B (1)(2)
  - ADC_RESOLUTION_10B (1)(2)
  - ADC_RESOLUTION_8B (1)(2)
  - ADC_RESOLUTION_6B (2)

Return value:

- Temperature: (unit: degree Celsius)

Notes:

- Computation is using temperature sensor typical values (refer to device datasheet). Calculation formula: Temperature = (TS_TYP_CALx_VOLT(uV) - TS_ADC_DATA * Conversion_uV) / Avg_Slope + CALx_TEMP with TS_ADC_DATA = temperature sensor raw data measured by ADC (unit: digital value) Avg_Slope = temperature sensor slope (unit: uV/Degree Celsius) TS_TYP_CALx_VOLT = temperature sensor digital value at temperature CALx_TEMP (unit: mV) Caution: Calculation relevancy under reserve the temperature sensor of the current device has characteristics in line with datasheet typical values. If temperature sensor calibration values are available on on this device (presence of macro __LL_ADC_CALC_TEMPERATURE()), temperature calculation will be more accurate using helper macro __LL_ADC_CALC_TEMPERATURE(). As calculation input, the analog reference voltage (Vref+) must be defined as it impacts the ADC LSB equivalent voltage. Analog reference voltage (Vref+) must be either known from user board environment or can be calculated using ADC measurement and ADC helper macro __LL_ADC_CALC_VREFANALOG_VOLTAGE(). ADC measurement data must correspond to a resolution of 12bits (full scale digital value 4095). If not the case, the data must be preliminarily rescaled to an equivalent resolution of 12 bits.

ADC low power and deep power down selection

ADC_LOW_POWER_NONE

Both Low Power Auto Off and Deep Power Down is disabled

ADC_LOW_POWER_AUTOFF

Low Power Auto Off enabled and Deep Power Down is disabled

ADC_LOW_POWER_DPD

Low Power Auto Off disabled and Deep Power Down is enabled

ADC_LOW_POWER_AUTOFF_DPD

Low Power Auto Off and Deep Power Down are enabled

ADC VREF+ protection mode selection

ADC_VREF_PPROT_NONE

No VREF protection is applied

ADC_VREF_PPROT_VREFPROT

VREF+ protection when multiple ADCs are working simultaneously and a clock divider is used.

ADC_VREF_PPROT_VREFSECSMP

VREF+ protection when multiple ADCs are working simultaneously and a clock divider of 1 is used.

ADC_VREF_PPROT_VREF_VREFSECSMP

Both VREF+ protection when multiple ADCs are working simultaneously and VREF+ second sample protection.

ADC group injected trigger edge (when external trigger is selected)

ADC_EXTERNALTRIGINJECCONV_EDGE_NONE

Injected conversions hardware trigger detection disabled

ADC_EXTERNALTRIGINJECCONV_EDGE_RISING

Injected conversions hardware trigger detection on the rising edge

ADC_EXTERNALTRIGINJECCONV_EDGE_FALLING

Injected conversions hardware trigger detection on the falling edge

ADC_EXTERNALTRIGINJECCONV_EDGE_RISINGFALLING

Injected conversions hardware trigger detection on both the rising and falling edges

ADC group injected trigger source

ADC_INJECTED_SOFTWARE_START

Software triggers injected group conversion start

ADC_EXTERNALTRIGINJEC_T1_TRGO

ADC group injected conversion trigger from external peripheral: TIM1 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T1_CC4

ADC group injected conversion trigger from external peripheral: TIM1 channel 4 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T2_TRGO

ADC group injected conversion trigger from external peripheral: TIM2 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T2_CC1

ADC group injected conversion trigger from external peripheral: TIM2 channel 1 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T3_CC4

ADC group injected conversion trigger from external peripheral: TIM3 channel 4 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T4_TRGO

ADC group injected conversion trigger from external peripheral: TIM4 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_EXT_IT15

ADC group injected conversion trigger from external peripheral: external interrupt line 15. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T8_CC4

ADC group injected conversion trigger from external peripheral: TIM8 channel 4 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T1_TRGO2

ADC group injected conversion trigger from external peripheral: TIM1 TRGO2 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T8_TRGO

ADC group injected conversion trigger from external peripheral: TIM8 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T8_TRGO2

ADC group injected conversion trigger from external peripheral: TIM8 TRGO2 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T3_CC3

ADC group injected conversion trigger from external peripheral: TIM3 channel 3 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T3_TRGO

ADC group injected conversion trigger from external peripheral: TIM3 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T3_CC1

ADC group injected conversion trigger from external peripheral: TIM3 channel 1 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T6_TRGO

ADC group injected conversion trigger from external peripheral: TIM6 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_T15_TRGO

ADC group injected conversion trigger from external peripheral: TIM15 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_LPTIM1_CH2

ADC group injected conversion trigger from external peripheral: LPTIM1 CH2 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_LPTIM2_CH2

ADC group injected conversion trigger from external peripheral: LPTIM2 CH2 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_LPTIM3_CH1

ADC group injected conversion trigger from external peripheral: LPTIM3 CH1 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIGINJEC_LPTIM4_OUT

ADC group injected conversion trigger from external peripheral: LPTIM4 OUT event. Trigger edge set to rising edge (default setting).

ADC group injected - Sequencer ranks

ADC_INJECTED_RANK_1

ADC group injected sequencer rank 1

ADC_INJECTED_RANK_2

ADC group injected sequencer rank 2

ADC_INJECTED_RANK_3

ADC group injected sequencer rank 3

ADC_INJECTED_RANK_4

ADC group injected sequencer rank 4

ADC interrupts definition

ADC_IT_RDY

ADC Ready interrupt source

ADC_IT_EOSMP

ADC End of sampling interrupt source

ADC_IT_EOC

ADC End of regular conversion interrupt source

ADC_IT_EOS

ADC End of regular sequence of conversions interrupt source

ADC_IT_OVR

ADC overrun interrupt source

ADC_IT_JEOC

ADC End of injected conversion interrupt source

ADC_IT_JEOS

ADC End of injected sequence of conversions interrupt source

ADC_IT_AWD1

ADC Analog watchdog 1 interrupt source (main analog watchdog)

ADC_IT_AWD2

ADC Analog watchdog 2 interrupt source (additional analog watchdog)

ADC_IT_AWD3

ADC Analog watchdog 3 interrupt source (additional analog watchdog)

ADC_IT_EOCAL

ADC End of Calibration interrupt source

ADC_IT_LDORDY

ADC Voltage Regulator (LDO) Ready interrupt source

ADC_IT_AWD

ADC Analog watchdog 1 interrupt source: naming for compatibility with other STM32 devices having only one analog watchdog

ADC group regular trigger edge (when external trigger is selected)

ADC_EXTERNALTRIGCONVEDGE_NONE

Regular conversions hardware trigger detection disabled

ADC_EXTERNALTRIGCONVEDGE_RISING

ADC group regular conversion trigger polarity set to rising edge

ADC_EXTERNALTRIGCONVEDGE_FALLING

ADC group regular conversion trigger polarity set to falling edge

ADC_EXTERNALTRIGCONVEDGE_RISINGFALLING

ADC group regular conversion trigger polarity set to both rising and falling edges

ADC group regular trigger source

ADC_SOFTWARE_START

ADC group regular conversion trigger internal: SW start.

ADC_EXTERNALTRIG_T1_CC1

ADC group regular conversion trigger from external peripheral: TIM1 channel 1 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T1_CC2

ADC group regular conversion trigger from external peripheral: TIM1 channel 2 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T1_CC3

ADC group regular conversion trigger from external peripheral: TIM1 channel 3 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T2_CC2

ADC group regular conversion trigger from external peripheral: TIM2 channel 2 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T3_TRGO

ADC group regular conversion trigger from external peripheral: TIM3 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T4_CC4

ADC group regular conversion trigger from external peripheral: TIM4 channel 4 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_EXT_IT11

ADC group regular conversion trigger from external peripheral: external interrupt line 11 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T8_TRGO

ADC group regular conversion trigger from external peripheral: TIM8 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T8_TRGO2

ADC group regular conversion trigger from external peripheral: TIM8 TRGO2 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T1_TRGO

ADC group regular conversion trigger from external peripheral: TIM1 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T1_TRGO2

ADC group regular conversion trigger from external peripheral: TIM1 TRGO2 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T2_TRGO

ADC group regular conversion trigger from external peripheral: TIM2 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T4_TRGO

ADC group regular conversion trigger from external peripheral: TIM4 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T6_TRGO

ADC group regular conversion trigger from external peripheral: TIM6 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T15_TRGO

ADC group regular conversion trigger from external peripheral: TIM15 TRGO event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_T3_CC4

ADC group regular conversion trigger from external peripheral: TIM3 channel 4 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_EXT_IT15

ADC group regular conversion trigger from external peripheral: external interrupt line 15 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_LPTIM1_CH1

ADC group regular conversion trigger from external peripheral: LPTIM1 channel 1 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_LPTIM2_CH1

ADC group regular conversion trigger from external peripheral: LPTIM2 channel 1 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_LPTIM3_CH1

ADC group regular conversion trigger from external peripheral: LPTIM3 channel 1 event. Trigger edge set to rising edge (default setting).

ADC_EXTERNALTRIG_LPTIM4_OUT

ADC group regular conversion trigger from external peripheral: LPTIM4 OUT event. Trigger edge set to rising edge (default setting).

ADC4_EXTERNALTRIG_T1_CC4

ADC group regular conversion trigger from external peripheral: TIM1 channel 4 event (capture compare: input capture or output capture). Trigger edge set to rising edge (default setting).

ADC4_EXTERNALTRIG_T1_TRGO2

ADC4_EXTERNALTRIG_T2_TRGO

ADC4_EXTERNALTRIG_T15_TRGO

ADC4_EXTERNALTRIG_T6_TRGO

ADC4_EXTERNALTRIG_LPTIM1_CH1

ADC4_EXTERNALTRIG_LPTIM3_CH2

ADC4_EXTERNALTRIG_EXT_IT15

ADC4 Regular Conversion Number Verification

IS_ADC4_REGULAR_NB_CONV

ADC sequencer scan mode

ADC_SCAN_DISABLE

Scan mode disabled

ADC_SCAN_ENABLE

Scan mode enabled

ADC_CHSELR_SQ2_TO_SQ8

ADCx SMPR1 fields

ADC_SMPR1_FIELDS

ADC States

HAL_ADC_STATE_RESET

Notes:

- ADC state machine is managed by bitfields, state must be compared with bit by bit. For example: " if ((HAL_ADC_GetState(hadc1) & HAL_ADC_STATE_REG_BUSY) != 0UL) " " if ((HAL_ADC_GetState(hadc1) & HAL_ADC_STATE_AWD1) != 0UL) " ADC not yet initialized or disabled

HAL_ADC_STATE_READY

ADC peripheral ready for use

HAL_ADC_STATE_BUSY_INTERNAL

ADC is busy due to an internal process (initialization, calibration)

HAL_ADC_STATE_TIMEOUT

TimeOut occurrence

HAL_ADC_STATE_ERROR_INTERNAL

Internal error occurrence

HAL_ADC_STATE_ERROR_CONFIG

Configuration error occurrence

HAL_ADC_STATE_ERROR_DMA

DMA error occurrence

HAL_ADC_STATE_REG_BUSY

A conversion on ADC group regular is ongoing or can occur (either by continuous mode, external trigger, low power auto power-on (if feature available), multimode ADC master control (if feature available))

HAL_ADC_STATE_REG_EOC

Conversion data available on group regular

HAL_ADC_STATE_REG_OVR

Overrun occurrence

HAL_ADC_STATE_REG_EOSMP

Not available on this STM32 series: End Of Sampling flag raised

HAL_ADC_STATE_INJ_BUSY

A conversion on ADC group injected is ongoing or can occur (either by auto-injection mode, external trigger, low power auto power-on (if feature available), multimode ADC master control (if feature available))

HAL_ADC_STATE_INJ_EOC

Conversion data available on group injected

HAL_ADC_STATE_AWD1

Out-of-window occurrence of ADC analog watchdog 1

HAL_ADC_STATE_AWD2

Out-of-window occurrence of ADC analog watchdog 2

HAL_ADC_STATE_AWD3

Out-of-window occurrence of ADC analog watchdog 3

HAL_ADC_STATE_MULTIMODE_SLAVE

ADC in multimode slave state, controlled by another ADC master (when feature available)

8 HAL ADC Extension Driver

8.1 ADCEx Firmware driver registers structures

8.1.1 ADC_InjOversamplingTypeDef

ADC_InjOversamplingTypeDef is defined in the stm32u5xx_hal_adc_ex.h

Data Fields

- ***uint32_t Ratio***
- ***uint32_t RightBitShift***

Field Documentation

- ***uint32_t ADC_InjOversamplingTypeDef::Ratio***
  Configures the oversampling ratio. In case of ADC1 or ADC2 (if available), this parameter can be in the range from 0 to 1023 In case of ADC4, this parameter can be a value of ***ADC_HAL_EC_OVS_RATIO***
- ***uint32_t ADC_InjOversamplingTypeDef::RightBitShift***
  Configures the division coefficient for the Oversampler. This parameter can be a value of ***ADC_HAL_EC_OVS_SHIFT***

8.1.2 ADC_InjectionConfTypeDef

ADC_InjectionConfTypeDef is defined in the stm32u5xx_hal_adc_ex.h

Data Fields

- ***uint32_t InjectedChannel***
- ***uint32_t InjectedRank***
- ***uint32_t InjectedSamplingTime***
- ***uint32_t InjectedSingleDiff***
- ***uint32_t InjectedOffsetNumber***
- ***uint32_t InjectedOffset***
- ***FunctionalState InjectedOffsetSignedSaturation***
- ***uint32_t InjectedOffsetSign***
- ***FunctionalState InjectedOffsetSaturation***
- ***uint32_t InjectedLeftBitShift***
- ***uint32_t InjectedNbrOfConversion***
- ***FunctionalState InjectedDiscontinuousConvMode***
- ***FunctionalState AutoInjectedConv***
- ***uint32_t ExternalTrigInjecConv***
- ***uint32_t ExternalTrigInjecConvEdge***
- ***FunctionalState InjecOversamplingMode***
- ***ADC_InjOversamplingTypeDef InjecOversampling***

Field Documentation

- ***uint32_t ADC_InjectionConfTypeDef::InjectedChannel***
  Specifies the channel to configure into ADC group injected. This parameter can be a value of ***ADC_HAL_EC_CHANNEL*** Note: Depending on devices and ADC instances, some channels may not be available on device package pins. Refer to device datasheet for channels availability.
- ***uint32_t ADC_InjectionConfTypeDef::InjectedRank***
  Specifies the rank in the ADC group injected sequencer. This parameter must be a value of ***ADC_INJ_SEQ_RANKS***. Note: to disable a channel or change order of conversion sequencer, rank containing a previous channel setting can be overwritten by the new channel setting (or parameter number of conversions adjusted)

- ***uint32_t ADC_InjectionConfTypeDef::InjectedSamplingTime***
Sampling time value to be set for the selected channel. Unit: ADC clock cycles. Conversion time is the addition of sampling time and processing time (12.5 ADC clock cycles at ADC resolution 12 bits, 10.5 cycles at 10 bits, 8.5 cycles at 8 bits, 6.5 cycles at 6 bits). This parameter can be a value of ***ADC_HAL_EC_CHANNEL_SAMPLINGTIME***. Caution: This parameter applies to a channel that can be used in a regular and/or injected group. It overwrites the last setting. Note: In case of usage of internal measurement channels (VrefInt/Vbat/TempSensor), sampling time constraints must be respected (sampling time can be adjusted in function of ADC clock frequency and sampling time setting); Refer to device datasheet for timings values.
- ***uint32_t ADC_InjectionConfTypeDef::InjectedSingleDiff***
Selection of single-ended or differential input. In differential mode: Differential measurement is between the selected channel 'i' (positive input) and channel 'i+1' (negative input). Only channel 'i' has to be configured, channel 'i+1' is configured automatically. This parameter must be a value of: ***ADC_HAL_EC_CHANNEL_SINGLE_DIFF_ENDING***. Caution: This parameter applies to a channel that can be used in a regular and/or injected group. It overwrites the last setting. Note: Refer to Reference Manual to ensure the selected channel is available in differential mode. Note: When configuring a channel 'i' in differential mode, the channel 'i+1' is not usable separately. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion). If ADC is enabled, this parameter setting is bypassed without error reporting (as it can be the expected behavior in case of another parameter update on the fly)
- ***uint32_t ADC_InjectionConfTypeDef::InjectedOffsetNumber***
Selects the offset number. This parameter can be a value of ***ADC_HAL_EC_OFFSET_NB***. Caution: Only one offset is allowed per channel. This parameter overwrites the last setting.
- ***uint32_t ADC_InjectionConfTypeDef::InjectedOffset***
Defines the offset to be subtracted from the raw converted data. Offset value must be a positive number. Depending of ADC resolution selected (12, 10, 8 or 6 bits), this parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF, 0x3FF, 0xFF or 0x3F respectively. Note: This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
- ***FunctionalState ADC_InjectionConfTypeDef::InjectedOffsetSignedSaturation***
Specify whether the Signed saturation feature is used or not. This parameter is only applied when InjectedOffsetSaturation is ENABLE. This parameter is applied only for 14-bit or 8-bit resolution. This parameter can be set to ENABLE or DISABLE. Note:
  – If InjectedOffsetSignedSaturation is set to DISABLE the unsigned saturation feature is used
- ***uint32_t ADC_InjectionConfTypeDef::InjectedOffsetSign***
Define if the offset should be subtracted (negative sign) or added (positive sign) from or to the raw converted data. This parameter can be a value of ***ADCEx_OffsetSign***. Note:
  – This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
  – This parameter is specific to ADC1 only.
- ***FunctionalState ADC_InjectionConfTypeDef::InjectedOffsetSaturation***
Define if the offset should be saturated upon under or over flow. This parameter value can be ENABLE or DISABLE. Note:
  – This parameter must be modified when no conversion is on going on both regular and injected groups (ADC disabled, or ADC enabled without continuous mode or external trigger that could launch a conversion).
  – This parameter is specific to ADC1 only.
- ***uint32_t ADC_InjectionConfTypeDef::InjectedLeftBitShift***
Configures the left shifting applied to the final result with or without oversampling. This parameter can be a value of ***ADCEx_Left_Bit_Shift***
- ***uint32_t ADC_InjectionConfTypeDef::InjectedNbrOfConversion***
Specifies the number of ranks that will be converted within the ADC group injected sequencer. To use the injected group sequencer and convert several ranks, parameter 'ScanConvMode' must be enabled. This parameter must be a number between Min_Data = 1 and Max_Data = 4. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.

- ***FunctionalState ADC_InjectionConfTypeDef::InjectedDiscontinuousConvMode***
Specifies whether the conversions sequence of ADC group injected is performed in Complete-sequence/ Discontinuous-sequence (main sequence subdivided in successive parts). Discontinuous mode is used only if sequencer is enabled (parameter 'ScanConvMode'). If sequencer is disabled, this parameter is discarded. Discontinuous mode can be enabled only if continuous mode is disabled. This parameter can be set to ENABLE or DISABLE. Note: This parameter must be modified when ADC is disabled (before ADC start conversion or after ADC stop conversion). Note: For injected group, discontinuous mode converts the sequence channel by channel (discontinuous length fixed to 1 rank). Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
- ***FunctionalState ADC_InjectionConfTypeDef::AutoInjectedConv***
Enables or disables the selected ADC group injected automatic conversion after regular one This parameter can be set to ENABLE or DISABLE. Note: To use Automatic injected conversion, discontinuous mode must be disabled ('DiscontinuousConvMode' and 'InjectedDiscontinuousConvMode' set to DISABLE) Note: To use Automatic injected conversion, injected group external triggers must be disabled ('ExternalTrigInjecConv' set to ADC_INJECTED_SOFTWARE_START) Note: In case of DMA used with regular group: if DMA configured in normal mode (single shot) JAUTO will be stopped upon DMA transfer complete. To maintain JAUTO always enabled, DMA must be configured in circular mode. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
- ***uint32_t ADC_InjectionConfTypeDef::ExternalTrigInjecConv***
Selects the external event used to trigger the conversion start of injected group. If set to ADC_INJECTED_SOFTWARE_START, external triggers are disabled and software trigger is used instead. This parameter can be a value of ***ADC_injected_external_trigger_source***. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
- ***uint32_t ADC_InjectionConfTypeDef::ExternalTrigInjecConvEdge***
Selects the external trigger edge of injected group. This parameter can be a value of ***ADC_injected_external_trigger_edge***. If trigger source is set to ADC_INJECTED_SOFTWARE_START, this parameter is discarded. Caution: this setting impacts the entire injected group. Therefore, call of **HAL_ADCEx_InjectedConfigChannel()** to configure a channel on injected group can impact the configuration of other channels previously set.
- ***FunctionalState ADC_InjectionConfTypeDef::InjecOversamplingMode***
Specifies whether the oversampling feature is enabled or disabled. This parameter can be set to ENABLE or DISABLE. Note: This parameter can be modified only if there is no conversion is ongoing (both ADSTART and JADSTART cleared).
- ***ADC_InjOversamplingTypeDef ADC_InjectionConfTypeDef::InjecOversampling***
Specifies the Oversampling parameters. Caution: this setting overwrites the previous oversampling configuration if oversampling already enabled. Note: This parameter can be modified only if there is no conversion is ongoing (both ADSTART and JADSTART cleared).

8.1.3 ADC_MultiModeTypeDef

ADC_MultiModeTypeDef is defined in the stm32u5xx_hal_adc_ex.h

Data Fields

- ***uint32_t Mode***
- ***uint32_t DualModeData***
- ***uint32_t TwoSamplingDelay***

Field Documentation

- ***uint32_t ADC_MultiModeTypeDef::Mode***
Configures the ADC to operate in independent or multimode. This parameter can be a value of ***ADC_HAL_EC_MULTI_MODE***.
- ***uint32_t ADC_MultiModeTypeDef::DualModeData***
Configures the Dual ADC Mode Data Format: This parameter can be a value of ***ADCEx_Dual_Mode_Data_Format***

- ***uint32_t ADC_MultiModeTypeDef::TwoSamplingDelay***
  Configures the Delay between 2 sampling phases. This parameter can be a value of *ADC_HAL_EC_MULTI_TWOSMP_DELAY*. Delay range depends on selected resolution: from 1 to 12 clock cycles for 12 bits, from 1 to 10 clock cycles for 10 bits, from 1 to 8 clock cycles for 8 bits, from 1 to 6 clock cycles for 6 bits.

8.2 ADCEx Firmware driver API description

The following section lists the various functions of the ADCEx library.

8.2.1 IO operation functions

This section provides functions allowing to:
- Perform the ADC self-calibration for single or differential ending.
- Get calibration factors for single or differential ending.
- Set calibration factors for single or differential ending.
- Start conversion of ADC group injected.
- Stop conversion of ADC group injected.
- Poll for conversion complete on ADC group injected.
- Get result of ADC group injected channel conversion.
- Start conversion of ADC group injected and enable interruptions.
- Stop conversion of ADC group injected and disable interruptions.
- When multimode feature is available, start multimode and enable DMA transfer.
- Stop multimode and disable ADC DMA transfer.
- Get result of multimode conversion.

This section contains the following APIs:
- *HAL_ADCEx_Calibration_Start()*
- *HAL_ADCEx_Calibration_GetValue()*
- *HAL_ADCEx_LinearCalibration_GetValue()*
- *HAL_ADCEx_Calibration_SetValue()*
- *HAL_ADCEx_LinearCalibration_SetValue()*
- *HAL_ADCEx_InjectedStart()*
- *HAL_ADCEx_InjectedStop()*
- *HAL_ADCEx_InjectedPollForConversion()*
- *HAL_ADCEx_InjectedStart_IT()*
- *HAL_ADCEx_InjectedStop_IT()*
- *HAL_ADCEx_MultiModeStart_DMA()*
- *HAL_ADCEx_MultiModeStop_DMA()*
- *HAL_ADCEx_MultiModeGetValue()*
- *HAL_ADCEx_MultiModeStart_DMA_Data32()*
- *HAL_ADCEx_MultiModeGetValue_Data32()*
- *HAL_ADCEx_InjectedGetValue()*
- *HAL_ADCEx_InjectedConvCpltCallback()*
- *HAL_ADCEx_InjectedQueueOverflowCallback()*
- *HAL_ADCEx_LevelOutOfWindow2Callback()*
- *HAL_ADCEx_LevelOutOfWindow3Callback()*
- *HAL_ADCEx_EndOfSamplingCallback()*
- *HAL_ADCEx_RegularStop()*
- *HAL_ADCEx_RegularStop_IT()*
- *HAL_ADCEx_RegularStop_DMA()*
- *HAL_ADCEx_RegularMultiModeStop_DMA()*

8.2.2 Peripheral Control functions

This section provides functions allowing to:

- Configure channels on injected group
- Configure multimode when multimode feature is available
- Enable or Disable Injected Queue
- Disable ADC voltage regulator
- Enter ADC deep-power-down mode

This section contains the following APIs:

- *HAL_ADCEx_InjectedConfigChannel()*
- *HAL_ADCEx_MultiModeConfigChannel()*
- *HAL_ADCEx_DisableVoltageRegulator()*
- *HAL_ADCEx_EnterADCDeepPowerDownMode()*

8.2.3 Detailed description of functions

HAL_ADCEx_Calibration_Start

Function name

HAL_StatusTypeDef HAL_ADCEx_Calibration_Start (ADC_HandleTypeDef * hadc, uint32_t CalibrationMode, uint32_t SingleDiff)

Function description

Perform an ADC automatic self-calibration Calibration prerequisite: ADC must be disabled (execute this function before HAL_ADC_Start() or after HAL_ADC_Stop()).

Parameters

- **hadc:** ADC handle
- **CalibrationMode:** Selection of calibration offset or linear calibration offset.
  – ADC_CALIB_OFFSET Channel in mode calibration offset
  – ADC_CALIB_OFFSET_LINEARITY Channel in mode linear calibration offset
- **SingleDiff:** Selection of single-ended or differential input This parameter can be one of the following values:
  – ADC_SINGLE_ENDED Channel in mode input single ended
  – ADC_DIFFERENTIAL_ENDED Channel in mode input differential ended

Return values

- **HAL:** status

HAL_ADCEx_Calibration_GetValue

Function name

uint32_t HAL_ADCEx_Calibration_GetValue (ADC_HandleTypeDef * hadc, uint32_t SingleDiff)

Function description

Get the calibration factor.

Parameters

- **hadc:** ADC handle.
- **SingleDiff:** This parameter can be only:
  – ADC_SINGLE_ENDED Channel in mode input single ended
  – ADC_DIFFERENTIAL_ENDED Channel in mode input differential ended

Return values

- **Calibration:** value.

HAL_ADCEx_LinearCalibration_GetValue

Function name

HAL_StatusTypeDef HAL_ADCEx_LinearCalibration_GetValue (ADC_HandleTypeDef * hadc, uint32_t * pLinearCalib_Buffer)

Function description

Get the calibration factor from automatic conversion result.

Parameters

- **hadc:** ADC handle
- **pLinearCalib_Buffer:** Linear calibration factor (table of 9 elements)

Return values

- **HAL:** state

HAL_ADCEx_Calibration_SetValue

Function name

HAL_StatusTypeDef HAL_ADCEx_Calibration_SetValue (ADC_HandleTypeDef * hadc, uint32_t SingleDiff, uint32_t CalibrationFactor)

Function description

Set the calibration factor to overwrite automatic conversion result.

Parameters

- **hadc:** ADC handle
- **SingleDiff:** This parameter can be only:
  – ADC_SINGLE_ENDED Channel in mode input single ended
  – ADC_DIFFERENTIAL_ENDED Channel in mode input differential ended
- **CalibrationFactor:** Calibration factor (range 0xFFFF for ADC1 and ADC2, range 0x7F for ADC4)

Return values

- **HAL:** state

HAL_ADCEx_LinearCalibration_SetValue

Function name

HAL_StatusTypeDef HAL_ADCEx_LinearCalibration_SetValue (ADC_HandleTypeDef * hadc, uint32_t * pLinearCalib_Buffer)

Function description

Set the linear calibration factor.

Parameters

- **hadc:** ADC handle
- **pLinearCalib_Buffer:** Linear calibration factor (table of 9 elements)

Return values

- **HAL:** state

HAL_ADCEx_InjectedStart

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStart (ADC_HandleTypeDef * hadc)

Function description

Enable ADC, start conversion of injected group.

Parameters

- **hadc:** ADC handle.

Return values

- **HAL:** status

Notes

- Interruptions enabled in this function: None.
- Case of multimode enabled when multimode feature is available: HAL_ADCEx_InjectedStart() API must be called for ADC slave first, then for ADC master. For ADC slave, ADC is enabled only (conversion is not started). For ADC master, ADC is enabled and multimode conversion is started.

HAL_ADCEx_InjectedStop

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStop (ADC_HandleTypeDef * hadc)

Function description

Stop conversion of injected channels.

Parameters

- **hadc:** ADC handle.

Return values

- **HAL:** status

Notes

- If ADC must be disabled and if conversion is on going on regular group, function HAL_ADC_Stop must be used to stop both injected and regular groups, and disable the ADC.
- If injected group mode auto-injection is enabled, function HAL_ADC_Stop must be used.
- In case of multimode enabled (when multimode feature is available), HAL_ADCEx_InjectedStop() must be called for ADC master first, then for ADC slave. For ADC master, conversion is stopped and ADC is disabled. For ADC slave, ADC is disabled only (conversion stop of ADC master has already stopped conversion of ADC slave).

HAL_ADCEx_InjectedPollForConversion

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedPollForConversion (ADC_HandleTypeDef * hadc, uint32_t Timeout)

Function description

Wait for injected group conversion to be completed.

Parameters

- **hadc:** ADC handle
- **Timeout:** Timeout value in millisecond.

Return values

- **HAL:** status

Notes

- Depending on hadc->Init.EOCSelection, JEOS or JEOC is checked and cleared depending on AUTDLY bit status.

HAL_ADCEx_InjectedStart_IT

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStart_IT (ADC_HandleTypeDef * hadc)

Function description

Enable ADC, start conversion of injected group with interruption.

Parameters

- **hadc:** ADC handle.

Return values

- **HAL:** status.

Notes

- Interruptions enabled in this function according to initialization setting : JEOC (end of conversion) or JEOS (end of sequence)
- Case of multimode enabled (when multimode feature is enabled): HAL_ADCEx_InjectedStart_IT() API must be called for ADC slave first, then for ADC master. For ADC slave, ADC is enabled only (conversion is not started). For ADC master, ADC is enabled and multimode conversion is started.

HAL_ADCEx_InjectedStop_IT

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedStop_IT (ADC_HandleTypeDef * hadc)

Function description

Stop conversion of injected channels, disable interruption of end-of-conversion.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- If ADC must be disabled and if conversion is on going on regular group, function HAL_ADC_Stop must be used to stop both injected and regular groups, and disable the ADC.
- If injected group mode auto-injection is enabled, function HAL_ADC_Stop must be used.
- Case of multimode enabled (when multimode feature is available): HAL_ADCEx_InjectedStop_IT() API must be called for ADC master first, then for ADC slave. For ADC master, conversion is stopped and ADC is disabled. For ADC slave, ADC is disabled only (conversion stop of ADC master has already stopped conversion of ADC slave).
- In case of auto-injection mode, HAL_ADC_Stop() must be used.

HAL_ADCEx_MultiModeStart_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_MultiModeStart_DMA (ADC_HandleTypeDef * hadc, const uint32_t * pData, uint32_t Length)

Function description

Enable ADC, start MultiMode conversion and transfer regular results through DMA.

Parameters

- **hadc:** ADC handle of ADC master (handle of ADC slave must not be used)
- **pData:** Destination Buffer address.
- **Length:** Length of data to be transferred from ADC peripheral to memory (in bytes).

Return values

- **HAL:** status

Notes

- Multimode must have been previously configured using HAL_ADCEx_MultiModeConfigChannel() function. Interruptions enabled in this function: overrun, DMA half transfer, DMA transfer complete. Each of these interruptions has its dedicated callback function.
- State field of Slave ADC handle is not updated in this configuration: user should not rely on it for information related to Slave regular conversions.

HAL_ADCEx_MultiModeStart_DMA_Data32

Function name

HAL_StatusTypeDef HAL_ADCEx_MultiModeStart_DMA_Data32 (ADC_HandleTypeDef * hadc, const uint32_t * pData, uint32_t Length)

Function description

Enable ADC, start MultiMode conversion and transfer regular results through DMA.

Parameters

- **hadc:** ADC handle of ADC
- **pData:** Destination Buffer address.
- **Length:** Length of data to be transferred from ADC peripheral to memory (in bytes).

Return values

- **HAL:** status

Notes

- Multimode must have been previously configured using HAL_ADCEx_MultiModeConfigChannel() function. Interruptions enabled in this function: overrun, DMA half transfer, DMA transfer complete. Each of these interruptions has its dedicated callback function.
- State field of Slave ADC handle is not updated in this configuration: user should not rely on it for information related to Slave regular conversions.
- - Only ADC master could start the conversion. Two ADC conversions (Master & Slave) per external trig and so two DMA requests.

HAL_ADCEx_MultiModeStop_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_MultiModeStop_DMA (ADC_HandleTypeDef * hadc)

Function description

Stop multimode ADC conversion, disable ADC DMA transfer, disable ADC peripheral.

Parameters

- **hadc:** ADC handle of ADC master (handle of ADC slave must not be used)

Return values

- **HAL:** status

Notes

- Multimode is kept enabled after this function. MultiMode DMA bits (MDMA and DMACFG bits of common CCR register) are maintained. To disable Multimode (set with HAL_ADCEx_MultiModeConfigChannel()), ADC must be reinitialized using HAL_ADC_Init() or HAL_ADC_DeInit(), or the user can resort to HAL_ADCEx_DisableMultiMode() API.
- In case of DMA configured in circular mode, function HAL_ADC_Stop_DMA() must be called after this function with handle of ADC slave, to properly disable the DMA channel.

HAL_ADCEx_MultiModeGetValue

Function name

uint32_t HAL_ADCEx_MultiModeGetValue (const ADC_HandleTypeDef * hadc)

Function description

Return the last ADC Master and Slave regular conversions results when in multimode configuration.

Parameters

- **hadc:** ADC handle of ADC Master (handle of ADC Slave must not be used)

Return values

- **The:** converted data values.

HAL_ADCEx_MultiModeGetValue_Data32

Function name

uint32_t HAL_ADCEx_MultiModeGetValue_Data32 (const ADC_HandleTypeDef * hadc)

Function description

Return the last ADC Master and Slave regular conversions results when in multimode configuration.

Parameters

- **hadc:** ADC handle of ADC Master (handle of ADC Slave must not be used)

Return values

- **The:** converted data values.

HAL_ADCEx_InjectedGetValue

Function name

uint32_t HAL_ADCEx_InjectedGetValue (const ADC_HandleTypeDef * hadc, uint32_t InjectedRank)

Function description

Get ADC injected group conversion result.

Parameters

- **hadc:** ADC handle
- **InjectedRank:** the converted ADC injected rank. This parameter can be one of the following values:
  - ADC_INJECTED_RANK_1 ADC group injected rank 1
  - ADC_INJECTED_RANK_2 ADC group injected rank 2
  - ADC_INJECTED_RANK_3 ADC group injected rank 3
  - ADC_INJECTED_RANK_4 ADC group injected rank 4

Return values

- **ADC:** group injected conversion data

Notes

- Reading register JDRx automatically clears ADC flag JEOC (ADC group injected end of unitary conversion).
- This function does not clear ADC flag JEOS (ADC group injected end of sequence conversion) Occurrence of flag JEOS rising: If sequencer is composed of 1 rank, flag JEOS is equivalent to flag JEOC.If sequencer is composed of several ranks, during the scan sequence flag JEOC only is raised, at the end of the scan sequence both flags JEOC and EOS are raised. Flag JEOS must not be cleared by this function because it would not be compliant with low power features (feature low power auto-wait, not available on all STM32 families). To clear this flag, either use function: in programming model IT: HAL_ADC_IRQHandler(), in programming model polling: HAL_ADCEx_InjectedPollForConversion() or __HAL_ADC_CLEAR_FLAG(&hadc, ADC_FLAG_JEOS).

HAL_ADCEx_InjectedConvCpltCallback

Function name

void HAL_ADCEx_InjectedConvCpltCallback (ADC_HandleTypeDef * hadc)

Function description

Injected conversion complete callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADCEx_InjectedQueueOverflowCallback

Function name

void HAL_ADCEx_InjectedQueueOverflowCallback (ADC_HandleTypeDef * hadc)

Function description

Injected context queue overflow callback.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

Notes

- This callback is called if injected context queue is enabled (parameter "QueueInjectedContext" in injected channel configuration) and if a new injected context is set when queue is full (maximum 2 contexts).

HAL_ADCEx_LevelOutOfWindow2Callback

Function name

void HAL_ADCEx_LevelOutOfWindow2Callback (ADC_HandleTypeDef * hadc)

Function description

Analog watchdog 2 callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADCEx_LevelOutOfWindow3Callback

Function name

void HAL_ADCEx_LevelOutOfWindow3Callback (ADC_HandleTypeDef * hadc)

Function description

Analog watchdog 3 callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADCEx_EndOfSamplingCallback

Function name

void HAL_ADCEx_EndOfSamplingCallback (ADC_HandleTypeDef * hadc)

Function description

End Of Sampling callback in non-blocking mode.

Parameters

- **hadc:** ADC handle

Return values

- **None:**

HAL_ADCEx_RegularStop

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularStop (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of regular group (and injected channels in case of auto_injection mode), disable ADC peripheral if no conversion is on going on injected group.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

HAL_ADCEx_RegularStop_IT

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularStop_IT (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of ADC groups regular and injected, disable interrution of end-of-conversion, disable ADC peripheral if no conversion is on going on injected group.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

HAL_ADCEx_RegularStop_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularStop_DMA (ADC_HandleTypeDef * hadc)

Function description

Stop ADC conversion of regular group (and injected group in case of auto_injection mode), disable ADC DMA transfer, disable ADC peripheral if no conversion is on going on injected group.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status.

Notes

- HAL_ADCEx_RegularStop_DMA() function is dedicated to single-ADC mode only. For multimode (when multimode feature is available), HAL_ADCEx_RegularMultiModeStop_DMA() API must be used.

HAL_ADCEx_RegularMultiModeStop_DMA

Function name

HAL_StatusTypeDef HAL_ADCEx_RegularMultiModeStop_DMA (ADC_HandleTypeDef * hadc)

Function description

Stop DMA-based multimode ADC conversion, disable ADC DMA transfer, disable ADC peripheral if no injected conversion is on-going.

Parameters

- **hadc:** ADC handle of ADC master (handle of ADC slave must not be used)

Return values

- **HAL:** status

Notes

- Multimode is kept enabled after this function. Multimode DMA bits (MDMA and DMACFG bits of common CCR register) are maintained. To disable multimode (set with HAL_ADCEx_MultiModeConfigChannel()), ADC must be reinitialized using HAL_ADC_Init() or HAL_ADC_DeInit(), or the user can resort to HAL_ADCEx_DisableMultiMode() API.
- In case of DMA configured in circular mode, function HAL_ADCEx_RegularStop_DMA() must be called after this function with handle of ADC slave, to properly disable the DMA channel.

HAL_ADCEx_InjectedConfigChannel

Function name

HAL_StatusTypeDef HAL_ADCEx_InjectedConfigChannel (ADC_HandleTypeDef * hadc, ADC_InjectionConfTypeDef * pConfigInjected)

Function description

Configure a channel to be assigned to ADC group injected.

Parameters

- **hadc:** ADC handle
- **pConfigInjected:** Structure of ADC injected group and ADC channel for injected group.

Return values

- **HAL:** status

Notes

- Possibility to update parameters on the fly: This function initializes injected group, following calls to this function can be used to reconfigure some parameters of structure "ADC_InjectionConfTypeDef" on the fly, without resetting the ADC. The setting of these parameters is conditioned to ADC state: Refer to comments of structure "ADC_InjectionConfTypeDef".
- In case of usage of internal measurement channels: Vbat/VrefInt/TempSensor. These internal paths can be disabled using function HAL_ADC_DeInit().
- Caution: For Injected Context Queue use, a context must be fully defined before start of injected conversion. All channels are configured consecutively for the same ADC instance. Therefore, the number of calls to HAL_ADCEx_InjectedConfigChannel() must be equal to the value of parameter InjectedNbrOfConversion for each context. Example 1: If 1 context is intended to be used (or if there is no use of the Injected Queue Context feature) and if the context contains 3 injected ranks (InjectedNbrOfConversion = 3), HAL_ADCEx_InjectedConfigChannel() must be called once for each channel (i.e. 3 times) before starting a conversion. This function must not be called to configure a 4th injected channel: it would start a new context into context queue.Example 2: If 2 contexts are intended to be used and each of them contains 3 injected ranks (InjectedNbrOfConversion = 3), HAL_ADCEx_InjectedConfigChannel() must be called once for each channel and for each context (3 channels x 2 contexts = 6 calls). Conversion can start once the 1st context is set, that is after the first three HAL_ADCEx_InjectedConfigChannel() calls. The 2nd context can be set on the fly.

HAL_ADCEx_MultiModeConfigChannel

Function name

HAL_StatusTypeDef HAL_ADCEx_MultiModeConfigChannel (ADC_HandleTypeDef * hadc, ADC_MultiModeTypeDef * pMultimode)

Function description

Enable ADC multimode and configure multimode parameters.

Parameters

- **hadc:** Master ADC handle
- **pMultimode:** Structure of ADC multimode configuration

Return values

- **HAL:** status

Notes

- Possibility to update parameters on the fly: This function initializes multimode parameters, following calls to this function can be used to reconfigure some parameters of structure "ADC_MultiModeTypeDef" on the fly, without resetting the ADCs. The setting of these parameters is conditioned to ADC state. For parameters constraints, see comments of structure "ADC_MultiModeTypeDef".
- To move back configuration from multimode to single mode, ADC must be reset (using function HAL_ADC_Init()).

HAL_ADCEx_DisableVoltageRegulator

Function name

HAL_StatusTypeDef HAL_ADCEx_DisableVoltageRegulator (ADC_HandleTypeDef * hadc)

Function description

Disable ADC voltage regulator.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- Disabling voltage regulator allows to save power. This operation can be carried out only when ADC is disabled.
- To enable again the voltage regulator, the user is expected to resort to HAL_ADC_Init() API.

HAL_ADCEx_EnterADCDeepPowerDownMode

Function name

HAL_StatusTypeDef HAL_ADCEx_EnterADCDeepPowerDownMode (ADC_HandleTypeDef * hadc)

Function description

Enter ADC deep-power-down mode.

Parameters

- **hadc:** ADC handle

Return values

- **HAL:** status

Notes

- This mode is achieved in setting DEEPPWD bit and allows to save power in reducing leakage currents. It is particularly interesting before entering stop modes.
- Setting DEEPPWD automatically clears ADVREGEN bit and disables the ADC voltage regulator. This means that this API encompasses HAL_ADCEx_DisableVoltageRegulator(). Additionally, the internal calibration is lost.
- To exit the ADC deep-power-down mode, the user is expected to resort to HAL_ADC_Init() API as well as to relaunch a calibration with HAL_ADCEx_Calibration_Start() API or to re-apply a previously saved calibration factor.

8.3 ADCEx Firmware driver defines

The following section lists the various define and macros of the module.

8.3.1 ADCEx

ADCEx

ADC indexes for linear calibration

ADC_CALIB_OFFSET_INDEX

Offset Calibration Index

ADC_CALIB_LINEARITY_INDEX1

Linearity Calibration Index 1

ADC_CALIB_LINEARITY_INDEX2

Linearity Calibration Index 1

ADC_CALIB_LINEARITY_INDEX3

Linearity Calibration Index 1

ADC Extended Calibration mode offset mode or linear mode

ADC_CALIB_OFFSET

ADC_CALIB_OFFSET_LINEARITY

ADC Extended Dual Mode Data Formatting

ADC_DUALMODEDATAFORMAT_DISABLED

Dual ADC mode without data packing: ADCx_CDR and ADCx_CDR2 registers not used

ADC_DUALMODEDATAFORMAT_32_10_BITS

Data formatting mode for 32 down to 10-bit resolution

ADC_DUALMODEDATAFORMAT_8_BITS

Data formatting mode for 8-bit resolution

ADC Extended Exported Macros

ADC_FORCE_MODE_INDEPENDENT

Description:

- Force ADC instance in multimode mode independent (multimode disable).

Parameters:

- __HANDLE__: ADC handle.

Return value:

- None

Notes:

- This macro must be used only in case of transition from multimode to mode independent and in case of unknown previous state, to ensure ADC configuration is in mode independent. Standard way of multimode configuration change is done from HAL ADC handle of ADC master using function "HAL_ADCEx_MultiModeConfigChannel(..., ADC_MODE_INDEPENDENT)")". Usage of this macro is not the Standard way of multimode configuration and can lead to have HAL ADC handles status misaligned. Usage of this macro must be limited to cases mentioned above.

ADC Extended Oversampling left Shift

ADC_LEFTBITSHIFT_NONE

ADC No bit shift

ADC_LEFTBITSHIFT_1

ADC 1 bit shift

ADC_LEFTBITSHIFT_2

ADC 2 bits shift

ADC_LEFTBITSHIFT_3

ADC 3 bits shift

ADC_LEFTBITSHIFT_4

ADC 4 bits shift

ADC_LEFTBITSHIFT_5

ADC 5 bits shift

ADC_LEFTBITSHIFT_6

ADC_OFFSET_SIGN_NEGATIVE

Offset sign negative, offset is subtracted

ADC_OFFSET_SIGN_POSITIVE

Offset sign positive, offset is added

9 HAL COMP Generic Driver

9.1 COMP Firmware driver registers structures

9.1.1 COMP_InitTypeDef

COMP_InitTypeDef is defined in the stm32u5xx_hal_comp.h

Data Fields

- ***uint32_t WindowMode***
- ***uint32_t WindowOutput***
- ***uint32_t Mode***
- ***uint32_t InputPlus***
- ***uint32_t InputMinus***
- ***uint32_t Hysteresis***
- ***uint32_t OutputPol***
- ***uint32_t BlankingSrce***
- ***uint32_t TriggerMode***

Field Documentation

- ***uint32_t COMP_InitTypeDef::WindowMode***
  Set window mode of a pair of comparators instances (2 consecutive instances odd and even COMP<x> and COMP<x+1>). Note: HAL COMP driver allows to set window mode from any COMP instance of the pair of COMP instances composing window mode. This parameter can be a value of ***COMP_WindowMode***
- ***uint32_t COMP_InitTypeDef::WindowOutput***
  Set window mode output. This parameter can be a value of ***COMP_WindowOutput***
- ***uint32_t COMP_InitTypeDef::Mode***
  Set comparator operating mode to adjust power and speed. Note: For the characteristics of comparator power modes (propagation delay and power consumption), refer to device datasheet. This parameter can be a value of ***COMP_PowerMode***
- ***uint32_t COMP_InitTypeDef::InputPlus***
  Set comparator input plus (non-inverting input). This parameter can be a value of ***COMP_InputPlus***
- ***uint32_t COMP_InitTypeDef::InputMinus***
  Set comparator input minus (inverting input). This parameter can be a value of ***COMP_InputMinus***
- ***uint32_t COMP_InitTypeDef::Hysteresis***
  Set comparator hysteresis mode of the input minus. This parameter can be a value of ***COMP_Hysteresis***
- ***uint32_t COMP_InitTypeDef::OutputPol***
  Set comparator output polarity. This parameter can be a value of ***COMP_OutputPolarity***
- ***uint32_t COMP_InitTypeDef::BlankingSrce***
  Set comparator blanking source. This parameter can be a value of ***COMP_BlankingSrce***
- ***uint32_t COMP_InitTypeDef::TriggerMode***
  Set the comparator output triggering External Interrupt Line (EXTI). This parameter can be a value of ***COMP_EXTI_TriggerMode***

9.1.2 __COMP_HandleTypeDef

__COMP_HandleTypeDef is defined in the stm32u5xx_hal_comp.h

Data Fields

- ***COMP_TypeDef * Instance***
- ***COMP_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_COMP_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***void(* TriggerCallback***

- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***COMP_TypeDef* __COMP_HandleTypeDef::Instance***
  Register base address
- ***COMP_InitTypeDef __COMP_HandleTypeDef::Init***
  COMP required parameters
- ***HAL_LockTypeDef __COMP_HandleTypeDef::Lock***
  Locking object
- ***__IO HAL_COMP_StateTypeDef __COMP_HandleTypeDef::State***
  COMP communication state
- ***__IO uint32_t __COMP_HandleTypeDef::ErrorCode***
  COMP error code
- ***void(* __COMP_HandleTypeDef::TriggerCallback)(struct __COMP_HandleTypeDef *hcomp)***
  COMP trigger callback
- ***void(* __COMP_HandleTypeDef::MspInitCallback)(struct __COMP_HandleTypeDef *hcomp)***
  COMP Msp Init callback
- ***void(* __COMP_HandleTypeDef::MspDeInitCallback)(struct __COMP_HandleTypeDef *hcomp)***
  COMP Msp DeInit callback

9.2 COMP Firmware driver API description

The following section lists the various functions of the COMP library.

9.2.1 COMP Peripheral features

The STM32U5xx device family integrates two analog comparators instances: COMP1, COMP2 except for the products featuring only one instance: COMP1 (in this case, all comments related to pair of comparators are not applicable)

1. Comparators input minus (inverting input) and input plus (non inverting input) can be set to internal references or to GPIO pins (refer to GPIO list in reference manual).
2. Comparators output level is available using HAL_COMP_GetOutputLevel() and can be redirected to other peripherals: GPIO pins (in mode alternate functions for comparator), timers. (refer to GPIO list in reference manual).
3. The comparators have interrupt capability through the EXTI controller with wake-up from sleep and stop modes.
   – COMP1 is internally connected to EXTI Line 20
   – COMP2 is internally connected to EXTI Line 21
4. Pairs of comparators instances can be combined in window mode (2 consecutive instances odd and even COMP<x> and COMP<x+1>). From the corresponding IRQ handler, the right interrupt source can be retrieved using macro __HAL_COMP_COMPx_EXTI_GET_FLAG().

9.2.2 How to use this driver

This driver provides functions to configure and program the comparator instances of STM32U5xx devices. To use the comparator, perform the following steps:

1. Initialize the COMP low level resources by implementing the HAL_COMP_MspInit():
   – Configure the GPIO connected to comparator inputs plus and minus in analog mode using HAL_GPIO_Init().
   – If needed, configure the GPIO connected to comparator output in alternate function mode using HAL_GPIO_Init().
   – If required enable the COMP interrupt by configuring and enabling EXTI line in Interrupt mode and selecting the desired sensitivity level using HAL_GPIO_Init() function. After that enable the comparator interrupt vector using HAL_NVIC_EnableIRQ() function.

2. Configure the comparator using HAL_COMP_Init() function:
   – Select the input minus (inverting input)
   – Select the input plus (non-inverting input)
   – Select the hysteresis
   – Select the blanking source
   – Select the output polarity
   – Select the power mode
   – Select the window mode

Note: HAL_COMP_Init() calls internally __HAL_RCC_SYSCFG_CLK_ENABLE() to enable internal control clock of the comparators. However, this is a legacy strategy. In future STM32 families, COMP clock enable must be implemented by user in "HAL_COMP_MspInit()". Therefore, for compatibility anticipation, it is recommended to implement __HAL_RCC_SYSCFG_CLK_ENABLE() in "HAL_COMP_MspInit()".

3. Reconfiguration on-the-fly of comparator can be done by calling again function HAL_COMP_Init() with new input structure parameters values.
4. Enable the comparator using HAL_COMP_Start() function.
5. Use HAL_COMP_TriggerCallback() or HAL_COMP_GetOutputLevel() functions to manage comparator outputs (events and output level).
6. Disable the comparator using HAL_COMP_Stop() function.
7. De-initialize the comparator using HAL_COMP_DeInit() function.
8. For safety purpose, comparator configuration can be locked using HAL_COMP_Lock() function. The only way to unlock the comparator is a device hardware reset.

Callback registration

The compilation flag USE_HAL_COMP_REGISTER_CALLBACKS, when set to 1, allows the user to configure dynamically the driver callbacks. Use Functions HAL_COMP_RegisterCallback() to register an interrupt callback.

Function HAL_COMP_RegisterCallback() allows to register following callbacks:

- TriggerCallback : callback for COMP trigger.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_COMP_UnRegisterCallback to reset a callback to the default weak function.

HAL_COMP_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- TriggerCallback : callback for COMP trigger.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit.

By default, after the HAL_COMP_Init() and when the state is HAL_COMP_STATE_RESET all callbacks are set to the corresponding weak functions: example HAL_COMP_TriggerCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_COMP_Init()/ HAL_COMP_DeInit() only when these callbacks are null (not registered beforehand).

If MspInit or MspDeInit are not null, the HAL_COMP_Init()/ HAL_COMP_DeInit() keep and use the user MspInit/ MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_COMP_STATE_READY state only. Exception done MspInit/ MspDeInit functions that can be registered/unregistered in HAL_COMP_STATE_READY or HAL_COMP_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit.

Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_COMP_RegisterCallback() before calling HAL_COMP_DeInit() or HAL_COMP_Init() function.

When the compilation flag USE_HAL_COMP_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

9.2.3 Initialization and de-initialization functions

This section provides functions to initialize and de-initialize comparators

This section contains the following APIs:
- *HAL_COMP_Init()*
- *HAL_COMP_DeInit()*
- *HAL_COMP_MspInit()*
- *HAL_COMP_MspDeInit()*
- *HAL_COMP_RegisterCallback()*
- *HAL_COMP_UnRegisterCallback()*

9.2.4 IO operation functions

This section provides functions allowing to:
- Start a comparator instance.
- Stop a comparator instance.

This section contains the following APIs:
- *HAL_COMP_Start()*
- *HAL_COMP_Stop()*
- *HAL_COMP_IRQHandler()*

9.2.5 Peripheral Control functions

This subsection provides a set of functions allowing to control the comparators.

This section contains the following APIs:
- *HAL_COMP_Lock()*
- *HAL_COMP_GetOutputLevel()*
- *HAL_COMP_TriggerCallback()*

9.2.6 Peripheral State functions

This subsection permit to get in run-time the status of the peripheral.

This section contains the following APIs:
- *HAL_COMP_GetState()*
- *HAL_COMP_GetError()*

9.2.7 Detailed description of functions

HAL_COMP_Init

Function name

HAL_StatusTypeDef HAL_COMP_Init (COMP_HandleTypeDef * hcomp)

Function description

Initialize the COMP according to the specified parameters in the COMP_InitTypeDef and initialize the associated handle.

Parameters
- **hcomp:** COMP handle

Return values
- **HAL:** status

Notes
- If the selected comparator is locked, initialization can't be performed. To unlock the configuration, perform a system reset.

HAL_COMP_DeInit

Function name

HAL_StatusTypeDef HAL_COMP_DeInit (COMP_HandleTypeDef * hcomp)

Function description

DeInitialize the COMP peripheral.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

Notes

- Deinitialization cannot be performed if the COMP configuration is locked. To unlock the configuration, perform a system reset.

HAL_COMP_MspInit

Function name

void HAL_COMP_MspInit (COMP_HandleTypeDef * hcomp)

Function description

Initialize the COMP MSP.

Parameters

- **hcomp:** COMP handle

Return values

- **None:**

HAL_COMP_MspDeInit

Function name

void HAL_COMP_MspDeInit (COMP_HandleTypeDef * hcomp)

Function description

DeInitialize the COMP MSP.

Parameters

- **hcomp:** COMP handle

Return values

- **None:**

HAL_COMP_RegisterCallback

Function name

HAL_StatusTypeDef HAL_COMP_RegisterCallback (COMP_HandleTypeDef * hcomp, HAL_COMP_CallbackIDTypeDef CallbackID, pCOMP_CallbackTypeDef pCallback)

Function description

Register a User COMP Callback To be used instead of the weak predefined callback.

Parameters

- **hcomp:** Pointer to a COMP_HandleTypeDef structure that contains the configuration information for the specified COMP.
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  – HAL_COMP_TRIGGER_CB_ID Trigger callback ID
  – HAL_COMP_MSPINIT_CB_ID MspInit callback ID
  – HAL_COMP_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_COMP_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_COMP_UnRegisterCallback (COMP_HandleTypeDef * hcomp, HAL_COMP_CallbackIDTypeDef CallbackID)

Function description

Unregister a COMP Callback COMP callback is redirected to the weak predefined callback.

Parameters

- **hcomp:** Pointer to a COMP_HandleTypeDef structure that contains the configuration information for the specified COMP.
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  – HAL_COMP_TRIGGER_CB_ID Trigger callback ID
  – HAL_COMP_MSPINIT_CB_ID MspInit callback ID
  – HAL_COMP_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_COMP_Start

Function name

HAL_StatusTypeDef HAL_COMP_Start (COMP_HandleTypeDef * hcomp)

Function description

Start the comparator.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

HAL_COMP_Stop

Function name

HAL_StatusTypeDef HAL_COMP_Stop (COMP_HandleTypeDef * hcomp)

Function description

Stop the comparator.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

HAL_COMP_IRQHandler

Function name

void HAL_COMP_IRQHandler (COMP_HandleTypeDef * hcomp)

Function description

Comparator IRQ handler.

Parameters

- **hcomp:** COMP handle

Return values

- **None:**

HAL_COMP_Lock

Function name

HAL_StatusTypeDef HAL_COMP_Lock (COMP_HandleTypeDef * hcomp)

Function description

Lock the selected comparator configuration.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** status

Notes

- A system reset is required to unlock the comparator configuration.
- Locking the comparator from reset state is possible if __HAL_RCC_SYSCFG_CLK_ENABLE() is being called before.

HAL_COMP_GetOutputLevel

Function name

uint32_t HAL_COMP_GetOutputLevel (const COMP_HandleTypeDef * hcomp)

Function description

Return the output level (high or low) of the selected comparator.

HAL_COMP_TriggerCallback

Function name

void HAL_COMP_TriggerCallback (COMP_HandleTypeDef * hcomp)

Function description

Comparator trigger callback.

Parameters

- **hcomp:** COMP handle

Return values

- **None:**

HAL_COMP_GetState

Function name

HAL_COMP_StateTypeDef HAL_COMP_GetState (const COMP_HandleTypeDef * hcomp)

Function description

Return the COMP handle state.

Parameters

- **hcomp:** COMP handle

Return values

- **HAL:** state

HAL_COMP_GetError

Function name

uint32_t HAL_COMP_GetError (const COMP_HandleTypeDef * hcomp)

Function description

Return the COMP error code.

Parameters

- **hcomp:** COMP handle

Return values

- **COMP:** error code

9.3 COMP Firmware driver defines

The following section lists the various define and macros of the module.

9.3.1 COMP

COMP

COMP blanking source

COMP_BLANKINGSRC_NONE

Comparator output without blanking

COMP_BLANKINGSRC_TIM1_OC5

TIM1 OC5 selected as blanking source for COMP1

COMP_BLANKINGSRC_TIM2_OC3

TIM2 OC3 selected as blanking source for COMP1

COMP_BLANKINGSRC_TIM3_OC3

TIM3 OC3 selected as blanking source for COMP1

COMP_BLANKINGSRC_TIM3_OC4

TIM3 OC4 selected as blanking source for COMP2

COMP_BLANKINGSRC_TIM8_OC5

TIM8 OC5 selected as blanking source for COMP2

COMP_BLANKINGSRC_TIM15_OC1

TIM15 OC1 selected as blanking source for COMP2

COMP Error Code

HAL_COMP_ERROR_NONE

No error

HAL_COMP_ERROR_INVALID_CALLBACK

Invalid Callback error

COMP Exported Types

COMP_STATE_BITFIELD_LOCK

COMP EXTI Lines

COMP_EXTI_LINE_COMP1

EXTI line 17 connected to COMP1 output

COMP_EXTI_LINE_COMP2

EXTI line 18 connected to COMP2 output

COMP_EXTI_IT

EXTI line event with interruption

COMP_EXTI_EVENT

EXTI line event only (without interruption)

COMP_EXTI_RISING

EXTI line event on rising edge

COMP_EXTI_FALLING

EXTI line event on falling edge

COMP external interrupt line management

__HAL_COMP_COMP1_EXTI_ENABLE_RISING_EDGE

Description:

- Enable the COMP1 EXTI line rising edge trigger.

Return value:

- None

__HAL_COMP_COMP1_EXTI_DISABLE_RISING_EDGE

Description:

- Disable the COMP1 EXTI line rising edge trigger.

Return value:

- None

__HAL_COMP_COMP1_EXTI_ENABLE_FALLING_EDGE

Description:

- Enable the COMP1 EXTI line falling edge trigger.

Return value:

- None

__HAL_COMP_COMP1_EXTI_DISABLE_FALLING_EDGE

Description:

- Disable the COMP1 EXTI line falling edge trigger.

Return value:

- None

__HAL_COMP_COMP1_EXTI_ENABLE_RISING_FALLING_EDGE

Description:

- Enable the COMP1 EXTI line rising & falling edge trigger.

Return value:

- None

__HAL_COMP_COMP1_EXTI_DISABLE_RISING_FALLING_EDGE

Description:

- Disable the COMP1 EXTI line rising & falling edge trigger.

Return value:

- None

__HAL_COMP_COMP1_EXTI_ENABLE_IT

Description:

- Enable the COMP1 EXTI line in interrupt mode.

Return value:

- None

__HAL_COMP_COMP1_EXTI_DISABLE_IT

Description:

- Disable the COMP1 EXTI line in interrupt mode.

Return value:

- None

__HAL_COMP_COMP1_EXTI_GENERATE_SWIT

Description:

- Generate a software interrupt on the COMP1 EXTI line.

Return value:

- None

__HAL_COMP_COMP1_EXTI_ENABLE_EVENT

Description:

- Enable the COMP1 EXTI line in event mode.

Return value:

- None

__HAL_COMP_COMP1_EXTI_DISABLE_EVENT

Description:

- Disable the COMP1 EXTI line in event mode.

Return value:

- None

__HAL_COMP_COMP1_EXTI_GET_RISING_FLAG

Description:
- Check whether the COMP1 EXTI line rising flag is set or not.

Return value:
- RESET: or SET

__HAL_COMP_COMP1_EXTI_GET_FALLING_FLAG

Description:
- Check whether the COMP1 EXTI line falling flag is set or not.

Return value:
- RESET: or SET

__HAL_COMP_COMP1_EXTI_CLEAR_RISING_FLAG

Description:
- Clear the COMP1 EXTI raising flag.

Return value:
- None

__HAL_COMP_COMP1_EXTI_CLEAR_FALLING_FLAG

Description:
- Clear the COMP1 EXTI falling flag.

Return value:
- None

__HAL_COMP_COMP2_EXTI_ENABLE_RISING_EDGE

Description:
- Enable the COMP2 EXTI line rising edge trigger.

Return value:
- None

__HAL_COMP_COMP2_EXTI_DISABLE_RISING_EDGE

Description:
- Disable the COMP2 EXTI line rising edge trigger.

Return value:
- None

__HAL_COMP_COMP2_EXTI_ENABLE_FALLING_EDGE

Description:
- Enable the COMP2 EXTI line falling edge trigger.

Return value:
- None

__HAL_COMP_COMP2_EXTI_DISABLE_FALLING_EDGE

Description:
- Disable the COMP2 EXTI line falling edge trigger.

Return value:
- None

__HAL_COMP_COMP2_EXTI_ENABLE_RISING_FALLING_EDGE

Description:
- Enable the COMP2 EXTI line rising & falling edge trigger.

Return value:
- None

__HAL_COMP_COMP2_EXTI_DISABLE_RISING_FALLING_EDGE

Description:
- Disable the COMP2 EXTI line rising & falling edge trigger.

Return value:
- None

__HAL_COMP_COMP2_EXTI_ENABLE_IT

Description:
- Enable the COMP2 EXTI line in interrupt mode.

Return value:
- None

__HAL_COMP_COMP2_EXTI_DISABLE_IT

Description:
- Disable the COMP2 EXTI line in interrupt mode.

Return value:
- None

__HAL_COMP_COMP2_EXTI_ENABLE_EVENT

Description:
- Enable the COMP2 EXTI Line in event mode.

Return value:
- None

__HAL_COMP_COMP2_EXTI_DISABLE_EVENT

Description:
- Disable the COMP2 EXTI Line in event mode.

Return value:
- None

__HAL_COMP_COMP2_EXTI_GET_RISING_FLAG

Description:
- Check whether the COMP2 EXTI line raising flag is set or not.

Return value:
- RESET: or SET

__HAL_COMP_COMP2_EXTI_GET_FALLING_FLAG

Description:
- Check whether the COMP2 EXTI line falling flag is set or not.

Return value:
- RESET: or SET

__HAL_COMP_COMP2_EXTI_CLEAR_RISING_FLAG

Description:

- Clear the the COMP2 EXTI raising flag.

Return value:

- None

__HAL_COMP_COMP2_EXTI_CLEAR_FALLING_FLAG

Description:

- Clear the the COMP2 EXTI falling flag.

Return value:

- None

__HAL_COMP_COMP2_EXTI_GENERATE_SWIT

Description:

- Generate a software interrupt on the COMP2 EXTI line.

Return value:

- None

COMP output to EXTI

COMP_TRIGGERMODE_NONE

Comparator output triggering no External Interrupt Line

COMP_TRIGGERMODE_IT_RISING

Comparator output triggering External Interrupt Line event with interruption, on rising edge

COMP_TRIGGERMODE_IT_FALLING

Comparator output triggering External Interrupt Line event with interruption, on falling edge

COMP_TRIGGERMODE_IT_RISING_FALLING

Comparator output triggering External Interrupt Line event with interruption, on both rising and falling edges

COMP_TRIGGERMODE_EVENT_RISING

Comparator output triggering External Interrupt Line event only (without interruption), on rising edge

COMP_TRIGGERMODE_EVENT_FALLING

Comparator output triggering External Interrupt Line event only (without interruption), on falling edge

COMP_TRIGGERMODE_EVENT_RISING_FALLING

Comparator output triggering External Interrupt Line event only (without interruption), on both rising and falling edges

COMP private macros to get EXTI line associated with comparators

COMP_GET_EXTI_LINE

Description:

- Get the specified EXTI line for a comparator instance.

Parameters:

- __INSTANCE__: specifies the COMP instance.

Return value:

- value: of

COMP Handle Management

__HAL_COMP_RESET_HANDLE_STATE

Description:
- Reset COMP handle state.

Parameters:
- __HANDLE__: COMP handle

Return value:
- None

COMP_CLEAR_ERRORCODE

Description:
- Clear COMP error code (set it to no error code "HAL_COMP_ERROR_NONE").

Parameters:
- __HANDLE__: COMP handle

Return value:
- None

__HAL_COMP_ENABLE

Description:
- Enable the specified comparator.

Parameters:
- __HANDLE__: COMP handle

Return value:
- None

__HAL_COMP_DISABLE

Description:
- Disable the specified comparator.

Parameters:
- __HANDLE__: COMP handle

Return value:
- None

__HAL_COMP_LOCK

Description:
- Lock the specified comparator configuration.

Parameters:
- __HANDLE__: COMP handle

Return value:
- None

Notes:
- Using this macro induce HAL COMP handle state machine being no more in line with COMP instance state. To keep HAL COMP handle state machine updated, it is recommended to use function "HAL_COMP_Lock')".

__HAL_COMP_IS_LOCKED

Description:
- Check whether the specified comparator is locked.

Parameters:
- __HANDLE__: COMP handle

Return value:
- Value: 0 if COMP instance is not locked, value 1 if COMP instance is locked

COMP hysteresis

COMP_HYSTERESIS_NONE

No hysteresis

COMP_HYSTERESIS_LOW

Hysteresis level low

COMP_HYSTERESIS_MEDIUM

Hysteresis level medium

COMP_HYSTERESIS_HIGH

Hysteresis level high

COMP input minus (inverting input)

COMP_INPUT_MINUS_1_4VREFINT

Comparator input minus connected to 1/4 VrefInt

COMP_INPUT_MINUS_1_2VREFINT

Comparator input minus connected to 1/2 VrefInt

COMP_INPUT_MINUS_3_4VREFINT

Comparator input minus connected to 3/4 VrefInt

COMP_INPUT_MINUS_VREFINT

Comparator input minus connected to VrefInt

COMP_INPUT_MINUS_DAC1_CH1

Comparator input minus connected to DAC1 channel 1 (DAC_OUT1)

COMP_INPUT_MINUS_DAC1_CH2

Comparator input minus connected to DAC1 channel 2 (DAC_OUT2)

COMP_INPUT_MINUS_IO1

Comparator input minus connected to IO1 (pin PB1 for COMP1, pin PB7 for COMP2)

COMP_INPUT_MINUS_IO2

Comparator input minus connected to IO2 (pin PC4 for COMP1, pin PB3 for COMP2)

COMP input plus (non-inverting input)

COMP_INPUT_PLUS_IO1

Comparator input plus connected to IO1 (pin PC5 for COMP1, pin PB4 for COMP2)

COMP_INPUT_PLUS_IO2

Comparator input plus connected to IO2 (pin PB2 for COMP1, pin PB6 for COMP2)

COMP_INPUT_PLUS_IO3

Comparator input plus connected to IO3 (pin PA2 for COMP1)

COMP Output Level

COMP_OUTPUT_LEVEL_LOW

COMP_OUTPUT_LEVEL_HIGH

COMP output Polarity

COMP_OUTPUTPOL_NONINVERTED

COMP output level is not inverted (comparator output is high when the input plus is at a higher voltage than the input minus)

COMP_OUTPUTPOL_INVERTED

COMP output level is inverted (comparator output is low when the input plus is at a higher voltage than the input minus)

COMP power mode

COMP_POWERMODE_HIGHSPEED

High Speed

COMP_POWERMODE_MEDIUMSPEED

Medium Speed

COMP_POWERMODE_ULTRALOWPOWER

Ultra-low power

COMP Window Mode

COMP_WINDOWMODE_DISABLE

Window mode disable: Comparators instances pair COMP1 and COMP2 are independent

COMP_WINDOWMODE_COMP1_INPUT_PLUS_COMMON

Window mode enable: Comparators instances pair COMP1 and COMP2 have their input plus connected together. The common input is COMP1 input plus (COMP2 input plus is no more accessible).

COMP_WINDOWMODE_COMP2_INPUT_PLUS_COMMON

Window mode enable: if used from COMP1 or COMP2 instance, comparators instances pair COMP1 and COMP2 have their input plus connected together, the common input is COMP2 input plus (COMP1 input plus is no more accessible).

COMP window mode instance differentiator

COMP_WINDOWMODE_COMP2

COMP window mode using common input of COMP instance: COMP2

COMP Window output

COMP_WINDOWOUTPUT_EACH_COMP

Window output default mode: Comparators output are indicating each their own state. To know window mode state: each comparator output must be read, if "((COMPx exclusive or COMPy) == 1)" then monitored signal is within comparators window.

COMP_WINDOWOUTPUT_COMP1

Window output synthesized on COMP1 output: COMP1 output is no more indicating its own state, but global window mode state (logical high means monitored signal is within comparators window). Note: impacts only comparator output signal level (COMPx_OUT propagated to GPIO, EXTI lines, timers, ...), does not impact output digital state of comparator (COMPx_VALUE) always reflecting each comparator output state.

COMP_WINDOWOUTPUT_COMP2

Window output synthesized on COMP2 output: COMP2 output is no more indicating its own state, but global window mode state (logical high means monitored signal is within comparators window). Note: impacts only comparator output signal level (COMPx_OUT propagated to GPIO, EXTI lines, timers, ...), does not impact output digital state of comparator (COMPx_VALUE) always reflecting each comparator output state.

COMP_WINDOWOUTPUT_BOTH

Window output synthesized on both comparators output of pair of comparator selected (COMP1 and COMP2: both comparators outputs are no more indicating their own state, but global window mode state (logical high means monitored signal is within comparators window). This is a specific configuration (technically possible but not relevant from application point of view: 2 comparators output used for the same signal level), standard configuration for window mode is one of the settings above.

10 HAL CORDIC Generic Driver

10.1 CORDIC Firmware driver registers structures

10.1.1 __CORDIC_HandleTypeDef

__CORDIC_HandleTypeDef is defined in the stm32u5xx_hal_cordic.h

Data Fields

- ***CORDIC_TypeDef * Instance***
- ***const int32_t * pInBuff***
- ***int32_t * pOutBuff***
- ***uint32_t NbCalcToOrder***
- ***uint32_t NbCalcToGet***
- ***uint32_t DMADirection***
- ***DMA_HandleTypeDef * hdmaIn***
- ***DMA_HandleTypeDef * hdmaOut***
- ***HAL_LockTypeDef Lock***

- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***CORDIC_TypeDef* __CORDIC_HandleTypeDef::Instance***
  Register base address
- ***const int32_t* __CORDIC_HandleTypeDef::pInBuff***
  Pointer to CORDIC input data buffer
- ***int32_t* __CORDIC_HandleTypeDef::pOutBuff***
  Pointer to CORDIC output data buffer
- ***uint32_t __CORDIC_HandleTypeDef::NbCalcToOrder***
  Remaining number of calculation to order
- ***uint32_t __CORDIC_HandleTypeDef::NbCalcToGet***
  Remaining number of calculation result to get
- ***uint32_t __CORDIC_HandleTypeDef::DMADirection***
  Direction of CORDIC DMA transfers
- ***DMA_HandleTypeDef* __CORDIC_HandleTypeDef::hdmaIn***
  CORDIC peripheral input data DMA handle parameters
- ***DMA_HandleTypeDef* __CORDIC_HandleTypeDef::hdmaOut***
  CORDIC peripheral output data DMA handle parameters
- ***HAL_LockTypeDef __CORDIC_HandleTypeDef::Lock***
  CORDIC locking object
- ***__IO HAL_CORDIC_StateTypeDef __CORDIC_HandleTypeDef::State***
  CORDIC state
- ***__IO uint32_t __CORDIC_HandleTypeDef::ErrorCode***
  CORDIC peripheral error code This parameter can be a value of ***CORDIC_Error_Code***
- ***void(* __CORDIC_HandleTypeDef::ErrorCallback)(struct __CORDIC_HandleTypeDef *hcordic)***
  CORDIC error callback
- ***void(* __CORDIC_HandleTypeDef::CalculateCpltCallback)(struct __CORDIC_HandleTypeDef *hcordic)***
  CORDIC calculate complete callback

- ***void(* __CORDIC_HandleTypeDef::MspInitCallback)(struct __CORDIC_HandleTypeDef *hcordic)***
  CORDIC Msp Init callback
- ***void(* __CORDIC_HandleTypeDef::MspDeInitCallback)(struct __CORDIC_HandleTypeDef *hcordic)***
  CORDIC Msp DeInit callback

10.1.2 CORDIC_ConfigTypeDef

CORDIC_ConfigTypeDef is defined in the stm32u5xx_hal_cordic.h

Data Fields

- ***uint32_t Function***
- ***uint32_t Scale***
- ***uint32_t InSize***
- ***uint32_t OutSize***
- ***uint32_t NbWrite***
- ***uint32_t NbRead***
- ***uint32_t Precision***

Field Documentation

- ***uint32_t CORDIC_ConfigTypeDef::Function***
  Function This parameter can be a value of ***CORDIC_Function***
- ***uint32_t CORDIC_ConfigTypeDef::Scale***
  Scaling factor This parameter can be a value of ***CORDIC_Scale***
- ***uint32_t CORDIC_ConfigTypeDef::InSize***
  Width of input data This parameter can be a value of ***CORDIC_In_Size***
- ***uint32_t CORDIC_ConfigTypeDef::OutSize***
  Width of output data This parameter can be a value of ***CORDIC_Out_Size***
- ***uint32_t CORDIC_ConfigTypeDef::NbWrite***
  Number of 32-bit write expected for one calculation This parameter can be a value of ***CORDIC_Nb_Write***
- ***uint32_t CORDIC_ConfigTypeDef::NbRead***
  Number of 32-bit read expected after one calculation This parameter can be a value of ***CORDIC_Nb_Read***
- ***uint32_t CORDIC_ConfigTypeDef::Precision***
  Number of cycles for calculation This parameter can be a value of ***CORDIC_Precision_In_Cycles_Number***

10.2 CORDIC Firmware driver API description

The following section lists the various functions of the CORDIC library.

10.2.1 How to use this driver

The CORDIC HAL driver can be used as follows:

1. Initialize the CORDIC low level resources by implementing the HAL_CORDIC_MspInit():
   - Enable the CORDIC interface clock using __HAL_RCC_CORDIC_CLK_ENABLE()
   - In case of using interrupts (e.g. HAL_CORDIC_Calculate_IT())
     - Configure the CORDIC interrupt priority using HAL_NVIC_SetPriority()
     - Enable the CORDIC IRQ handler using HAL_NVIC_EnableIRQ()
     - In CORDIC IRQ handler, call HAL_CORDIC_IRQHandler()
   - In case of using DMA to control data transfer (e.g. HAL_CORDIC_Calculate_DMA())
     - Enable the DMA2 interface clock using __HAL_RCC_DMA2_CLK_ENABLE()
     - Configure and enable two DMA channels one for managing data transfer from memory to peripheral (input channel) and another channel for managing data transfer from peripheral to memory (output channel)
     - Associate the initialized DMA handle to the CORDIC DMA handle using __HAL_LINKDMA()
     - Configure the priority and enable the NVIC for the transfer complete interrupt on the two DMA channels. Resort to HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ()

2. Initialize the CORDIC HAL using HAL_CORDIC_Init(). This function
   – resorts to HAL_CORDIC_MspInit() for low-level initialization,
3. Configure CORDIC processing (calculation) using HAL_CORDIC_Configure(). This function configures:
   – Processing functions: Cosine, Sine, Phase, Modulus, Arctangent, Hyperbolic cosine, Hyperbolic sine, Hyperbolic arctangent, Natural log, Square root
   – Scaling factor: 1 to 2exp(-7)
   – Width of input data: 32 bits input data size (Q1.31 format) or 16 bits input data size (Q1.15 format)
   – Width of output data: 32 bits output data size (Q1.31 format) or 16 bits output data size (Q1.15 format)
   – Number of 32-bit write expected for one calculation: One 32-bits write or Two 32-bit write
   – Number of 32-bit read expected after one calculation: One 32-bits read or Two 32-bit read
   – Precision: 1 to 15 cycles for calculation (the more cycles, the better precision)
4. Four processing (calculation) functions are available:
   – Polling mode: processing API is blocking function i.e. it processes the data and wait till the processing is finished API is HAL_CORDIC_Calculate
   – Polling Zero-overhead mode: processing API is blocking function i.e. it processes the data and wait till the processing is finished A bit faster than standard polling mode, but blocking also AHB bus API is HAL_CORDIC_CalculateZO
   – Interrupt mode: processing API is not blocking functions i.e. it processes the data under interrupt API is HAL_CORDIC_Calculate_IT
   – DMA mode: processing API is not blocking functions and the CPU is not used for data transfer, i.e. the data transfer is ensured by DMA API is HAL_CORDIC_Calculate_DMA
5. Call HAL_CORDIC_DeInit() to de-initialize the CORDIC peripheral. This function
   – resorts to HAL_CORDIC_MspDeInit() for low-level de-initialization,

Callback registration

10.2.2 Initialization and de-initialization functions

This section provides functions allowing to:
- Initialize the CORDIC peripheral and the associated handle
- DeInitialize the CORDIC peripheral
- Initialize the CORDIC MSP (MCU Specific Package)
- De-Initialize the CORDIC MSP

This section contains the following APIs:
- *HAL_CORDIC_Init()*
- *HAL_CORDIC_DeInit()*
- *HAL_CORDIC_MspInit()*
- *HAL_CORDIC_MspDeInit()*
- *HAL_CORDIC_RegisterCallback()*
- *HAL_CORDIC_UnRegisterCallback()*
- *HAL_CORDIC_RegisterCallback()*

10.2.3 Peripheral Control functions

This section provides functions allowing to:
- Configure the CORDIC peripheral: function, precision, scaling factor, number of input data and output data, size of input data and output data.
- Calculate output data of CORDIC processing on input date, using the existing CORDIC configuration

Four processing functions are available for calculation:
- Polling mode
- Polling mode, with Zero-Overhead register access
- Interrupt mode
- DMA mode

This section contains the following APIs:
- *HAL_CORDIC_Configure()*
- *HAL_CORDIC_Calculate()*
- *HAL_CORDIC_CalculateZO()*
- *HAL_CORDIC_Calculate_IT()*
- *HAL_CORDIC_Calculate_DMA()*

10.2.4 Callback functions

This section provides Interruption and DMA callback functions:
- DMA or Interrupt calculate complete
- DMA or Interrupt error

This section contains the following APIs:
- *HAL_CORDIC_ErrorCallback()*
- *HAL_CORDIC_CalculateCpltCallback()*

10.2.5 IRQ handler management

This section provides IRQ handler function.

This section contains the following APIs:
- *HAL_CORDIC_IRQHandler()*

10.2.6 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:
- *HAL_CORDIC_GetState()*
- *HAL_CORDIC_GetError()*

10.2.7 Detailed description of functions

HAL_CORDIC_Init

Function name

HAL_StatusTypeDef HAL_CORDIC_Init (CORDIC_HandleTypeDef * hcordic)

Function description

Initialize the CORDIC peripheral and the associated handle.

Parameters
- **hcordic:** pointer to a CORDIC_HandleTypeDef structure.

Return values
- **HAL:** status

HAL_CORDIC_DeInit

Function name

HAL_StatusTypeDef HAL_CORDIC_DeInit (CORDIC_HandleTypeDef * hcordic)

Function description

DeInitialize the CORDIC peripheral.

Parameters
- **hcordic:** pointer to a CORDIC_HandleTypeDef structure.

Return values

- **HAL:** status

HAL_CORDIC_MspInit

Function name

void HAL_CORDIC_MspInit (CORDIC_HandleTypeDef * hcordic)

Function description

Initialize the CORDIC MSP.

Parameters

- **hcordic:** CORDIC handle

Return values

- **None:**

HAL_CORDIC_MspDeInit

Function name

void HAL_CORDIC_MspDeInit (CORDIC_HandleTypeDef * hcordic)

Function description

DeInitialize the CORDIC MSP.

Parameters

- **hcordic:** CORDIC handle

Return values

- **None:**

HAL_CORDIC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_CORDIC_RegisterCallback (CORDIC_HandleTypeDef * hcordic, HAL_CORDIC_CallbackIDTypeDef CallbackID, pCORDIC_CallbackTypeDef pCallback)

Function description

HAL_CORDIC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_CORDIC_UnRegisterCallback (CORDIC_HandleTypeDef * hcordic, HAL_CORDIC_CallbackIDTypeDef CallbackID)

Function description

Unregister a CORDIC CallBack.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  – HAL_CORDIC_ERROR_CB_ID error Callback ID
  – HAL_CORDIC_CALCULATE_CPLT_CB_ID calculate complete Callback ID
  – HAL_CORDIC_MSPINIT_CB_ID MspInit callback ID
  – HAL_CORDIC_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_CORDIC_Configure

Function name

HAL_StatusTypeDef HAL_CORDIC_Configure (CORDIC_HandleTypeDef * hcordic, const CORDIC_ConfigTypeDef * sConfig)

Function description

Configure the CORDIC processing according to the specified parameters in the CORDIC_ConfigTypeDef structure.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module
- **sConfig:** pointer to a CORDIC_ConfigTypeDef structure that contains the CORDIC configuration information.

Return values

- **HAL:** status

HAL_CORDIC_Calculate

Function name

HAL_StatusTypeDef HAL_CORDIC_Calculate (CORDIC_HandleTypeDef * hcordic, const int32_t * pInBuff, int32_t * pOutBuff, uint32_t NbCalc, uint32_t Timeout)

Function description

Carry out data of CORDIC processing in polling mode, according to the existing CORDIC configuration.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module.
- **pInBuff:** Pointer to buffer containing input data for CORDIC processing.
- **pOutBuff:** Pointer to buffer where output data of CORDIC processing will be stored.
- **NbCalc:** Number of CORDIC calculation to process.
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CORDIC_CalculateZO

Function name

HAL_StatusTypeDef HAL_CORDIC_CalculateZO (CORDIC_HandleTypeDef * hcordic, const int32_t * pInBuff, int32_t * pOutBuff, uint32_t NbCalc, uint32_t Timeout)

Function description

Carry out data of CORDIC processing in Zero-Overhead mode (output data being read soon as input data are written), according to the existing CORDIC configuration.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module.
- **pInBuff:** Pointer to buffer containing input data for CORDIC processing.
- **pOutBuff:** Pointer to buffer where output data of CORDIC processing will be stored.
- **NbCalc:** Number of CORDIC calculation to process.
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CORDIC_Calculate_IT

Function name

HAL_StatusTypeDef HAL_CORDIC_Calculate_IT (CORDIC_HandleTypeDef * hcordic, const int32_t * pInBuff, int32_t * pOutBuff, uint32_t NbCalc)

Function description

Carry out data of CORDIC processing in interrupt mode, according to the existing CORDIC configuration.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module.
- **pInBuff:** Pointer to buffer containing input data for CORDIC processing.
- **pOutBuff:** Pointer to buffer where output data of CORDIC processing will be stored.
- **NbCalc:** Number of CORDIC calculation to process.

Return values

- **HAL:** status

HAL_CORDIC_Calculate_DMA

Function name

HAL_StatusTypeDef HAL_CORDIC_Calculate_DMA (CORDIC_HandleTypeDef * hcordic, const int32_t * pInBuff, int32_t * pOutBuff, uint32_t NbCalc, uint32_t DMADirection)

Function description

Carry out input and/or output data of CORDIC processing in DMA mode, according to the existing CORDIC configuration.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module.
- **pInBuff:** Pointer to buffer containing input data for CORDIC processing.
- **pOutBuff:** Pointer to buffer where output data of CORDIC processing will be stored.
- **NbCalc:** Number of CORDIC calculation to process.
- **DMADirection:** Direction of DMA transfers. This parameter can be one of the following values:
  - CORDIC DMA direction CORDIC DMA direction

Return values

- **HAL:** status

Notes

- pInBuff or pOutBuff is unused in case of unique DMADirection transfer, and can be set to NULL value in this case.
- pInBuff and pOutBuff buffers must be 32-bit aligned to ensure a correct DMA transfer to and from the Peripheral.

HAL_CORDIC_ErrorCallback

Function name

void HAL_CORDIC_ErrorCallback (CORDIC_HandleTypeDef * hcordic)

Function description

CORDIC error callback.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module

Return values

- **None:**

HAL_CORDIC_CalculateCpltCallback

Function name

void HAL_CORDIC_CalculateCpltCallback (CORDIC_HandleTypeDef * hcordic)

Function description

CORDIC calculate complete callback.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module

Return values

- **None:**

HAL_CORDIC_IRQHandler

Function name

void HAL_CORDIC_IRQHandler (CORDIC_HandleTypeDef * hcordic)

Function description

Handle CORDIC interrupt request.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module

Return values

- **None:**

HAL_CORDIC_GetState

Function name

HAL_CORDIC_StateTypeDef HAL_CORDIC_GetState (const CORDIC_HandleTypeDef * hcordic)

Function description

Return the CORDIC handle state.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module

Return values

- **HAL:** state

HAL_CORDIC_GetError

Function name

uint32_t HAL_CORDIC_GetError (const CORDIC_HandleTypeDef * hcordic)

Function description

Return the CORDIC peripheral error.

Parameters

- **hcordic:** pointer to a CORDIC_HandleTypeDef structure that contains the configuration information for CORDIC module

Return values

- **Error:** bit-map

Notes

- The returned error is a bit-map combination of possible errors

10.3 CORDIC Firmware driver defines

The following section lists the various define and macros of the module.

10.3.1 CORDIC

CORDIC

DMA Read Request Enable bit

CORDIC_DMA_REN

DMA Read requests enable

DMA Write Request Enable bit

CORDIC_DMA_WEN

DMA Write channel enable

CORDIC DMA direction

CORDIC_DMA_DIR_NONE

DMA direction : none

CORDIC_DMA_DIR_IN

DMA direction : Input of CORDIC

CORDIC_DMA_DIR_OUT

DMA direction : Output of CORDIC

CORDIC_DMA_DIR_IN_OUT

DMA direction : Input and Output of CORDIC

CORDIC Error code

HAL_CORDIC_ERROR_NONE

No error

HAL_CORDIC_ERROR_PARAM

Wrong parameter error

HAL_CORDIC_ERROR_NOT_READY

Peripheral not ready

HAL_CORDIC_ERROR_TIMEOUT

Timeout error

HAL_CORDIC_ERROR_DMA

DMA error

HAL_CORDIC_ERROR_INVALID_CALLBACK

Invalid Callback error

CORDIC Exported Macros

__HAL_CORDIC_RESET_HANDLE_STATE

Description:

- Reset CORDIC handle state.

Parameters:

- __HANDLE__: CORDIC handle

Return value:

- None

__HAL_CORDIC_ENABLE_IT

Description:

- Enable the CORDIC interrupt when result is ready.

Parameters:

- __HANDLE__: CORDIC handle.
- __INTERRUPT__: CORDIC Interrupt. This parameter can be one of the following values:
  - CORDIC_IT_IEN Enable Interrupt

Return value:

- None

__HAL_CORDIC_DISABLE_IT

Description:

- Disable the CORDIC interrupt.

Parameters:

- __HANDLE__: CORDIC handle.
- __INTERRUPT__: CORDIC Interrupt. This parameter can be one of the following values:
  - CORDIC_IT_IEN Enable Interrupt

Return value:

- None

__HAL_CORDIC_GET_IT

Description:
- Check whether the specified CORDIC interrupt occurred or not.

Parameters:
- __HANDLE__: CORDIC handle.
- __INTERRUPT__: CORDIC interrupt to check

Return value:
- SET: (interrupt occurred) or RESET (interrupt did not occurred)

__HAL_CORDIC_CLEAR_IT

Description:
- Clear specified CORDIC interrupt status.

Parameters:
- __HANDLE__: CORDIC handle.
- __INTERRUPT__: CORDIC interrupt to clear

Return value:
- None

__HAL_CORDIC_GET_FLAG

Description:
- Check whether the specified CORDIC status flag is set or not.

Parameters:
- __HANDLE__: CORDIC handle.
- __FLAG__: CORDIC flag to check This parameter can be one of the following values:
  - CORDIC_FLAG_RRDY Result Ready Flag

Return value:
- SET: (flag is set) or RESET (flag is reset)

__HAL_CORDIC_CLEAR_FLAG

Description:
- Clear specified CORDIC status flag.

Parameters:
- __HANDLE__: CORDIC handle.
- __FLAG__: CORDIC flag to clear This parameter can be one of the following values:
  - CORDIC_FLAG_RRDY Result Ready Flag

Return value:
- None

__HAL_CORDIC_GET_IT_SOURCE

Description:
- Check whether the specified CORDIC interrupt is enabled or not.

Parameters:
- __HANDLE__: CORDIC handle.
- __INTERRUPT__: CORDIC interrupt to check This parameter can be one of the following values:
  - CORDIC_IT_IEN Enable Interrupt

Return value:
- FlagStatus

CORDIC status flags

CORDIC_FLAG_RRDY

Result Ready Flag

CORDIC Function

CORDIC_FUNCTION_COSINE

Cosine

CORDIC_FUNCTION_SINE

Sine

CORDIC_FUNCTION_PHASE

Phase

CORDIC_FUNCTION_MODULUS

Modulus

CORDIC_FUNCTION_ARCTANGENT

Arctangent

CORDIC_FUNCTION_HCOSINE

Hyperbolic Cosine

CORDIC_FUNCTION_HSINE

Result ready interrupt enable

CORDIC input data size

CORDIC_INSIZE_32BITS

32 bits input data size (Q1.31 format)

CORDIC_INSIZE_16BITS

16 bits input data size (Q1.15 format)

CORDIC Number of 32-bit read required after one calculation

CORDIC_NBREAD_1

One 32-bits read containing either only one 32-bit data output (Q1.31 format), or two 16-bit data output (Q1.15 format) packed in one 32 bits Data

CORDIC_NBREAD_2

Two 32-bit Data containing two 32-bits data output (Q1.31 format)

CORDIC Number of 32-bit write required for one calculation

CORDIC_NBWRITE_1

One 32-bits write containing either only one 32-bit data input (Q1.31 format), or two 16-bit data input (Q1.15 format) packed in one 32 bits Data

CORDIC_NBWRITE_2

Two 32-bit write containing two 32-bits data input (Q1.31 format)

CORDIC Results Size

CORDIC_OUTSIZE_32BITS

32 bits output data size (Q1.31 format)

CORDIC_OUTSIZE_16BITS

16 bits output data size (Q1.15 format)

11 HAL CORTEX Generic Driver

11.1 CORTEX Firmware driver registers structures

11.1.1 MPU_Region_InitTypeDef

MPU_Region_InitTypeDef is defined in the stm32u5xx_hal_cortex.h

Data Fields

- ***uint8_t Enable***
- ***uint8_t Number***
- ***uint32_t BaseAddress***
- ***uint32_t LimitAddress***
- ***uint8_t AttributesIndex***
- ***uint8_t AccessPermission***
- ***uint8_t DisableExec***
- ***uint8_t IsShareable***

Field Documentation

- ***uint8_t MPU_Region_InitTypeDef::Enable***
  Specifies the status of the region. This parameter can be a value of ***CORTEX_MPU_Region_Enable***
- ***uint8_t MPU_Region_InitTypeDef::Number***
  Specifies the index of the region to protect. This parameter can be a value of ***CORTEX_MPU_Region_Number***
- ***uint32_t MPU_Region_InitTypeDef::BaseAddress***
  Specifies the base address of the region to protect.
- ***uint32_t MPU_Region_InitTypeDef::LimitAddress***
  Specifies the limit address of the region to protect.
- ***uint8_t MPU_Region_InitTypeDef::AttributesIndex***
  Specifies the memory attributes index. This parameter can be a value of ***CORTEX_MPU_Attributes_Number***
- ***uint8_t MPU_Region_InitTypeDef::AccessPermission***
  Specifies the region access permission type. This parameter can be a value of ***CORTEX_MPU_Region_Permission_Attributes***
- ***uint8_t MPU_Region_InitTypeDef::DisableExec***
  Specifies the instruction access status. This parameter can be a value of ***CORTEX_MPU_Instruction_Access***
- ***uint8_t MPU_Region_InitTypeDef::IsShareable***
  Specifies the shareability status of the protected region. This parameter can be a value of ***CORTEX_MPU_Access_Shareable***

11.1.2 MPU_Attributes_InitTypeDef

MPU_Attributes_InitTypeDef is defined in the stm32u5xx_hal_cortex.h

Data Fields

- ***uint8_t Number***
- ***uint8_t Attributes***

Field Documentation

- ***uint8_t MPU_Attributes_InitTypeDef::Number***
  Specifies the number of the memory attributes to configure. This parameter can be a value of ***CORTEX_MPU_Attributes_Number***
- ***uint8_t MPU_Attributes_InitTypeDef::Attributes***
  Specifies the memory attributes value. Attributes This parameter can be a combination of ***CORTEX_MPU_Attributes***

11.2 CORTEX Firmware driver API description

The following section lists the various functions of the CORTEX library.

11.2.1 How to use this driver

How to configure Interrupts using CORTEX HAL driver

This section provides functions allowing to configure the NVIC interrupts (IRQ). The Cortex-M33 exceptions are managed by CMSIS functions.

1. Configure the NVIC Priority Grouping using HAL_NVIC_SetPriorityGrouping() function.
2. Configure the priority of the selected IRQ Channels using HAL_NVIC_SetPriority().
3. Enable the selected IRQ Channels using HAL_NVIC_EnableIRQ().

Note: When the NVIC_PRIORITYGROUP_0 is selected, IRQ pre-emption is no more possible. The pending IRQ priority will be managed only by the sub priority.

Note: IRQ priority order (sorted by highest to lowest priority):

- *Lowest pre-emption priority*
- *Lowest sub priority*
- *Lowest hardware priority (IRQ number)*

How to configure SysTick using CORTEX HAL driver

Setup SysTick Timer for time base.

- The HAL_SYSTICK_Config() function calls the SysTick_Config() function which is a CMSIS function that:
  - Configures the SysTick Reload register with value passed as function parameter.
  - Configures the SysTick IRQ priority to the lowest value (0x0F).
  - Resets the SysTick Counter register.
  - Configures the SysTick Counter clock source to be Core Clock Source (HCLK).
  - Enables the SysTick Interrupt.
  - Starts the SysTick Counter.
- You can change the SysTick Clock source to be HCLK_Div8 by calling the macro __HAL_CORTEX_SYSTICKCLK_CONFIG(SYSTICK_CLKSOURCE_HCLK_DIV8) just after the HAL_SYSTICK_Config() function call. The __HAL_CORTEX_SYSTICKCLK_CONFIG() macro is defined inside the stm32u5xx_hal_cortex.h file.
- You can change the SysTick IRQ priority by calling the HAL_NVIC_SetPriority(SysTick_IRQn,...) function just after the HAL_SYSTICK_Config() function call. The HAL_NVIC_SetPriority() call the NVIC_SetPriority() function which is a CMSIS function.
- To adjust the SysTick time base, use the following formula: Reload Value = SysTick Counter Clock (Hz) x Desired Time base (s)
  - Reload Value is the parameter to be passed for HAL_SYSTICK_Config() function
  - Reload Value should not exceed 0xFFFFFF

How to configure MPU (secure and non secure) using CORTEX HAL driver

This section provides functions allowing to Enable and configure the MPU secure and non-secure.

1. Enable the MPU using HAL_MPU_Enable() function.
2. Disable the MPU using HAL_MPU_Disable() function.
3. Enable the MPU using HAL_MPU_Enable_NS() function to address the non secure MPU.
4. Disable the MPU using HAL_MPU_Disable_NS() function to address the non secure MPU.
5. Configure the MPU region using HAL_MPU_ConfigRegion() and HAL_MPU_ConfigRegion_NS() to address the non secure MPU.
6. Configure the MPU Memory attributes using HAL_MPU_ConfigMemoryAttributes() and HAL_MPU_ConfigMemoryAttributes_NS() to address the non secure MPU.

11.2.2 Initialization and Configuration functions

This section provides the CORTEX HAL driver functions allowing to configure Interrupts SysTick functionalities

This section contains the following APIs:

- *HAL_NVIC_SetPriorityGrouping()*
- *HAL_NVIC_SetPriority()*
- *HAL_NVIC_EnableIRQ()*
- *HAL_NVIC_DisableIRQ()*
- *HAL_NVIC_SystemReset()*
- *HAL_SYSTICK_Config()*

11.2.3 Peripheral Control functions

This subsection provides a set of functions allowing to control the CORTEX (NVIC, SYSTICK, MPU) functionalities.

This section contains the following APIs:

- *HAL_NVIC_GetPriorityGrouping()*
- *HAL_NVIC_GetPriority()*
- *HAL_NVIC_SetPendingIRQ()*
- *HAL_NVIC_GetPendingIRQ()*
- *HAL_NVIC_ClearPendingIRQ()*
- *HAL_NVIC_GetActive()*
- *HAL_SYSTICK_CLKSourceConfig()*
- *HAL_SYSTICK_GetCLKSourceConfig()*
- *HAL_SYSTICK_IRQHandler()*
- *HAL_SYSTICK_Callback()*
- *HAL_MPU_Enable()*
- *HAL_MPU_Enable_NS()*
- *HAL_MPU_Disable()*
- *HAL_MPU_Disable_NS()*
- *HAL_MPU_EnableRegion()*
- *HAL_MPU_EnableRegion_NS()*
- *HAL_MPU_DisableRegion()*
- *HAL_MPU_DisableRegion_NS()*
- *HAL_MPU_ConfigRegion()*
- *HAL_MPU_ConfigRegion_NS()*
- *HAL_MPU_ConfigMemoryAttributes()*
- *HAL_MPU_ConfigMemoryAttributes_NS()*

11.2.4 Detailed description of functions

HAL_NVIC_SetPriorityGrouping

Function name

void HAL_NVIC_SetPriorityGrouping (uint32_t PriorityGroup)

Function description

Set the priority grouping field (pre-emption priority and subpriority) using the required unlock sequence.

Parameters

- **PriorityGroup:** The priority grouping bits length. This parameter can be one of the following values:
  - NVIC_PRIORITYGROUP_0: 0 bit for pre-emption priority, 4 bits for subpriority
  - NVIC_PRIORITYGROUP_1: 1 bit for pre-emption priority, 3 bits for subpriority
  - NVIC_PRIORITYGROUP_2: 2 bits for pre-emption priority, 2 bits for subpriority
  - NVIC_PRIORITYGROUP_3: 3 bits for pre-emption priority, 1 bit for subpriority
  - NVIC_PRIORITYGROUP_4: 4 bits for pre-emption priority, 0 bit for subpriority

Return values

- **None:**

Notes

- When the NVIC_PriorityGroup_0 is selected, IRQ pre-emption is no more possible. The pending IRQ priority will be managed only by the subpriority.

HAL_NVIC_SetPriority

Function name

void HAL_NVIC_SetPriority (IRQn_Type IRQn, uint32_t PreemptPriority, uint32_t SubPriority)

Function description

Set the priority of an interrupt.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32u5xxxx.h))
- **PreemptPriority:** The pre-emption priority for the IRQn channel. This parameter can be a value between 0 and 15 A lower priority value indicates a higher priority
- **SubPriority:** the subpriority level for the IRQ channel. This parameter can be a value between 0 and 15 A lower priority value indicates a higher priority.

Return values

- **None:**

HAL_NVIC_EnableIRQ

Function name

void HAL_NVIC_EnableIRQ (IRQn_Type IRQn)

Function description

Enable a device specific interrupt in the NVIC interrupt controller.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32u5xxxx.h))

Return values

- **None:**

Notes

- To configure interrupts priority correctly, the NVIC_PriorityGroupConfig() function should be called before.

HAL_NVIC_DisableIRQ

Function name

void HAL_NVIC_DisableIRQ (IRQn_Type IRQn)

Function description

Disable a device specific interrupt in the NVIC interrupt controller.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32u5xxxx.h))

Return values

- **None:**

HAL_NVIC_SystemReset

Function name

void HAL_NVIC_SystemReset (void)

Function description

Initiate a system reset request to reset the MCU.

Return values

- **None:**

HAL_SYSTICK_Config

Function name

uint32_t HAL_SYSTICK_Config (uint32_t TicksNumb)

Function description

Initialize the System Timer with interrupt enabled and start the System Tick Timer (SysTick): Counter is in free running mode to generate periodic interrupts.

Parameters

- **TicksNumb:** Specifies the ticks Number of ticks between two interrupts.

Return values

- **status:** - 0 Function succeeded.
  - 1 Function failed.

HAL_NVIC_GetPriorityGrouping

Function name

uint32_t HAL_NVIC_GetPriorityGrouping (void)

Function description

Get the priority grouping field from the NVIC Interrupt Controller.

Return values

- **Priority:** grouping field (SCB->AIRCR [10:8] PRIGROUP field)

HAL_NVIC_GetPriority

Function name

void HAL_NVIC_GetPriority (IRQn_Type IRQn, uint32_t PriorityGroup, uint32_t *const pPreemptPriority, uint32_t *const pSubPriority)

Function description

Get the priority of an interrupt.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32u5xxxx.h))
- **PriorityGroup:** the priority grouping bits length. This parameter can be one of the following values:
  - NVIC_PRIORITYGROUP_0: 0 bit for pre-emption priority, 4 bits for subpriority
  - NVIC_PRIORITYGROUP_1: 1 bit for pre-emption priority, 3 bits for subpriority
  - NVIC_PRIORITYGROUP_2: 2 bits for pre-emption priority, 2 bits for subpriority
  - NVIC_PRIORITYGROUP_3: 3 bits for pre-emption priority, 1 bit for subpriority
  - NVIC_PRIORITYGROUP_4: 4 bits for pre-emption priority, 0 bit for subpriority
- **pPreemptPriority:** Pointer on the Preemptive priority value (starting from 0).
- **pSubPriority:** Pointer on the Subpriority value (starting from 0).

Return values

- **None:**

HAL_NVIC_GetPendingIRQ

Function name

uint32_t HAL_NVIC_GetPendingIRQ (IRQn_Type IRQn)

Function description

Get Pending Interrupt (read the pending register in the NVIC and return the pending bit for the specified interrupt).

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32u5xxxx.h))

Return values

- **status:** - 0 Interrupt status is not pending.
  - 1 Interrupt status is pending.

HAL_NVIC_SetPendingIRQ

Function name

void HAL_NVIC_SetPendingIRQ (IRQn_Type IRQn)

Function description

Set Pending bit of an external interrupt.

Parameters

- **IRQn:** External interrupt number This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32u5xxxx.h))

Return values

- **None:**

HAL_NVIC_ClearPendingIRQ

Function name

void HAL_NVIC_ClearPendingIRQ (IRQn_Type IRQn)

Function description

Clear the pending bit of an external interrupt.

Parameters

- **IRQn:** External interrupt number. This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32u5xxxx.h))

Return values

- **None:**

HAL_NVIC_GetActive

Function name

uint32_t HAL_NVIC_GetActive (IRQn_Type IRQn)

Function description

Get active interrupt (read the active register in NVIC and return the active bit).

Parameters

- **IRQn:** External interrupt number This parameter can be an enumerator of IRQn_Type enumeration (For the complete STM32 Devices IRQ Channels list, please refer to the appropriate CMSIS device file (stm32u5xxxx.h))

Return values

- **status:** - 0 Interrupt status is not pending.
  – 1 Interrupt status is pending.

HAL_SYSTICK_CLKSourceConfig

Function name

void HAL_SYSTICK_CLKSourceConfig (uint32_t CLKSource)

Function description

Configure the SysTick clock source.

Parameters

- **CLKSource:** specifies the SysTick clock source. This parameter can be one of the following values:
  – SYSTICK_CLKSOURCE_LSI: LSI clock selected as SysTick clock source.
  – SYSTICK_CLKSOURCE_LSE: LSE clock selected as SysTick clock source.
  – SYSTICK_CLKSOURCE_HCLK: AHB clock selected as SysTick clock source.
  – SYSTICK_CLKSOURCE_HCLK_DIV8: AHB clock divided by 8 selected as SysTick clock source.

Return values

- **None:**

HAL_SYSTICK_GetCLKSourceConfig

Function name

uint32_t HAL_SYSTICK_GetCLKSourceConfig (void)

Function description

Get the SysTick clock source configuration.

Return values

- **SysTick:** clock source that can be one of the following values:
  - SYSTICK_CLKSOURCE_LSI: LSI clock selected as SysTick clock source.
  - SYSTICK_CLKSOURCE_LSE: LSE clock selected as SysTick clock source.
  - SYSTICK_CLKSOURCE_HCLK: AHB clock selected as SysTick clock source.
  - SYSTICK_CLKSOURCE_HCLK_DIV8: AHB clock divided by 8 selected as SysTick clock source.

HAL_SYSTICK_IRQHandler

Function name

void HAL_SYSTICK_IRQHandler (void)

Function description

Handle SYSTICK interrupt request.

Return values

- **None:**

HAL_SYSTICK_Callback

Function name

void HAL_SYSTICK_Callback (void)

Function description

SYSTICK callback.

Return values

- **None:**

HAL_MPU_Enable

Function name

void HAL_MPU_Enable (uint32_t MPU_Control)

Function description

Enable the MPU.

Parameters

- **MPU_Control:** Specifies the control mode of the MPU during hard fault, NMI, FAULTMASK and privileged access to the default memory This parameter can be one of the following values:
  - MPU_HFNMI_PRIVDEF_NONE
  - MPU_HARDFAULT_NMI
  - MPU_PRIVILEGED_DEFAULT
  - MPU_HFNMI_PRIVDEF

Return values

- **None:**

HAL_MPU_Disable

Function name

void HAL_MPU_Disable (void)

Function description

Disable the MPU.

Return values

- **None:**

HAL_MPU_EnableRegion

Function name

void HAL_MPU_EnableRegion (uint32_t RegionNumber)

Function description

Enable the MPU Region.

Parameters

- **RegionNumber:** Specifies the index of the region to enable. this parameter can be a value of CORTEX MPU Region Number

Return values

- **None:**

HAL_MPU_DisableRegion

Function name

void HAL_MPU_DisableRegion (uint32_t RegionNumber)

Function description

Disable the MPU Region.

Parameters

- **RegionNumber:** Specifies the index of the region to disable. this parameter can be a value of CORTEX MPU Region Number

Return values

- **None:**

HAL_MPU_ConfigRegion

Function name

void HAL_MPU_ConfigRegion (const MPU_Region_InitTypeDef *const pMPU_RegionInit)

Function description

Initialize and configure the Region and the memory to be protected.

Parameters

- **pMPU_RegionInit:** Pointer to a MPU_Region_InitTypeDef structure that contains the initialization and configuration information.

Return values

- **None:**

HAL_MPU_ConfigMemoryAttributes

Function name

void HAL_MPU_ConfigMemoryAttributes (const MPU_Attributes_InitTypeDef *const pMPU_AttributesInit)

Function description

Initialize and configure the memory attributes.

Parameters

- **pMPU_AttributesInit:** Pointer to a MPU_Attributes_InitTypeDef structure that contains the initialization and configuration information.

Return values

- **None:**

HAL_MPU_Enable_NS

Function name

void HAL_MPU_Enable_NS (uint32_t MPU_Control)

Function description

Enable the non-secure MPU.

Parameters

- **MPU_Control:** Specifies the control mode of the MPU during hard fault, NMI, FAULTMASK and privileged access to the default memory This parameter can be one of the following values:
  - MPU_HFNMI_PRIVDEF_NONE
  - MPU_HARDFAULT_NMI
  - MPU_PRIVILEGED_DEFAULT
  - MPU_HFNMI_PRIVDEF

Return values

- **None:**

HAL_MPU_Disable_NS

Function name

void HAL_MPU_Disable_NS (void)

Function description

Disable the non-secure MPU.

Return values

- **None:**

HAL_MPU_EnableRegion_NS

Function name

void HAL_MPU_EnableRegion_NS (uint32_t RegionNumber)

Function description

Enable the non-secure MPU Region.

Parameters

- **RegionNumber:** Specifies the index of the region to enable. this parameter can be a value of CORTEX MPU Region Number

Return values

- **None:**

HAL_MPU_DisableRegion_NS

Function name

void HAL_MPU_DisableRegion_NS (uint32_t RegionNumber)

Function description

Disable the non-secure MPU Region.

Parameters

- **RegionNumber:** Specifies the index of the region to disable. this parameter can be a value of CORTEX MPU Region Number

Return values

- **None:**

HAL_MPU_ConfigRegion_NS

Function name

void HAL_MPU_ConfigRegion_NS (const MPU_Region_InitTypeDef *const pMPU_RegionInit)

Function description

Initialize and configure the Region and the memory to be protected for non-secure MPU.

Parameters

- **pMPU_RegionInit:** Pointer to a MPU_Region_InitTypeDef structure that contains the initialization and configuration information.

Return values

- **None:**

HAL_MPU_ConfigMemoryAttributes_NS

Function name

void HAL_MPU_ConfigMemoryAttributes_NS (const MPU_Attributes_InitTypeDef *const pMPU_AttributesInit)

Function description

Initialize and configure the memory attributes for non-secure MPU.

Parameters

- **pMPU_AttributesInit:** Pointer to a MPU_Attributes_InitTypeDef structure that contains the initialization and configuration information.

Return values

- **None:**

11.3 CORTEX Firmware driver defines

12 HAL CRC Generic Driver

12.1 CRC Firmware driver registers structures

12.1.1 CRC_InitTypeDef

CRC_InitTypeDef is defined in the stm32u5xx_hal_crc.h

Data Fields

- ***uint8_t DefaultPolynomialUse***
- ***uint8_t DefaultInitValueUse***
- ***uint32_t GeneratingPolynomial***
- ***uint32_t CRCLength***
- ***uint32_t InitValue***
- ***uint32_t InputDataInversionMode***
- ***uint32_t OutputDataInversionMode***

Field Documentation

- ***uint8_t CRC_InitTypeDef::DefaultPolynomialUse***
  This parameter is a value of ***CRC_Default_Polynomial*** and indicates if default polynomial is used. If set to DEFAULT_POLYNOMIAL_ENABLE, resort to default X^32 + X^26 + X^23 + X^22 + X^16 + X^12 + X^11 + X^10 +X^8 + X^7 + X^5 + X^4 + X^2+ X +1. In that case, there is no need to set GeneratingPolynomial field. If otherwise set to DEFAULT_POLYNOMIAL_DISABLE, GeneratingPolynomial and CRCLength fields must be set.
- ***uint8_t CRC_InitTypeDef::DefaultInitValueUse***
  This parameter is a value of ***CRC_Default_InitValue_Use*** and indicates if default init value is used. If set to DEFAULT_INIT_VALUE_ENABLE, resort to default 0xFFFFFFFF value. In that case, there is no need to set InitValue field. If otherwise set to DEFAULT_INIT_VALUE_DISABLE, InitValue field must be set.
- ***uint32_t CRC_InitTypeDef::GeneratingPolynomial***
  Set CRC generating polynomial as a 7, 8, 16 or 32-bit long value for a polynomial degree respectively equal to 7, 8, 16 or 32. This field is written in normal, representation e.g., for a polynomial of degree 7, X^7 + X^6 + X^5 + X^2 + 1 is written 0x65. No need to specify it if DefaultPolynomialUse is set to DEFAULT_POLYNOMIAL_ENABLE.
- ***uint32_t CRC_InitTypeDef::CRCLength***
  This parameter is a value of ***CRC_Polynomial_Sizes*** and indicates CRC length. Value can be either one of
  - **CRC_POLYLENGTH_32B** (32-bit CRC),
  - **CRC_POLYLENGTH_16B** (16-bit CRC),
  - **CRC_POLYLENGTH_8B** (8-bit CRC),
  - **CRC_POLYLENGTH_7B** (7-bit CRC).
- ***uint32_t CRC_InitTypeDef::InitValue***
  Init value to initiate CRC computation. No need to specify it if DefaultInitValueUse is set to DEFAULT_INIT_VALUE_ENABLE.
- ***uint32_t CRC_InitTypeDef::InputDataInversionMode***
  This parameter is a value of ***CRCEx_Input_Data_Inversion*** and specifies input data inversion mode. Can be either one of the following values
  - **CRC_INPUTDATA_INVERSION_NONE** no input data inversion
  - **CRC_INPUTDATA_INVERSION_BYTE** byte-wise inversion, 0x1A2B3C4D becomes 0x58D43CB2
  - **CRC_INPUTDATA_INVERSION_HALFWORD** halfword-wise inversion, 0x1A2B3C4D becomes 0xD458B23C
  - **CRC_INPUTDATA_INVERSION_WORD** word-wise inversion, 0x1A2B3C4D becomes 0xB23CD458

- ***uint32_t CRC_InitTypeDef::OutputDataInversionMode***
  This parameter is a value of ***CRCEx_Output_Data_Inversion*** and specifies output data (i.e. CRC) inversion mode. Can be either
  – **CRC_OUTPUTDATA_INVERSION_DISABLE** no CRC inversion,
  – **CRC_OUTPUTDATA_INVERSION_ENABLE** CRC 0x11223344 is converted into 0x22CC4488

12.1.2 CRC_HandleTypeDef

CRC_HandleTypeDef is defined in the stm32u5xx_hal_crc.h

Data Fields

- ***CRC_TypeDef * Instance***
- ***CRC_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_CRC_StateTypeDef State***
- ***uint32_t InputDataFormat***

Field Documentation

- ***CRC_TypeDef* CRC_HandleTypeDef::Instance***
  Register base address
- ***CRC_InitTypeDef CRC_HandleTypeDef::Init***
  CRC configuration parameters
- ***HAL_LockTypeDef CRC_HandleTypeDef::Lock***
  CRC Locking object
- ***__IO HAL_CRC_StateTypeDef CRC_HandleTypeDef::State***
  CRC communication state
- ***uint32_t CRC_HandleTypeDef::InputDataFormat***
  This parameter is a value of ***CRC_Input_Buffer_Format*** and specifies input data format. Can be either
  – **CRC_INPUTDATA_FORMAT_BYTES** input data is a stream of bytes (8-bit data)
  – **CRC_INPUTDATA_FORMAT_HALFWORDS** input data is a stream of half-words (16-bit data)
  – **CRC_INPUTDATA_FORMAT_WORDS** input data is a stream of words (32-bit data)

  Note that constant CRC_INPUT_FORMAT_UNDEFINED is defined but an initialization error must occur if InputBufferFormat is not one of the three values listed above

12.2 CRC Firmware driver API description

The following section lists the various functions of the CRC library.

12.2.1 How to use this driver

- Enable CRC AHB clock using __HAL_RCC_CRC_CLK_ENABLE();
- Initialize CRC calculator
  – specify generating polynomial (peripheral default or non-default one)
  – specify initialization value (peripheral default or non-default one)
  – specify input data format
  – specify input or output data inversion mode if any
- Use HAL_CRC_Accumulate() function to compute the CRC value of the input data buffer starting with the previously computed CRC as initialization value
- Use HAL_CRC_Calculate() function to compute the CRC value of the input data buffer starting with the defined initialization value (default or non-default) to initiate CRC calculation

12.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the CRC according to the specified parameters in the CRC_InitTypeDef and create the associated handle
- DeInitialize the CRC peripheral

- Initialize the CRC MSP (MCU Specific Package)
- DeInitialize the CRC MSP

This section contains the following APIs:

- *HAL_CRC_Init()*
- *HAL_CRC_DeInit()*
- *HAL_CRC_MspInit()*
- *HAL_CRC_MspDeInit()*

12.2.3 Peripheral Control functions

This section provides functions allowing to:

- compute the 7, 8, 16 or 32-bit CRC value of an 8, 16 or 32-bit data buffer using combination of the previous CRC value and the new one.

or

- compute the 7, 8, 16 or 32-bit CRC value of an 8, 16 or 32-bit data buffer independently of the previous CRC value.

This section contains the following APIs:

- *HAL_CRC_Accumulate()*
- *HAL_CRC_Calculate()*

12.2.4 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_CRC_GetState()*

12.2.5 Detailed description of functions

HAL_CRC_Init

Function name

HAL_StatusTypeDef HAL_CRC_Init (CRC_HandleTypeDef * hcrc)

Function description

Initialize the CRC according to the specified parameters in the CRC_InitTypeDef and create the associated handle.

Parameters

- **hcrc:** CRC handle

Return values

- **HAL:** status

HAL_CRC_DeInit

Function name

HAL_StatusTypeDef HAL_CRC_DeInit (CRC_HandleTypeDef * hcrc)

Function description

DeInitialize the CRC peripheral.

Parameters

- **hcrc:** CRC handle

Return values

- **HAL:** status

HAL_CRC_MspInit

Function name

void HAL_CRC_MspInit (CRC_HandleTypeDef * hcrc)

Function description

Initializes the CRC MSP.

Parameters

- **hcrc:** CRC handle

Return values

- **None:**

HAL_CRC_MspDeInit

Function name

void HAL_CRC_MspDeInit (CRC_HandleTypeDef * hcrc)

Function description

DeInitialize the CRC MSP.

Parameters

- **hcrc:** CRC handle

Return values

- **None:**

HAL_CRC_Accumulate

Function name

uint32_t HAL_CRC_Accumulate (CRC_HandleTypeDef * hcrc, uint32_t pBuffer, uint32_t BufferLength)

Function description

Compute the 7, 8, 16 or 32-bit CRC value of an 8, 16 or 32-bit data buffer starting with the previously computed CRC as initialization value.

Parameters

- **hcrc:** CRC handle
- **pBuffer:** pointer to the input data buffer, exact input data format is provided by hcrc->InputDataFormat.
- **BufferLength:** input data buffer length (number of bytes if pBuffer type is * uint8_t, number of half-words if pBuffer type is * uint16_t, number of words if pBuffer type is * uint32_t).

Return values

- **uint32_t:** CRC (returned value LSBs for CRC shorter than 32 bits)

Notes

- By default, the API expects a uint32_t pointer as input buffer parameter. Input buffer pointers with other types simply need to be cast in uint32_t and the API will internally adjust its input data processing based on the handle field hcrc->InputDataFormat.

HAL_CRC_Calculate

Function name

uint32_t HAL_CRC_Calculate (CRC_HandleTypeDef * hcrc, uint32_t pBuffer, uint32_t BufferLength)

Function description

Compute the 7, 8, 16 or 32-bit CRC value of an 8, 16 or 32-bit data buffer starting with hcrc->Instance->INIT as initialization value.

Parameters

- **hcrc:** CRC handle
- **pBuffer:** pointer to the input data buffer, exact input data format is provided by hcrc->InputDataFormat.
- **BufferLength:** input data buffer length (number of bytes if pBuffer type is * uint8_t, number of half-words if pBuffer type is * uint16_t, number of words if pBuffer type is * uint32_t).

Return values

- **uint32_t:** CRC (returned value LSBs for CRC shorter than 32 bits)

Notes

- By default, the API expects a uint32_t pointer as input buffer parameter. Input buffer pointers with other types simply need to be cast in uint32_t and the API will internally adjust its input data processing based on the handle field hcrc->InputDataFormat.

HAL_CRC_GetState

Function name

HAL_CRC_StateTypeDef HAL_CRC_GetState (const CRC_HandleTypeDef * hcrc)

Function description

Return the CRC handle state.

Parameters

- **hcrc:** CRC handle

Return values

- **HAL:** state

12.3 CRC Firmware driver defines

The following section lists the various define and macros of the module.

12.3.1 CRC

CRC

Default CRC computation initialization value

DEFAULT_CRC_INITVALUE

Initial CRC default value

Indicates whether or not default init value is used

DEFAULT_INIT_VALUE_ENABLE

Enable initial CRC default value

DEFAULT_INIT_VALUE_DISABLE

Disable initial CRC default value

Indicates whether or not default polynomial is used

DEFAULT_POLYNOMIAL_ENABLE

Enable default generating polynomial 0x04C11DB7

DEFAULT_POLYNOMIAL_DISABLE

Disable default generating polynomial 0x04C11DB7

Default CRC generating polynomial

DEFAULT_CRC32_POLY

X^32 + X^26 + X^23 + X^22 + X^16 + X^12 + X^11 + X^10 +X^8 + X^7 + X^5 + X^4 + X^2+ X +1

CRC Exported Macros

__HAL_CRC_RESET_HANDLE_STATE

Description:

- Reset CRC handle state.

Parameters:

- __HANDLE__: CRC handle.

Return value:

- None

__HAL_CRC_DR_RESET

Description:

- Reset CRC Data Register.

Parameters:

- __HANDLE__: CRC handle

Return value:

- None

__HAL_CRC_INITIALCRCVALUE_CONFIG

Description:

- Set CRC INIT non-default value.

Parameters:

- __HANDLE__: CRC handle
- __INIT__: 32-bit initial value

Return value:

- None

__HAL_CRC_SET_IDR

Description:

- Store data in the Independent Data (ID) register.

Parameters:

- __HANDLE__: CRC handle
- __VALUE__: Value to be stored in the ID register

Return value:

- None

Notes:

- Refer to the Reference Manual to get the authorized __VALUE__ length in bits

__HAL_CRC_GET_IDR

Description:
- Return the data stored in the Independent Data (ID) register.

Parameters:
- __HANDLE__: CRC handle

Return value:
- Value: of the ID register

Notes:
- Refer to the Reference Manual to get the authorized __VALUE__ length in bits

Input Buffer Format

CRC_INPUTDATA_FORMAT_UNDEFINED

Undefined input data format

CRC_INPUTDATA_FORMAT_BYTES

Input data in byte format

CRC_INPUTDATA_FORMAT_HALFWORDS

Input data in half-word format

CRC_INPUTDATA_FORMAT_WORDS

Input data in word format

Polynomial sizes to configure the peripheral

CRC_POLYLENGTH_32B

Resort to a 32-bit long generating polynomial

CRC_POLYLENGTH_16B

Resort to a 16-bit long generating polynomial

CRC_POLYLENGTH_8B

Resort to a 8-bit long generating polynomial

CRC_POLYLENGTH_7B

Resort to a 7-bit long generating polynomial

CRC polynomial possible sizes actual definitions

HAL_CRC_LENGTH_32B

32-bit long CRC

HAL_CRC_LENGTH_16B

16-bit long CRC

HAL_CRC_LENGTH_8B

8-bit long CRC

HAL_CRC_LENGTH_7B

7-bit long CRC

13 HAL CRC Extension Driver

13.1 CRCEx Firmware driver API description

The following section lists the various functions of the CRCEx library.

13.1.1 How to use this driver

- Set user-defined generating polynomial through HAL_CRCEx_Polynomial_Set()
- Configure Input or Output data inversion

13.1.2 Extended configuration functions

This section provides functions allowing to:

- Configure the generating polynomial
- Configure the input data inversion
- Configure the output data inversion

This section contains the following APIs:

- *HAL_CRCEx_Polynomial_Set()*
- *HAL_CRCEx_Input_Data_Reverse()*
- *HAL_CRCEx_Output_Data_Reverse()*

13.1.3 Detailed description of functions

HAL_CRCEx_Polynomial_Set

Function name

HAL_StatusTypeDef HAL_CRCEx_Polynomial_Set (CRC_HandleTypeDef * hcrc, uint32_t Pol, uint32_t PolyLength)

Function description

Initialize the CRC polynomial if different from default one.

Parameters

- **hcrc:** CRC handle
- **Pol:** CRC generating polynomial (7, 8, 16 or 32-bit long). This parameter is written in normal representation, e.g.
  – for a polynomial of degree 7, X^7 + X^6 + X^5 + X^2 + 1 is written 0x65
  – for a polynomial of degree 16, X^16 + X^12 + X^5 + 1 is written 0x1021
- **PolyLength:** CRC polynomial length. This parameter can be one of the following values:
  – CRC_POLYLENGTH_7B 7-bit long CRC (generating polynomial of degree 7)
  – CRC_POLYLENGTH_8B 8-bit long CRC (generating polynomial of degree 8)
  – CRC_POLYLENGTH_16B 16-bit long CRC (generating polynomial of degree 16)
  – CRC_POLYLENGTH_32B 32-bit long CRC (generating polynomial of degree 32)

Return values

- **HAL:** status

HAL_CRCEx_Input_Data_Reverse

Function name

HAL_StatusTypeDef HAL_CRCEx_Input_Data_Reverse (CRC_HandleTypeDef * hcrc, uint32_t InputReverseMode)

Function description

Set the Reverse Input data mode.

Parameters

- **hcrc:** CRC handle
- **InputReverseMode:** Input Data inversion mode. This parameter can be one of the following values:
  - CRC_INPUTDATA_INVERSION_NONE no change in bit order (default value)
  - CRC_INPUTDATA_INVERSION_BYTE Byte-wise bit reversal
  - CRC_INPUTDATA_INVERSION_HALFWORD HalfWord-wise bit reversal
  - CRC_INPUTDATA_INVERSION_WORD Word-wise bit reversal

Return values

- **HAL:** status

HAL_CRCEx_Output_Data_Reverse

Function name

HAL_StatusTypeDef HAL_CRCEx_Output_Data_Reverse (CRC_HandleTypeDef * hcrc, uint32_t OutputReverseMode)

Function description

Set the Reverse Output data mode.

Parameters

- **hcrc:** CRC handle
- **OutputReverseMode:** Output Data inversion mode. This parameter can be one of the following values:
  - CRC_OUTPUTDATA_INVERSION_DISABLE no CRC inversion (default value)
  - CRC_OUTPUTDATA_INVERSION_ENABLE bit-level inversion (e.g. for a 8-bit CRC: 0xB5 becomes 0xAD)

Return values

- **HAL:** status

13.2 CRCEx Firmware driver defines

The following section lists the various define and macros of the module.

13.2.1 CRCEx

CRCEx

CRC Extended Exported Macros

__HAL_CRC_OUTPUTREVERSAL_ENABLE

Description:

- Set CRC output reversal.

Parameters:

- __HANDLE__: CRC handle

Return value:

- None

__HAL_CRC_OUTPUTREVERSAL_DISABLE

Description:
- Unset CRC output reversal.

Parameters:
- __HANDLE__: CRC handle

Return value:
- None

__HAL_CRC_POLYNOMIAL_CONFIG

Description:
- Set CRC non-default polynomial.

Parameters:
- __HANDLE__: CRC handle
- __POLYNOMIAL__: 7, 8, 16 or 32-bit polynomial

Return value:
- None

Input Data Inversion Modes

CRC_INPUTDATA_INVERSION_NONE

No input data inversion

CRC_INPUTDATA_INVERSION_BYTE

Byte-wise input data inversion

CRC_INPUTDATA_INVERSION_HALFWORD

HalfWord-wise input data inversion

CRC_INPUTDATA_INVERSION_WORD

Word-wise input data inversion

Output Data Inversion Modes

CRC_OUTPUTDATA_INVERSION_DISABLE

No output data inversion

CRC_OUTPUTDATA_INVERSION_ENABLE

Bit-wise output data inversion

14 HAL CRYP Generic Driver

14.1 CRYP Firmware driver registers structures

14.1.1 CRYP_ConfigTypeDef

CRYP_ConfigTypeDef is defined in the stm32u5xx_hal_cryp.h

Data Fields

- ***uint32_t DataType***
- ***uint32_t KeySize***
- ***uint32_t * pKey***
- ***uint32_t * pInitVect***
- ***uint32_t Algorithm***
- ***uint32_t * Header***
- ***uint32_t HeaderSize***
- ***uint32_t * B0***
- ***uint32_t DataWidthUnit***
- ***uint32_t HeaderWidthUnit***
- ***uint32_t KeyIVConfigSkip***
- ***uint32_t KeyMode***
- ***uint32_t KeySelect***
- ***uint32_t KeyProtection***

Field Documentation

- ***uint32_t CRYP_ConfigTypeDef::DataType***
  32-bit data, 16-bit data, 8-bit data or 1-bit string. This parameter can be a value of ***CRYP_Data_Type***
- ***uint32_t CRYP_ConfigTypeDef::KeySize***
  Used only in AES mode : 128, 192 or 256 bit key length in CRYP1. 128 or 256 bit key length in TinyAES This parameter can be a value of ***CRYP_Key_Size***
- ***uint32_t* CRYP_ConfigTypeDef::pKey***
  The key used for encryption/decryption
- ***uint32_t* CRYP_ConfigTypeDef::pInitVect***
  The initialization vector used also as initialization counter in CTR mode
- ***uint32_t CRYP_ConfigTypeDef::Algorithm***
  DES/ TDES Algorithm ECB/CBC AES Algorithm ECB/CBC/CTR/GCM or CCM This parameter can be a value of ***CRYP_Algorithm_Mode***
- ***uint32_t* CRYP_ConfigTypeDef::Header***
  used only in AES GCM and CCM Algorithm for authentication, GCM : also known as Additional Authentication Data CCM : named B1 composed of the associated data length and Associated Data.
- ***uint32_t CRYP_ConfigTypeDef::HeaderSize***
  The size of header buffer
- ***uint32_t* CRYP_ConfigTypeDef::B0***
  B0 is first authentication block used only in AES CCM mode
- ***uint32_t CRYP_ConfigTypeDef::DataWidthUnit***
  Payload Data Width Unit, this parameter can be value of ***CRYP_Data_Width_Unit***
- ***uint32_t CRYP_ConfigTypeDef::HeaderWidthUnit***
  Header Width Unit, this parameter can be value of ***CRYP_Header_Width_Unit***
- ***uint32_t CRYP_ConfigTypeDef::KeyIVConfigSkip***
  CRYP peripheral Key and IV configuration skip, to config Key and Initialization Vector only once and to skip configuration for consecutive processings. This parameter can be a value of ***CRYP_Configuration_Skip***
- ***uint32_t CRYP_ConfigTypeDef::KeyMode***
  Key mode selection, this parameter can be value of ***CRYP_Key_Mode***
- ***uint32_t CRYP_ConfigTypeDef::KeySelect***
  Only for SAES : Key selection, this parameter can be value of ***CRYP_Key_Select***

- ***uint32_t CRYP_ConfigTypeDef::KeyProtection***
  Only for SAES : Key protection, this parameter can be value of ***CRYP_Key_Protection***

14.1.2 CRYP_ContextTypeDef

CRYP_ContextTypeDef is defined in the stm32u5xx_hal_cryp.h

Data Fields

- ***uint32_t DataType***
- ***uint32_t KeySize***
- ***uint32_t * pKey***
- ***uint32_t * pInitVect***
- ***uint32_t Algorithm***
- ***uint32_t DataWidthUnit***
- ***uint32_t KeyIVConfigSkip***
- ***uint32_t KeyMode***
- ***uint32_t Phase***
- ***uint32_t KeyIVConfig***
- ***uint32_t CR_Reg***
- ***uint32_t IER_Reg***
- ***uint32_t IVR0_Reg***
- ***uint32_t IVR1_Reg***
- ***uint32_t IVR2_Reg***
- ***uint32_t IVR3_Reg***

Field Documentation

- ***uint32_t CRYP_ContextTypeDef::DataType***
  This parameter can be a value of ***CRYP_Data_Type***
- ***uint32_t CRYP_ContextTypeDef::KeySize***
  This parameter can be a value of ***CRYP_Key_Size***
- ***uint32_t* CRYP_ContextTypeDef::pKey***
  The key used for encryption/decryption
- ***uint32_t* CRYP_ContextTypeDef::pInitVect***
  The initialization vector, counter with CBC and CTR Algorithm
- ***uint32_t CRYP_ContextTypeDef::Algorithm***
  This parameter can be a value of ***CRYP_Algorithm_Mode***
- ***uint32_t CRYP_ContextTypeDef::DataWidthUnit***
  This parameter can be value of ***CRYP_Data_Width_Unit***
- ***uint32_t CRYP_ContextTypeDef::KeyIVConfigSkip***
  This parameter can be a value of ***CRYP_Configuration_Skip***
- ***uint32_t CRYP_ContextTypeDef::KeyMode***
  This parameter can be value of ***CRYP_Key_Mode***
- ***uint32_t CRYP_ContextTypeDef::Phase***
  CRYP peripheral phase
- ***uint32_t CRYP_ContextTypeDef::KeyIVConfig***
  CRYP peripheral Key and IV configuration flag
- ***uint32_t CRYP_ContextTypeDef::CR_Reg***
  CRYP CR register
- ***uint32_t CRYP_ContextTypeDef::IER_Reg***
  CRYP IER register
- ***uint32_t CRYP_ContextTypeDef::IVR0_Reg***
  CRYP IVR0 register
- ***uint32_t CRYP_ContextTypeDef::IVR1_Reg***
  CRYP IVR1 register
- ***uint32_t CRYP_ContextTypeDef::IVR2_Reg***
  CRYP IVR2 register

- ***uint32_t CRYP_ContextTypeDef::IVR3_Reg***
  CRYP IVR3 register

14.1.3 __CRYP_HandleTypeDef

__CRYP_HandleTypeDef is defined in the stm32u5xx_hal_cryp.h

Data Fields

- ***AES_TypeDef * Instance***
- ***CRYP_ConfigTypeDef Init***
- ***uint32_t * pCrypInBuffPtr***
- ***uint32_t * pCrypOutBuffPtr***
- ***__IO uint16_t CrypHeaderCount***

- ***__IO uint16_t CrypOutCount***
- ***uint16_t Size***
- ***uint32_t Phase***
- ***DMA_HandleTypeDef * hdmain***
- ***DMA_HandleTypeDef * hdmaout***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_CRYP_STATETypeDef State***
- ***__IO uint32_t ErrorCode***
- ***uint32_t KeyIVConfig***
- ***uint32_t SizesSum***
- ***void(* InCpltCallback***
- ***void(* OutCpltCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***AES_TypeDef* __CRYP_HandleTypeDef::Instance***
  AES Register base address
- ***CRYP_ConfigTypeDef __CRYP_HandleTypeDef::Init***
  CRYP required parameters
- ***uint32_t* __CRYP_HandleTypeDef::pCrypInBuffPtr***
  Pointer to CRYP processing (encryption, decryption,...) buffer
- ***uint32_t* __CRYP_HandleTypeDef::pCrypOutBuffPtr***
  Pointer to CRYP processing (encryption, decryption,...) buffer
- ***__IO uint16_t __CRYP_HandleTypeDef::CrypHeaderCount***
  Counter of header data in words
- ***__IO uint16_t __CRYP_HandleTypeDef::CrypInCount***
  Counter of input data in words
- ***__IO uint16_t __CRYP_HandleTypeDef::CrypOutCount***
  Counter of output data in words
- ***uint16_t __CRYP_HandleTypeDef::Size***
  length of input data in word or in byte, according to DataWidthUnit
- ***uint32_t __CRYP_HandleTypeDef::Phase***
  CRYP peripheral phase
- ***DMA_HandleTypeDef* __CRYP_HandleTypeDef::hdmain***
  CRYP In DMA handle parameters
- ***DMA_HandleTypeDef* __CRYP_HandleTypeDef::hdmaout***
  CRYP Out DMA handle parameters
- ***HAL_LockTypeDef __CRYP_HandleTypeDef::Lock***
  CRYP locking object

- ***__IO HAL_CRYP_STATETypeDef __CRYP_HandleTypeDef::State***
  CRYP peripheral state
- ***__IO uint32_t __CRYP_HandleTypeDef::ErrorCode***
  CRYP peripheral error code
- ***uint32_t __CRYP_HandleTypeDef::KeyIVConfig***
  CRYP peripheral Key and IV configuration flag, used when configuration can be skipped
- ***uint32_t __CRYP_HandleTypeDef::SizesSum***
  Sum of successive payloads lengths (in bytes), stored for a single signature computation after several messages processing
- ***void(* __CRYP_HandleTypeDef::InCpltCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Input FIFO transfer completed callback
- ***void(* __CRYP_HandleTypeDef::OutCpltCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Output FIFO transfer completed callback
- ***void(* __CRYP_HandleTypeDef::ErrorCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Error callback
- ***void(* __CRYP_HandleTypeDef::MspInitCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Msp Init callback
- ***void(* __CRYP_HandleTypeDef::MspDeInitCallback)(struct __CRYP_HandleTypeDef *hcryp)***
  CRYP Msp DeInit callback

14.2 CRYP Firmware driver API description

The following section lists the various functions of the CRYP library.

14.2.1 How to use this driver

The CRYP HAL driver can be used as follows:

1. Initialize the CRYP low level resources by implementing the HAL_CRYP_MspInit():
   a. Enable the CRYP interface clock using __HAL_RCC_CRYP_CLK_ENABLE()or __HAL_RCC_AES_CLK_ENABLE
   b. In case of using interrupts (e.g. HAL_CRYP_Encrypt_IT())
      - Configure the CRYP interrupt priority using HAL_NVIC_SetPriority()
      - Enable the CRYP IRQ handler using HAL_NVIC_EnableIRQ()
      - In CRYP IRQ handler, call HAL_CRYP_IRQHandler()
   c. In case of using DMA to control data transfer (e.g. HAL_CRYP_Encrypt_DMA())
      - Enable the DMAx interface clock using __RCC_DMAx_CLK_ENABLE()
      - Configure and enable two DMA channels one for managing data transfer from memory to peripheral (input channel) and another channel for managing data transfer from peripheral to memory (output channel)
      - Associate the initialized DMA handle to the CRYP DMA handle using __HAL_LINKDMA()
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the two DMA channels. The output channel should have higher priority than the input channel HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ()

2. Initialize the CRYP according to the specified parameters :
   a. The data type: 1-bit, 8-bit, 16-bit or 32-bit.
   b. The key size: 128, 192 or 256.
   c. The AES Algorithm ECB/CBC/CTR/GCM or CCM.
   d. The initialization vector (counter). It is not used in ECB mode.
   e. The key buffer used for encryption/decryption.
      - In some specific configurations, the key is written by the application code out of the HAL scope. In that case, user can still resort to the HAL APIs as usual but must make sure that pKey pointer is set to NULL.
   f. The DataWidthUnit field. It specifies whether the data length (or the payload length for authentication algorithms) is in words or bytes.
   g. The Header used only in AES GCM and CCM Algorithm for authentication.
   h. The HeaderSize used to give size of header buffer in word or bytes, depending upon HeaderWidthUnit field.
   i. The HeaderWidthUnit field. It specifies whether the header length (for authentication algorithms) is in words or bytes.
   j. The B0 block is the first authentication block used only in AES CCM mode.
   k. The KeyIVConfigSkip used to process several messages in a row.
   l. The KeyMode used to special key operation modes (for SAES : wrapped key, shared key with AES peripheral).
   m. The KeySelect, Only for SAES, used to select key from different key source.
   n. The KeyProtection, Only for SAES, used for security context enforcement.
3. Three processing (encryption/decryption) functions are available:
   a. Polling mode: encryption and decryption APIs are blocking functions i.e. they process the data and wait till the processing is finished, e.g. HAL_CRYP_Encrypt & HAL_CRYP_Decrypt
   b. Interrupt mode: encryption and decryption APIs are not blocking functions i.e. they process the data under interrupt, e.g. HAL_CRYP_Encrypt_IT & HAL_CRYP_Decrypt_IT
   c. DMA mode: encryption and decryption APIs are not blocking functions i.e. the data transfer is ensured by DMA, e.g. HAL_CRYP_Encrypt_DMA & HAL_CRYP_Decrypt_DMA
4. When the processing function is called at first time after HAL_CRYP_Init() the CRYP peripheral is configured and processes the buffer in input. At second call, no need to Initialize the CRYP, user have to get current configuration via HAL_CRYP_GetConfig() API, then only HAL_CRYP_SetConfig() is requested to set new parameters, finally user can start encryption/decryption.
5. Call HAL_CRYP_DeInit() to deinitialize the CRYP peripheral.
6. To process a single message with consecutive calls to HAL_CRYP_Encrypt() or HAL_CRYP_Decrypt() without having to configure again the Key or the Initialization Vector between each API call, the field KeyIVConfigSkip of the initialization structure must be set to CRYP_KEYIVCONFIG_ONCE. Same is true for consecutive calls of HAL_CRYP_Encrypt_IT(), HAL_CRYP_Decrypt_IT(), HAL_CRYP_Encrypt_DMA() or HAL_CRYP_Decrypt_DMA().

The cryptographic processor supports following standards:

1. The advanced encryption standard (AES) supported:
   a. 128-bit data block processing
   b. chaining modes supported :
      - Electronic Code Book(ECB)
      - Cipher Block Chaining (CBC)
      - Counter mode (CTR)
      - Galois/counter mode (GCM/GMAC)
      - Counter with Cipher Block Chaining-Message(CCM)
   c. keys length Supported : 128-bit and 256-bit

Note: *Specific care must be taken to format the key and the Initialization Vector IV!*

If the key is defined as a 128-bit long array key[127..0] = {b127 ... b0} where b127 is the MSB and b0 the LSB, the key must be stored in MCU memory

- as a sequence of words where the MSB word comes first (occupies the lowest memory address)
  - address n+0 : 0b b127 .. b120 b119 .. b112 b111 .. b104 b103 .. b96
  - address n+4 : 0b b95 .. b88 b87 .. b80 b79 .. b72 b71 .. b64
  - address n+8 : 0b b63 .. b56 b55 .. b48 b47 .. b40 b39 .. b32
  - address n+C : 0b b31 .. b24 b23 .. b16 b15 .. b8 b7 .. b0

Hereafter, another illustration when considering a 128-bit long key made of 16 bytes {B15..B0}. The 4 32-bit words that make the key must be stored as follows in MCU memory:

- address n+0 : 0x B15 B14 B13 B12
- address n+4 : 0x B11 B10 B9 B8
- address n+8 : 0x B7 B6 B5 B4
- address n+C : 0x B3 B2 B1 B0

which leads to the expected setting

- AES_KEYR3 = 0x B15 B14 B13 B12
- AES_KEYR2 = 0x B11 B10 B9 B8
- AES_KEYR1 = 0x B7 B6 B5 B4
- AES_KEYR0 = 0x B3 B2 B1 B0

Same format must be applied for a 256-bit long key made of 32 bytes {B31..B0}. The 8 32-bit words that make the key must be stored as follows in MCU memory:

- address n+00 : 0x B31 B30 B29 B28
- address n+04 : 0x B27 B26 B25 B24
- address n+08 : 0x B23 B22 B21 B20
- address n+0C : 0x B19 B18 B17 B16
- address n+10 : 0x B15 B14 B13 B12
- address n+14 : 0x B11 B10 B9 B8
- address n+18 : 0x B7 B6 B5 B4
- address n+1C : 0x B3 B2 B1 B0

which leads to the expected setting

- AES_KEYR7 = 0x B31 B30 B29 B28
- AES_KEYR6 = 0x B27 B26 B25 B24
- AES_KEYR5 = 0x B23 B22 B21 B20
- AES_KEYR4 = 0x B19 B18 B17 B16
- AES_KEYR3 = 0x B15 B14 B13 B12
- AES_KEYR2 = 0x B11 B10 B9 B8
- AES_KEYR1 = 0x B7 B6 B5 B4
- AES_KEYR0 = 0x B3 B2 B1 B0

Initialization Vector IV (4 32-bit words) format must follow the same as that of a 128-bit long key.

Note that key and IV registers are not sensitive to swap mode selection.

This section describes the AES Galois/counter mode (GCM) supported by the peripherals:

1. Algorithm supported :
   a. Galois/counter mode (GCM)
   b. Galois message authentication code (GMAC) :is exactly the same as GCM algorithm composed only by an header.
2. Four phases are performed in GCM :
   a. Init phase: peripheral prepares the GCM hash subkey (H) and do the IV processing
   b. Header phase: peripheral processes the Additional Authenticated Data (AAD), with hash computation only.
   c. Payload phase: peripheral processes the plaintext (P) with hash computation + keystream encryption + data XORing. It works in a similar way for ciphertext (C).
   d. Final phase: peripheral generates the authenticated tag (T) using the last block of data. HAL_CRYPEx_AESGCM_GenerateAuthTAG API used in this phase to generate 4 words which correspond to the Tag. user should consider only part of this 4 words, if Tag length is less than 128 bits.

3. structure of message construction in GCM is defined as below :
   a. 16 bytes Initial Counter Block (ICB)composed of IV and counter
   b. The authenticated header A (also knows as Additional Authentication Data AAD) this part of the message is only authenticated, not encrypted.
   c. The plaintext message P is both authenticated and encrypted as ciphertext. GCM standard specifies that ciphertext has same bit length as the plaintext.
   d. The last block is composed of the length of A (on 64 bits) and the length of ciphertext (on 64 bits)

A more detailed description of the GCM message structure is available below.

This section describe The AES Counter with Cipher Block Chaining-Message Authentication Code (CCM) supported by the peripheral:

1. Specific parameters for CCM :
   a. B0 block : follows NIST Special Publication 800-38C,
   b. B1 block (header)
   c. CTRx block : control blocks

A detailed description of the CCM message structure is available below.

1. CCM in peripheral:
   a. To perform message payload encryption or decryption AES is configured in CTR mode.
   b. For authentication two phases are performed : - Header phase: peripheral processes the Additional Authenticated Data (AAD) first, then the cleartext message only cleartext payload (not the ciphertext payload) is used and no output.
   c. Final phase: peripheral generates the authenticated tag (T) using the last block of data. HAL_CRYPEx_AESCCM_GenerateAuthTAG API used in this phase to generate 4 words which correspond to the Tag. user should consider only part of this 4 words, if Tag length is less than 128 bits

Callback registration

The compilation define USE_HAL_CRYP_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions @ref HAL_CRYP_RegisterCallback() or HAL_CRYP_RegisterXXXCallback() to register an interrupt callback.

Function @ref HAL_CRYP_RegisterCallback() allows to register following callbacks:

- InCpltCallback : Input FIFO transfer completed callback.
- OutCpltCallback : Output FIFO transfer completed callback.
- ErrorCallback : callback for error detection.
- MspInitCallback : CRYP MspInit.
- MspDeInitCallback : CRYP MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function @ref HAL_CRYP_UnRegisterCallback() to reset a callback to the default weak function. @ref HAL_CRYP_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- InCpltCallback : Input FIFO transfer completed callback.
- OutCpltCallback : Output FIFO transfer completed callback.
- ErrorCallback : callback for error detection.
- MspInitCallback : CRYP MspInit.
- MspDeInitCallback : CRYP MspDeInit.

By default, after the @ref HAL_CRYP_Init() and when the state is HAL_CRYP_STATE_RESET all callbacks are set to the corresponding weak functions : examples @ref HAL_CRYP_InCpltCallback() , @ref HAL_CRYP_OutCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak function in the @ref HAL_CRYP_Init()/ @ref HAL_CRYP_DeInit() only when these callbacks are null (not registered beforehand). if not, MspInit or MspDeInit are not null, the @ref HAL_CRYP_Init() / @ref HAL_CRYP_DeInit() keep and use the user MspInit/MspDeInit functions (registered beforehand)

Callbacks can be registered/unregistered in HAL_CRYP_STATE_READY state only. Exception done MspInit/ MspDeInit callbacks that can be registered/unregistered in HAL_CRYP_STATE_READY or HAL_CRYP_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit. In that case first register the MspInit/MspDeInit user callbacks using @ref HAL_CRYP_RegisterCallback() before calling @ref HAL_CRYP_DeInit() or @ref HAL_CRYP_Init() function.

When The compilation define USE_HAL_CRYP_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

Suspend/Resume feature

The compilation define USE_HAL_CRYP_SUSPEND_RESUME when set to 1 allows the user to resort to the suspend/resume feature. A low priority block processing can be suspended to process a high priority block instead. When the high priority block processing is over, the low priority block processing can be resumed, restarting from the point where it was suspended. This feature is applicable only in non-blocking interrupt mode.

User must resort to HAL_CRYP_Suspend() to suspend the low priority block processing. This API manages the hardware block processing suspension and saves all the internal data that will be needed to restart later on. Upon HAL_CRYP_Suspend() completion, the user can launch the processing of any other block (high priority block processing).

When the high priority block processing is over, user must invoke HAL_CRYP_Resume() to resume the low priority block processing. Ciphering (or deciphering) restarts from the suspension point and ends as usual.

HAL_CRYP_Suspend() reports an error when the suspension request is sent too late (i.e when the low priority block processing is about to end). There is no use to suspend the tag generation processing for authentication algorithms.

Note: If the key is written out of HAL scope (case pKey pointer set to NULL by the user), the block processing suspension/resumption mechanism is NOT applicable.

Note: If the Key and Initialization Vector are configured only once and configuration is skipped for consecutive processings (case KeyIVConfigSkip set to CRYP_KEYIVCONFIG_ONCE), the block processing suspension/ resumption mechanism is NOT applicable.

14.2.2 Initialization, de-initialization and Set and Get configuration functions

This section provides functions allowing to:

- Initialize the CRYP
- DeInitialize the CRYP
- Initialize the CRYP MSP
- DeInitialize the CRYP MSP
- configure CRYP (HAL_CRYP_SetConfig) with the specified parameters in the CRYP_ConfigTypeDef Parameters which are configured in This section are :
- Key size
- Data Type : 32,16, 8 or 1bit
- AlgoMode : ECB,CBC,CTR,GCM/GMAC and CCM in AES Standard.
- Get CRYP configuration (HAL_CRYP_GetConfig) from the specified parameters in the CRYP_HandleTypeDef
- For interleave mode, API HAL_CRYP_SaveContext and HAL_CRYP_RestoreContext to be used to save then Restore CRYP configuration and parameters. CRYP_IVCONFIG_ONCE should be selected for KeyIVConfigSkip parameter. Only polling mode is supported, interleave mode should be used with HAL_CRYP_Encrypt and HAL_CRYP_Decrypt API.

This section contains the following APIs:

- *HAL_CRYP_Init()*
- *HAL_CRYP_DeInit()*
- *HAL_CRYP_SetConfig()*
- *HAL_CRYP_GetConfig()*
- *HAL_CRYP_MspInit()*
- *HAL_CRYP_MspDeInit()*
- *HAL_CRYP_RegisterCallback()*
- *HAL_CRYP_UnRegisterCallback()*
- *HAL_CRYP_SaveContext()*
- *HAL_CRYP_RestoreContext()*

14.2.3 Encrypt Decrypt functions

This section provides API allowing to Encrypt/Decrypt Data following

- Standard AES algorithms supported by the peripheral: - Electronic Code Book(ECB) - Cipher Block Chaining (CBC) - Counter mode (CTR) - Cipher Block Chaining (CBC) - Counter mode (CTR) - Galois/counter mode (GCM) - Counter with Cipher Block Chaining-Message(CCM)

Three processing functions are available:

- Polling mode : HAL_CRYP_Encrypt & HAL_CRYP_Decrypt
- Interrupt mode : HAL_CRYP_Encrypt_IT & HAL_CRYP_Decrypt_IT
- DMA mode : HAL_CRYP_Encrypt_DMA & HAL_CRYP_Decrypt_DMA

This section contains the following APIs:

- *HAL_CRYP_Encrypt()*
- *HAL_CRYP_Decrypt()*
- *HAL_CRYP_Encrypt_IT()*
- *HAL_CRYP_Decrypt_IT()*
- *HAL_CRYP_Encrypt_DMA()*
- *HAL_CRYP_Decrypt_DMA()*

14.2.4 CRYP IRQ handler management

This section provides CRYP IRQ handler and callback functions.

- HAL_CRYP_IRQHandler CRYP interrupt request
- HAL_CRYP_InCpltCallback input data transfer complete callback
- HAL_CRYP_OutCpltCallback output data transfer complete callback
- HAL_CRYP_ErrorCallback CRYP error callback
- HAL_CRYP_GetState return the CRYP state
- HAL_CRYP_GetError return the CRYP error code

This section contains the following APIs:

- *HAL_CRYP_IRQHandler()*
- *HAL_CRYP_GetError()*
- *HAL_CRYP_GetState()*
- *HAL_CRYP_InCpltCallback()*
- *HAL_CRYP_OutCpltCallback()*
- *HAL_CRYP_ErrorCallback()*

14.2.5 Detailed description of functions

HAL_CRYP_Init

Function name

HAL_StatusTypeDef HAL_CRYP_Init (CRYP_HandleTypeDef * hcryp)

Function description

Initializes the CRYP according to the specified parameters in the CRYP_ConfigTypeDef and creates the associated handle.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **HAL:** status

HAL_CRYP_DeInit

Function name

HAL_StatusTypeDef HAL_CRYP_DeInit (CRYP_HandleTypeDef * hcryp)

Function description

De-Initializes the CRYP peripheral.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **HAL:** status

HAL_CRYP_MspInit

Function name

void HAL_CRYP_MspInit (CRYP_HandleTypeDef * hcryp)

Function description

Initializes the CRYP MSP.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **None:**

HAL_CRYP_MspDeInit

Function name

void HAL_CRYP_MspDeInit (CRYP_HandleTypeDef * hcryp)

Function description

DeInitializes CRYP MSP.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **None:**

HAL_CRYP_SetConfig

Function name

HAL_StatusTypeDef HAL_CRYP_SetConfig (CRYP_HandleTypeDef * hcryp, CRYP_ConfigTypeDef * pConf)

Function description

Configure the CRYP according to the specified parameters in the CRYP_ConfigTypeDef.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure
- **pConf:** pointer to a CRYP_ConfigTypeDef structure that contains the configuration information for CRYP module

Return values

- **HAL:** status

HAL_CRYP_GetConfig

Function name

HAL_StatusTypeDef HAL_CRYP_GetConfig (CRYP_HandleTypeDef * hcryp, CRYP_ConfigTypeDef * pConf)

Function description

Get CRYP Configuration parameters in associated handle.

Parameters

- **pConf:** pointer to a CRYP_ConfigTypeDef structure
- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **HAL:** status

HAL_CRYP_RegisterCallback

Function name

HAL_StatusTypeDef HAL_CRYP_RegisterCallback (CRYP_HandleTypeDef * hcryp, HAL_CRYP_CallbackIDTypeDef CallbackID, pCRYP_CallbackTypeDef pCallback)

Function description

Register a User CRYP Callback To be used instead of the weak predefined callback.

Parameters

- **hcryp:** cryp handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_CRYP_INPUT_COMPLETE_CB_ID Input FIFO transfer completed callback ID
  - HAL_CRYP_OUTPUT_COMPLETE_CB_ID Output FIFO transfer completed callback ID
  - HAL_CRYP_ERROR_CB_ID Error callback ID
  - HAL_CRYP_MSPINIT_CB_ID MspInit callback ID
  - HAL_CRYP_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_CRYP_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_CRYP_UnRegisterCallback (CRYP_HandleTypeDef * hcryp, HAL_CRYP_CallbackIDTypeDef CallbackID)

Function description

Unregister an CRYP Callback CRYP callback is redirected to the weak predefined callback.

Parameters

- **hcryp:** cryp handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_CRYP_INPUT_COMPLETE_CB_ID Input FIFO transfer completed callback ID
  - HAL_CRYP_OUTPUT_COMPLETE_CB_ID Output FIFO transfer completed callback ID
  - HAL_CRYP_ERROR_CB_ID Error callback ID
  - HAL_CRYP_MSPINIT_CB_ID MspInit callback ID
  - HAL_CRYP_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **status:**

HAL_CRYP_SaveContext

Function name

HAL_StatusTypeDef HAL_CRYP_SaveContext (CRYP_HandleTypeDef * hcryp, CRYP_ContextTypeDef * pcont)

Function description

CRYP peripheral parameters storage when processing Interleaved mode .

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pcont:** pointer to a CRYP_ContextTypeDef structure where CRYP parameters will be stored.

Return values

- **HAL:** status

HAL_CRYP_RestoreContext

Function name

HAL_StatusTypeDef HAL_CRYP_RestoreContext (CRYP_HandleTypeDef * hcryp, CRYP_ContextTypeDef * pcont)

Function description

Restore CRYP parameters needed for Interleaved mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pcont:** pointer to a CRYP_ContextTypeDef structure that contains CRYP parameters stored.

Return values

- **HAL:** status

HAL_CRYP_Encrypt

Function name

HAL_StatusTypeDef HAL_CRYP_Encrypt (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint16_t Size, uint32_t * pOutput, uint32_t Timeout)

Function description

Encryption mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the input buffer (plaintext)
- **Size:** Length of the plaintext buffer either in word or in byte, according to DataWidthUnit
- **pOutput:** Pointer to the output buffer(ciphertext)
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CRYP_Decrypt

Function name

HAL_StatusTypeDef HAL_CRYP_Decrypt (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint16_t Size, uint32_t * pOutput, uint32_t Timeout)

Function description

Decryption mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the input buffer (ciphertext)
- **Size:** Length of the input buffer either in word or in byte, according to DataWidthUnit
- **pOutput:** Pointer to the output buffer(plaintext)
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CRYP_Encrypt_IT

Function name

HAL_StatusTypeDef HAL_CRYP_Encrypt_IT (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint16_t Size, uint32_t * pOutput)

Function description

Encryption in interrupt mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the input buffer (plaintext)
- **Size:** Length of the input buffer either in word or in byte, according to DataWidthUnit
- **pOutput:** Pointer to the output buffer(ciphertext)

Return values

- **HAL:** status

HAL_CRYP_Decrypt_IT

Function name

HAL_StatusTypeDef HAL_CRYP_Decrypt_IT (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint16_t Size, uint32_t * pOutput)

Function description

Decryption in interrupt mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the input buffer (ciphertext)
- **Size:** Length of the input buffer either in word or in byte, according to DataWidthUnit
- **pOutput:** Pointer to the output buffer(plaintext)

Return values

- **HAL:** status

HAL_CRYP_Encrypt_DMA

Function name

HAL_StatusTypeDef HAL_CRYP_Encrypt_DMA (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint16_t Size, uint32_t * pOutput)

Function description

Encryption in DMA mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the input buffer (plaintext)
- **Size:** Length of the input buffer either in word or in byte, according to DataWidthUnit
- **pOutput:** Pointer to the output buffer(ciphertext)

Return values

- **HAL:** status

HAL_CRYP_Decrypt_DMA

Function name

HAL_StatusTypeDef HAL_CRYP_Decrypt_DMA (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint16_t Size, uint32_t * pOutput)

Function description

Decryption in DMA mode.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the input buffer (ciphertext)
- **Size:** Length of the input buffer either in word or in byte, according to DataWidthUnit
- **pOutput:** Pointer to the output buffer(plaintext)

Return values

- **HAL:** status

HAL_CRYP_IRQHandler

Function name

void HAL_CRYP_IRQHandler (CRYP_HandleTypeDef * hcryp)

Function description

This function handles cryptographic interrupt request.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module

Return values

- **None:**

HAL_CRYP_GetState

Function name

HAL_CRYP_STATETypeDef HAL_CRYP_GetState (const CRYP_HandleTypeDef * hcryp)

Function description

Returns the CRYP state.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module.

Return values

- **HAL:** state

HAL_CRYP_InCpltCallback

Function name

void HAL_CRYP_InCpltCallback (CRYP_HandleTypeDef * hcryp)

Function description

Input FIFO transfer completed callback.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module.

Return values

- **None:**

HAL_CRYP_OutCpltCallback

Function name

void HAL_CRYP_OutCpltCallback (CRYP_HandleTypeDef * hcryp)

Function description

Output FIFO transfer completed callback.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module.

Return values

- **None:**

HAL_CRYP_ErrorCallback

Function name

void HAL_CRYP_ErrorCallback (CRYP_HandleTypeDef * hcryp)

Function description

CRYP error callback.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module.

Return values

- **None:**

HAL_CRYP_GetError

Function name

uint32_t HAL_CRYP_GetError (const CRYP_HandleTypeDef * hcryp)

Function description

Return the CRYP error code.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for the CRYP peripheral

Return values

- **CRYP:** error code

14.3 CRYP Firmware driver defines

The following section lists the various define and macros of the module.

14.3.1 CRYP

CRYP

CRYP Algorithm Mode

CRYP_AES_ECB

Electronic codebook chaining algorithm

CRYP_AES_CBC

Cipher block chaining algorithm

CRYP_AES_CTR

Counter mode chaining algorithm

CRYP_AES_GCM_GMAC

Galois counter mode - Galois message authentication code

CRYP_AES_CCM

Counter with Cipher Mode

CRYP CLEAR Flags

CRYP_CLEAR_CCF

Computation Complete Flag Clear

CRYP_CLEAR_RWEIF

Clear Error Flag : RWEIF in AES_ISR and both RDERR and WRERR flags in AES_SR

CRYP_CLEAR_KEIF

Clear Key Error Flag: KEIF in AES_ISR

CRYP_CLEAR_RNGEIF

Clear rng Error Flag: RNGEIF in AES_ISR

CRYP Key and IV Configuration Skip Mode

CRYP_KEYIVCONFIG_ALWAYS

Peripheral Key and IV configuration to do systematically

CRYP_KEYIVCONFIG_ONCE

Peripheral Key and IV configuration to do only once

CRYP_KEYNOCONFIG

Peripheral Key configuration to not do

CRYP_IVCONFIG_ONCE

Peripheral IV configuration do once for interleave mode

CRYP Data Type

CRYP_DATATYPE_32B

CRYP_DATATYPE_16B

CRYP_DATATYPE_8B

CRYP_DATATYPE_1B

CRYP_NO_SWAP

32-bit data type (no swapping)

CRYP_HALFWORD_SWAP

16-bit data type (half-word swapping)

CRYP_BYTE_SWAP

8-bit data type (byte swapping)

CRYP_BIT_SWAP

1-bit data type (bit swapping)

CRYP Data Width Unit

CRYP_DATAWIDTHUNIT_WORD

By default, size unit is word

CRYP_DATAWIDTHUNIT_BYTE

By default, size unit is byte

CRYP Error Definition

HAL_CRYP_ERROR_NONE

No error

HAL_CRYP_ERROR_WRITE
Write error

HAL_CRYP_ERROR_READ
Read error

HAL_CRYP_ERROR_DMA
DMA error

HAL_CRYP_ERROR_BUSY
Busy flag error

HAL_CRYP_ERROR_TIMEOUT
Timeout error

HAL_CRYP_ERROR_NOT_SUPPORTED
Not supported mode

HAL_CRYP_ERROR_AUTH_TAG_SEQUENCE
Sequence are not respected only for GCM or CCM

HAL_CRYP_ERROR_INVALID_CALLBACK
Invalid Callback error

HAL_CRYP_ERROR_KEY
Key error

HAL_CRYP_ERROR_RNG
Rng error

CRYP Exported Macros

__HAL_CRYP_RESET_HANDLE_STATE

Description:
- Reset CRYP handle state.

Parameters:
- __HANDLE__: specifies the CRYP handle.

Return value:
- None

__HAL_CRYP_ENABLE

Description:
- Enable/Disable the CRYP peripheral.

Parameters:
- __HANDLE__: specifies the CRYP handle.

Return value:
- None

__HAL_CRYP_DISABLE

__HAL_CRYP_GET_FLAG

Description:

- Check whether the specified CRYP status flag is set or not.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values for TinyAES:
  - CRYP_FLAG_KEYVALID Key valid flag
  - CRYP_FLAG_BUSY GCM process suspension forbidden or transferring a shared key from SAES IP.
  - CRYP_FLAG_WRERR Write Error flag
  - CRYP_FLAG_RDERR Read Error flag
  - CRYP_FLAG_CCF Computation Complete flag
  - CRYP_FLAG_KEIF Key error flag
  - CRYP_FLAG_RWEIF Read/write Error flag

Return value:

- The: state of __FLAG__ (TRUE or FALSE).

__HAL_CRYP_CLEAR_FLAG

Description:

- Clear the CRYP pending status flag.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __FLAG__: specifies the flag to clear. This parameter can be one of the following values:
  - CRYP_CLEAR_RWEIF Read (RDERR), Write (WRERR) or Read/write (RWEIF) Error Flag Clear
  - CRYP_CLEAR_CCF Computation Complete Flag (CCF) Clear
  - CRYP_CLEAR_KEIF Key error interrupt flag clear

Return value:

- None

__HAL_CRYP_GET_IT_SOURCE

Description:

- Check whether the specified CRYP interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __INTERRUPT__: CRYP interrupt source to check This parameter can be one of the following values for TinyAES:
  - CRYP_IT_RWEIE Error interrupt (used for RDERR and WRERR)
  - CRYP_IT_CCFIE Computation Complete interrupt
  - CRYP_IT_KEIE Key error interrupt

Return value:

- State: of interruption (TRUE or FALSE).

__HAL_CRYP_ENABLE_IT

Description:

- Enable the CRYP interrupt.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __INTERRUPT__: CRYP Interrupt. This parameter can be one of the following values for TinyAES:
  - CRYP_IT_RWEIE Error interrupt (used for RDERR and WRERR)
  - CRYP_IT_CCFIE Computation Complete interrupt
  - CRYP_IT_KEIE Key error interrupt

Return value:

- None

__HAL_CRYP_DISABLE_IT

Description:

- Disable the CRYP interrupt.

Parameters:

- __HANDLE__: specifies the CRYP handle.
- __INTERRUPT__: CRYP Interrupt. This parameter can be one of the following values for TinyAES:
  - CRYP_IT_RWEIE Error interrupt (used for RDERR and WRERR)
  - CRYP_IT_CCFIE Computation Complete interrupt
  - CRYP_IT_KEIE Key error interrupt

Return value:

- None

CRYP Flags

CRYP_FLAG_BUSY

GCM process suspension forbidden also set when transferring a shared key from SAES peripheral

CRYP_FLAG_WRERR

Write Error flag

CRYP_FLAG_RDERR

Read error flag

CRYP_FLAG_CCF

Computation completed flag as AES_ISR_CCF

CRYP_FLAG_KEYVALID

Key Valid flag

CRYP_FLAG_KEIF

Key error interrupt flag

CRYP_FLAG_RWEIF

Read or write error Interrupt flag

CRYP_FLAG_RNGEIF

RNG error interrupt flag

CRYP Header Width Unit

CRYP_HEADERWIDTHUNIT_WORD

By default, header size unit is word

CRYP_HEADERWIDTHUNIT_BYTE

By default, header size unit is byte

CRYP Interrupt

CRYP_IT_CCFIE

Computation Complete interrupt enable

CRYP_IT_RWEIE

Read or write Error interrupt enable

CRYP_IT_KEIE

Key error interrupt enable

CRYP_IT_RNGEIE

Rng error interrupt enable

CRYP Key Mode

CRYP_KEYMODE_NORMAL

Normal key usage, Key registers are freely usable

CRYP_KEYMODE_SHARED

Shared key

CRYP_KEYMODE_WRAPPED

Only for SAES, Wrapped key: to encrypt or decrypt AES keys

CRYP Key Protection

CRYP_KEYPROT_ENABLE

Only for SAES, Key protection between 2 applications with different security contexts

CRYP_KEYPROT_DISABLE

Only for SAES, Key not protected between 2 applications with different security contexts

CRYP Key Select

CRYP_KEYSEL_NORMAL

Normal key, key registers SAES_KEYx or CRYP_KEYx

CRYP_KEYSEL_HW

Only for SAES, Hardware key : derived hardware unique key (DHUK 256-bit)

CRYP_KEYSEL_SW

Only for SAES, Software key : boot hardware key BHK (256-bit)

CRYP_KEYSEL_HSW

Only for SAES, DHUK XOR BHK Hardware unique key XOR software key

CRYP Key Share ID

CRYP_KSHAREID_AES

Share SAES Key with AES peripheral

CRYP Key Size

CRYP_KEYSIZE_128B

128-bit long key

CRYP_KEYSIZE_256B

256-bit long key

15 HAL CRYP Extension Driver

15.1 CRYPEx Firmware driver API description

The following section lists the various functions of the CRYPEx library.

15.1.1 Extended AES processing functions

This section provides functions allowing to generate the authentication TAG in Polling mode

1. HAL_CRYPEx_AESGCM_GenerateAuthTAG
2. HAL_CRYPEx_AESCCM_GenerateAuthTAG they should be used after Encrypt/Decrypt operation.

This section contains the following APIs:

- *HAL_CRYPEx_AESGCM_GenerateAuthTAG()*
- *HAL_CRYPEx_AESCCM_GenerateAuthTAG()*

15.1.2 Wrap and Unwrap key

This section provides API allowing to wrap (encrypt) and unwrap (decrypt) key using one of the following keys, and AES Algorithm. Key selection : - Derived hardware unique key (DHUK) - XOR of DHUK and BHK - Boot hardware key (BHK)

This section contains the following APIs:

- *HAL_CRYPEx_WrapKey()*
- *HAL_CRYPEx_UnwrapKey()*

15.1.3 Encrypt and Decrypt Shared key functions

This section provides API allowing to Encrypt and Decrypt Shared key

This section contains the following APIs:

- *HAL_CRYPEx_EncryptSharedKey()*
- *HAL_CRYPEx_DecryptSharedKey()*

15.1.4 Detailed description of functions

HAL_CRYPEx_AESGCM_GenerateAuthTAG

Function name

HAL_StatusTypeDef HAL_CRYPEx_AESGCM_GenerateAuthTAG (CRYP_HandleTypeDef * hcryp, const uint32_t * pAuthTag, uint32_t Timeout)

Function description

generate the GCM authentication TAG.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pAuthTag:** Pointer to the authentication buffer the pAuthTag generated here is 128bits length, if the TAG length is less than 128bits, user should consider only the valid part of pAuthTag buffer which correspond exactly to TAG length.
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_CRYPEx_AESCCM_GenerateAuthTAG

Function name

HAL_StatusTypeDef HAL_CRYPEx_AESCCM_GenerateAuthTAG (CRYP_HandleTypeDef * hcryp, const uint32_t * pAuthTag, uint32_t Timeout)

Function description

AES CCM Authentication TAG generation.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pAuthTag:** Pointer to the authentication buffer the pAuthTag generated here is 128bits length, if the TAG length is less than 128bits, user should consider only the valid part of pAuthTag buffer which correspond exactly to TAG length.
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_CRYPEx_UnwrapKey

Function name

HAL_StatusTypeDef HAL_CRYPEx_UnwrapKey (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint32_t Timeout)

Function description

Unwrap (Decrypt) application keys.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the Key buffer to decrypt.
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CRYPEx_WrapKey

Function name

HAL_StatusTypeDef HAL_CRYPEx_WrapKey (CRYP_HandleTypeDef * hcryp, uint32_t * pInput, uint32_t * pOutput, uint32_t Timeout)

Function description

Wrap (encrypt) application keys.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pInput:** Pointer to the Key buffer to encrypt in case of ECB or CBC
- **pOutput:** Pointer to the Key buffer encrypted in case of ECB or CBC
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CRYPEx_EncryptSharedKey

Function name

HAL_StatusTypeDef HAL_CRYPEx_EncryptSharedKey (CRYP_HandleTypeDef * hcryp, uint32_t * pKey, uint32_t * pOutput, uint32_t ID, uint32_t Timeout)

Function description

Encrypt Shared key.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pKey:** Pointer to the Key buffer to share
- **pOutput:** Pointer to the Key buffer encrypted
- **ID:** Key share identification
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_CRYPEx_DecryptSharedKey

Function name

HAL_StatusTypeDef HAL_CRYPEx_DecryptSharedKey (CRYP_HandleTypeDef * hcryp, uint32_t * pKey, uint32_t ID, uint32_t Timeout)

Function description

Decrypt Shared key.

Parameters

- **hcryp:** pointer to a CRYP_HandleTypeDef structure that contains the configuration information for CRYP module
- **pKey:** Pointer to the Key buffer to share
- **ID:** Key share identification
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

16 HAL DAC Generic Driver

16.1 DAC Firmware driver registers structures

16.1.1 __DAC_HandleTypeDef

__DAC_HandleTypeDef is defined in the stm32u5xx_hal_dac.h

Data Fields

- ***DAC_TypeDef * Instance***
- ***__IO HAL_DAC_StateTypeDef State***

16.1.2 DAC_SampleAndHoldConfTypeDef

DAC_SampleAndHoldConfTypeDef is defined in the stm32u5xx_hal_dac.h

Data Fields

- ***uint32_t DAC_SampleTime***
- ***uint32_t DAC_HoldTime***
- ***uint32_t DAC_RefreshTime***

Field Documentation

- ***uint32_t DAC_SampleAndHoldConfTypeDef::DAC_SampleTime***
  Specifies the Sample time for the selected channel. This parameter applies when DAC_SampleAndHold is DAC_SAMPLEANDHOLD_ENABLE. This parameter must be a number between Min_Data = 0 and Max_Data = 1023
- ***uint32_t DAC_SampleAndHoldConfTypeDef::DAC_HoldTime***
  Specifies the hold time for the selected channel This parameter applies when DAC_SampleAndHold is DAC_SAMPLEANDHOLD_ENABLE. This parameter must be a number between Min_Data = 0 and Max_Data = 1023
- ***uint32_t DAC_SampleAndHoldConfTypeDef::DAC_RefreshTime***
  Specifies the refresh time for the selected channel This parameter applies when DAC_SampleAndHold is DAC_SAMPLEANDHOLD_ENABLE. This parameter must be a number between Min_Data = 0 and Max_Data = 255

16.1.3 DAC_ChannelConfTypeDef

DAC_ChannelConfTypeDef is defined in the stm32u5xx_hal_dac.h

Data Fields

- ***uint32_t DAC_HighFrequency***
- ***uint32_t DAC_AutonomousMode***
- ***FunctionalState DAC_DMADoubleDataMode***
- ***FunctionalState DAC_SignedFormat***
- ***uint32_t DAC_SampleAndHold***
- ***uint32_t DAC_Trigger***
- ***uint32_t DAC_OutputBuffer***
- ***uint32_t DAC_ConnectOnChipPeripheral***
- ***uint32_t DAC_UserTrimming***
- ***uint32_t DAC_TrimmingValue***
- ***DAC_SampleAndHoldConfTypeDef DAC_SampleAndHoldConfig***

Field Documentation

- ***uint32_t DAC_ChannelConfTypeDef::DAC_HighFrequency***
  Specifies the frequency interface mode This parameter can be a value of ***DAC_HighFrequency***
- ***uint32_t DAC_ChannelConfTypeDef::DAC_AutonomousMode***
  Specifies whether the autonomous mode state This parameter can be a value of ***DAC_AutonomousMode***
  Note: **HAL_DACEx_SetConfigAutonomousMode()** API allows to select and update the autonomous mode state afterwards
- ***FunctionalState DAC_ChannelConfTypeDef::DAC_DMADoubleDataMode***
  Specifies if DMA double data mode should be enabled or not for the selected channel. This parameter can be ENABLE or DISABLE
- ***FunctionalState DAC_ChannelConfTypeDef::DAC_SignedFormat***
  Specifies if signed format should be used or not for the selected channel. This parameter can be ENABLE or DISABLE
- ***uint32_t DAC_ChannelConfTypeDef::DAC_SampleAndHold***
  Specifies whether the DAC mode. This parameter can be a value of ***DAC_SampleAndHold***
- ***uint32_t DAC_ChannelConfTypeDef::DAC_Trigger***
  Specifies the external trigger for the selected DAC channel. This parameter can be a value of ***DAC_trigger_selection***
- ***uint32_t DAC_ChannelConfTypeDef::DAC_OutputBuffer***
  Specifies whether the DAC channel output buffer is enabled or disabled. This parameter can be a value of ***DAC_output_buffer***

- ***uint32_t DAC_ChannelConfTypeDef::DAC_ConnectOnChipPeripheral***
  Specifies whether the DAC output is connected or not to on chip peripheral. This parameter can be a value of ***DAC_ConnectOnChipPeripheral***
- ***uint32_t DAC_ChannelConfTypeDef::DAC_UserTrimming***
  Specifies the trimming mode This parameter must be a value of ***DAC_UserTrimming*** DAC_UserTrimming is either factory or user trimming
- ***uint32_t DAC_ChannelConfTypeDef::DAC_TrimmingValue***
  Specifies the offset trimming value i.e. when DAC_SampleAndHold is DAC_TRIMMING_USER. This parameter must be a number between Min_Data = 1 and Max_Data = 31
- ***DAC_SampleAndHoldConfTypeDef DAC_ChannelConfTypeDef::DAC_SampleAndHoldConfig***
  Sample and Hold settings

16.2 DAC Firmware driver API description

The following section lists the various functions of the DAC library.

16.2.1 DAC Peripheral features

DAC Channels

STM32U5 devices integrate two 12-bit Digital Analog Converters The 2 converters (i.e. channel1 & channel2) can be used independently or simultaneously (dual mode):

1. DAC channel1 with DAC_OUT1 (PA4) as output or connected to on-chip peripherals (ex. ADC).
2. DAC channel2 with DAC_OUT2 (PA5) as output or connected to on-chip peripherals (ex. ADC).

DAC Triggers

Digital to Analog conversion can be non-triggered using DAC_TRIGGER_NONE and DAC_OUT1/DAC_OUT2 is available once writing to DHRx register.

Digital to Analog conversion can be triggered by:

1. External event: EXTI Line 9 (any GPIOx_PIN_9) using DAC_TRIGGER_EXT_IT9. The used pin (GPIOx_PIN_9) must be configured in input mode.
2. Timers TRGO: TIM1, TIM2, TIM4, TIM5, TIM6, TIM7, TIM8 and TIM15 (DAC_TRIGGER_T1_TRGO, DAC_TRIGGER_T2_TRGO...)
3. Low Power Timers TRGO: LPTIM1 and LPTIM3 (DAC_TRIGGER_LPTIM1_OUT, DAC_TRIGGER_LPTIM3_OUT)
4. Software using DAC_TRIGGER_SOFTWARE

The trigger selection depends on the PWR mode: in stop0, stop1 and stop2 we should select DAC_TRIGGER_EXT_IT9, DAC_TRIGGER_LPTIM1_OUT or DAC_TRIGGER_LPTIM3_OUT.The other triggers are not functional.

DAC Buffer mode feature

Each DAC channel integrates an output buffer that can be used to reduce the output impedance, and to drive external loads directly without having to add an external operational amplifier. To enable, the output buffer use sConfig.DAC_OutputBuffer = DAC_OUTPUTBUFFER_ENABLE;

Note: *Refer to the device datasheet for more details about output impedance value with and without output buffer.*

GPIO configurations guidelines

When a DAC channel is used (ex channel1 on PA4) and the other is not (ex channel2 on PA5 is configured in Analog and disabled). Channel1 may disturb channel2 as coupling effect. Note that there is no coupling on channel2 as soon as channel2 is turned on. Coupling on adjacent channel could be avoided as follows: when unused PA5 is configured as INPUT PULL-UP or DOWN. PA5 is configured in ANALOG just before it is turned on.

DAC Sample and Hold feature

For each converter, 2 modes are supported: normal mode and "sample and hold" mode (i.e. low power mode). In the sample and hold mode, the DAC core converts data, then holds the converted voltage on a capacitor. When not converting, the DAC cores and buffer are completely turned off between samples and the DAC output is tri-stated, therefore reducing the overall power consumption. A new stabilization period is needed before each new conversion. The sample and hold allow setting internal or external voltage @ low power consumption cost (output value can be at any given rate either by CPU or DMA). The Sample and hold block and registers uses either LSI & run in several power modes: run mode, sleep mode, low power run, low power sleep mode & stop1 mode. Low power stop1 mode allows only static conversion. To enable Sample and Hold mode Enable LSI using HAL_RCC_OscConfig with RCC_OSCILLATORTYPE_LSI & RCC_LSI_ON parameters. Use DAC_InitStructure.DAC_SampleAndHold = DAC_SAMPLEANDHOLD_ENABLE; & DAC_ChannelConfTypeDef.DAC_SampleAndHoldConfig.DAC_SampleTime, DAC_HoldTime & DAC_RefreshTime;

DAC calibration feature

1. The 2 converters (channel1 & channel2) provide calibration capabilities.
   – Calibration aims at correcting some offset of output buffer.
   – The DAC uses either factory calibration settings OR user defined calibration (trimming) settings (i.e. trimming mode).
   – The user defined settings can be figured out using self calibration handled by HAL_DACEx_SelfCalibrate.
   – HAL_DACEx_SelfCalibrate:
     ◦ Runs automatically the calibration.
     ◦ Enables the user trimming mode
     ◦ Updates a structure with trimming values with fresh calibration results. The user may store the calibration results for larger (ex monitoring the trimming as a function of temperature for instance)

DAC wave generation feature

Both DAC channels can be used to generate

1. Noise wave
2. Triangle wave

DAC data format

The DAC data format can be:

1. 8-bit right alignment using DAC_ALIGN_8B_R
2. 12-bit left alignment using DAC_ALIGN_12B_L
3. 12-bit right alignment using DAC_ALIGN_12B_R

DAC data value to voltage correspondence

The analog output voltage on each DAC channel pin is determined by the following equation:

DAC_OUTx = VREF+ * DOR / 4095

- with DOR is the Data Output Register

VREF+ is the input voltage reference (refer to the device datasheet)

e.g. To set DAC_OUT1 to 0.7V, use

- Assuming that VREF+ = 3.3V, DAC_OUT1 = (3.3 * 868) / 4095 = 0.7V

DMA requests

A DMA request can be generated when an external trigger (but not a software trigger) occurs if DMA requests are enabled using HAL_DAC_Start_DMA(). DMA requests are mapped as following: GPDMA requests are mapped as following:

- DAC channel1 mapped on GPDMA request 2 (can be any GPDMA channel)

- DAC channel2 mapped on GPDMA request 3 (can be any GPDMA channel) LPDMA requests are mapped as following:
- DAC channel1 mapped on LPDMA request 8 (can be any LPDMA channel)
- DAC channel2 mapped on LPDMA request 9 (can be any LPDMA channel)

High frequency interface mode

The high frequency interface informs DAC instance about the bus frequency in use. It is mandatory information for DAC (as internal timing of DAC is bus frequency dependent) provided thanks to parameter DAC_HighFrequency handled in HAL_DAC_ConfigChannel () function. Use of DAC_HIGH_FREQUENCY_INTERFACE_MODE_AUTOMATIC value of DAC_HighFrequency is recommended function figured out the correct setting. The high frequency mode is same for all converters of a same DAC instance. Either same parameter DAC_HighFrequency is used for all DAC converters or again self DAC_HIGH_FREQUENCY_INTERFACE_MODE_AUTOMATIC detection parameter.

Note: For Dual mode and specific signal (Triangle and noise) generation please refer to Extended Features Driver description

16.2.2 How to use this driver

- DAC APB clock must be enabled to get write access to DAC registers using HAL_DAC_Init()
- Configure DAC_OUTx (DAC_OUT1: PA4, DAC_OUT2: PA5) in analog mode.
- Configure the DAC channel using HAL_DAC_ConfigChannel() function.
- Enable the DAC channel using HAL_DAC_Start() or HAL_DAC_Start_DMA() functions.

Calibration mode IO operation

- Retrieve the factory trimming (calibration settings) using HAL_DACEx_GetTrimOffset()
- Run the calibration using HAL_DACEx_SelfCalibrate()
- Update the trimming while DAC running using HAL_DACEx_SetUserTrimming()

Polling mode IO operation

- Start the DAC peripheral using HAL_DAC_Start()
- To read the DAC last data output value, use the HAL_DAC_GetValue() function.
- Stop the DAC peripheral using HAL_DAC_Stop()

DMA mode IO operation

- Start the DAC peripheral using HAL_DAC_Start_DMA(), at this stage the user specify the length of data to be transferred at each end of conversion First issued trigger will start the conversion of the value previously set by HAL_DAC_SetValue().
- At the middle of data transfer HAL_DAC_ConvHalfCpltCallbackCh1() or HAL_DACEx_ConvHalfCpltCallbackCh2() function is executed and user can add his own code by customization of function pointer HAL_DAC_ConvHalfCpltCallbackCh1() or HAL_DACEx_ConvHalfCpltCallbackCh2()
- At The end of data transfer HAL_DAC_ConvCpltCallbackCh1() or HAL_DACEx_ConvHalfCpltCallbackCh2() function is executed and user can add his own code by customization of function pointer HAL_DAC_ConvCpltCallbackCh1() or HAL_DACEx_ConvHalfCpltCallbackCh2()
- In case of transfer Error, HAL_DAC_ErrorCallbackCh1() function is executed and user can add his own code by customization of function pointer HAL_DAC_ErrorCallbackCh1
- In case of DMA underrun, DAC interruption triggers and execute internal function HAL_DAC_IRQHandler. HAL_DAC_DMAUnderrunCallbackCh1() or HAL_DACEx_DMAUnderrunCallbackCh2() function is executed and user can add his own code by customization of function pointer HAL_DAC_DMAUnderrunCallbackCh1() or HAL_DACEx_DMAUnderrunCallbackCh2() and add his own code by customization of function pointer HAL_DAC_ErrorCallbackCh1()
- Stop the DAC peripheral using HAL_DAC_Stop_DMA()

Callback registration

The compilation define USE_HAL_DAC_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_DAC_RegisterCallback() to register a user callback, it allows to register following callbacks:

- ConvCpltCallbackCh1 : callback when a half transfer is completed on Ch1.
- ConvHalfCpltCallbackCh1 : callback when a transfer is completed on Ch1.
- ErrorCallbackCh1 : callback when an error occurs on Ch1.
- DMAUnderrunCallbackCh1 : callback when an underrun error occurs on Ch1.
- ConvCpltCallbackCh2 : callback when a half transfer is completed on Ch2.
- ConvHalfCpltCallbackCh2 : callback when a transfer is completed on Ch2.
- ErrorCallbackCh2 : callback when an error occurs on Ch2.
- DMAUnderrunCallbackCh2 : callback when an underrun error occurs on Ch2.
- MspInitCallback : DAC MspInit.
- MspDeInitCallback : DAC MspdeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_DAC_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:
- ConvCpltCallbackCh1 : callback when a half transfer is completed on Ch1.
- ConvHalfCpltCallbackCh1 : callback when a transfer is completed on Ch1.
- ErrorCallbackCh1 : callback when an error occurs on Ch1.
- DMAUnderrunCallbackCh1 : callback when an underrun error occurs on Ch1.
- ConvCpltCallbackCh2 : callback when a half transfer is completed on Ch2.
- ConvHalfCpltCallbackCh2 : callback when a transfer is completed on Ch2.
- ErrorCallbackCh2 : callback when an error occurs on Ch2.
- DMAUnderrunCallbackCh2 : callback when an underrun error occurs on Ch2.
- MspInitCallback : DAC MspInit.
- MspDeInitCallback : DAC MspdeInit.
- All Callbacks This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_DAC_Init and if the state is HAL_DAC_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_DAC_Init and HAL_DAC_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_DAC_Init and HAL_DAC_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_DAC_RegisterCallback before calling HAL_DAC_DeInit or HAL_DAC_Init function. When The compilation define USE_HAL_DAC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

DAC HAL driver macros list

Below the list of most used macros in DAC HAL driver.

- __HAL_DAC_ENABLE : Enable the DAC peripheral
- __HAL_DAC_DISABLE : Disable the DAC peripheral
- __HAL_DAC_CLEAR_FLAG: Clear the DAC's pending flags
- __HAL_DAC_GET_FLAG: Get the selected DAC's flag status

Note: *You can refer to the DAC HAL driver header file for more useful macros*

16.2.3 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize and configure the DAC.
- De-initialize the DAC.

This section contains the following APIs:
- *HAL_DAC_Init()*
- *HAL_DAC_DeInit()*
- *HAL_DAC_MspInit()*
- *HAL_DAC_MspDeInit()*
- *HAL_DAC_RegisterCallback()*
- *HAL_DAC_UnRegisterCallback()*

16.2.4 IO operation functions

This section provides functions allowing to:
- Start conversion.
- Stop conversion.
- Start conversion and enable DMA transfer.
- Stop conversion and disable DMA transfer.
- Get result of conversion.

This section contains the following APIs:
- *HAL_DAC_Start()*
- *HAL_DAC_Stop()*
- *HAL_DAC_Start_DMA()*
- *HAL_DAC_Stop_DMA()*
- *HAL_DAC_IRQHandler()*
- *HAL_DAC_SetValue()*
- *HAL_DAC_ConvCpltCallbackCh1()*
- *HAL_DAC_ConvHalfCpltCallbackCh1()*
- *HAL_DAC_ErrorCallbackCh1()*
- *HAL_DAC_DMAUnderrunCallbackCh1()*
- *HAL_DAC_RegisterCallback()*
- *HAL_DAC_UnRegisterCallback()*

16.2.5 Peripheral Control functions

This section provides functions allowing to:
- Configure channels.
- Set the specified data holding register value for DAC channel.

This section contains the following APIs:
- *HAL_DAC_GetValue()*
- *HAL_DAC_ConfigChannel()*

16.2.6 Peripheral State and Errors functions

This subsection provides functions allowing to
- Check the DAC state.
- Check the DAC Errors.

This section contains the following APIs:
- *HAL_DAC_GetState()*
- *HAL_DAC_GetError()*

16.2.7 Detailed description of functions

HAL_DAC_Init

Function name

HAL_StatusTypeDef HAL_DAC_Init (DAC_HandleTypeDef * hdac)

Function description

Initialize the DAC peripheral according to the specified parameters in the DAC_InitStruct and initialize the associated handle.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** status

HAL_DAC_DeInit

Function name

HAL_StatusTypeDef HAL_DAC_DeInit (DAC_HandleTypeDef * hdac)

Function description

Deinitialize the DAC peripheral registers to their default reset values.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** status

HAL_DAC_MspInit

Function name

void HAL_DAC_MspInit (DAC_HandleTypeDef * hdac)

Function description

Initialize the DAC MSP.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_MspDeInit

Function name

void HAL_DAC_MspDeInit (DAC_HandleTypeDef * hdac)

Function description

DeInitialize the DAC MSP.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_Start

Function name

HAL_StatusTypeDef HAL_DAC_Start (DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Enables DAC and starts conversion of channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **HAL:** status

HAL_DAC_Stop

Function name

HAL_StatusTypeDef HAL_DAC_Stop (DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Disables DAC and stop conversion of channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **HAL:** status

HAL_DAC_Start_DMA

Function name

HAL_StatusTypeDef HAL_DAC_Start_DMA (DAC_HandleTypeDef * hdac, uint32_t Channel, const uint32_t * pData, uint32_t Length, uint32_t Alignment)

Function description

Enables DAC and starts conversion of channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **pData:** The source Buffer address.
- **Length:** The length of data to be transferred from memory to DAC peripheral
- **Alignment:** Specifies the data alignment for DAC channel. This parameter can be one of the following values:
  - DAC_ALIGN_8B_R: 8bit right data alignment selected
  - DAC_ALIGN_12B_L: 12bit left data alignment selected
  - DAC_ALIGN_12B_R: 12bit right data alignment selected

Return values

- **HAL:** status

HAL_DAC_Stop_DMA

Function name

HAL_StatusTypeDef HAL_DAC_Stop_DMA (DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Disables DAC and stop conversion of channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **HAL:** status

HAL_DAC_IRQHandler

Function name

void HAL_DAC_IRQHandler (DAC_HandleTypeDef * hdac)

Function description

Handles DAC interrupt request This function uses the interruption of DMA underrun.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_SetValue

Function name

HAL_StatusTypeDef HAL_DAC_SetValue (DAC_HandleTypeDef * hdac, uint32_t Channel, uint32_t Alignment, uint32_t Data)

Function description

Set the specified data holding register value for DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **Alignment:** Specifies the data alignment. This parameter can be one of the following values:
  - DAC_ALIGN_8B_R: 8bit right data alignment selected
  - DAC_ALIGN_12B_L: 12bit left data alignment selected
  - DAC_ALIGN_12B_R: 12bit right data alignment selected
- **Data:** Data to be loaded in the selected data holding register.

Return values

- **HAL:** status

HAL_DAC_ConvCpltCallbackCh1

Function name

void HAL_DAC_ConvCpltCallbackCh1 (DAC_HandleTypeDef * hdac)

Function description

Conversion complete callback in non-blocking mode for Channel1.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_ConvHalfCpltCallbackCh1

Function name

void HAL_DAC_ConvHalfCpltCallbackCh1 (DAC_HandleTypeDef * hdac)

Function description

Conversion half DMA transfer callback in non-blocking mode for Channel1.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_ErrorCallbackCh1

Function name

void HAL_DAC_ErrorCallbackCh1 (DAC_HandleTypeDef * hdac)

Function description

Error DAC callback for Channel1.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_DMAUnderrunCallbackCh1

Function name

void HAL_DAC_DMAUnderrunCallbackCh1 (DAC_HandleTypeDef * hdac)

Function description

DMA underrun DAC callback for channel1.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DAC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DAC_RegisterCallback (DAC_HandleTypeDef * hdac, HAL_DAC_CallbackIDTypeDef CallbackID, pDAC_CallbackTypeDef pCallback)

Function description

Register a User DAC Callback To be used instead of the weak (overridden) predefined callback.

Parameters

- **hdac:** DAC handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  – HAL_DAC_ERROR_INVALID_CALLBACK DAC Error Callback ID
  – HAL_DAC_CH1_COMPLETE_CB_ID DAC CH1 Complete Callback ID
  – HAL_DAC_CH1_HALF_COMPLETE_CB_ID DAC CH1 Half Complete Callback ID
  – HAL_DAC_CH1_ERROR_ID DAC CH1 Error Callback ID
  – HAL_DAC_CH1_UNDERRUN_CB_ID DAC CH1 UnderRun Callback ID
  – HAL_DAC_CH2_COMPLETE_CB_ID DAC CH2 Complete Callback ID
  – HAL_DAC_CH2_HALF_COMPLETE_CB_ID DAC CH2 Half Complete Callback ID
  – HAL_DAC_CH2_ERROR_ID DAC CH2 Error Callback ID
  – HAL_DAC_CH2_UNDERRUN_CB_ID DAC CH2 UnderRun Callback ID
  – HAL_DAC_MSPINIT_CB_ID DAC MSP Init Callback ID
  – HAL_DAC_MSPDEINIT_CB_ID DAC MSP DeInit Callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

Notes

- The HAL_DAC_RegisterCallback() may be called before HAL_DAC_Init() in HAL_DAC_STATE_RESET to register callbacks for HAL_DAC_MSPINIT_CB_ID and HAL_DAC_MSPDEINIT_CB_ID

HAL_DAC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DAC_UnRegisterCallback (DAC_HandleTypeDef * hdac, HAL_DAC_CallbackIDTypeDef CallbackID)

Function description

Unregister a User DAC Callback DAC Callback is redirected to the weak (overridden) predefined callback.

Parameters

- **hdac:** DAC handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_DAC_CH1_COMPLETE_CB_ID DAC CH1 transfer Complete Callback ID
  - HAL_DAC_CH1_HALF_COMPLETE_CB_ID DAC CH1 Half Complete Callback ID
  - HAL_DAC_CH1_ERROR_ID DAC CH1 Error Callback ID
  - HAL_DAC_CH1_UNDERRUN_CB_ID DAC CH1 UnderRun Callback ID
  - HAL_DAC_CH2_COMPLETE_CB_ID DAC CH2 Complete Callback ID
  - HAL_DAC_CH2_HALF_COMPLETE_CB_ID DAC CH2 Half Complete Callback ID
  - HAL_DAC_CH2_ERROR_ID DAC CH2 Error Callback ID
  - HAL_DAC_CH2_UNDERRUN_CB_ID DAC CH2 UnderRun Callback ID
  - HAL_DAC_MSPINIT_CB_ID DAC MSP Init Callback ID
  - HAL_DAC_MSPDEINIT_CB_ID DAC MSP DeInit Callback ID
  - HAL_DAC_ALL_CB_ID DAC All callbacks

Return values

- **status:**

Notes

- The HAL_DAC_UnRegisterCallback() may be called before HAL_DAC_Init() in HAL_DAC_STATE_RESET to un-register callbacks for HAL_DAC_MSPINIT_CB_ID and HAL_DAC_MSPDEINIT_CB_ID

HAL_DAC_GetValue

Function name

uint32_t HAL_DAC_GetValue (const DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Returns the last data output value of the selected DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **The:** selected DAC channel data output value.

HAL_DAC_ConfigChannel

Function name

HAL_StatusTypeDef HAL_DAC_ConfigChannel (DAC_HandleTypeDef * hdac, const DAC_ChannelConfTypeDef * sConfig, uint32_t Channel)

Function description

Configures the selected DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **sConfig:** DAC configuration structure.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  – DAC_CHANNEL_1: DAC Channel1 selected
  – DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **HAL:** status

Notes

- By calling this function, if the application will be run in stop mode, the DAC_Trigger field of the structure sConfig should be one of the following values: DAC_TRIGGER_STOP_LPTIM1_OUTDAC_TRIGGER_STOP_LPTIM3_OUTDAC_TRIGGER_STOP_EXT_IT9 For application where DAC is not run in stop mode, the DAC trigger should be a value of DAC trigger selection
- By calling this function, the high frequency interface mode (HFSEL bits) will be set. This parameter scope is the DAC instance. As the function is called for each channel, the DAC high frequency interface mode of sConfig must be the same at each call. (or DAC_HIGH_FREQUENCY_INTERFACE_MODE_AUTOMATIC self detect).

HAL_DAC_GetState

Function name

HAL_DAC_StateTypeDef HAL_DAC_GetState (const DAC_HandleTypeDef * hdac)

Function description

return the DAC handle state

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** state

HAL_DAC_GetError

Function name

uint32_t HAL_DAC_GetError (const DAC_HandleTypeDef * hdac)

Function description

Return the DAC error code.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **DAC:** Error Code

DAC_DMAConvCpltCh1

Function name

void DAC_DMAConvCpltCh1 (DMA_HandleTypeDef * hdma)

Function description

DMA conversion complete callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

DAC_DMAErrorCh1

Function name

void DAC_DMAErrorCh1 (DMA_HandleTypeDef * hdma)

Function description

DMA error callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

DAC_DMAHalfConvCpltCh1

Function name

void DAC_DMAHalfConvCpltCh1 (DMA_HandleTypeDef * hdma)

Function description

DMA half transfer complete callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

DAC Exported Macros

__HAL_DAC_RESET_HANDLE_STATE

Description:

- Reset DAC handle state.

Parameters:

- __HANDLE__: specifies the DAC handle.

Return value:

- None

__HAL_DAC_ENABLE

Description:

- Enable the DAC channel.

Parameters:

- __HANDLE__: specifies the DAC handle.
- __DAC_Channel__: specifies the DAC channel

Return value:

- None

__HAL_DAC_DISABLE

Description:

- Disable the DAC channel.

Parameters:

- __HANDLE__: specifies the DAC handle
- __DAC_Channel__: specifies the DAC channel.

Return value:

- None

DAC_DHR12R1_ALIGNMENT

Description:

- Set DHR12R1 alignment.

Parameters:

- __ALIGNMENT__: specifies the DAC alignment

Return value:

- None

DAC_DHR12R2_ALIGNMENT

Description:

- Set DHR12R2 alignment.

Parameters:

- __ALIGNMENT__: specifies the DAC alignment

Return value:

- None

DAC_DHR12RD_ALIGNMENT

Description:

- Set DHR12RD alignment.

Parameters:

- __ALIGNMENT__: specifies the DAC alignment

Return value:

- None

__HAL_DAC_ENABLE_IT

Description:

- Enable the DAC interrupt.

Parameters:

- __HANDLE__: specifies the DAC handle
- __INTERRUPT__: specifies the DAC interrupt. This parameter can be any combination of the following values:
  – DAC_IT_DMAUDR1 DAC channel 1 DMA underrun interrupt
  – DAC_IT_DMAUDR2 DAC channel 2 DMA underrun interrupt

Return value:

- None

__HAL_DAC_DISABLE_IT

Description:

- Disable the DAC interrupt.

Parameters:

- __HANDLE__: specifies the DAC handle
- __INTERRUPT__: specifies the DAC interrupt. This parameter can be any combination of the following values:
  – DAC_IT_DMAUDR1 DAC channel 1 DMA underrun interrupt
  – DAC_IT_DMAUDR2 DAC channel 2 DMA underrun interrupt

Return value:

- None

__HAL_DAC_GET_IT_SOURCE

Description:

- Check whether the specified DAC interrupt source is enabled or not.

Parameters:

- __HANDLE__: DAC handle
- __INTERRUPT__: DAC interrupt source to check This parameter can be any combination of the following values:
  – DAC_IT_DMAUDR1 DAC channel 1 DMA underrun interrupt
  – DAC_IT_DMAUDR2 DAC channel 2 DMA underrun interrupt

Return value:

- State: of interruption (SET or RESET)

__HAL_DAC_GET_FLAG

Description:

- Get the selected DAC's flag status.

Parameters:

- __HANDLE__: specifies the DAC handle.
- __FLAG__: specifies the DAC flag to get. This parameter can be any combination of the following values:
  – DAC_FLAG_DMAUDR1 DAC channel 1 DMA underrun flag
  – DAC_FLAG_DMAUDR2 DAC channel 2 DMA underrun flag
  – DAC_FLAG_DAC1RDY DAC channel 1 ready status flag
  – DAC_FLAG_DAC2RDY DAC channel 2 ready status flag

Return value:

- None

__HAL_DAC_CLEAR_FLAG

Description:

- Clear the DAC's flag.

Parameters:

- __HANDLE__: specifies the DAC handle.
- __FLAG__: specifies the DAC flag to clear. This parameter can be any combination of the following values:
  – DAC_FLAG_DMAUDR1 DAC channel 1 DMA underrun flag
  – DAC_FLAG_DMAUDR2 DAC channel 2 DMA underrun flag

Return value:

- None

17 HAL DAC Extension Driver

17.1 DACEx Firmware driver registers structures

17.1.1 DAC_AutonomousModeConfTypeDef

DAC_AutonomousModeConfTypeDef is defined in the stm32u5xx_hal_dac_ex.h

Data Fields

- ***uint32_t AutonomousModeState***

Field Documentation

- ***uint32_t DAC_AutonomousModeConfTypeDef::AutonomousModeState***
  Specifies the autonomous mode state. This parameter can be a value of ***DAC_AutonomousMode***

17.2 DACEx Firmware driver API description

The following section lists the various functions of the DACEx library.

17.2.1 How to use this driver

Dual mode IO operation

- Use HAL_DACEx_DualStart() to enable both channel and start conversion for dual mode operation. If software trigger is selected, using HAL_DACEx_DualStart() will start the conversion of the value previously set by HAL_DACEx_DualSetValue().
- Use HAL_DACEx_DualStop() to disable both channel and stop conversion for dual mode operation.
- Use HAL_DACEx_DualStart_DMA() to enable both channel and start conversion for dual mode operation using DMA to feed DAC converters. First issued trigger will start the conversion of the value previously set by HAL_DACEx_DualSetValue(). The same callbacks that are used in single mode are called in dual mode to notify transfer completion (half complete or complete), errors or underrun.
- Use HAL_DACEx_DualStop_DMA() to disable both channel and stop conversion for dual mode operation using DMA to feed DAC converters.
- When Dual mode is enabled (i.e. DAC Channel1 and Channel2 are used simultaneously) : Use HAL_DACEx_DualGetValue() to get digital data to be converted and use HAL_DACEx_DualSetValue() to set digital value to converted simultaneously in Channel 1 and Channel 2.

Signal generation operation

- Use HAL_DACEx_TriangleWaveGenerate() to generate Triangle signal.
- Use HAL_DACEx_NoiseWaveGenerate() to generate Noise signal.
- HAL_DACEx_SelfCalibrate to calibrate one DAC channel.
- HAL_DACEx_SetUserTrimming to set user trimming value.
- HAL_DACEx_GetTrimOffset to retrieve trimming value (factory setting after reset, user setting if HAL_DACEx_SetUserTrimming have been used at least one time after reset).

Autonomous Mode operation

- Use HAL_DACx_SetConfigAutonomousMode() to configure the autonomous mode
- Use HAL_DACx_GetConfigAutonomousMode() to get the current configuration of the autonomous mode
- Use HAL_DACx_ClearConfigAutonomousMode() to clear the configuration of the autonomous mode

17.2.2 Extended features functions

This section provides functions allowing to:

- Start conversion.
- Stop conversion.
- Start conversion and enable DMA transfer.

- Stop conversion and disable DMA transfer.
- Get result of conversion.
- Get result of dual mode conversion.

This section contains the following APIs:

- *HAL_DACEx_DualStart()*
- *HAL_DACEx_DualStop()*
- *HAL_DACEx_DualStart_DMA()*
- *HAL_DACEx_DualStop_DMA()*
- *HAL_DACEx_TriangleWaveGenerate()*
- *HAL_DACEx_NoiseWaveGenerate()*
- *HAL_DACEx_DualSetValue()*
- *HAL_DACEx_ConvCpltCallbackCh2()*
- *HAL_DACEx_ConvHalfCpltCallbackCh2()*
- *HAL_DACEx_ErrorCallbackCh2()*
- *HAL_DACEx_DMAUnderrunCallbackCh2()*
- *HAL_DACEx_SelfCalibrate()*
- *HAL_DACEx_SetUserTrimming()*
- *HAL_DACEx_GetTrimOffset()*
- *HAL_DACEx_DualGetValue()*

17.2.3 Peripheral Control functions

This section provides functions allowing to:

- Set the specified data holding register value for DAC channel.

This section contains the following APIs:

- *HAL_DACEx_DualGetValue()*
- *HAL_DACEx_SelfCalibrate()*
- *HAL_DACEx_SetUserTrimming()*
- *HAL_DACEx_GetTrimOffset()*
- *HAL_DACEx_SetConfigAutonomousMode()*
- *HAL_DACEx_GetConfigAutonomousMode()*
- *HAL_DACEx_ClearConfigAutonomousMode()*

17.2.4 Detailed description of functions

HAL_DACEx_TriangleWaveGenerate

Function name

HAL_StatusTypeDef HAL_DACEx_TriangleWaveGenerate (DAC_HandleTypeDef * hdac, uint32_t Channel, uint32_t Amplitude)

Function description

Enable or disable the selected DAC channel wave generation.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  – DAC_CHANNEL_1: DAC Channel1 selected
  – DAC_CHANNEL_2: DAC Channel2 selected
- **Amplitude:** Select max triangle amplitude. This parameter can be one of the following values:
  – DAC_TRIANGLEAMPLITUDE_1: Select max triangle amplitude of 1
  – DAC_TRIANGLEAMPLITUDE_3: Select max triangle amplitude of 3
  – DAC_TRIANGLEAMPLITUDE_7: Select max triangle amplitude of 7
  – DAC_TRIANGLEAMPLITUDE_15: Select max triangle amplitude of 15
  – DAC_TRIANGLEAMPLITUDE_31: Select max triangle amplitude of 31
  – DAC_TRIANGLEAMPLITUDE_63: Select max triangle amplitude of 63
  – DAC_TRIANGLEAMPLITUDE_127: Select max triangle amplitude of 127
  – DAC_TRIANGLEAMPLITUDE_255: Select max triangle amplitude of 255
  – DAC_TRIANGLEAMPLITUDE_511: Select max triangle amplitude of 511
  – DAC_TRIANGLEAMPLITUDE_1023: Select max triangle amplitude of 1023
  – DAC_TRIANGLEAMPLITUDE_2047: Select max triangle amplitude of 2047
  – DAC_TRIANGLEAMPLITUDE_4095: Select max triangle amplitude of 4095

Return values

- **HAL:** status

HAL_DACEx_NoiseWaveGenerate

Function name

HAL_StatusTypeDef HAL_DACEx_NoiseWaveGenerate (DAC_HandleTypeDef * hdac, uint32_t Channel, uint32_t Amplitude)

Function description

Enable or disable the selected DAC channel wave generation.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  – DAC_CHANNEL_1: DAC Channel1 selected
  – DAC_CHANNEL_2: DAC Channel2 selected
- **Amplitude:** Unmask DAC channel LFSR for noise wave generation. This parameter can be one of the following values:
  – DAC_LFSRUNMASK_BIT0: Unmask DAC channel LFSR bit0 for noise wave generation
  – DAC_LFSRUNMASK_BITS1_0: Unmask DAC channel LFSR bit[1:0] for noise wave generation
  – DAC_LFSRUNMASK_BITS2_0: Unmask DAC channel LFSR bit[2:0] for noise wave generation
  – DAC_LFSRUNMASK_BITS3_0: Unmask DAC channel LFSR bit[3:0] for noise wave generation
  – DAC_LFSRUNMASK_BITS4_0: Unmask DAC channel LFSR bit[4:0] for noise wave generation
  – DAC_LFSRUNMASK_BITS5_0: Unmask DAC channel LFSR bit[5:0] for noise wave generation
  – DAC_LFSRUNMASK_BITS6_0: Unmask DAC channel LFSR bit[6:0] for noise wave generation
  – DAC_LFSRUNMASK_BITS7_0: Unmask DAC channel LFSR bit[7:0] for noise wave generation
  – DAC_LFSRUNMASK_BITS8_0: Unmask DAC channel LFSR bit[8:0] for noise wave generation
  – DAC_LFSRUNMASK_BITS9_0: Unmask DAC channel LFSR bit[9:0] for noise wave generation
  – DAC_LFSRUNMASK_BITS10_0: Unmask DAC channel LFSR bit[10:0] for noise wave generation
  – DAC_LFSRUNMASK_BITS11_0: Unmask DAC channel LFSR bit[11:0] for noise wave generation

Return values

- **HAL:** status

HAL_DACEx_DualStart

Function name

HAL_StatusTypeDef HAL_DACEx_DualStart (DAC_HandleTypeDef * hdac)

Function description

Enables DAC and starts conversion of both channels.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** status

HAL_DACEx_DualStop

Function name

HAL_StatusTypeDef HAL_DACEx_DualStop (DAC_HandleTypeDef * hdac)

Function description

Disables DAC and stop conversion of both channels.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** status

HAL_DACEx_DualStart_DMA

Function name

HAL_StatusTypeDef HAL_DACEx_DualStart_DMA (DAC_HandleTypeDef * hdac, uint32_t Channel, const uint32_t * pData, uint32_t Length, uint32_t Alignment)

Function description

Enables DAC and starts conversion of both channel 1 and 2 of the same DAC.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The DAC channel that will request data from DMA. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **pData:** The destination peripheral Buffer address.
- **Length:** The length of data to be transferred from memory to DAC peripheral
- **Alignment:** Specifies the data alignment for DAC channel. This parameter can be one of the following values:
  - DAC_ALIGN_8B_R: 8bit right data alignment selected
  - DAC_ALIGN_12B_L: 12bit left data alignment selected
  - DAC_ALIGN_12B_R: 12bit right data alignment selected

Return values

- **HAL:** status

HAL_DACEx_DualStop_DMA

Function name

HAL_StatusTypeDef HAL_DACEx_DualStop_DMA (DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Disables DAC and stop conversion both channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Channel:** The DAC channel that requests data from DMA. This parameter can be one of the following values:
  – DAC_CHANNEL_1: DAC Channel1 selected
  – DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **HAL:** status

HAL_DACEx_DualSetValue

Function name

HAL_StatusTypeDef HAL_DACEx_DualSetValue (DAC_HandleTypeDef * hdac, uint32_t Alignment, uint32_t Data1, uint32_t Data2)

Function description

Set the specified data holding register value for dual DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **Alignment:** Specifies the data alignment for dual channel DAC. This parameter can be one of the following values: DAC_ALIGN_8B_R: 8bit right data alignment selected DAC_ALIGN_12B_L: 12bit left data alignment selected DAC_ALIGN_12B_R: 12bit right data alignment selected
- **Data1:** Data for DAC Channel1 to be loaded in the selected data holding register.
- **Data2:** Data for DAC Channel2 to be loaded in the selected data holding register.

Return values

- **HAL:** status

Notes

- In dual mode, a unique register access is required to write in both DAC channels at the same time.

HAL_DACEx_DualGetValue

Function name

uint32_t HAL_DACEx_DualGetValue (const DAC_HandleTypeDef * hdac)

Function description

Return the last data output value of the selected DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **The:** selected DAC channel data output value.

HAL_DACEx_ConvCpltCallbackCh2

Function name

void HAL_DACEx_ConvCpltCallbackCh2 (DAC_HandleTypeDef * hdac)

Function description

Conversion complete callback in non-blocking mode for Channel2.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DACEx_ConvHalfCpltCallbackCh2

Function name

void HAL_DACEx_ConvHalfCpltCallbackCh2 (DAC_HandleTypeDef * hdac)

Function description

Conversion half DMA transfer callback in non-blocking mode for Channel2.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DACEx_ErrorCallbackCh2

Function name

void HAL_DACEx_ErrorCallbackCh2 (DAC_HandleTypeDef * hdac)

Function description

Error DAC callback for Channel2.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DACEx_DMAUnderrunCallbackCh2

Function name

void HAL_DACEx_DMAUnderrunCallbackCh2 (DAC_HandleTypeDef * hdac)

Function description

DMA underrun DAC callback for Channel2.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **None:**

HAL_DACEx_SelfCalibrate

Function name

HAL_StatusTypeDef HAL_DACEx_SelfCalibrate (DAC_HandleTypeDef * hdac, DAC_ChannelConfTypeDef * sConfig, uint32_t Channel)

Function description

Run the self calibration of one DAC channel.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **sConfig:** DAC channel configuration structure.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **Updates:** DAC_TrimmingValue. , DAC_UserTrimming set to DAC_UserTrimming
- **HAL:** status

Notes

- Calibration runs about 7 ms.

HAL_DACEx_SetUserTrimming

Function name

HAL_StatusTypeDef HAL_DACEx_SetUserTrimming (DAC_HandleTypeDef * hdac, DAC_ChannelConfTypeDef * sConfig, uint32_t Channel, uint32_t NewTrimmingValue)

Function description

Set the trimming mode and trimming value (user trimming mode applied).

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **sConfig:** DAC configuration structure updated with new DAC trimming value.
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  - DAC_CHANNEL_1: DAC Channel1 selected
  - DAC_CHANNEL_2: DAC Channel2 selected
- **NewTrimmingValue:** DAC new trimming value

Return values

- **HAL:** status

HAL_DACEx_GetTrimOffset

Function name

uint32_t HAL_DACEx_GetTrimOffset (const DAC_HandleTypeDef * hdac, uint32_t Channel)

Function description

Return the DAC trimming value.

Parameters

- **hdac:** DAC handle
- **Channel:** The selected DAC channel. This parameter can be one of the following values:
  – DAC_CHANNEL_1: DAC Channel1 selected
  – DAC_CHANNEL_2: DAC Channel2 selected

Return values

- **Trimming:** value : range: 0->31

HAL_DACEx_SetConfigAutonomousMode

Function name

HAL_StatusTypeDef HAL_DACEx_SetConfigAutonomousMode (DAC_HandleTypeDef * hdac, const DAC_AutonomousModeConfTypeDef * sConfig)

Function description

Set autonomous mode Configuration.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **sConfig:** pointer to Autonomous mode structure parameters.

Return values

- **HAL:** status

Notes

- The autonomous mode applies to the 2 channels of a DAC block (same for both channels)

HAL_DACEx_GetConfigAutonomousMode

Function name

HAL_StatusTypeDef HAL_DACEx_GetConfigAutonomousMode (const DAC_HandleTypeDef * hdac, DAC_AutonomousModeConfTypeDef * sConfig)

Function description

Get autonomous mode Configuration.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.
- **sConfig:** pointer to Autonomous mode structure parameters.

Return values

- **HAL:** status

HAL_DACEx_ClearConfigAutonomousMode

Function name

HAL_StatusTypeDef HAL_DACEx_ClearConfigAutonomousMode (DAC_HandleTypeDef * hdac)

Function description

Clear autonomous mode Configuration.

Parameters

- **hdac:** pointer to a DAC_HandleTypeDef structure that contains the configuration information for the specified DAC.

Return values

- **HAL:** status

Notes

- The autonomous mode applies to the 2 channels of a DAC block (same for both channels)

DAC_DMAConvCpltCh2

Function name

void DAC_DMAConvCpltCh2 (DMA_HandleTypeDef * hdma)

Function description

DMA conversion complete callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

DAC_DMAErrorCh2

Function name

void DAC_DMAErrorCh2 (DMA_HandleTypeDef * hdma)

Function description

DMA error callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

DAC_DMAHalfConvCpltCh2

Function name

void DAC_DMAHalfConvCpltCh2 (DMA_HandleTypeDef * hdma)

Function description

DMA half transfer complete callback.

Parameters

- **hdma:** pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA module.

Return values

- **None:**

17.3 DACEx Firmware driver defines

The following section lists the various define and macros of the module.

17.3.1 DACEx

DACEx

DACEx lfsrunmask triangle amplitude

DAC_LFSRUNMASK_BIT0

Unmask DAC channel LFSR bit0 for noise wave generation

DAC_LFSRUNMASK_BITS1_0

Unmask DAC channel LFSR bit[1:0] for noise wave generation

DAC_LFSRUNMASK_BITS2_0

Unmask DAC channel LFSR bit[2:0] for noise wave generation

DAC_LFSRUNMASK_BITS3_0

Unmask DAC channel LFSR bit[3:0] for noise wave generation

DAC_LFSRUNMASK_BITS4_0

Unmask DAC channel LFSR bit[4:0] for noise wave generation

DAC_LFSRUNMASK_BITS5_0

Unmask DAC channel LFSR bit[5:0] for noise wave generation

DAC_LFSRUNMASK_BITS6_0

Unmask DAC channel LFSR bit[6:0] for noise wave generation

DAC_LFSRUNMASK_BITS7_0

Unmask DAC channel LFSR bit[7:0] for noise wave generation

DAC_LFSRUNMASK_BITS8_0

Unmask DAC channel LFSR bit[8:0] for noise wave generation

DAC_LFSRUNMASK_BITS9_0

Unmask DAC channel LFSR bit[9:0] for noise wave generation

DAC_LFSRUNMASK_BITS10_0

Unmask DAC channel LFSR bit[10:0] for noise wave generation

DAC_LFSRUNMASK_BITS11_0

Unmask DAC channel LFSR bit[11:0] for noise wave generation

DAC_TRIANGLEAMPLITUDE_1

Select max triangle amplitude of 1

DAC_TRIANGLEAMPLITUDE_3

Select max triangle amplitude of 3

DAC_TRIANGLEAMPLITUDE_7

Select max triangle amplitude of 7

DAC_TRIANGLEAMPLITUDE_15

Select max triangle amplitude of 15

DAC_TRIANGLEAMPLITUDE_31

Select max triangle amplitude of 31

DAC_TRIANGLEAMPLITUDE_63

Select max triangle amplitude of 63

DAC_TRIANGLEAMPLITUDE_127

Select max triangle amplitude of 127

DAC_TRIANGLEAMPLITUDE_255

Select max triangle amplitude of 255

DAC_TRIANGLEAMPLITUDE_511

Select max triangle amplitude of 511

DAC_TRIANGLEAMPLITUDE_1023

Select max triangle amplitude of 1023

DAC_TRIANGLEAMPLITUDE_2047

Select max triangle amplitude of 2047

DAC_TRIANGLEAMPLITUDE_4095

Select max triangle amplitude of 4095

18 HAL DCACHE Generic Driver

18.1 DCACHE Firmware driver registers structures

18.1.1 DCACHE_InitTypeDef

DCACHE_InitTypeDef is defined in the stm32u5xx_hal_dcache.h

Data Fields

18.2 DCACHE Firmware driver API description

The following section lists the various functions of the DCACHE library.

18.2.1 How to use this driver

1. Configure and enable the MPU to override default config if needed, please refers to ARM manual for default memory attribute. Then enable DCACHE.

- Use HAL_DCACHE_Invalidate() to invalidate the full cache content:
  - Cache content is lost, and reloaded when needed.
  - Used for complete invalidate of the DCACHE in case.
  - Blocking call until operation is done.
- Use HAL_DCACHE_InvalidateByAddr() to invalidate cache content for specific range:
  - Cache content for specific range is lost, and reloaded when needed.
  - Used when excepting a buffer to be updated by a peripheral (typically DMA transfer)
  - Blocking call until operation is done.
- Use HAL_DCACHE_CleanByAddr() to clean cache content for a specific range:
  - Cache content for specific range is written back to memory.
  - Used when buffer is updated by CPU before usage by a peripheral (typically DMA transfer)
  - Blocking call until operation is done.
- Use HAL_DCACHE_CleanInvalidateByAddr() to clean and invalidate cache content for a specific range:
  - Cache content for specific range is written back to memory, and reloaded when needed.
  - Used when sharing buffer between CPU and other peripheral.
  - Recommended to use for MPU reprogramming.
  - Blocking call until operation is done.

Interrupt mode IO operation

- Configure the DCACHE interrupt priority using HAL_NVIC_SetPriority()
- Enable the DCACHE IRQ handler using HAL_NVIC_EnableIRQ()
- Override weak definition for following callbacks (if needed):
  - HAL_DCACHE_CleanAndInvalidateByAddrCallback()
  - HAL_DCACHE_InvalidateCompleteCallback()
  - HAL_DCACHE_InvalidateByAddrCallback()
  - HAL_DCACHE_CleanByAddrCallback()
  - HAL_DCACHE_ErrorCallback()
- Use HAL_DCACHE_<COMMAND>_IT() to start a DCACHE operation with IT enabled.
- Use HAL_DCACHE_IRQHandler() called under DCACHEx_IRQHandler() Interrupt subroutine

Use HAL_DCACHE_GetState() function to return the DCACHE state and HAL_DCACHE_GetError() in case of error detection.

DCACHE HAL driver macros list

Below the list of macros defined in the DCACHE HAL driver.

- __HAL_DCACHE_ENABLE_IT : Enable DCACHE interrupts.
- __HAL_DCACHE_DISABLE_IT : Disable DCACHE interrupts.
- __HAL_DCACHE_GET_IT_SOURCE: Check whether the specified DCACHE interrupt source is enabled or not.
- __HAL_DCACHE_GET_FLAG : Check whether the selected DCACHE flag is set or not.
- __HAL_DCACHE_CLEAR_FLAG : Clear the selected DCACHE flags.

Note: You can refer to the header file of the DCACHE HAL driver for more useful macros.

18.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and deinitialize the DCACHEx peripheral:

- User must implement HAL_DCACHE_MspInit() function in which he configures all related peripherals resources (CLOCK, MPU, IT and NVIC).

- Call the function HAL_DCACHE_Init() to configure the selected device with the selected configuration:
  – ReadBurstType
- Call the function HAL_DCACHE_DeInit() to restore the reset configuration of the selected DCACHEx peripheral.

This section contains the following APIs:
- *HAL_DCACHE_Init()*
- *HAL_DCACHE_DeInit()*
- *HAL_DCACHE_MspInit()*
- *HAL_DCACHE_MspDeInit()*

18.2.3 IO operation functions

This section provides functions allowing to:
- Enable the Data cache.
- Disable the Data cache.
- Set Read Burst Type.
- Invalidate the Data cache.
- Invalidate the Data cache with interrupt.
- Clean the Data cache by Addr.
- Invalidate the Data cache by Addr.
- Clean and Invalidate the Data cache by Addr.
- Clean the Data cache by Addr with interrupt.
- Invalidate the Data cache by Addr with interrupt.
- Clean and Invalidate the Data cache by Addr with interrupt.
- Start the Data Cache performance monitoring.
- Stop the Data Cache performance monitoring.
- Reset the Data Cache performance monitoring values.
- Get the Data Cache performance Read Hit monitoring value.
- Get the Data Cache performance Read Miss monitoring value.
- Get the Data Cache performance Write Hit monitoring value.
- Get the Data Cache performance Write Miss monitoring value.

This section contains the following APIs:
- *HAL_DCACHE_Enable()*
- *HAL_DCACHE_Disable()*
- *HAL_DCACHE_IsEnabled()*
- *HAL_DCACHE_SetReadBurstType()*
- *HAL_DCACHE_Invalidate()*
- *HAL_DCACHE_InvalidateByAddr()*
- *HAL_DCACHE_CleanByAddr()*
- *HAL_DCACHE_CleanInvalidByAddr()*
- *HAL_DCACHE_Invalidate_IT()*
- *HAL_DCACHE_InvalidateByAddr_IT()*
- *HAL_DCACHE_CleanByAddr_IT()*
- *HAL_DCACHE_CleanInvalidByAddr_IT()*
- *HAL_DCACHE_Monitor_Start()*
- *HAL_DCACHE_Monitor_Stop()*
- *HAL_DCACHE_Monitor_Reset()*
- *HAL_DCACHE_Monitor_GetReadHitValue()*
- *HAL_DCACHE_Monitor_GetReadMissValue()*
- *HAL_DCACHE_Monitor_GetWriteHitValue()*
- *HAL_DCACHE_Monitor_GetWriteMissValue()*

- *HAL_DCACHE_IRQHandler()*
- *HAL_DCACHE_ErrorCallback()*
- *HAL_DCACHE_CleanByAddrCallback()*
- *HAL_DCACHE_InvalidateByAddrCallback()*
- *HAL_DCACHE_InvalidateCompleteCallback()*
- *HAL_DCACHE_CleanAndInvalidateByAddrCallback()*
- *HAL_DCACHE_RegisterCallback()*
- *HAL_DCACHE_UnRegisterCallback()*

18.2.4 DCACHE IRQ Handler and Callback functions

This section provides functions allowing to treat ISR and provide user callback
This section contains the following APIs:

- *HAL_DCACHE_IRQHandler()*
- *HAL_DCACHE_RegisterCallback()*
- *HAL_DCACHE_UnRegisterCallback()*
- *HAL_DCACHE_CleanByAddrCallback()*
- *HAL_DCACHE_InvalidateByAddrCallback()*
- *HAL_DCACHE_CleanAndInvalidateByAddrCallback()*
- *HAL_DCACHE_InvalidateCompleteCallback()*
- *HAL_DCACHE_ErrorCallback()*
- *HAL_DCACHE_GetState()*
- *HAL_DCACHE_GetError()*

18.2.5 Peripheral State

This subsection permit to get in run-time the status of the peripheral and the data flow.
This section contains the following APIs:

- *HAL_DCACHE_GetState()*
- *HAL_DCACHE_GetError()*

18.2.6 Detailed description of functions

HAL_DCACHE_Init

Function name

HAL_StatusTypeDef HAL_DCACHE_Init (DCACHE_HandleTypeDef * hdcache)

Function description

Initializes the DCACHE according to the specified parameters in the DCACHE_InitTypeDef and initialize the associated handle.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHE.

Return values

- **HAL:** status

HAL_DCACHE_DeInit

Function name

HAL_StatusTypeDef HAL_DCACHE_DeInit (DCACHE_HandleTypeDef * hdcache)

Function description

DeInitialize the Data cache.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **HAL:** status

HAL_DCACHE_MspInit

Function name

void HAL_DCACHE_MspInit (DCACHE_HandleTypeDef * hdcache)

Function description

Initialize the DCACHE MSP.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

HAL_DCACHE_MspDeInit

Function name

void HAL_DCACHE_MspDeInit (DCACHE_HandleTypeDef * hdcache)

Function description

DeInitialize the DCACHE MSP.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

HAL_DCACHE_Enable

Function name

HAL_StatusTypeDef HAL_DCACHE_Enable (DCACHE_HandleTypeDef * hdcache)

Function description

Enable the Data cache.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **HAL:** status

HAL_DCACHE_Disable

Function name

HAL_StatusTypeDef HAL_DCACHE_Disable (DCACHE_HandleTypeDef * hdcache)

Function description

Disable the Data cache.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **HAL:** status

HAL_DCACHE_IsEnabled

Function name

uint32_t HAL_DCACHE_IsEnabled (const DCACHE_HandleTypeDef * hdcache)

Function description

Check whether the Data Cache is enabled or not.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **Status:** (0: disabled, 1: enabled)

HAL_DCACHE_SetReadBurstType

Function name

HAL_StatusTypeDef HAL_DCACHE_SetReadBurstType (DCACHE_HandleTypeDef * hdcache, uint32_t ReadBurstType)

Function description

Set Read Burst Type.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **ReadBurstType:** Burst type to be applied for Data Cache DCACHE_READ_BURST_WRAP, DCACHE_READ_BURST_INC.

Return values

- **HAL:** status

HAL_DCACHE_Invalidate

Function name

HAL_StatusTypeDef HAL_DCACHE_Invalidate (DCACHE_HandleTypeDef * hdcache)

Function description

Invalidate the Data cache.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **HAL:** status

Notes

- This function waits for end of full cache invalidation

HAL_DCACHE_InvalidateByAddr

Function name

HAL_StatusTypeDef HAL_DCACHE_InvalidateByAddr (DCACHE_HandleTypeDef * hdcache, const uint32_t *const pAddr, uint32_t dSize)

Function description

Invalidate the Data cache for a specific region.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **pAddr:** Start address of the region to be Invalidated
- **dSize:** Size of the region to be Invalidated(in bytes)

Return values

- **HAL:** status

Notes

- This function waits for end of cache Invalidation

HAL_DCACHE_CleanByAddr

Function name

HAL_StatusTypeDef HAL_DCACHE_CleanByAddr (DCACHE_HandleTypeDef * hdcache, const uint32_t *const pAddr, uint32_t dSize)

Function description

Clean the Data cache by Addr.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **pAddr:** Start address of the region to be Cleaned
- **dSize:** Size of the region to be Cleaned (in bytes)

Return values

- **HAL:** status

Notes

- This function waits for end of cache Clean

HAL_DCACHE_CleanInvalidByAddr

Function name

HAL_StatusTypeDef HAL_DCACHE_CleanInvalidByAddr (DCACHE_HandleTypeDef * hdcache, const uint32_t *const pAddr, uint32_t dSize)

Function description

Clean and Invalidate the Data cache by Addr.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **pAddr:** Start address of the region to be Cleaned and Invalidated
- **dSize:** Size of the region to be Cleaned and Invalidated (in bytes)

Return values

- **HAL:** status

Notes

- This function waits for end of cache Clean and Invalidation

HAL_DCACHE_Invalidate_IT

Function name

HAL_StatusTypeDef HAL_DCACHE_Invalidate_IT (DCACHE_HandleTypeDef * hdcache)

Function description

Invalidate the Data cache with interrupt.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **HAL:** status

Notes

- This function launches maintenance operation and returns immediately. User application shall resort to interrupt generation to check the end of operation.

HAL_DCACHE_InvalidateByAddr_IT

Function name

HAL_StatusTypeDef HAL_DCACHE_InvalidateByAddr_IT (DCACHE_HandleTypeDef * hdcache, const uint32_t *const pAddr, uint32_t dSize)

Function description

Invalidate the Data cache by Addr with interrupt.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **pAddr:** Start address of the region to be Invalidated
- **dSize:** Size of the region to be Invalidated

Return values

- **HAL:** status

Notes

- This function launches maintenance operation and returns immediately. User application shall resort to interrupt generation to check the end of operation.

HAL_DCACHE_CleanByAddr_IT

Function name

HAL_StatusTypeDef HAL_DCACHE_CleanByAddr_IT (DCACHE_HandleTypeDef * hdcache, const uint32_t *const pAddr, uint32_t dSize)

Function description

Clean the Data cache by Addr with interrupt.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **pAddr:** Start address of the region to be Cleaned
- **dSize:** Size of the region to be Cleaned

Return values

- **HAL:** status

Notes

- This function launches maintenance operation and returns immediately. User application shall resort to interrupt generation to check the end of operation.

HAL_DCACHE_CleanInvalidByAddr_IT

Function name

HAL_StatusTypeDef HAL_DCACHE_CleanInvalidByAddr_IT (DCACHE_HandleTypeDef * hdcache, const uint32_t *const pAddr, uint32_t dSize)

Function description

Clean and Invalidate the Data cache by Addr with interrupt.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **pAddr:** Start address of the region to be Cleaned and Invalidated
- **dSize:** Size of the region to be Cleaned and Invalidated

Return values

- **HAL:** status

Notes

- This function launches maintenance operation and returns immediately. User application shall resort to interrupt generation to check the end of operation.

HAL_DCACHE_IRQHandler

Function name

void HAL_DCACHE_IRQHandler (DCACHE_HandleTypeDef * hdcache)

Function description

Handle the Data Cache interrupt request.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

Notes

- This API should be called under the DCACHEx_IRQHandler().

HAL_DCACHE_ErrorCallback

Function name

void HAL_DCACHE_ErrorCallback (DCACHE_HandleTypeDef * hdcache)

Function description

Error callback.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

HAL_DCACHE_CleanByAddrCallback

Function name

void HAL_DCACHE_CleanByAddrCallback (DCACHE_HandleTypeDef * hdcache)

Function description

Cache clean command by address callback.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

HAL_DCACHE_InvalidateByAddrCallback

Function name

void HAL_DCACHE_InvalidateByAddrCallback (DCACHE_HandleTypeDef * hdcache)

Function description

Cache Invalidate command by address callback.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

HAL_DCACHE_InvalidateCompleteCallback

Function name

void HAL_DCACHE_InvalidateCompleteCallback (DCACHE_HandleTypeDef * hdcache)

Function description

Cache full invalidation complete callback.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

HAL_DCACHE_CleanAndInvalidateByAddrCallback

Function name

void HAL_DCACHE_CleanAndInvalidateByAddrCallback (DCACHE_HandleTypeDef * hdcache)

Function description

Cache clean and Invalidate command by address callback.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **None:**

HAL_DCACHE_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DCACHE_RegisterCallback (DCACHE_HandleTypeDef * hdcache, HAL_DCACHE_CallbackIDTypeDef CallbackID, pDCACHE_CallbackTypeDef pCallback)

Function description

Register a User DCACHE Callback To be used instead of the weak predefined callback.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_DCACHE_CLEAN_BY_ADDRESS_CB_ID Clean By Addr callback ID
  - HAL_DCACHE_INVALIDATE_BY_ADDRESS_CB_ID Invalidate By Addr callback ID
  - HAL_DCACHE_CLEAN_AND_INVALIDATE_BY_ADDRESS_CB_ID Clean and Invalidate By Addr callback ID
  - HAL_DCACHE_INVALIDATE_COMPLETE_CB_ID Invalidate Complete ID
  - HAL_DCACHE_ERROR_CB_ID Error callback ID
  - HAL_DCACHE_MSPINIT_CB_ID MspInit callback ID
  - HAL_DCACHE_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_DCACHE_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DCACHE_UnRegisterCallback (DCACHE_HandleTypeDef * hdcache, HAL_DCACHE_CallbackIDTypeDef CallbackID)

Function description

Unregister an DCACHE Callback DCACHE callback is redirected to the weak predefined callback.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  – HAL_DCACHE_CLEAN_BY_ADDRESS_CB_ID Clean By Addr callback ID
  – HAL_DCACHE_INVALIDATE_BY_ADDRESS_CB_ID Invalidate By Addr callback ID
  – HAL_DCACHE_CLEAN_AND_INVALIDATE_BY_ADDRESS_CB_ID Clean and Invalidate By Addr callback ID
  – HAL_DCACHE_INVALIDATE_COMPLETE_CB_ID Invalidate Complete callback ID
  – HAL_DCACHE_ERROR_CB_ID Error callback ID
  – HAL_DCACHE_MSPINIT_CB_ID MspInit callback ID
  – HAL_DCACHE_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_DCACHE_Monitor_GetReadHitValue

Function name

uint32_t HAL_DCACHE_Monitor_GetReadHitValue (const DCACHE_HandleTypeDef * hdcache)

Function description

Get the Data Cache performance Read Hit monitoring value.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **Read:** Hit monitoring value

Notes

- Upon reaching the 32-bit maximum value, monitor does not wrap.

HAL_DCACHE_Monitor_GetReadMissValue

Function name

uint32_t HAL_DCACHE_Monitor_GetReadMissValue (const DCACHE_HandleTypeDef * hdcache)

Function description

Get the Data Cache performance Read Miss monitoring value.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **Read:** Miss monitoring value

Notes

- Upon reaching the 16-bit maximum value, monitor does not wrap.

HAL_DCACHE_Monitor_GetWriteHitValue

Function name

uint32_t HAL_DCACHE_Monitor_GetWriteHitValue (const DCACHE_HandleTypeDef * hdcache)

Function description

Get the Data Cache performance Write Hit monitoring value.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **Write:** Hit monitoring value

Notes

- Upon reaching the 32-bit maximum value, monitor does not wrap.

HAL_DCACHE_Monitor_GetWriteMissValue

Function name

uint32_t HAL_DCACHE_Monitor_GetWriteMissValue (const DCACHE_HandleTypeDef * hdcache)

Function description

Get the Data Cache performance Write Miss monitoring value.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **Write:** Miss monitoring value

Notes

- Upon reaching the 16-bit maximum value, monitor does not wrap.

HAL_DCACHE_Monitor_Reset

Function name

HAL_StatusTypeDef HAL_DCACHE_Monitor_Reset (DCACHE_HandleTypeDef * hdcache, uint32_t MonitorType)

Function description

Reset the Data Cache performance monitoring values.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **MonitorType:** Monitoring type This parameter can be a combination of the following values:
  – DCACHE_MONITOR_READ_HIT
  – DCACHE_MONITOR_READ_MISS
  – DCACHE_MONITOR_WRITE_HIT
  – DCACHE_MONITOR_WRITE_MISS
  – DCACHE_MONITOR_ALL

Return values

- **HAL:** status

HAL_DCACHE_Monitor_Start

Function name

HAL_StatusTypeDef HAL_DCACHE_Monitor_Start (DCACHE_HandleTypeDef * hdcache, uint32_t MonitorType)

Function description

Start the Data Cache performance monitoring.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **MonitorType:** Monitoring type This parameter can be a combination of the following values:
  – DCACHE_MONITOR_READ_HIT
  – DCACHE_MONITOR_READ_MISS
  – DCACHE_MONITOR_WRITE_HIT
  – DCACHE_MONITOR_WRITE_MISS
  – DCACHE_MONITOR_ALL

Return values

- **HAL:** status

HAL_DCACHE_Monitor_Stop

Function name

HAL_StatusTypeDef HAL_DCACHE_Monitor_Stop (DCACHE_HandleTypeDef * hdcache, uint32_t MonitorType)

Function description

Stop the Data Cache performance monitoring.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.
- **MonitorType:** Monitoring type This parameter can be a combination of the following values:
  – DCACHE_MONITOR_READ_HIT
  – DCACHE_MONITOR_READ_MISS
  – DCACHE_MONITOR_WRITE_HIT
  – DCACHE_MONITOR_WRITE_MISS
  – DCACHE_MONITOR_ALL

Return values

- **HAL:** status

Notes

- Stopping the monitoring does not reset the values.

HAL_DCACHE_GetState

Function name

HAL_DCACHE_StateTypeDef HAL_DCACHE_GetState (const DCACHE_HandleTypeDef * hdcache)

Function description

Return the DCACHE handle state.

Parameters

- **hdcache:** Pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHEx peripheral.

Return values

- **HAL:** state

HAL_DCACHE_GetError

Function name

uint32_t HAL_DCACHE_GetError (const DCACHE_HandleTypeDef * hdcache)

Function description

Return the DCACHE error code.

Parameters

- **hdcache:** pointer to a DCACHE_HandleTypeDef structure that contains the configuration information for the specified DCACHE.

Return values

- **DCACHE:** Error Code

18.3 DCACHE Firmware driver defines

The following section lists the various define and macros of the module.

18.3.1 DCACHE

DCACHE

Command Operation

LL_DCACHE_COMMAND_NO_OPERATION

LL_DCACHE_COMMAND_CLEAN_BY_ADDR

LL_DCACHE_COMMAND_INVALIDATE_BY_ADDR

LL_DCACHE_COMMAND_CLEAN_INVALIDATE_BY_ADDR

DCACHE Error Code

HAL_DCACHE_ERROR_NONE

No error

HAL_DCACHE_ERROR_TIMEOUT

Timeout error

HAL_DCACHE_ERROR_INVALID_CALLBACK

Invalid callback error

HAL_DCACHE_ERROR_EVICTION_CLEAN

Eviction or clean operation write-back error

HAL_DCACHE_ERROR_INVALID_OPERATION

Invalid operation

DCACHE Exported Macros

__HAL_DCACHE_ENABLE_IT

Description:

- Enable DCACHE interrupts.

Parameters:

- __HANDLE__: specifies the DCACHE handle.
- __INTERRUPT__: specifies the DCACHE interrupt sources to be enabled. This parameter can be any combination of the following values:
  – DCACHE_IT_BUSYEND Busy end interrupt
  – DCACHE_IT_ERROR Cache error interrupt
  – DCACHE_IT_CMDEND Cache Command end interrupt

Return value:

- None

__HAL_DCACHE_DISABLE_IT

Description:

- Disable DCACHE interrupts.

Parameters:

- __HANDLE__: specifies the DCACHE handle.
- __INTERRUPT__: specifies the DCACHE interrupt sources to be disabled. This parameter can be any combination of the following values:
  – DCACHE_IT_BUSYEND Busy end interrupt
  – DCACHE_IT_ERROR Cache error interrupt
  – DCACHE_IT_CMDEND Cache Command end interrupt

Return value:

- None

__HAL_DCACHE_GET_IT_SOURCE

Description:

- Check whether the specified DCACHE interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the DCACHE handle.
- __INTERRUPT__: specifies the DCACHE interrupt source to check. This parameter can be any combination of the following values:
  – DCACHE_IT_BUSYEND Busy end interrupt
  – DCACHE_IT_ERROR Cache error interrupt
  – DCACHE_IT_CMDEND Cache Command end interrupt

Return value:

- The: state of __INTERRUPT__ (SET or RESET).

__HAL_DCACHE_GET_FLAG

Description:

- Check whether the selected DCACHE flag is set or not.

Parameters:

- __HANDLE__: specifies the DCACHE handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - DCACHE_FLAG_BUSY Busy flag
  - DCACHE_FLAG_BUSYEND Busy end flag
  - DCACHE_FLAG_ERROR Cache error flag
  - DCACHE_FLAG_BUSYCMD Cache Busy command flag
  - DCACHE_FLAG_CMDEND Cache command end flag

Return value:

- The: state of __FLAG__ (0 or 1).

__HAL_DCACHE_CLEAR_FLAG

Description:

- Clear the selected DCACHE flags.

Parameters:

- __HANDLE__: specifies the DCACHE handle.
- __FLAG__: specifies the DCACHE flags to clear. This parameter can be any combination of the following values:
  - DCACHE_FLAG_BUSYEND Busy end flag
  - DCACHE_FLAG_ERROR Cache error flag
  - DCACHE_FLAG_CMDEND Cache command end flag

Flags

DCACHE_FLAG_BUSY

Busy flag

DCACHE_FLAG_BUSYEND

Busy end flag

DCACHE_FLAG_ERROR

19 HAL DCMI Generic Driver

19.1 DCMI Firmware driver registers structures

19.1.1 DCMI_CodesInitTypeDef

DCMI_CodesInitTypeDef is defined in the stm32u5xx_hal_dcmi.h

Data Fields

- ***uint8_t FrameStartCode***
- ***uint8_t LineStartCode***
- ***uint8_t LineEndCode***
- ***uint8_t FrameEndCode***

Field Documentation

- ***uint8_t DCMI_CodesInitTypeDef::FrameStartCode***
  Specifies the code of the frame start delimiter.
- ***uint8_t DCMI_CodesInitTypeDef::LineStartCode***
  Specifies the code of the line start delimiter.
- ***uint8_t DCMI_CodesInitTypeDef::LineEndCode***
  Specifies the code of the line end delimiter.
- ***uint8_t DCMI_CodesInitTypeDef::FrameEndCode***
  Specifies the code of the frame end delimiter.

19.1.2 DCMI_SyncUnmaskTypeDef

DCMI_SyncUnmaskTypeDef is defined in the stm32u5xx_hal_dcmi.h

Data Fields

- ***uint8_t FrameStartUnmask***
- ***uint8_t LineStartUnmask***
- ***uint8_t LineEndUnmask***
- ***uint8_t FrameEndUnmask***

Field Documentation

- ***uint8_t DCMI_SyncUnmaskTypeDef::FrameStartUnmask***
  Specifies the frame start delimiter unmask.
- ***uint8_t DCMI_SyncUnmaskTypeDef::LineStartUnmask***
  Specifies the line start delimiter unmask.
- ***uint8_t DCMI_SyncUnmaskTypeDef::LineEndUnmask***
  Specifies the line end delimiter unmask.
- ***uint8_t DCMI_SyncUnmaskTypeDef::FrameEndUnmask***
  Specifies the frame end delimiter unmask.

19.1.3 DCMI_InitTypeDef

DCMI_InitTypeDef is defined in the stm32u5xx_hal_dcmi.h

Data Fields

- ***uint32_t SynchroMode***
- ***uint32_t PCKPolarity***
- ***uint32_t VSPolarity***
- ***uint32_t HSPolarity***
- ***uint32_t CaptureRate***
- ***uint32_t ExtendedDataMode***
- ***DCMI_CodesInitTypeDef SyncroCode***
- ***uint32_t JPEGMode***
- ***uint32_t ByteSelectMode***

- *uint32_t ByteSelectStart*
- *uint32_t LineSelectMode*
- *uint32_t LineSelectStart*

Field Documentation

- ***uint32_t DCMI_InitTypeDef::SynchroMode***
  Specifies the Synchronization Mode: Hardware or Embedded. This parameter can be a value of *DCMI_Synchronization_Mode*
- ***uint32_t DCMI_InitTypeDef::PCKPolarity***
  Specifies the Pixel clock polarity: Falling or Rising. This parameter can be a value of *DCMI_PIXCK_Polarity*
- ***uint32_t DCMI_InitTypeDef::VSPolarity***
  Specifies the Vertical synchronization polarity: High or Low. This parameter can be a value of *DCMI_VSYNC_Polarity*
- ***uint32_t DCMI_InitTypeDef::HSPolarity***
  Specifies the Horizontal synchronization polarity: High or Low. This parameter can be a value of *DCMI_HSYNC_Polarity*
- ***uint32_t DCMI_InitTypeDef::CaptureRate***
  Specifies the frequency of frame capture: All, 1/2 or 1/4. This parameter can be a value of *DCMI_Capture_Rate*
- ***uint32_t DCMI_InitTypeDef::ExtendedDataMode***
  Specifies the data width: 8-bit, 10-bit, 12-bit or 14-bit. This parameter can be a value of *DCMI_Extended_Data_Mode*
- ***DCMI_CodesInitTypeDef DCMI_InitTypeDef::SyncroCode***
  Specifies the code of the line/frame start delimiter and the line/frame end delimiter
- ***uint32_t DCMI_InitTypeDef::JPEGMode***
  Enable or Disable the JPEG mode. This parameter can be a value of *DCMI_MODE_JPEG*
- ***uint32_t DCMI_InitTypeDef::ByteSelectMode***
  Specifies the data to be captured by the interface This parameter can be a value of *DCMI_Byte_Select_Mode*
- ***uint32_t DCMI_InitTypeDef::ByteSelectStart***
  Specifies if the data to be captured by the interface is even or odd This parameter can be a value of *DCMI_Byte_Select_Start*
- ***uint32_t DCMI_InitTypeDef::LineSelectMode***
  Specifies the line of data to be captured by the interface This parameter can be a value of *DCMI_Line_Select_Mode*
- ***uint32_t DCMI_InitTypeDef::LineSelectStart***
  Specifies if the line of data to be captured by the interface is even or odd This parameter can be a value of *DCMI_Line_Select_Start*

19.1.4 __DCMI_HandleTypeDef

__DCMI_HandleTypeDef is defined in the stm32u5xx_hal_dcmi.h

Data Fields

- *DCMI_TypeDef * Instance*
- *DCMI_InitTypeDef Init*
- *HAL_LockTypeDef Lock*
- *__IO HAL_DCMI_StateTypeDef State*
- *__IO uint32_t XferCount*
- *__IO uint32_t XferSize*
- *uint32_t XferTransferNumber*
- *uint32_t pBuffPtr*
- *DMA_HandleTypeDef * DMA_Handle*
- *__IO uint32_t ErrorCode*
- *void(* FrameEventCallback*
- *void(* VsyncEventCallback*

- ***void(* LineEventCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***DCMI_TypeDef* __DCMI_HandleTypeDef::Instance***
  DCMI Register base address
- ***DCMI_InitTypeDef __DCMI_HandleTypeDef::Init***
  DCMI parameters
- ***HAL_LockTypeDef __DCMI_HandleTypeDef::Lock***
  DCMI locking object
- ***__IO HAL_DCMI_StateTypeDef __DCMI_HandleTypeDef::State***
  DCMI state
- ***__IO uint32_t __DCMI_HandleTypeDef::XferCount***
  DMA transfer counter
- ***__IO uint32_t __DCMI_HandleTypeDef::XferSize***
  DMA transfer size
- ***uint32_t __DCMI_HandleTypeDef::XferTransferNumber***
  DMA transfer number
- ***uint32_t __DCMI_HandleTypeDef::pBuffPtr***
  Pointer to DMA output buffer
- ***DMA_HandleTypeDef* __DCMI_HandleTypeDef::DMA_Handle***
  Pointer to the DMA handler
- ***__IO uint32_t __DCMI_HandleTypeDef::ErrorCode***
  DCMI Error code
- ***void(* __DCMI_HandleTypeDef::FrameEventCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Frame Event Callback
- ***void(* __DCMI_HandleTypeDef::VsyncEventCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Vsync Event Callback
- ***void(* __DCMI_HandleTypeDef::LineEventCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Line Event Callback
- ***void(* __DCMI_HandleTypeDef::ErrorCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Error Callback
- ***void(* __DCMI_HandleTypeDef::MspInitCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Msp Init callback
- ***void(* __DCMI_HandleTypeDef::MspDeInitCallback)(struct __DCMI_HandleTypeDef *hdcmi)***
  DCMI Msp DeInit callback

19.2 DCMI Firmware driver API description

The following section lists the various functions of the DCMI library.

19.2.1 How to use this driver

The sequence below describes how to use this driver to capture image from a camera module connected to the DCMI Interface. This sequence does not take into account the configuration of the camera module, which should be made before to configure and enable the DCMI to capture images.

1. Program the required configuration through following parameters: horizontal and vertical polarity, pixel clock polarity, Capture Rate, Synchronization Mode, code of the frame delimiter and data width using HAL_DCMI_Init() function.
2. Configure the selected DMA stream to transfer Data from DCMI DR register to the destination memory buffer.
3. Program the required configuration through following parameters: DCMI mode, destination memory Buffer address and the data length and enable capture using HAL_DCMI_Start_DMA() function.
4. Optionally, configure and Enable the CROP feature to select a rectangular window from the received image using HAL_DCMI_ConfigCrop() and HAL_DCMI_EnableCrop() functions
5. The capture can be stopped using HAL_DCMI_Stop() function.

6. To control DCMI state you can use the function HAL_DCMI_GetState().

DCMI HAL driver macros list

Below the list of most used macros in DCMI HAL driver.

- __HAL_DCMI_ENABLE: Enable the DCMI peripheral.
- __HAL_DCMI_DISABLE: Disable the DCMI peripheral.
- __HAL_DCMI_GET_FLAG: Get the DCMI pending flags.
- __HAL_DCMI_CLEAR_FLAG: Clear the DCMI pending flags.
- __HAL_DCMI_ENABLE_IT: Enable the specified DCMI interrupts.
- __HAL_DCMI_DISABLE_IT: Disable the specified DCMI interrupts.
- __HAL_DCMI_GET_IT_SOURCE: Check whether the specified DCMI interrupt has occurred or not.

Note: *You can refer to the DCMI HAL driver header file for more useful macros*

Callback registration

19.2.2 Initialization and Configuration functions

This section provides functions allowing to:

- Initialize and configure the DCMI
- De-initialize the DCMI

This section contains the following APIs:

- *HAL_DCMI_Init()*
- *HAL_DCMI_DeInit()*
- *HAL_DCMI_MspInit()*
- *HAL_DCMI_MspDeInit()*
- *HAL_DCMI_RegisterCallback()*
- *HAL_DCMI_UnRegisterCallback()*

19.2.3 IO operation functions

This section provides functions allowing to:

- Configure destination address and data length and Enables DCMI DMA request and enables DCMI capture
- Stop the DCMI capture.
- Handles DCMI interrupt request.

This section contains the following APIs:

- *HAL_DCMI_Start_DMA()*
- *HAL_DCMI_Stop()*
- *HAL_DCMI_Suspend()*
- *HAL_DCMI_Resume()*
- *HAL_DCMI_IRQHandler()*
- *HAL_DCMI_ErrorCallback()*
- *HAL_DCMI_LineEventCallback()*
- *HAL_DCMI_VsyncEventCallback()*
- *HAL_DCMI_FrameEventCallback()*

19.2.4 Peripheral Control functions

This section provides functions allowing to:

- Configure the CROP feature.
- Enable/Disable the CROP feature.
- Set embedded synchronization delimiters unmasks.

This section contains the following APIs:

- *HAL_DCMI_ConfigCrop()*
- *HAL_DCMI_DisableCrop()*
- *HAL_DCMI_EnableCrop()*
- *HAL_DCMI_ConfigSyncUnmask()*

19.2.5 Peripheral State and Errors functions

This subsection provides functions allowing to
- Check the DCMI state.
- Get the specific DCMI error flag.

This section contains the following APIs:
- *HAL_DCMI_GetState()*
- *HAL_DCMI_GetError()*
- *HAL_DCMI_RegisterCallback()*
- *HAL_DCMI_UnRegisterCallback()*

19.2.6 Detailed description of functions

HAL_DCMI_Init

Function name

HAL_StatusTypeDef HAL_DCMI_Init (DCMI_HandleTypeDef * hdcmi)

Function description

Initializes the DCMI according to the specified parameters in the DCMI_InitTypeDef and create the associated handle.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_DeInit

Function name

HAL_StatusTypeDef HAL_DCMI_DeInit (DCMI_HandleTypeDef * hdcmi)

Function description

Deinitializes the DCMI peripheral registers to their default reset values.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_MspInit

Function name

void HAL_DCMI_MspInit (DCMI_HandleTypeDef * hdcmi)

Function description

Initializes the DCMI MSP.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_MspDeInit

Function name

void HAL_DCMI_MspDeInit (DCMI_HandleTypeDef * hdcmi)

Function description

DeInitializes the DCMI MSP.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DCMI_RegisterCallback (DCMI_HandleTypeDef * hdcmi, HAL_DCMI_CallbackIDTypeDef CallbackID, pDCMI_CallbackTypeDef pCallback)

Function description

Register a User DCMI Callback To be used instead of the weak predefined callback.

Parameters

- **hdcmi:** DCMI handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_DCMI_LINE_EVENT_CB_ID Line Event callback ID
  - HAL_DCMI_FRAME_EVENT_CB_ID Frame Event callback ID
  - HAL_DCMI_VSYNC_EVENT_CB_ID Vsync Event callback ID
  - HAL_DCMI_ERROR_CB_ID Error callback ID
  - HAL_DCMI_MSPINIT_CB_ID MspInit callback ID
  - HAL_DCMI_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_DCMI_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DCMI_UnRegisterCallback (DCMI_HandleTypeDef * hdcmi, HAL_DCMI_CallbackIDTypeDef CallbackID)

Function description

Unregister a DCMI Callback DCMI callback is redirected to the weak predefined callback.

Parameters

- **hdcmi:** DCMI handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_DCMI_LINE_EVENT_CB_ID Line Event callback ID
  - HAL_DCMI_FRAME_EVENT_CB_ID Frame Event callback ID
  - HAL_DCMI_VSYNC_EVENT_CB_ID Vsync Event callback ID
  - HAL_DCMI_ERROR_CB_ID Error callback ID
  - HAL_DCMI_MSPINIT_CB_ID MspInit callback ID
  - HAL_DCMI_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_DCMI_Start_DMA

Function name

HAL_StatusTypeDef HAL_DCMI_Start_DMA (DCMI_HandleTypeDef * hdcmi, uint32_t DCMI_Mode, uint32_t pData, uint32_t Length)

Function description

Enables DCMI DMA request and enables DCMI capture.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.
- **DCMI_Mode:** DCMI capture mode snapshot or continuous grab.
- **pData:** The destination memory Buffer address (LCD Frame buffer).
- **Length:** The length of capture to be transferred.

Return values

- **HAL:** status

HAL_DCMI_Stop

Function name

HAL_StatusTypeDef HAL_DCMI_Stop (DCMI_HandleTypeDef * hdcmi)

Function description

Disable DCMI DMA request and Disable DCMI capture.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_Suspend

Function name

HAL_StatusTypeDef HAL_DCMI_Suspend (DCMI_HandleTypeDef * hdcmi)

Function description

Suspend DCMI capture.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_Resume

Function name

HAL_StatusTypeDef HAL_DCMI_Resume (DCMI_HandleTypeDef * hdcmi)

Function description

Resume DCMI capture.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_ErrorCallback

Function name

void HAL_DCMI_ErrorCallback (DCMI_HandleTypeDef * hdcmi)

Function description

Error DCMI callback.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_LineEventCallback

Function name

void HAL_DCMI_LineEventCallback (DCMI_HandleTypeDef * hdcmi)

Function description

Line Event callback.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_FrameEventCallback

Function name

void HAL_DCMI_FrameEventCallback (DCMI_HandleTypeDef * hdcmi)

Function description

Frame Event callback.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_VsyncEventCallback

Function name

void HAL_DCMI_VsyncEventCallback (DCMI_HandleTypeDef * hdcmi)

Function description

VSYNC Event callback.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **None:**

HAL_DCMI_IRQHandler

Function name

void HAL_DCMI_IRQHandler (DCMI_HandleTypeDef * hdcmi)

Function description

Handles DCMI interrupt request.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for the DCMI.

Return values

- **None:**

HAL_DCMI_ConfigCrop

Function name

HAL_StatusTypeDef HAL_DCMI_ConfigCrop (DCMI_HandleTypeDef * hdcmi, uint32_t X0, uint32_t Y0, uint32_t XSize, uint32_t YSize)

Function description

Configure the DCMI CROP coordinate.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.
- **YSize:** DCMI Line number
- **XSize:** DCMI Pixel per line
- **X0:** DCMI window X offset
- **Y0:** DCMI window Y offset

Return values

- **HAL:** status

HAL_DCMI_EnableCrop

Function name

HAL_StatusTypeDef HAL_DCMI_EnableCrop (DCMI_HandleTypeDef * hdcmi)

Function description

Enable the Crop feature.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_DisableCrop

Function name

HAL_StatusTypeDef HAL_DCMI_DisableCrop (DCMI_HandleTypeDef * hdcmi)

Function description

Disable the Crop feature.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** status

HAL_DCMI_ConfigSyncUnmask

Function name

HAL_StatusTypeDef HAL_DCMI_ConfigSyncUnmask (DCMI_HandleTypeDef * hdcmi, DCMI_SyncUnmaskTypeDef * SyncUnmask)

Function description

Set embedded synchronization delimiters unmasks.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.
- **SyncUnmask:** pointer to a DCMI_SyncUnmaskTypeDef structure that contains the embedded synchronization delimiters unmasks.

Return values

- **HAL:** status

HAL_DCMI_GetState

Function name

HAL_DCMI_StateTypeDef HAL_DCMI_GetState (const DCMI_HandleTypeDef * hdcmi)

Function description

Return the DCMI state.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **HAL:** state

HAL_DCMI_GetError

Function name

uint32_t HAL_DCMI_GetError (const DCMI_HandleTypeDef * hdcmi)

Function description

Return the DCMI error code.

Parameters

- **hdcmi:** pointer to a DCMI_HandleTypeDef structure that contains the configuration information for DCMI.

Return values

- **DCMI:** Error Code

19.3 DCMI Firmware driver defines

The following section lists the various define and macros of the module.

19.3.1 DCMI

DCMI

DCMI Byte Select Mode

DCMI_BSM_ALL

Interface captures all received data

DCMI_BSM_OTHER

Interface captures every other byte from the received data

DCMI_BSM_ALTERNATE_4

Interface captures one byte out of four

DCMI_BSM_ALTERNATE_2

Interface captures two bytes out of four

DCMI Byte Select Start

DCMI_OEBS_ODD

Interface captures first data from the frame/line start, second one being dropped

DCMI_OEBS_EVEN

Interface captures second data from the frame/line start, first one being dropped

DCMI Capture Mode

DCMI_MODE_CONTINUOUS

The received data are transferred continuously into the destination memory through the DMA

DCMI_MODE_SNAPSHOT

Once activated, the interface waits for the start of frame and then transfers a single frame through the DMA

DCMI Capture Rate

DCMI_CR_ALL_FRAME

All frames are captured

DCMI_CR_ALTERNATE_2_FRAME

Every alternate frame captured

DCMI_CR_ALTERNATE_4_FRAME

One frame in 4 frames captured

DCMI Error Code

HAL_DCMI_ERROR_NONE

No error

HAL_DCMI_ERROR_OVR

Overrun error

HAL_DCMI_ERROR_SYNC

Synchronization error

HAL_DCMI_ERROR_TIMEOUT

Timeout error

HAL_DCMI_ERROR_DMA

DMA error

HAL_DCMI_ERROR_INVALID_CALLBACK

Invalid callback error

DCMI Exported Macros

__HAL_DCMI_RESET_HANDLE_STATE

Description:
- Reset DCMI handle state.

Parameters:
- __HANDLE__: specifies the DCMI handle.

Return value:
- None

__HAL_DCMI_ENABLE

Description:
- Enable the DCMI.

Parameters:
- __HANDLE__: DCMI handle

Return value:
- None

__HAL_DCMI_DISABLE

Description:
- Disable the DCMI.

Parameters:
- __HANDLE__: DCMI handle

Return value:
- None

__HAL_DCMI_GET_FLAG

Description:

- Get the DCMI pending flag.

Parameters:

- __HANDLE__: DCMI handle
- __FLAG__: Get the specified flag. This parameter can be one of the following values (no combination allowed)
  - DCMI_FLAG_HSYNC: HSYNC pin state (active line / synchronization between lines)
  - DCMI_FLAG_VSYNC: VSYNC pin state (active frame / synchronization between frames)
  - DCMI_FLAG_FNE: FIFO empty flag
  - DCMI_FLAG_FRAMERI: Frame capture complete flag mask
  - DCMI_FLAG_OVRRI: Overrun flag mask
  - DCMI_FLAG_ERRRI: Synchronization error flag mask
  - DCMI_FLAG_VSYNCRI: VSYNC flag mask
  - DCMI_FLAG_LINERI: Line flag mask
  - DCMI_FLAG_FRAMEMI: DCMI Capture complete masked interrupt status
  - DCMI_FLAG_OVRMI: DCMI Overrun masked interrupt status
  - DCMI_FLAG_ERRMI: DCMI Synchronization error masked interrupt status
  - DCMI_FLAG_VSYNCMI: DCMI VSYNC masked interrupt status
  - DCMI_FLAG_LINEMI: DCMI Line masked interrupt status

Return value:

- The: state of FLAG.

__HAL_DCMI_CLEAR_FLAG

Description:

- Clear the DCMI pending flags.

Parameters:

- __HANDLE__: DCMI handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - DCMI_FLAG_FRAMERI: Frame capture complete flag mask
  - DCMI_FLAG_OVFRI: Overflow flag mask
  - DCMI_FLAG_ERRRI: Synchronization error flag mask
  - DCMI_FLAG_VSYNCRI: VSYNC flag mask
  - DCMI_FLAG_LINERI: Line flag mask

Return value:

- None

__HAL_DCMI_ENABLE_IT

Description:

- Enable the specified DCMI interrupts.

Parameters:

- __HANDLE__: DCMI handle
- __INTERRUPT__: specifies the DCMI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DCMI_IT_FRAME: Frame capture complete interrupt mask
  - DCMI_IT_OVF: Overflow interrupt mask
  - DCMI_IT_ERR: Synchronization error interrupt mask
  - DCMI_IT_VSYNC: VSYNC interrupt mask
  - DCMI_IT_LINE: Line interrupt mask

Return value:

- None

__HAL_DCMI_DISABLE_IT

Description:

- Disable the specified DCMI interrupts.

Parameters:

- __HANDLE__: DCMI handle
- __INTERRUPT__: specifies the DCMI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DCMI_IT_FRAME: Frame capture complete interrupt mask
  - DCMI_IT_OVF: Overflow interrupt mask
  - DCMI_IT_ERR: Synchronization error interrupt mask
  - DCMI_IT_VSYNC: VSYNC interrupt mask
  - DCMI_IT_LINE: Line interrupt mask

Return value:

- None

__HAL_DCMI_GET_IT_SOURCE

Description:

- Check whether the specified DCMI interrupt has occurred or not.

Parameters:

- __HANDLE__: DCMI handle
- __INTERRUPT__: specifies the DCMI interrupt source to check. This parameter can be one of the following values:
  - DCMI_IT_FRAME: Frame capture complete interrupt mask
  - DCMI_IT_OVF: Overflow interrupt mask
  - DCMI_IT_ERR: Synchronization error interrupt mask
  - DCMI_IT_VSYNC: VSYNC interrupt mask
  - DCMI_IT_LINE: Line interrupt mask

Return value:

- The: state of INTERRUPT.

DCMI Extended Data Mode

DCMI_EXTEND_DATA_8B

Interface captures 8-bit data on every pixel clock

DCMI_EXTEND_DATA_10B

Interface captures 10-bit data on every pixel clock

DCMI_EXTEND_DATA_12B

Interface captures 12-bit data on every pixel clock

DCMI_EXTEND_DATA_14B

Interface captures 14-bit data on every pixel clock

DCMI Flags

DCMI_FLAG_HSYNC

HSYNC pin state (active line / synchronization between lines)

DCMI_FLAG_VSYNC

VSYNC pin state (active frame / synchronization between frames)

DCMI_FLAG_FNE

FIFO not empty flag

DCMI_FLAG_FRAMERI

Frame capture complete interrupt flag

DCMI_FLAG_OVRRI

Overrun interrupt flag

DCMI_FLAG_ERRRI

Synchronization error interrupt flag

DCMI_FLAG_VSYNCRI

VSYNC interrupt flag

DCMI_FLAG_LINERI

Line interrupt flag

DCMI_FLAG_FRAMEMI

DCMI Frame capture complete masked interrupt status

DCMI_FLAG_OVRMI

DCMI Overrun masked interrupt status

DCMI_FLAG_ERRMI

DCMI Synchronization error masked interrupt status

DCMI_FLAG_VSYNCMI

DCMI VSYNC masked interrupt status

DCMI_FLAG_LINEMI

DCMI Line masked interrupt status

DCMI HSYNC Polarity

DCMI_HSPOLARITY_LOW

Horizontal synchronization active Low

DCMI_HSPOLARITY_HIGH

Horizontal synchronization active High

DCMI interrupt sources

DCMI_IT_FRAME

Capture complete interrupt

DCMI_IT_OVR

Overrun interrupt

DCMI_IT_ERR

Synchronization error interrupt

DCMI_IT_VSYNC

VSYNC interrupt

DCMI_IT_LINE

Line interrupt

DCMI Line Select Mode

DCMI_LSM_ALL

Interface captures all received lines

DCMI_LSM_ALTERNATE_2

Interface captures one line out of two

DCMI Line Select Start

DCMI_OELS_ODD

Interface captures first line from the frame start, second one being dropped

DCMI_OELS_EVEN

Interface captures second line from the frame start, first one being dropped

DCMI Mis Index

DCMI_MIS_INDEX

DCMI MIS register index

DCMI MODE JPEG

DCMI_JPEG_DISABLE

Mode JPEG Disabled

DCMI_JPEG_ENABLE

Mode JPEG Enabled

DCMI PIXCK Polarity

DCMI_PCKPOLARITY_FALLING

Pixel clock active on Falling edge

DCMI_PCKPOLARITY_RISING

Pixel clock active on Rising edge

DCMI SR Index

DCMI_SR_INDEX

DCMI SR register index

DCMI Stop Time Out

HAL_TIMEOUT_DCMI_STOP

DCMI Synchronization Mode

DCMI_SYNCHRO_HARDWARE

Hardware synchronization data capture (frame/line start/stop) is synchronized with the HSYNC/VSYNC signals

DCMI_SYNCHRO_EMBEDDED

Embedded synchronization data capture is synchronized with synchronization codes embedded in the data flow

DCMI VSYNC Polarity

DCMI_VSPOLARITY_LOW

Vertical synchronization active Low

DCMI_VSPOLARITY_HIGH

Vertical synchronization active High

DCMI Window Coordinate

DCMI_WINDOW_COORDINATE

Window coordinate

DCMI Window Height

DCMI_WINDOW_HEIGHT

Window Height

20 HAL DMA2D Generic Driver

20.1 DMA2D Firmware driver registers structures

20.1.1 DMA2D_CLUTCfgTypeDef

DMA2D_CLUTCfgTypeDef is defined in the stm32u5xx_hal_dma2d.h

Data Fields

- ***uint32_t * pCLUT***
- ***uint32_t CLUTColorMode***
- ***uint32_t Size***

Field Documentation

- ***uint32_t* DMA2D_CLUTCfgTypeDef::pCLUT***
  Configures the DMA2D CLUT memory address.
- ***uint32_t DMA2D_CLUTCfgTypeDef::CLUTColorMode***
  Configures the DMA2D CLUT color mode. This parameter can be one value of ***DMA2D_CLUT_CM***.
- ***uint32_t DMA2D_CLUTCfgTypeDef::Size***
  Configures the DMA2D CLUT size. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.

20.1.2 DMA2D_InitTypeDef

DMA2D_InitTypeDef is defined in the stm32u5xx_hal_dma2d.h

Data Fields

- ***uint32_t Mode***
- ***uint32_t ColorMode***
- ***uint32_t OutputOffset***
- ***uint32_t AlphaInverted***
- ***uint32_t RedBlueSwap***
- ***uint32_t BytesSwap***
- ***uint32_t LineOffsetMode***

Field Documentation

- ***uint32_t DMA2D_InitTypeDef::Mode***
  Configures the DMA2D transfer mode. This parameter can be one value of ***DMA2D_Mode***.
- ***uint32_t DMA2D_InitTypeDef::ColorMode***
  Configures the color format of the output image. This parameter can be one value of ***DMA2D_Output_Color_Mode***.
- ***uint32_t DMA2D_InitTypeDef::OutputOffset***
  Specifies the Offset value. This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x3FFF.
- ***uint32_t DMA2D_InitTypeDef::AlphaInverted***
  Select regular or inverted alpha value for the output pixel format converter. This parameter can be one value of ***DMA2D_Alpha_Inverted***.
- ***uint32_t DMA2D_InitTypeDef::RedBlueSwap***
  Select regular mode (RGB or ARGB) or swap mode (BGR or ABGR) for the output pixel format converter. This parameter can be one value of ***DMA2D_RB_Swap***.
- ***uint32_t DMA2D_InitTypeDef::BytesSwap***
  Select byte regular mode or bytes swap mode (two by two). This parameter can be one value of ***DMA2D_Bytes_Swap***.
- ***uint32_t DMA2D_InitTypeDef::LineOffsetMode***
  Configures how is expressed the line offset for the foreground, background and output. This parameter can be one value of ***DMA2D_Line_Offset_Mode***.

20.1.3 DMA2D_LayerCfgTypeDef

DMA2D_LayerCfgTypeDef is defined in the stm32u5xx_hal_dma2d.h

Data Fields

- ***uint32_t InputOffset***
- ***uint32_t InputColorMode***
- ***uint32_t AlphaMode***
- ***uint32_t InputAlpha***
- ***uint32_t AlphaInverted***
- ***uint32_t RedBlueSwap***
- ***uint32_t ChromaSubSampling***

Field Documentation

- ***uint32_t DMA2D_LayerCfgTypeDef::InputOffset***
  Configures the DMA2D foreground or background offset. This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x3FFF.
- ***uint32_t DMA2D_LayerCfgTypeDef::InputColorMode***
  Configures the DMA2D foreground or background color mode. This parameter can be one value of ***DMA2D_Input_Color_Mode***.
- ***uint32_t DMA2D_LayerCfgTypeDef::AlphaMode***
  Configures the DMA2D foreground or background alpha mode. This parameter can be one value of ***DMA2D_Alpha_Mode***.
- ***uint32_t DMA2D_LayerCfgTypeDef::InputAlpha***
  Specifies the DMA2D foreground or background alpha value and color value in case of A8 or A4 color mode. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF except for the color modes detailed below.
  Note:
  – In case of A8 or A4 color mode (ARGB), this parameter must be a number between Min_Data = 0x00000000 and Max_Data = 0xFFFFFFFF where
    - InputAlpha[24:31] is the alpha value ALPHA[0:7]
    - InputAlpha[16:23] is the red value RED[0:7]
    - InputAlpha[8:15] is the green value GREEN[0:7]
    - InputAlpha[0:7] is the blue value BLUE[0:7].
- ***uint32_t DMA2D_LayerCfgTypeDef::AlphaInverted***
  Select regular or inverted alpha value. This parameter can be one value of ***DMA2D_Alpha_Inverted***.
- ***uint32_t DMA2D_LayerCfgTypeDef::RedBlueSwap***
  Select regular mode (RGB or ARGB) or swap mode (BGR or ABGR). This parameter can be one value of ***DMA2D_RB_Swap***.
- ***uint32_t DMA2D_LayerCfgTypeDef::ChromaSubSampling***
  Configure the chroma sub-sampling mode for the YCbCr color mode This parameter can be one value of ***DMA2D_Chroma_Sub_Sampling***

20.1.4 __DMA2D_HandleTypeDef

__DMA2D_HandleTypeDef is defined in the stm32u5xx_hal_dma2d.h

Data Fields

- ***DMA2D_TypeDef * Instance***
- ***DMA2D_InitTypeDef Init***
- ***void(* XferCpltCallback***
- ***void(* XferErrorCallback***
- ***void(* LineEventCallback***
- ***void(* CLUTLoadingCpltCallback***
- ***void(* MspInitCallback***

- ***HAL_LockTypeDef Lock***

- ***__IO HAL_DMA2D_StateTypeDef State***
- ***__IO uint32_t ErrorCode***

Field Documentation

- ***DMA2D_TypeDef* __DMA2D_HandleTypeDef::Instance***
  DMA2D register base address.
- ***DMA2D_InitTypeDef __DMA2D_HandleTypeDef::Init***
  DMA2D communication parameters.
- ***void(* __DMA2D_HandleTypeDef::XferCpltCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D transfer complete callback.
- ***void(* __DMA2D_HandleTypeDef::XferErrorCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D transfer error callback.
- ***void(* __DMA2D_HandleTypeDef::LineEventCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D line event callback.
- ***void(* __DMA2D_HandleTypeDef::CLUTLoadingCpltCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D CLUT loading completion callback
- ***void(* __DMA2D_HandleTypeDef::MspInitCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D Msp Init callback.
- ***void(* __DMA2D_HandleTypeDef::MspDeInitCallback)(struct __DMA2D_HandleTypeDef *hdma2d)***
  DMA2D Msp DeInit callback.
- ***DMA2D_LayerCfgTypeDef __DMA2D_HandleTypeDef::LayerCfg[MAX_DMA2D_LAYER]***
  DMA2D Layers parameters
- ***HAL_LockTypeDef __DMA2D_HandleTypeDef::Lock***
  DMA2D lock.
- ***__IO HAL_DMA2D_StateTypeDef __DMA2D_HandleTypeDef::State***
  DMA2D transfer state.
- ***__IO uint32_t __DMA2D_HandleTypeDef::ErrorCode***
  DMA2D error code.

20.2 DMA2D Firmware driver API description

The following section lists the various functions of the DMA2D library.

20.2.1 How to use this driver

1. Program the required configuration through the following parameters: the transfer mode, the output color mode and the output offset using HAL_DMA2D_Init() function.
2. Program the required configuration through the following parameters: the input color mode, the input color, the input alpha value, the alpha mode, the red/blue swap mode, the inverted alpha mode and the input offset using HAL_DMA2D_ConfigLayer() function for foreground or/and background layer.

Polling mode IO operation

1. Configure pdata parameter (explained hereafter), destination and data length and enable the transfer using HAL_DMA2D_Start().
2. Wait for end of transfer using HAL_DMA2D_PollForTransfer(), at this stage user can specify the value of timeout according to his end application.

Interrupt mode IO operation

1. Configure pdata parameter, destination and data length and enable the transfer using HAL_DMA2D_Start_IT().
2. Use HAL_DMA2D_IRQHandler() called under DMA2D_IRQHandler() interrupt subroutine.
3. At the end of data transfer HAL_DMA2D_IRQHandler() function is executed and user can add his own function by customization of function pointer XferCpltCallback (member of DMA2D handle structure).

4. In case of error, the HAL_DMA2D_IRQHandler() function calls the callback XferErrorCallback.

Note: In Register-to-Memory transfer mode, pdata parameter is the register color, in Memory-to-memory or Memory-to-Memory with pixel format conversion pdata is the source address.

Note: Configure the foreground source address, the background source address, the destination and data length then Enable the transfer using HAL_DMA2D_BlendingStart() in polling mode and HAL_DMA2D_BlendingStart_IT() in interrupt mode.

Note: HAL_DMA2D_BlendingStart() and HAL_DMA2D_BlendingStart_IT() functions are used if the memory to memory with blending transfer mode is selected.

5. Optionally, configure and enable the CLUT using HAL_DMA2D_CLUTLoad() in polling mode or HAL_DMA2D_CLUTLoad_IT() in interrupt mode.
6. Optionally, configure the line watermark in using the API HAL_DMA2D_ProgramLineEvent().
7. Optionally, configure the dead time value in the AHB clock cycle inserted between two consecutive accesses on the AHB master port in using the API HAL_DMA2D_ConfigDeadTime() and enable/disable the functionality with the APIs HAL_DMA2D_EnableDeadTime() or HAL_DMA2D_DisableDeadTime().
8. The transfer can be suspended, resumed and aborted using the following functions: HAL_DMA2D_Suspend(), HAL_DMA2D_Resume(), HAL_DMA2D_Abort().
9. The CLUT loading can be suspended, resumed and aborted using the following functions: HAL_DMA2D_CLUTLoading_Suspend(), HAL_DMA2D_CLUTLoading_Resume(), HAL_DMA2D_CLUTLoading_Abort().
10. To control the DMA2D state, use the following function: HAL_DMA2D_GetState().
11. To read the DMA2D error code, use the following function: HAL_DMA2D_GetError().

DMA2D HAL driver macros list

Below the list of most used macros in DMA2D HAL driver :

- __HAL_DMA2D_ENABLE: Enable the DMA2D peripheral.
- __HAL_DMA2D_GET_FLAG: Get the DMA2D pending flags.
- __HAL_DMA2D_CLEAR_FLAG: Clear the DMA2D pending flags.
- __HAL_DMA2D_ENABLE_IT: Enable the specified DMA2D interrupts.
- __HAL_DMA2D_DISABLE_IT: Disable the specified DMA2D interrupts.
- __HAL_DMA2D_GET_IT_SOURCE: Check whether the specified DMA2D interrupt is enabled or not.

Callback registration

1. The compilation define USE_HAL_DMA2D_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use function @ref HAL_DMA2D_RegisterCallback() to register a user callback.
2. Function @ref HAL_DMA2D_RegisterCallback() allows to register following callbacks: (+) XferCpltCallback : callback for transfer complete. (+) XferErrorCallback : callback for transfer error. (+) LineEventCallback : callback for line event. (+) CLUTLoadingCpltCallback : callback for CLUT loading completion. (+) MspInitCallback : DMA2D MspInit. (+) MspDeInitCallback : DMA2D MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.
3. Use function @ref HAL_DMA2D_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. @ref HAL_DMA2D_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks: (+) XferCpltCallback : callback for transfer complete. (+) XferErrorCallback : callback for transfer error. (+) LineEventCallback : callback for line event. (+) CLUTLoadingCpltCallback : callback for CLUT loading completion. (+) MspInitCallback : DMA2D MspInit. (+) MspDeInitCallback : DMA2D MspDeInit.

4. By default, after the @ref HAL_DMA2D_Init and if the state is HAL_DMA2D_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions: examples @ref HAL_DMA2D_LineEventCallback(), @ref HAL_DMA2D_CLUTLoadingCpltCallback() Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the @ref HAL_DMA2D_Init and @ref HAL_DMA2D_DeInit only when these callbacks are null (not registered beforehand) If not, MspInit or MspDeInit are not null, the @ref HAL_DMA2D_Init and @ref HAL_DMA2D_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand). Exception as well for Transfer Completion and Transfer Error callbacks that are not defined as weak (surcharged) functions. They must be defined by the user to be resorted to. Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using @ref HAL_DMA2D_RegisterCallback before calling @ref HAL_DMA2D_DeInit or @ref HAL_DMA2D_Init function. When The compilation define USE_HAL_DMA2D_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

(#) The compilation define USE_HAL_DMA2D_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use function @ref HAL_DMA2D_RegisterCallback() to register a user callback. (#) Function @ref HAL_DMA2D_RegisterCallback() allows to register following callbacks:

- XferCpltCallback : callback for transfer complete.
- XferErrorCallback : callback for transfer error.
- LineEventCallback : callback for line event.
- CLUTLoadingCpltCallback : callback for CLUT loading completion.
- MspInitCallback : DMA2D MspInit.
- MspDeInitCallback : DMA2D MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. (#) Use function @ref HAL_DMA2D_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. @ref HAL_DMA2D_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:
- XferCpltCallback : callback for transfer complete.
- XferErrorCallback : callback for transfer error.
- LineEventCallback : callback for line event.
- CLUTLoadingCpltCallback : callback for CLUT loading completion.
- MspInitCallback : DMA2D MspInit.
- MspDeInitCallback : DMA2D MspDeInit. (#) By default, after the @ref HAL_DMA2D_Init and if the state is HAL_DMA2D_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions: examples @ref HAL_DMA2D_LineEventCallback(), @ref HAL_DMA2D_CLUTLoadingCpltCallback() Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the @ref HAL_DMA2D_Init and @ref HAL_DMA2D_DeInit only when these callbacks are null (not registered beforehand) If not, MspInit or MspDeInit are not null, the @ref HAL_DMA2D_Init and @ref HAL_DMA2D_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand). Exception as well for Transfer Completion and Transfer Error callbacks that are not defined as weak (surcharged) functions. They must be defined by the user to be resorted to. Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using @ref HAL_DMA2D_RegisterCallback before calling @ref HAL_DMA2D_DeInit or @ref HAL_DMA2D_Init function. When The compilation define USE_HAL_DMA2D_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

Note: *You can refer to the DMA2D HAL driver header file for more useful macros*

20.2.2 Initialization and Configuration functions

This section provides functions allowing to:

- Initialize and configure the DMA2D
- De-initialize the DMA2D

This section contains the following APIs:

- *HAL_DMA2D_Init()*
- *HAL_DMA2D_DeInit()*
- *HAL_DMA2D_MspInit()*
- *HAL_DMA2D_MspDeInit()*
- *HAL_DMA2D_RegisterCallback()*
- *HAL_DMA2D_UnRegisterCallback()*

20.2.3 IO operation functions

This section provides functions allowing to:

- Configure the pdata, destination address and data size then start the DMA2D transfer.
- Configure the source for foreground and background, destination address and data size then start a MultiBuffer DMA2D transfer.
- Configure the pdata, destination address and data size then start the DMA2D transfer with interrupt.
- Configure the source for foreground and background, destination address and data size then start a MultiBuffer DMA2D transfer with interrupt.
- Abort DMA2D transfer.
- Suspend DMA2D transfer.
- Resume DMA2D transfer.
- Enable CLUT transfer.
- Configure CLUT loading then start transfer in polling mode.
- Configure CLUT loading then start transfer in interrupt mode.
- Abort DMA2D CLUT loading.
- Suspend DMA2D CLUT loading.
- Resume DMA2D CLUT loading.
- Poll for transfer complete.
- handle DMA2D interrupt request.
- Transfer watermark callback.
- CLUT Transfer Complete callback.

This section contains the following APIs:

- *HAL_DMA2D_Start()*
- *HAL_DMA2D_Start_IT()*
- *HAL_DMA2D_BlendingStart()*
- *HAL_DMA2D_BlendingStart_IT()*
- *HAL_DMA2D_Abort()*
- *HAL_DMA2D_Suspend()*
- *HAL_DMA2D_Resume()*
- *HAL_DMA2D_EnableCLUT()*
- *HAL_DMA2D_CLUTStartLoad()*
- *HAL_DMA2D_CLUTStartLoad_IT()*
- *HAL_DMA2D_CLUTLoad()*
- *HAL_DMA2D_CLUTLoad_IT()*
- *HAL_DMA2D_CLUTLoading_Abort()*
- *HAL_DMA2D_CLUTLoading_Suspend()*
- *HAL_DMA2D_CLUTLoading_Resume()*
- *HAL_DMA2D_PollForTransfer()*
- *HAL_DMA2D_IRQHandler()*
- *HAL_DMA2D_LineEventCallback()*
- *HAL_DMA2D_CLUTLoadingCpltCallback()*

20.2.4 Peripheral Control functions

This section provides functions allowing to:
- Configure the DMA2D foreground or background layer parameters.
- Configure the DMA2D CLUT transfer.
- Configure the line watermark
- Configure the dead time value.
- Enable or disable the dead time value functionality.

This section contains the following APIs:
- *HAL_DMA2D_ConfigLayer()*
- *HAL_DMA2D_ConfigCLUT()*
- *HAL_DMA2D_ProgramLineEvent()*
- *HAL_DMA2D_EnableDeadTime()*
- *HAL_DMA2D_DisableDeadTime()*
- *HAL_DMA2D_ConfigDeadTime()*

20.2.5 Peripheral State and Errors functions

This subsection provides functions allowing to:
- Get the DMA2D state
- Get the DMA2D error code

This section contains the following APIs:
- *HAL_DMA2D_GetState()*
- *HAL_DMA2D_GetError()*

20.2.6 Detailed description of functions

HAL_DMA2D_Init

Function name

HAL_StatusTypeDef HAL_DMA2D_Init (DMA2D_HandleTypeDef * hdma2d)

Function description

Initialize the DMA2D according to the specified parameters in the DMA2D_InitTypeDef and create the associated handle.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **HAL:** status

HAL_DMA2D_DeInit

Function name

HAL_StatusTypeDef HAL_DMA2D_DeInit (DMA2D_HandleTypeDef * hdma2d)

Function description

Deinitializes the DMA2D peripheral registers to their default reset values.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **None:**

HAL_DMA2D_MspInit

Function name

void HAL_DMA2D_MspInit (DMA2D_HandleTypeDef * hdma2d)

Function description

Initializes the DMA2D MSP.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **None:**

HAL_DMA2D_MspDeInit

Function name

void HAL_DMA2D_MspDeInit (DMA2D_HandleTypeDef * hdma2d)

Function description

DeInitializes the DMA2D MSP.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **None:**

HAL_DMA2D_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DMA2D_RegisterCallback (DMA2D_HandleTypeDef * hdma2d, HAL_DMA2D_CallbackIDTypeDef CallbackID, pDMA2D_CallbackTypeDef pCallback)

Function description

Register a User DMA2D Callback To be used instead of the weak (surcharged) predefined callback.

Parameters

- **hdma2d:** DMA2D handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  – HAL_DMA2D_TRANSFERCOMPLETE_CB_ID DMA2D transfer complete Callback ID
  – HAL_DMA2D_TRANSFERERROR_CB_ID DMA2D transfer error Callback ID
  – HAL_DMA2D_LINEEVENT_CB_ID DMA2D line event Callback ID
  – HAL_DMA2D_CLUTLOADINGCPLT_CB_ID DMA2D CLUT loading completion Callback ID
  – HAL_DMA2D_MSPINIT_CB_ID DMA2D MspInit callback ID
  – HAL_DMA2D_MSPDEINIT_CB_ID DMA2D MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

Notes

- No weak predefined callbacks are defined for HAL_DMA2D_TRANSFERCOMPLETE_CB_ID or HAL_DMA2D_TRANSFERERROR_CB_ID

HAL_DMA2D_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DMA2D_UnRegisterCallback (DMA2D_HandleTypeDef * hdma2d, HAL_DMA2D_CallbackIDTypeDef CallbackID)

Function description

Unregister a DMA2D Callback DMA2D Callback is redirected to the weak (surcharged) predefined callback.

Parameters

- **hdma2d:** DMA2D handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  – HAL_DMA2D_TRANSFERCOMPLETE_CB_ID DMA2D transfer complete Callback ID
  – HAL_DMA2D_TRANSFERERROR_CB_ID DMA2D transfer error Callback ID
  – HAL_DMA2D_LINEEVENT_CB_ID DMA2D line event Callback ID
  – HAL_DMA2D_CLUTLOADINGCPLT_CB_ID DMA2D CLUT loading completion Callback ID
  – HAL_DMA2D_MSPINIT_CB_ID DMA2D MspInit callback ID
  – HAL_DMA2D_MSPDEINIT_CB_ID DMA2D MspDeInit callback ID

Return values

- **status:**

Notes

- No weak predefined callbacks are defined for HAL_DMA2D_TRANSFERCOMPLETE_CB_ID or HAL_DMA2D_TRANSFERERROR_CB_ID

HAL_DMA2D_Start

Function name

HAL_StatusTypeDef HAL_DMA2D_Start (DMA2D_HandleTypeDef * hdma2d, uint32_t pdata, uint32_t DstAddress, uint32_t Width, uint32_t Height)

Function description

Start the DMA2D Transfer.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **pdata:** Configure the source memory Buffer address if Memory-to-Memory or Memory-to-Memory with pixel format conversion mode is selected, or configure the color value if Register-to-Memory mode is selected.
- **DstAddress:** The destination memory Buffer address.
- **Width:** The width of data to be transferred from source to destination (expressed in number of pixels per line).
- **Height:** The height of data to be transferred from source to destination (expressed in number of lines).

Return values

- **HAL:** status

HAL_DMA2D_BlendingStart

Function name

HAL_StatusTypeDef HAL_DMA2D_BlendingStart (DMA2D_HandleTypeDef * hdma2d, uint32_t SrcAddress1, uint32_t SrcAddress2, uint32_t DstAddress, uint32_t Width, uint32_t Height)

Function description

Start the multi-source DMA2D Transfer.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **SrcAddress1:** The source memory Buffer address for the foreground layer.
- **SrcAddress2:** The source memory Buffer address for the background layer.
- **DstAddress:** The destination memory Buffer address.
- **Width:** The width of data to be transferred from source to destination (expressed in number of pixels per line).
- **Height:** The height of data to be transferred from source to destination (expressed in number of lines).

Return values

- **HAL:** status

HAL_DMA2D_Start_IT

Function name

HAL_StatusTypeDef HAL_DMA2D_Start_IT (DMA2D_HandleTypeDef * hdma2d, uint32_t pdata, uint32_t DstAddress, uint32_t Width, uint32_t Height)

Function description

Start the DMA2D Transfer with interrupt enabled.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **pdata:** Configure the source memory Buffer address if the Memory-to-Memory or Memory-to-Memory with pixel format conversion mode is selected, or configure the color value if Register-to-Memory mode is selected.
- **DstAddress:** The destination memory Buffer address.
- **Width:** The width of data to be transferred from source to destination (expressed in number of pixels per line).
- **Height:** The height of data to be transferred from source to destination (expressed in number of lines).

Return values

- **HAL:** status

HAL_DMA2D_BlendingStart_IT

Function name

HAL_StatusTypeDef HAL_DMA2D_BlendingStart_IT (DMA2D_HandleTypeDef * hdma2d, uint32_t SrcAddress1, uint32_t SrcAddress2, uint32_t DstAddress, uint32_t Width, uint32_t Height)

Function description

Start the multi-source DMA2D Transfer with interrupt enabled.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **SrcAddress1:** The source memory Buffer address for the foreground layer.
- **SrcAddress2:** The source memory Buffer address for the background layer.
- **DstAddress:** The destination memory Buffer address.
- **Width:** The width of data to be transferred from source to destination (expressed in number of pixels per line).
- **Height:** The height of data to be transferred from source to destination (expressed in number of lines).

Return values

- **HAL:** status

HAL_DMA2D_Suspend

Function name

HAL_StatusTypeDef HAL_DMA2D_Suspend (DMA2D_HandleTypeDef * hdma2d)

Function description

Suspend the DMA2D Transfer.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **HAL:** status

HAL_DMA2D_Resume

Function name

HAL_StatusTypeDef HAL_DMA2D_Resume (DMA2D_HandleTypeDef * hdma2d)

Function description

Resume the DMA2D Transfer.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **HAL:** status

HAL_DMA2D_Abort

Function name

HAL_StatusTypeDef HAL_DMA2D_Abort (DMA2D_HandleTypeDef * hdma2d)

Function description

Abort the DMA2D Transfer.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **HAL:** status

HAL_DMA2D_EnableCLUT

Function name

HAL_StatusTypeDef HAL_DMA2D_EnableCLUT (DMA2D_HandleTypeDef * hdma2d, uint32_t LayerIdx)

Function description

Enable the DMA2D CLUT Transfer.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

HAL_DMA2D_CLUTStartLoad

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTStartLoad (DMA2D_HandleTypeDef * hdma2d, const DMA2D_CLUTCfgTypeDef * CLUTCfg, uint32_t LayerIdx)

Function description

Start DMA2D CLUT Loading.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **CLUTCfg:** Pointer to a DMA2D_CLUTCfgTypeDef structure that contains the configuration information for the color look up table.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

HAL_DMA2D_CLUTStartLoad_IT

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTStartLoad_IT (DMA2D_HandleTypeDef * hdma2d, const DMA2D_CLUTCfgTypeDef * CLUTCfg, uint32_t LayerIdx)

Function description

Start DMA2D CLUT Loading with interrupt enabled.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **CLUTCfg:** Pointer to a DMA2D_CLUTCfgTypeDef structure that contains the configuration information for the color look up table.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

HAL_DMA2D_CLUTLoad

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTLoad (DMA2D_HandleTypeDef * hdma2d, DMA2D_CLUTCfgTypeDef CLUTCfg, uint32_t LayerIdx)

Function description

Start DMA2D CLUT Loading.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **CLUTCfg:** Pointer to a DMA2D_CLUTCfgTypeDef structure that contains the configuration information for the color look up table.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

Notes

- API obsolete and maintained for compatibility with legacy. User is invited to resort to HAL_DMA2D_CLUTStartLoad() instead to benefit from code compactness, code size and improved heap usage.

HAL_DMA2D_CLUTLoad_IT

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTLoad_IT (DMA2D_HandleTypeDef * hdma2d, DMA2D_CLUTCfgTypeDef CLUTCfg, uint32_t LayerIdx)

Function description

Start DMA2D CLUT Loading with interrupt enabled.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **CLUTCfg:** Pointer to a DMA2D_CLUTCfgTypeDef structure that contains the configuration information for the color look up table.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

Notes

- API obsolete and maintained for compatibility with legacy. User is invited to resort to HAL_DMA2D_CLUTStartLoad_IT() instead to benefit from code compactness, code size and improved heap usage.

HAL_DMA2D_CLUTLoading_Abort

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTLoading_Abort (DMA2D_HandleTypeDef * hdma2d, uint32_t LayerIdx)

Function description

Abort the DMA2D CLUT loading.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

HAL_DMA2D_CLUTLoading_Suspend

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTLoading_Suspend (DMA2D_HandleTypeDef * hdma2d, uint32_t LayerIdx)

Function description

Suspend the DMA2D CLUT loading.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

HAL_DMA2D_CLUTLoading_Resume

Function name

HAL_StatusTypeDef HAL_DMA2D_CLUTLoading_Resume (DMA2D_HandleTypeDef * hdma2d, uint32_t LayerIdx)

Function description

Resume the DMA2D CLUT loading.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

HAL_DMA2D_PollForTransfer

Function name

HAL_StatusTypeDef HAL_DMA2D_PollForTransfer (DMA2D_HandleTypeDef * hdma2d, uint32_t Timeout)

Function description

Polling for transfer complete or CLUT loading.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_DMA2D_IRQHandler

Function name

void HAL_DMA2D_IRQHandler (DMA2D_HandleTypeDef * hdma2d)

Function description

Handle DMA2D interrupt request.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **HAL:** status

HAL_DMA2D_LineEventCallback

Function name

void HAL_DMA2D_LineEventCallback (DMA2D_HandleTypeDef * hdma2d)

Function description

Transfer watermark callback.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **None:**

HAL_DMA2D_CLUTLoadingCpltCallback

Function name

void HAL_DMA2D_CLUTLoadingCpltCallback (DMA2D_HandleTypeDef * hdma2d)

Function description

CLUT Transfer Complete callback.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **None:**

HAL_DMA2D_ConfigLayer

Function name

HAL_StatusTypeDef HAL_DMA2D_ConfigLayer (DMA2D_HandleTypeDef * hdma2d, uint32_t LayerIdx)

Function description

Configure the DMA2D Layer according to the specified parameters in the DMA2D_HandleTypeDef.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

HAL_DMA2D_ConfigCLUT

Function name

HAL_StatusTypeDef HAL_DMA2D_ConfigCLUT (DMA2D_HandleTypeDef * hdma2d, DMA2D_CLUTCfgTypeDef CLUTCfg, uint32_t LayerIdx)

Function description

Configure the DMA2D CLUT Transfer.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **CLUTCfg:** Pointer to a DMA2D_CLUTCfgTypeDef structure that contains the configuration information for the color look up table.
- **LayerIdx:** DMA2D Layer index. This parameter can be one of the following values: DMA2D_BACKGROUND_LAYER(0) / DMA2D_FOREGROUND_LAYER(1)

Return values

- **HAL:** status

Notes

- API obsolete and maintained for compatibility with legacy. User is invited to resort to HAL_DMA2D_CLUTStartLoad() instead to benefit from code compactness, code size and improved heap usage.

HAL_DMA2D_ProgramLineEvent

Function name

HAL_StatusTypeDef HAL_DMA2D_ProgramLineEvent (DMA2D_HandleTypeDef * hdma2d, uint32_t Line)

Function description

Configure the line watermark.

Parameters

- **hdma2d:** Pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.
- **Line:** Line Watermark configuration (maximum 16-bit long value expected).

Return values

- **HAL:** status

Notes

- HAL_DMA2D_ProgramLineEvent() API enables the transfer watermark interrupt.
- The transfer watermark interrupt is disabled once it has occurred.

HAL_DMA2D_EnableDeadTime

Function name

HAL_StatusTypeDef HAL_DMA2D_EnableDeadTime (DMA2D_HandleTypeDef * hdma2d)

Function description

Enable DMA2D dead time feature.

Parameters

- **hdma2d:** DMA2D handle.

Return values

- **HAL:** status

HAL_DMA2D_DisableDeadTime

Function name

HAL_StatusTypeDef HAL_DMA2D_DisableDeadTime (DMA2D_HandleTypeDef * hdma2d)

Function description

Disable DMA2D dead time feature.

Parameters

- **hdma2d:** DMA2D handle.

Return values

- **HAL:** status

HAL_DMA2D_ConfigDeadTime

Function name

HAL_StatusTypeDef HAL_DMA2D_ConfigDeadTime (DMA2D_HandleTypeDef * hdma2d, uint8_t DeadTime)

Function description

Configure dead time.

Parameters

- **hdma2d:** DMA2D handle.
- **DeadTime:** dead time value.

Return values

- **HAL:** status

Notes

- The dead time value represents the guaranteed minimum number of cycles between two consecutive transactions on the AHB bus.

HAL_DMA2D_GetState

Function name

HAL_DMA2D_StateTypeDef HAL_DMA2D_GetState (const DMA2D_HandleTypeDef * hdma2d)

Function description

Return the DMA2D state.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for the DMA2D.

Return values

- **HAL:** state

HAL_DMA2D_GetError

Function name

uint32_t HAL_DMA2D_GetError (const DMA2D_HandleTypeDef * hdma2d)

Function description

Return the DMA2D error code.

Parameters

- **hdma2d:** pointer to a DMA2D_HandleTypeDef structure that contains the configuration information for DMA2D.

Return values

- **DMA2D:** Error Code

20.3 DMA2D Firmware driver defines

The following section lists the various define and macros of the module.

20.3.1 DMA2D

DMA2D

DMA2D Alpha Inversion

DMA2D_REGULAR_ALPHA

No modification of the alpha channel value

DMA2D_INVERTED_ALPHA

Invert the alpha channel value

DMA2D Alpha Mode

DMA2D_NO_MODIF_ALPHA

No modification of the alpha channel value

DMA2D_REPLACE_ALPHA

Replace original alpha channel value by programmed alpha value

DMA2D_COMBINE_ALPHA

Replace original alpha channel value by programmed alpha value with original alpha channel value

DMA2D Bytes Swap

DMA2D_BYTES_REGULAR

Bytes in regular order in output FIFO

DMA2D_BYTES_SWAP

Bytes are swapped two by two in output FIFO

DMA2D Chroma Sub Sampling

DMA2D_NO_CSS

No chroma sub-sampling 4:4:4

DMA2D_CSS_422

chroma sub-sampling 4:2:2

DMA2D_CSS_420

chroma sub-sampling 4:2:0

DMA2D CLUT Color Mode

DMA2D_CCM_ARGB8888

ARGB8888 DMA2D CLUT color mode

DMA2D_CCM_RGB888

RGB888 DMA2D CLUT color mode

DMA2D CLUT Size

DMA2D_CLUT_SIZE

DMA2D maximum CLUT size

DMA2D Color Value

DMA2D_COLOR_VALUE

Color value mask

DMA2D Error Code

HAL_DMA2D_ERROR_NONE

No error

HAL_DMA2D_ERROR_TE

Transfer error

HAL_DMA2D_ERROR_CE

Configuration error

HAL_DMA2D_ERROR_CAE

CLUT access error

HAL_DMA2D_ERROR_TIMEOUT

Timeout error

HAL_DMA2D_ERROR_INVALID_CALLBACK

Invalid callback error

DMA2D Exported Macros

__HAL_DMA2D_RESET_HANDLE_STATE

Description:

- Reset DMA2D handle state.

Parameters:

- __HANDLE__: specifies the DMA2D handle.

Return value:

- None

__HAL_DMA2D_ENABLE

Description:

- Enable the DMA2D.

Parameters:

- __HANDLE__: DMA2D handle

Return value:

- None.

__HAL_DMA2D_GET_FLAG

Description:

- Get the DMA2D pending flags.

Parameters:

- __HANDLE__: DMA2D handle
- __FLAG__: flag to check. This parameter can be any combination of the following values:
  – DMA2D_FLAG_CE: Configuration error flag
  – DMA2D_FLAG_CTC: CLUT transfer complete flag
  – DMA2D_FLAG_CAE: CLUT access error flag
  – DMA2D_FLAG_TW: Transfer Watermark flag
  – DMA2D_FLAG_TC: Transfer complete flag
  – DMA2D_FLAG_TE: Transfer error flag

Return value:

- The: state of FLAG.

__HAL_DMA2D_CLEAR_FLAG

Description:

- Clear the DMA2D pending flags.

Parameters:

- __HANDLE__: DMA2D handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  – DMA2D_FLAG_CE: Configuration error flag
  – DMA2D_FLAG_CTC: CLUT transfer complete flag
  – DMA2D_FLAG_CAE: CLUT access error flag
  – DMA2D_FLAG_TW: Transfer Watermark flag
  – DMA2D_FLAG_TC: Transfer complete flag
  – DMA2D_FLAG_TE: Transfer error flag

Return value:

- None

__HAL_DMA2D_ENABLE_IT

Description:
- Enable the specified DMA2D interrupts.

Parameters:
- __HANDLE__: DMA2D handle
- __INTERRUPT__: specifies the DMA2D interrupt sources to be enabled. This parameter can be any combination of the following values:
  – DMA2D_IT_CE: Configuration error interrupt mask
  – DMA2D_IT_CTC: CLUT transfer complete interrupt mask
  – DMA2D_IT_CAE: CLUT access error interrupt mask
  – DMA2D_IT_TW: Transfer Watermark interrupt mask
  – DMA2D_IT_TC: Transfer complete interrupt mask
  – DMA2D_IT_TE: Transfer error interrupt mask

Return value:
- None

__HAL_DMA2D_DISABLE_IT

Description:
- Disable the specified DMA2D interrupts.

Parameters:
- __HANDLE__: DMA2D handle
- __INTERRUPT__: specifies the DMA2D interrupt sources to be disabled. This parameter can be any combination of the following values:
  – DMA2D_IT_CE: Configuration error interrupt mask
  – DMA2D_IT_CTC: CLUT transfer complete interrupt mask
  – DMA2D_IT_CAE: CLUT access error interrupt mask
  – DMA2D_IT_TW: Transfer Watermark interrupt mask
  – DMA2D_IT_TC: Transfer complete interrupt mask
  – DMA2D_IT_TE: Transfer error interrupt mask

Return value:
- None

__HAL_DMA2D_GET_IT_SOURCE

Description:
- Check whether the specified DMA2D interrupt source is enabled or not.

Parameters:
- __HANDLE__: DMA2D handle
- __INTERRUPT__: specifies the DMA2D interrupt source to check. This parameter can be one of the following values:
  – DMA2D_IT_CE: Configuration error interrupt mask
  – DMA2D_IT_CTC: CLUT transfer complete interrupt mask
  – DMA2D_IT_CAE: CLUT access error interrupt mask
  – DMA2D_IT_TW: Transfer Watermark interrupt mask
  – DMA2D_IT_TC: Transfer complete interrupt mask
  – DMA2D_IT_TE: Transfer error interrupt mask

Return value:
- The: state of INTERRUPT source.

DMA2D Exported Types

MAX_DMA2D_LAYER

- ***uint32_t DestBurstLength***
- ***uint32_t TransferAllocatedPort***
- ***uint32_t TransferEventMode***
- ***uint32_t Mode***

Field Documentation

- ***uint32_t DMA_InitTypeDef::Request***
  Specifies the DMA channel request. This parameter can be a value of ***DMA_Request_Selection***
- ***uint32_t DMA_InitTypeDef::BlkHWRequest***
  Specifies the Block hardware request mode for DMA channel. Block Hardware request feature can be used only with dedicated peripherals. This parameter can be a value of ***DMA_Block_Request***
- ***uint32_t DMA_InitTypeDef::Direction***
  Specifies the transfer direction for DMA channel. This parameter can be a value of ***DMA_Transfer_Direction***
- ***uint32_t DMA_InitTypeDef::SrcInc***
  Specifies the source increment mode for the DMA channel. This parameter can be a value of ***DMA_Source_Increment_Mode***
- ***uint32_t DMA_InitTypeDef::DestInc***
  Specifies the destination increment mode for the DMA channel. This parameter can be a value of ***DMA_Destination_Increment_Mode***
- ***uint32_t DMA_InitTypeDef::SrcDataWidth***
  Specifies the source data width for the DMA channel. This parameter can be a value of ***DMA_Source_Data_Width***
- ***uint32_t DMA_InitTypeDef::DestDataWidth***
  Specifies the destination data width for the DMA channel. This parameter can be a value of ***DMA_Destination_Data_Width***
- ***uint32_t DMA_InitTypeDef::Priority***
  Specifies the priority level for the DMA channel. This parameter can be a value of ***DMA_Priority_Level***
- ***uint32_t DMA_InitTypeDef::SrcBurstLength***
  Specifies the source burst length (number of beats within a burst) for the DMA channel. This parameter can be a value between 1 and 64
- ***uint32_t DMA_InitTypeDef::DestBurstLength***
  Specifies the destination burst length (number of beats within a burst) for the DMA channel. This parameter can be a value between 1 and 64
- ***uint32_t DMA_InitTypeDef::TransferAllocatedPort***
  Specifies the transfer allocated ports. This parameter can be a combination of ***DMA_Transfer_Allocated_Port***

- ***uint32_t DMA_InitTypeDef::TransferEventMode***
  Specifies the transfer event mode for the DMA channel. This parameter can be a value of ***DMA_Transfer_Event_Mode***
- ***uint32_t DMA_InitTypeDef::Mode***
  Specifies the transfer mode for the DMA channel. This parameter can be a value of ***DMA_Transfer_Mode***

21.2 DMA Firmware driver API description

The following section lists the various functions of the DMA library.

21.2.1 How to use this driver

DMA transfer modes are divided to 2 major categories :

- Normal transfers (legacy)
- Linked-list transfers

Normal transfers mode is initialized via the standard module and linked-list mode is configured via the extended module.

Additionally to linked-list capability, all advanced DMA features are managed and configured via the extended module as extensions to normal mode. Advanced features are :

- Repeated block feature.
- Trigger feature.
- Data handling feature.

DMA Legacy circular transfer, is replaced by circular linked-list configuration.

Initialization and De-Initialization

For a given channel, enable and configure the peripheral to be connected to the DMA Channel (except for internal SRAM/FLASH memories: no initialization is necessary) please refer to Reference manual for connection between peripherals and DMA requests.

For a given channel, use HAL_DMA_Init function to program the required configuration for normal transfer through the following parameters:

- Request : Specifies the DMA channel request Request parameters :
  – can be a value of DMA_Request_Selection
- BlkHWRequest : Specifies the Block hardware request mode for DMA channel
  – can be a value of DMA_Block_Request
- Direction : Specifies the transfer direction for DMA channel
  – can be a value of DMA_Transfer_Direction

- SrcInc : Specifies the source increment mode for the DMA channel
  – can be a value of DMA_Source_Increment_Mode
- DestInc : Specifies the destination increment mode for the DMA channel
  – can be a value of DMA_Destination_Increment_Mode
- SrcDataWidth : Specifies the source data width for the DMA channel
  – can be a value of DMA_Source_Data_Width
- DestDataWidth : Specifies the destination data width for the DMA channel
  – can be a value of DMA_Destination_Data_Width
- Priority : Specifies the priority for the DMA channel
  – can be a value of DMA_Priority_Level
- SrcBurstLength : Specifies the source burst length (number of beats) for the DMA channel
  – can be a value of between 1 and 64
- DestBurstLength : Specifies the destination burst length (number of beats) for the DMA channel
  – can be a value of between 1 and 64
- TransferAllocatedPort : Specifies the source and destination allocated ports
  – can be a value of DMA_Transfer_Allocated_Port
- TransferEventMode : Specifies the transfer event mode for the DMA channel
  – can be a value of DMA_Transfer_Event_Mode
- Mode : Specifies the transfer mode for the DMA channel
  – can be DMA_NORMAL

Polling mode IO operation

- Use HAL_DMA_Start() to start a DMA normal transfer after the configuration of source address, destination address and the size of data to be transferred.
- Use HAL_DMA_PollForTransfer() to poll for selected transfer level. In this case a fixed Timeout can be configured by User depending on his application. Transfer level can be :
  – HAL_DMA_HALF_TRANSFER
  – HAL_DMA_FULL_TRANSFER For circular transfer, this API returns an HAL_ERROR with HAL_DMA_ERROR_NOT_SUPPORTED error code.
- Use HAL_DMA_Abort() function to abort any ongoing DMA transfer in blocking mode. This API returns HAL_ERROR when there is no ongoing transfer or timeout is reached when disabling the DMA channel. (This API should not be called from an interrupt service routine)

Interrupt mode IO operation

- Configure the DMA interrupt priority using HAL_NVIC_SetPriority()
- Enable the DMA IRQ handler using HAL_NVIC_EnableIRQ()
- Use HAL_DMA_RegisterCallback() function to register user callbacks from the following list :
  – XferCpltCallback : transfer complete callback.
  – XferHalfCpltCallback : half transfer complete callback.
  – XferErrorCallback : transfer error callback.
  – XferAbortCallback : transfer abort complete callback.
  – XferSuspendCallback : transfer suspend complete callback.
- Use HAL_DMA_Start_IT() to start the DMA transfer after the enable of DMA interrupts and the configuration of source address,destination address and the size of data to be transferred.
- Use HAL_DMA_IRQHandler() called under DMA_IRQHandler() interrupt subroutine to handle any DMA interrupt.
- Use HAL_DMA_Abort_IT() function to abort any on-going DMA transfer in non-blocking mode. This API will suspend immediately the DMA channel execution. When the transfer is effectively suspended, an interrupt is generated and HAL_DMA_IRQHandler() will reset the channel and execute the callback XferAbortCallback. (This API could be called from an interrupt service routine)

State and errors

- Use HAL_DMA_GetState() function to get the DMA state.
- Use HAL_DMA_GetError() function to get the DMA error code.

Security and privilege attributes

- Use HAL_DMA_ConfigChannelAttributes() function to configure DMA channel security and privilege attributes.
  – Security : at channel level, at source level and at destination level.
  – Privilege : at channel level.
- Use HAL_DMA_GetConfigChannelAttributes() function to get the DMA channel attributes.
- Use HAL_DMA_LockChannelAttributes() function to lock the DMA channel security and privilege attributes configuration. This API can be called once after each system boot. If called again, HAL_DMA_ConfigChannelAttributes() API has no effect. Unlock is done either by a system boot or a by an RCC reset.
- Use HAL_DMA_GetLockChannelAttributes() function to get the attributes lock status.

DMA HAL driver macros list

Below the list of most used macros in DMA HAL driver.

- __HAL_DMA_ENABLE : Enable the specified DMA Channel.
- __HAL_DMA_DISABLE : Disable the specified DMA Channel.
- __HAL_DMA_GET_FLAG : Get the DMA Channel pending flags.
- __HAL_DMA_CLEAR_FLAG : Clear the DMA Channel pending flags.
- __HAL_DMA_ENABLE_IT : Enable the specified DMA Channel interrupts.
- __HAL_DMA_DISABLE_IT : Disable the specified DMA Channel interrupts.
- __HAL_DMA_GET_IT_SOURCE : Check whether the specified DMA Channel interrupt has occurred or not.

Note: You can refer to the header file of the DMA HAL driver for more useful macros.

21.2.2 Initialization and de-initialization functions

This section provides functions allowing to initialize and de-initialize the DMA channel in normal mode.

- The HAL_DMA_Init() function follows the DMA channel configuration procedures as described in reference manual.
- The HAL_DMA_DeInit() function allows to de-initialize the DMA channel.

This section contains the following APIs:

- ***HAL_DMA_Init()***
- ***HAL_DMA_DeInit()***

21.2.3 IO operation functions

This section provides functions allowing to :

- Configure the source, destination address and data size and Start DMA transfer in normal mode
- Abort DMA transfer
- Poll for transfer complete
- Handle DMA interrupt request
- Register and Unregister DMA callbacks
- The HAL_DMA_Start() function allows to start the DMA channel transfer in normal mode (Blocking mode).
- The HAL_DMA_Start_IT() function allows to start the DMA channel transfer in normal mode (Non-blocking mode).
- The HAL_DMA_Abort() function allows to abort any on-going transfer (Blocking mode).
- The HAL_DMA_Abort_IT() function allows to abort any on-going transfer (Non-blocking mode).

- The HAL_DMA_PollForTransfer() function allows to poll on half transfer and transfer complete (Blocking mode). This API cannot be used for circular transfers.
- The HAL_DMA_IRQHandler() function allows to handle any DMA channel interrupt (Non-blocking mode).
- The HAL_DMA_RegisterCallback() and HAL_DMA_UnRegisterCallback() functions allow respectively to register and unregister user customized callbacks. User callbacks are called under HAL_DMA_IRQHandler().

This section contains the following APIs:

- *HAL_DMA_Start()*
- *HAL_DMA_Start_IT()*
- *HAL_DMA_Abort()*
- *HAL_DMA_Abort_IT()*
- *HAL_DMA_PollForTransfer()*
- *HAL_DMA_IRQHandler()*
- *HAL_DMA_RegisterCallback()*
- *HAL_DMA_UnRegisterCallback()*

21.2.4 State and Errors functions

This section provides functions allowing to :

- Check the DMA state
- Get error code
- The HAL_DMA_GetState() function allows to get the DMA channel state.
- The HAL_DMA_DeInit() function allows to get the DMA channel error code.

This section contains the following APIs:

- *HAL_DMA_GetState()*
- *HAL_DMA_GetError()*

21.2.5 DMA Attributes functions

This section provides functions allowing to :

- Configure DMA channel secure and privilege attributes.
- Get DMA channel secure and privilege attributes.
- Lock DMA channel secure and privilege attributes configuration.
- Check whether DMA channel secure and privilege attributes configuration is locked or not.
- The HAL_DMA_ConfigChannelAttributes() function allows to configure DMA channel security and privilege attributes.
- The HAL_DMA_GetConfigChannelAttributes() function allows to get DMA channel security and privilege attributes configuration.
- The HAL_DMA_LockChannelAttributes() function allows to lock the DMA channel security and privilege attributes.
- The HAL_DMA_GetLockChannelAttributes() function allows to get the DMA channel security and privilege attributes lock status.

This section contains the following APIs:

- *HAL_DMA_ConfigChannelAttributes()*
- *HAL_DMA_GetConfigChannelAttributes()*
- *HAL_DMA_LockChannelAttributes()*
- *HAL_DMA_GetLockChannelAttributes()*

21.2.6 Detailed description of functions

HAL_DMA_Init

Function name

HAL_StatusTypeDef HAL_DMA_Init (DMA_HandleTypeDef *const hdma)

Function description

Initialize the DMA channel in normal mode according to the specified parameters in the DMA_InitTypeDef and create the associated handle.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMA_DeInit

Function name

HAL_StatusTypeDef HAL_DMA_DeInit (DMA_HandleTypeDef *const hdma)

Function description

DeInitialize the DMA channel when it is configured in normal mode.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMA_Start

Function name

HAL_StatusTypeDef HAL_DMA_Start (DMA_HandleTypeDef *const hdma, uint32_t SrcAddress, uint32_t DstAddress, uint32_t SrcDataSize)

Function description

Start the DMA channel transfer in normal mode (Blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **SrcAddress:** : The source data address.
- **DstAddress:** : The destination data address.
- **SrcDataSize:** : The length of data to be transferred from source to destination in bytes.

Return values

- **HAL:** status.

HAL_DMA_Start_IT

Function name

HAL_StatusTypeDef HAL_DMA_Start_IT (DMA_HandleTypeDef *const hdma, uint32_t SrcAddress, uint32_t DstAddress, uint32_t SrcDataSize)

Function description

Starts the DMA channel transfer in normal mode with interrupts enabled (Non-blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **SrcAddress:** : The source data address.
- **DstAddress:** : The destination data address.
- **SrcDataSize:** : The length of data to be transferred from source to destination in bytes.

Return values

- **HAL:** status.

HAL_DMA_Abort

Function name

HAL_StatusTypeDef HAL_DMA_Abort (DMA_HandleTypeDef *const hdma)

Function description

Abort any on-going DMA channel transfer (Blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

Notes

- After suspending a DMA channel, a wait until the DMA channel is effectively stopped is added. If a channel is suspended while a data transfer is on-going, the current data will be transferred and the channel will be effectively suspended only after the transfer of any on-going data is finished.

HAL_DMA_Abort_IT

Function name

HAL_StatusTypeDef HAL_DMA_Abort_IT (DMA_HandleTypeDef *const hdma)

Function description

Abort any on-going DMA channel transfer in interrupt mode (Non-blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMA_PollForTransfer

Function name

HAL_StatusTypeDef HAL_DMA_PollForTransfer (DMA_HandleTypeDef *const hdma, HAL_DMA_LevelCompleteTypeDef CompleteLevel, uint32_t Timeout)

Function description

Polling for transfer status (Blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **CompleteLevel:** : Specifies the DMA level complete.
- **Timeout:** : Timeout duration.

Return values

- **HAL:** status

HAL_DMA_IRQHandler

Function name

void HAL_DMA_IRQHandler (DMA_HandleTypeDef *const hdma)

Function description

Handle DMA interrupt request (Non-blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **None.:**

HAL_DMA_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DMA_RegisterCallback (DMA_HandleTypeDef *const hdma, HAL_DMA_CallbackIDTypeDef CallbackID, void(*)(DMA_HandleTypeDef *const _hdma) pCallback)

Function description

Register callback according to specified ID.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **CallbackID:** : User Callback identifier which could be a value of HAL_DMA_CallbackIDTypeDef enumeration.
- **pCallback:** : Pointer to private callback function.

Return values

- **HAL:** status.

Notes

- The HAL_DMA_RegisterCallback() may be called before HAL_DMA_Init() in HAL_DMA_STATE_RESET to register callbacks for HAL_DMA_MSPINIT_CB_ID and HAL_DMA_MSPDEINIT_CB_ID.

HAL_DMA_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DMA_UnRegisterCallback (DMA_HandleTypeDef *const hdma, HAL_DMA_CallbackIDTypeDef CallbackID)

Function description

Unregister callback according to specified ID.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **CallbackID:** : User Callback identifier which could be a value of HAL_DMA_CallbackIDTypeDef enum.

Return values

- **HAL:** status.

Notes

- The HAL_DMA_UnRegisterCallback() may be called before HAL_DMA_Init() in HAL_DMA_STATE_RESET to un-register callbacks for HAL_DMA_MSPINIT_CB_ID and HAL_DMA_MSPDEINIT_CB_ID.

HAL_DMA_GetState

Function name

HAL_DMA_StateTypeDef HAL_DMA_GetState (DMA_HandleTypeDef const *const hdma)

Function description

Returns the DMA channel state.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **DMA:** state.

HAL_DMA_GetError

Function name

uint32_t HAL_DMA_GetError (DMA_HandleTypeDef const *const hdma)

Function description

Return the DMA channel error code.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **DMA:** Error Code.

HAL_DMA_ConfigChannelAttributes

Function name

HAL_StatusTypeDef HAL_DMA_ConfigChannelAttributes (DMA_HandleTypeDef *const hdma, uint32_t ChannelAttributes)

Function description

Configure the DMA channel security and privilege attribute(s).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **ChannelAttributes:** : Specifies the DMA channel secure/privilege attributes. This parameter can be a one or a combination of DMA Channel Attributes.

Return values

- **HAL:** Status.

Notes

- These attributes cannot be modified when the corresponding lock state is enabled.

HAL_DMA_GetConfigChannelAttributes

Function name

HAL_StatusTypeDef HAL_DMA_GetConfigChannelAttributes (DMA_HandleTypeDef const *const hdma, uint32_t *const pChannelAttributes)

Function description

Get the DMA channel security and privilege attributes.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pChannelAttributes:** : Pointer to the returned attributes.

Return values

- **HAL:** Status.

HAL_DMA_LockChannelAttributes

Function name

HAL_StatusTypeDef HAL_DMA_LockChannelAttributes (DMA_HandleTypeDef const *const hdma)

Function description

Lock the DMA channel security and privilege attribute(s).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** Status.

HAL_DMA_GetLockChannelAttributes

Function name

HAL_StatusTypeDef HAL_DMA_GetLockChannelAttributes (DMA_HandleTypeDef const *const hdma, uint32_t *const pLockState)

Function description

Get the security and privilege attribute lock state of a DMA channel.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pLockState:** : Pointer to lock state (returned value can be DMA_CHANNEL_ATTRIBUTE_UNLOCKED or DMA_CHANNEL_ATTRIBUTE_LOCKED).

Return values

- **HAL:** status.

21.3 DMA Firmware driver defines

The following section lists the various define and macros of the module.

21.3.1 DMA

DMA

DMA Block Request

DMA_BREQ_SINGLE_BURST

Hardware request protocol at a single / burst level

DMA_BREQ_BLOCK

Hardware request protocol at a block level

DMA Channel Attributes

DMA_CHANNEL_PRIV

Channel is privileged

DMA_CHANNEL_NPRIV

Channel is unprivileged

DMA_CHANNEL_SEC

Channel is secure

DMA_CHANNEL_NSEC

Channel is non-secure

DMA_CHANNEL_SRC_SEC

Channel source is secure

DMA_CHANNEL_SRC_NSEC

Channel source is non-secure

DMA_CHANNEL_DEST_SEC

Channel destination is secure

DMA_CHANNEL_DEST_NSEC

Channel destination is non-secure

DMA_CHANNEL_ATTRIBUTE_UNLOCKED

Channel attribute is unlocked

DMA_CHANNEL_ATTRIBUTE_LOCKED

Channel attribute is locked

DMA destination Data Width

DMA_DEST_DATAWIDTH_BYTE

Destination data width : Byte

DMA_DEST_DATAWIDTH_HALFWORD

Destination data width : HalfWord

DMA_DEST_DATAWIDTH_WORD

Destination data width : Word

DMA Destination Increment Mode

DMA_DINC_FIXED

Destination fixed single / burst

DMA_DINC_INCREMENTED

Destination incremented single / burst

DMA Error Codes

HAL_DMA_ERROR_NONE

No error

HAL_DMA_ERROR_DTE

Data transfer error

HAL_DMA_ERROR_ULE

Update linked-list item error

HAL_DMA_ERROR_USE

User setting error

HAL_DMA_ERROR_TO

Trigger overrun error

HAL_DMA_ERROR_TIMEOUT

Timeout error

HAL_DMA_ERROR_NO_XFER

No transfer ongoing error

HAL_DMA_ERROR_BUSY

Busy error

HAL_DMA_ERROR_INVALID_CALLBACK

Invalid callback error

HAL_DMA_ERROR_NOT_SUPPORTED

Not supported mode

DMA Exported Macros

__HAL_DMA_RESET_HANDLE_STATE

Description:

- Reset DMA handle state.

Parameters:

- __HANDLE__: : DMA handle.

Return value:

- None.

__HAL_DMA_ENABLE

Description:

- Enable the specified DMA Channel.

Parameters:

- __HANDLE__: : DMA handle.

Return value:

- None

__HAL_DMA_DISABLE

Description:

- Disable the specified DMA Channel.

Parameters:

- __HANDLE__: : DMA handle.

Return value:

- None

__HAL_DMA_GET_FLAG

Description:

- Get the DMA channel pending flags.

Parameters:

- __HANDLE__: : DMA handle.
- __FLAG__: : Get the specified flag. This parameter can be any combination of the following values:
  - DMA_FLAG_TC : Transfer Complete flag.
  - DMA_FLAG_HT : Half Transfer Complete flag.
  - DMA_FLAG_DTE : Data Transfer Error flag.
  - DMA_FLAG_ULE : Update linked-list Error flag.
  - DMA_FLAG_USE : User Setting Error flag.
  - DMA_FLAG_TO : Trigger Overrun flag.
  - DMA_FLAG_SUSP : Completed Suspension flag.
  - DMA_FLAG_IDLEF : Idle flag.

Return value:

- The: state of FLAG (SET or RESET).

__HAL_DMA_CLEAR_FLAG

Description:

- Clear the DMA Channel pending flags.

Parameters:

- __HANDLE__: : DMA handle.
- __FLAG__: : Specifies the flag to clear. This parameter can be any combination of the following values:
  - DMA_FLAG_TC : Transfer Complete flag.
  - DMA_FLAG_HT : Half Transfer Complete flag.
  - DMA_FLAG_DTE : Data Transfer Error flag.
  - DMA_FLAG_ULE : Update Linked-List Error flag.
  - DMA_FLAG_USE : User Setting Error flag.
  - DMA_FLAG_TO : Trigger Overrun flag.
  - DMA_FLAG_SUSP : Completed Suspension flag.

Return value:

- None

__HAL_DMA_ENABLE_IT

Description:

- Enable the specified DMA Channel interrupts.

Parameters:

- __HANDLE__: : DMA handle.
- __INTERRUPT__: : Specifies the DMA interrupt sources to be enabled. This parameter can be any combination of the following values:
  - DMA_IT_TC : Transfer Complete interrupt.
  - DMA_IT_HT : Half Transfer Complete interrupt.
  - DMA_IT_DTE : Data Transfer Error interrupt.
  - DMA_IT_ULE : Update Linked-List Error interrupt.
  - DMA_IT_USE : User Setting Error interrupt.
  - DMA_IT_TO : Trigger Overrun interrupt.
  - DMA_IT_SUSP : Completed Suspension interrupt.

Return value:

- None

__HAL_DMA_DISABLE_IT

Description:

- Disable the specified DMA Channel interrupts.

Parameters:

- __HANDLE__: : DMA handle.
- __INTERRUPT__: : specifies the DMA interrupt sources to be disabled. This parameter can be any combination of the following values:
  - DMA_IT_TC : Transfer Complete interrupt.
  - DMA_IT_HT : Half Transfer Complete interrupt.
  - DMA_IT_DTE : Data Transfer Error interrupt.
  - DMA_IT_ULE : Update Linked-List Error interrupt.
  - DMA_IT_USE : User Setting Error interrupt.
  - DMA_IT_TO : Trigger Overrun interrupt.
  - DMA_IT_SUSP : Completed Suspension interrupt.

Return value:

- None

__HAL_DMA_GET_IT_SOURCE

Description:

- Checks whether the specified DMA Channel interrupt is enabled or not.

Parameters:

- __HANDLE__: : DMA handle.
- __INTERRUPT__: : specifies the DMA interrupt source to check.
  - DMA_IT_TC : Transfer Complete interrupt.
  - DMA_IT_HT : Half Transfer Complete interrupt.
  - DMA_IT_DTE : Data Transfer Error interrupt.
  - DMA_IT_ULE : Update Linked-List Error interrupt.
  - DMA_IT_USE : User Setting Error interrupt.
  - DMA_IT_TO : Trigger Overrun interrupt.
  - DMA_IT_SUSP : Completed Suspension interrupt.

Return value:

- The: state of DMA_IT (SET or RESET).

__HAL_DMA_SET_COUNTER

Description:

- Writes the block number of bytes to be transferred from the source on the DMA Channel.

Parameters:

- __HANDLE__: : DMA handle.
- __COUNTER__: : Number of data bytes to be transferred from the source (from 0 to 65535).

__HAL_DMA_GET_COUNTER

Description:

- Returns the number of remaining data bytes in the current DMA Channel transfer.

Parameters:

- __HANDLE__: : DMA handle.

Return value:

- The: number of remaining data units in the current DMA Stream transfer.

DMA Flag Definition

DMA_FLAG_IDLE

Idle flag

DMA_FLAG_TC

Transfer complete flag

DMA_FLAG_HT

Half transfer complete flag

DMA_FLAG_DTE

Data transfer error flag

DMA_FLAG_ULE

Update linked-list item error flag

DMA_FLAG_USE

User setting error flag

DMA_FLAG_SUSP

Completed suspension flag

DMA_FLAG_TO

Trigger overrun flag

TIM DMA Handle Index

TIM_DMA_ID_UPDATE

Index of the DMA handle used for Update DMA requests

TIM_DMA_ID_CC1

Index of the DMA handle used for Capture/Compare 1 DMA requests

TIM_DMA_ID_CC2

Index of the DMA handle used for Capture/Compare 2 DMA requests

TIM_DMA_ID_CC3

Index of the DMA handle used for Capture/Compare 3 DMA requests

TIM_DMA_ID_CC4

Index of the DMA handle used for Capture/Compare 4 DMA requests

TIM_DMA_ID_COMMUTATION

Index of the DMA handle used for Commutation DMA requests

TIM_DMA_ID_TRIGGER

Index of the DMA handle used for Trigger DMA requests

DMA Interrupt Enable Definition

DMA_IT_TC

Transfer complete interrupt

DMA_IT_HT

Half transfer complete interrupt

DMA_IT_DTE

Data transfer error interrupt

DMA_IT_ULE

Update linked-list item error interrupt

DMA_IT_USE

User eetting error interrupt

DMA_IT_SUSP

Completed suspension interrupt

DMA_IT_TO

Trigger overrun interrupt

DMA Priority Level

DMA_LOW_PRIORITY_LOW_WEIGHT

Priority level : Low Priority, Low weight

DMA_LOW_PRIORITY_MID_WEIGHT

Priority level : Low Priority, Mid weight

DMA_LOW_PRIORITY_HIGH_WEIGHT

Priority level : Low Priority, High weight

DMA_HIGH_PRIORITY

Priority level : HIGH Priority

DMA Request Selection

GPDMA1_REQUEST_ADC1

GPDMA1 HW request is ADC1

GPDMA1_REQUEST_ADC4

GPDMA1 HW request is ADC4

GPDMA1_REQUEST_DAC1_CH1

GPDMA1 HW request is DAC1_CH1

GPDMA1_REQUEST_DAC1_CH2
GPDMA1 HW request is DAC1_CH2

GPDMA1_REQUEST_TIM6_UP
GPDMA1 HW request is TIM6_UP

GPDMA1_REQUEST_TIM7_UP
GPDMA1 HW request is TIM7_UP

GPDMA1_REQUEST_SPI1_RX
GPDMA1 HW request is SPI1_RX

GPDMA1_REQUEST_SPI1_TX
GPDMA1 HW request is SPI1_TX

GPDMA1_REQUEST_SPI2_RX
GPDMA1 HW request is SPI2_RX

GPDMA1_REQUEST_SPI2_TX
GPDMA1 HW request is SPI2_TX

GPDMA1_REQUEST_SPI3_RX
GPDMA1 HW request is SPI3_RX

GPDMA1_REQUEST_SPI3_TX
GPDMA1 HW request is SPI3_TX

GPDMA1_REQUEST_I2C1_RX
GPDMA1 HW request is I2C1_RX

GPDMA1_REQUEST_I2C1_TX
GPDMA1 HW request is I2C1_TX

GPDMA1_REQUEST_I2C1_EVC
GPDMA1 HW request is I2C1_EVC

GPDMA1_REQUEST_I2C2_RX
GPDMA1 HW request is I2C2_RX

GPDMA1_REQUEST_I2C2_TX
GPDMA1 HW request is I2C2_TX

GPDMA1_REQUEST_I2C2_EVC
GPDMA1 HW request is I2C2_EVC

GPDMA1_REQUEST_I2C3_RX
GPDMA1 HW request is I2C3_RX

GPDMA1_REQUEST_I2C3_TX
GPDMA1 HW request is I2C3_TX

GPDMA1_REQUEST_I2C3_EVC
GPDMA1 HW request is I2C3_EVC

GPDMA1_REQUEST_I2C4_RX
GPDMA1 HW request is I2C4_RX

GPDMA1_REQUEST_I2C4_TX
GPDMA1 HW request is I2C4_TX

GPDMA1_REQUEST_I2C4_EVC
GPDMA1 HW request is I2C4_EVC

GPDMA1_REQUEST_USART1_RX
GPDMA1 HW request is USART1_RX

GPDMA1_REQUEST_USART1_TX
GPDMA1 HW request is USART1_TX

GPDMA1_REQUEST_USART2_RX
GPDMA1 HW request is USART2_RX

GPDMA1_REQUEST_USART2_TX
GPDMA1 HW request is USART2_TX

GPDMA1_REQUEST_USART3_RX
GPDMA1 HW request is USART3_RX

GPDMA1_REQUEST_USART3_TX
GPDMA1 HW request is USART3_TX

GPDMA1_REQUEST_UART4_RX
GPDMA1 HW request is UART4_RX

GPDMA1_REQUEST_UART4_TX
GPDMA1 HW request is UART4_TX

GPDMA1_REQUEST_UART5_RX
GPDMA1 HW request is UART5_RX

GPDMA1_REQUEST_UART5_TX
GPDMA1 HW request is UART5_TX

GPDMA1_REQUEST_LPUART1_RX
GPDMA1 HW request is LPUART1_RX

GPDMA1_REQUEST_LPUART1_TX
GPDMA1 HW request is LPUART1_TX

GPDMA1_REQUEST_SAI1_A
GPDMA1 HW request is SAI1_A

GPDMA1_REQUEST_SAI1_B
GPDMA1 HW request is SAI1_B

GPDMA1_REQUEST_SAI2_A
GPDMA1 HW request is SAI2_A

GPDMA1_REQUEST_SAI2_B
GPDMA1 HW request is SAI2_B

GPDMA1_REQUEST_OCTOSPI1
GPDMA1 HW request is OCTOSPI1

GPDMA1_REQUEST_OCTOSPI2
GPDMA1 HW request is OCTOSPI2

GPDMA1_REQUEST_TIM1_CH1
GPDMA1 HW request is TIM1_CH1

GPDMA1_REQUEST_TIM1_CH2
GPDMA1 HW request is TIM1_CH2

GPDMA1_REQUEST_TIM1_CH3
GPDMA1 HW request is TIM1_CH3

GPDMA1_REQUEST_TIM1_CH4
GPDMA1 HW request is TIM1_CH4

GPDMA1_REQUEST_TIM1_UP
GPDMA1 HW request is TIM1_UP

GPDMA1_REQUEST_TIM1_TRIG
GPDMA1 HW request is TIM1_TRIG

GPDMA1_REQUEST_TIM1_COM
GPDMA1 HW request is TIM1_COM

GPDMA1_REQUEST_TIM8_CH1
GPDMA1 HW request is TIM8_CH1

GPDMA1_REQUEST_TIM8_CH2
GPDMA1 HW request is TIM8_CH2

GPDMA1_REQUEST_TIM8_CH3
GPDMA1 HW request is TIM8_CH3

GPDMA1_REQUEST_TIM8_CH4
GPDMA1 HW request is TIM8_CH4

GPDMA1_REQUEST_TIM8_UP
GPDMA1 HW request is TIM8_UP

GPDMA1_REQUEST_TIM8_TRIG
GPDMA1 HW request is TIM8_TRIG

GPDMA1_REQUEST_TIM8_COM
GPDMA1 HW request is TIM8_COM

GPDMA1_REQUEST_TIM2_CH1
GPDMA1 HW request is TIM2_CH1

GPDMA1_REQUEST_TIM2_CH2
GPDMA1 HW request is TIM2_CH2

GPDMA1_REQUEST_TIM2_CH3
GPDMA1 HW request is TIM2_CH3

GPDMA1_REQUEST_TIM2_CH4
GPDMA1 HW request is TIM2_CH4

GPDMA1_REQUEST_TIM2_UP
GPDMA1 HW request is TIM2_UP

GPDMA1_REQUEST_TIM3_CH1
GPDMA1 HW request is TIM3_CH1

GPDMA1_REQUEST_TIM3_CH2
GPDMA1 HW request is TIM3_CH2

GPDMA1_REQUEST_TIM3_CH3
GPDMA1 HW request is TIM3_CH3

GPDMA1_REQUEST_TIM3_CH4
GPDMA1 HW request is TIM3_CH4

GPDMA1_REQUEST_TIM3_UP
GPDMA1 HW request is TIM3_UP

GPDMA1_REQUEST_TIM3_TRIG
GPDMA1 HW request is TIM3_TRIG

GPDMA1_REQUEST_TIM4_CH1
GPDMA1 HW request is TIM4_CH1

GPDMA1_REQUEST_TIM4_CH2
GPDMA1 HW request is TIM4_CH2

GPDMA1_REQUEST_TIM4_CH3
GPDMA1 HW request is TIM4_CH3

GPDMA1_REQUEST_TIM4_CH4
GPDMA1 HW request is TIM4_CH4

GPDMA1_REQUEST_TIM4_UP
GPDMA1 HW request is TIM4_UP

GPDMA1_REQUEST_TIM5_CH1
GPDMA1 HW request is TIM5_CH1

GPDMA1_REQUEST_TIM5_CH2
GPDMA1 HW request is TIM5_CH2

GPDMA1_REQUEST_TIM5_CH3
GPDMA1 HW request is TIM5_CH3

GPDMA1_REQUEST_TIM5_CH4
GPDMA1 HW request is TIM5_CH4

GPDMA1_REQUEST_TIM5_UP
GPDMA1 HW request is TIM5_UP

GPDMA1_REQUEST_TIM5_TRIG
GPDMA1 HW request is TIM5_TRIG

GPDMA1_REQUEST_TIM15_CH1
GPDMA1 HW request is TIM15_CH1

GPDMA1_REQUEST_TIM15_UP
GPDMA1 HW request is TIM15_UP

GPDMA1_REQUEST_TIM15_TRIG
GPDMA1 HW request is TIM15_TRIG

GPDMA1_REQUEST_TIM15_COM
GPDMA1 HW request is TIM15_COM

GPDMA1_REQUEST_TIM16_CH1
GPDMA1 HW request is TIM16_CH1

GPDMA1_REQUEST_TIM16_UP
GPDMA1 HW request is TIM16_UP

GPDMA1_REQUEST_TIM17_CH1
GPDMA1 HW request is TIM17_CH1

GPDMA1_REQUEST_TIM17_UP
GPDMA1 HW request is TIM17_UP

GPDMA1_REQUEST_DCMI_PSSI
GPDMA1 HW request is DCMI_PSSI

GPDMA1_REQUEST_AES_IN
GPDMA1 HW request is AES_IN

GPDMA1_REQUEST_AES_OUT
GPDMA1 HW request is AES_OUT

GPDMA1_REQUEST_HASH_IN
GPDMA1 HW request is HASH_IN

GPDMA1_REQUEST_UCPD1_TX
GPDMA1 HW request is UCPD1_TX

GPDMA1_REQUEST_UCPD1_RX
GPDMA1 HW request is UCPD1_RX

GPDMA1 HW request is MDF1_FLT2

GPDMA1_REQUEST_MDF1_FLT3
GPDMA1 HW request is MDF1_FLT3

GPDMA1_REQUEST_MDF1_FLT4
GPDMA1 HW request is MDF1_FLT4

GPDMA1_REQUEST_MDF1_FLT5
GPDMA1 HW request is MDF1_FLT5

GPDMA1_REQUEST_ADF1_FLT0
GPDMA1 HW request is ADF1_FLT0

GPDMA1_REQUEST_FMAC_READ
GPDMA1 HW request is FMAC_READ

GPDMA1_REQUEST_FMAC_WRITE
GPDMA1 HW request is FMAC_WRITE

GPDMA1_REQUEST_CORDIC_READ
GPDMA1 HW request is CORDIC_READ

GPDMA1_REQUEST_CORDIC_WRITE
GPDMA1 HW request is CORDIC_WRITE

GPDMA1_REQUEST_SAES_IN
GPDMA1 HW request is SAES_IN

GPDMA1_REQUEST_SAES_OUT
GPDMA1 HW request is SAES_OUT

GPDMA1_REQUEST_LPTIM1_IC1
GPDMA1 HW request is LPTIM1_IC1

GPDMA1_REQUEST_LPTIM1_IC2
GPDMA1 HW request is LPTIM1_IC2

GPDMA1_REQUEST_LPTIM1_UE
GPDMA1 HW request is LPTIM1_UE

GPDMA1_REQUEST_LPTIM2_IC1
GPDMA1 HW request is LPTIM2_IC1

GPDMA1_REQUEST_LPTIM2_IC2
GPDMA1 HW request is LPTIM2_IC2

GPDMA1_REQUEST_LPTIM2_UE
GPDMA1 HW request is LPTIM2_UE

GPDMA1_REQUEST_LPTIM3_IC1
GPDMA1 HW request is LPTIM3_IC1

GPDMA1_REQUEST_LPTIM3_IC2
GPDMA1 HW request is LPTIM3_IC2

GPDMA1_REQUEST_LPTIM3_UE
GPDMA1 HW request is LPTIM3_UE

GPDMA1_REQUEST_HSPI1
GPDMA1 HW request is HSPI1

GPDMA1_REQUEST_I2C5_RX
GPDMA1 HW request is I2C5_RX

GPDMA1_REQUEST_I2C5_TX
GPDMA1 HW request is I2C5_TX

GPDMA1_REQUEST_I2C5_EVC
GPDMA1 HW request is I2C5_EVC

GPDMA1_REQUEST_I2C6_RX
GPDMA1 HW request is I2C6_RX

GPDMA1_REQUEST_I2C6_TX
GPDMA1 HW request is I2C6_TX

GPDMA1_REQUEST_I2C6_EVC
GPDMA1 HW request is I2C6_EVC

GPDMA1_REQUEST_USART6_RX
GPDMA1 HW request is USART6_RX

GPDMA1_REQUEST_USART6_TX
GPDMA1 HW request is USART6_TX

GPDMA1_REQUEST_ADC2
GPDMA1 HW request is ADC2

GPDMA1_REQUEST_JPEG_RX
GPDMA1 HW request is JPEG_TX

GPDMA1_REQUEST_JPEG_TX
GPDMA1 HW request is JPEG_RX

LPDMA1_REQUEST_LPUART1_RX
LPDMA1 HW request is LPUART1_RX

LPDMA1_REQUEST_LPUART1_TX
LPDMA1 HW request is LPUART1_TX

LPDMA1_REQUEST_SPI3_RX
LPDMA1 HW request is SPI3_RX

LPDMA1_REQUEST_SPI3_TX
LPDMA1 HW request is SPI3_TX

LPDMA1_REQUEST_I2C3_RX
LPDMA1 HW request is I2C3_RX

DMA SW request

DMA Source Data Width

DMA_SRC_DATAWIDTH_BYTE
Source data width : Byte

DMA_SRC_DATAWIDTH_HALFWORD
Source data width : HalfWord

DMA_SRC_DATAWIDTH_WORD
Source data width : Word

DMA Source Increment Mode

DMA_SINC_FIXED
Source fixed single / burst

DMA_SINC_INCREMENTED
Source incremented single / burst

DMA Transfer Allocated Port

DMA_SRC_ALLOCATED_PORT0
Source allocated Port 0

DMA_SRC_ALLOCATED_PORT1
Source allocated Port 1

DMA_DEST_ALLOCATED_PORT0
Destination allocated Port 0

DMA_DEST_ALLOCATED_PORT1
Destination allocated Port 1

DMA Transfer Direction

DMA_PERIPH_TO_MEMORY

Peripheral to memory direction

DMA_MEMORY_TO_PERIPH

Memory to peripheral direction

DMA_MEMORY_TO_MEMORY

Memory to memory direction

DMA Transfer Event Mode

DMA_TCEM_BLOCK_TRANSFER

The TC event is generated at the end of each block and the HT event is generated at the half of each block

DMA_TCEM_REPEATED_BLOCK_TRANSFER

The TC event is generated at the end of the repeated block and the HT event is generated at the half of the repeated block

DMA_TCEM_EACH_LL_ITEM_TRANSFER

The TC event is generated at the end of each linked-list item and the HT event is generated at the half of each linked-list item

DMA_TCEM_LAST_LL_ITEM_TRANSFER

The TC event is generated at the end of the last linked-list item and the HT event is generated at the half of the last linked-list item

DMA Transfer Mode

DMA_NORMAL

Normal DMA transfer

22 HAL DMA Extension Driver

22.1 DMAEx Firmware driver registers structures

22.1.1 DMA_DataHandlingConfTypeDef

DMA_DataHandlingConfTypeDef is defined in the stm32u5xx_hal_dma_ex.h

Data Fields

- ***uint32_t DataExchange***
- ***uint32_t DataAlignment***

Field Documentation

- ***uint32_t DMA_DataHandlingConfTypeDef::DataExchange***
  Specifies the DMA channel data exchange mode. This parameter can be a value of ***DMAEx_Data_Exchange***
- ***uint32_t DMA_DataHandlingConfTypeDef::DataAlignment***
  Specifies the DMA channel data padding and alignment mode This parameter can be a value of ***DMAEx_Data_Alignment***

22.1.2 DMA_TriggerConfTypeDef

DMA_TriggerConfTypeDef is defined in the stm32u5xx_hal_dma_ex.h

Data Fields

- ***uint32_t TriggerMode***
- ***uint32_t TriggerPolarity***
- ***uint32_t TriggerSelection***

Field Documentation

- ***uint32_t DMA_TriggerConfTypeDef::TriggerMode***
  Specifies the DMA channel trigger mode. This parameter can be a value of ***DMAEx_Trigger_Mode***
- ***uint32_t DMA_TriggerConfTypeDef::TriggerPolarity***
  Specifies the DMA channel trigger event polarity. This parameter can be a value of ***DMAEx_Trigger_Polarity***
- ***uint32_t DMA_TriggerConfTypeDef::TriggerSelection***
  Specifies the DMA channel trigger event selection. This parameter can be a value of ***DMAEx_Trigger_Selection***

22.1.3 DMA_RepeatBlockConfTypeDef

DMA_RepeatBlockConfTypeDef is defined in the stm32u5xx_hal_dma_ex.h

Data Fields

- ***uint32_t RepeatCount***
- ***int32_t SrcAddrOffset***
- ***int32_t DestAddrOffset***
- ***int32_t BlkSrcAddrOffset***
- ***int32_t BlkDestAddrOffset***

Field Documentation

- ***uint32_t DMA_RepeatBlockConfTypeDef::RepeatCount***
  Specifies the DMA channel repeat count (the number of repetitions of block). This parameter can be a value between 1 and 2048
- ***int32_t DMA_RepeatBlockConfTypeDef::SrcAddrOffset***
  Specifies the DMA channel single/burst source address offset : This parameter can be a value between -8191 and 8191. If source address offset > 0 => Increment the source address by offset from where the last single/burst transfer ends. If source address offset < 0 => Decrement the source address by offset from where the last single/burst transfer ends. If source address offset == 0 => The next single/burst source address starts from where the last transfer ends

- ***int32_t DMA_RepeatBlockConfTypeDef::DestAddrOffset***
  Specifies the DMA channel single/burst destination address offset signed value : This parameter can be a value between -8191 and 8191. If destination address offset > 0 => Increment the destination address by offset from where the last single/burst transfer ends. If destination address offset < 0 => Decrement the destination address by offset from where the last single/burst transfer ends. If destination address offset == 0 => The next single/burst destination address starts from where the last transfer ends.
- ***int32_t DMA_RepeatBlockConfTypeDef::BlkSrcAddrOffset***
  Specifies the DMA channel block source address offset signed value : This parameter can be a value between -65535 and 65535. If block source address offset > 0 => Increment the block source address by offset from where the last block ends. If block source address offset < 0 => Decrement the next block source address by offset from where the last block ends. If block source address offset == 0 => the next block source address starts from where the last block ends
- ***int32_t DMA_RepeatBlockConfTypeDef::BlkDestAddrOffset***
  Specifies the DMA channel block destination address offset signed value : This parameter can be a value between -65535 and 65535. If block destination address offset > 0 => Increment the block destination address by offset from where the last block ends. If block destination address offset < 0 => Decrement the next block destination address by offset from where the last block ends. If block destination address offset == 0 => the next block destination address starts from where the last block ends

22.1.4 DMA_NodeConfTypeDef

DMA_NodeConfTypeDef is defined in the stm32u5xx_hal_dma_ex.h

Data Fields

- ***uint32_t NodeType***
- ***DMA_InitTypeDef Init***
- ***DMA_DataHandlingConfTypeDef DataHandlingConfig***
- ***DMA_TriggerConfTypeDef TriggerConfig***
- ***DMA_RepeatBlockConfTypeDef RepeatBlockConfig***
- ***uint32_t SrcAddress***
- ***uint32_t DstAddress***
- ***uint32_t DataSize***
- ***uint32_t SrcSecure***
- ***uint32_t DestSecure***

Field Documentation

- ***uint32_t DMA_NodeConfTypeDef::NodeType***
  Specifies the DMA channel node type. This parameter can be a value of ***DMAEx_Node_Type***
- ***DMA_InitTypeDef DMA_NodeConfTypeDef::Init***
  Specifies the DMA channel basic configuration
- ***DMA_DataHandlingConfTypeDef DMA_NodeConfTypeDef::DataHandlingConfig***
  Specifies the DMA channel data handling channel configuration
- ***DMA_TriggerConfTypeDef DMA_NodeConfTypeDef::TriggerConfig***
  Specifies the DMA channel trigger configuration
- ***DMA_RepeatBlockConfTypeDef DMA_NodeConfTypeDef::RepeatBlockConfig***
  Specifies the DMA channel repeated block configuration
- ***uint32_t DMA_NodeConfTypeDef::SrcAddress***
  Specifies the source memory address
- ***uint32_t DMA_NodeConfTypeDef::DstAddress***
  Specifies the destination memory address
- ***uint32_t DMA_NodeConfTypeDef::DataSize***
  Specifies the source data size in bytes
- ***uint32_t DMA_NodeConfTypeDef::SrcSecure***
  Specifies the source security attribute
- ***uint32_t DMA_NodeConfTypeDef::DestSecure***
  Specifies the destination security attribute

22.1.5 DMA_NodeTypeDef

DMA_NodeTypeDef is defined in the stm32u5xx_hal_dma_ex.h

Data Fields

- ***uint32_t LinkRegisters***
- ***uint32_t NodeInfo***

Field Documentation

- ***uint32_t DMA_NodeTypeDef::LinkRegisters[8U]***
  Physical Node register description
- ***uint32_t DMA_NodeTypeDef::NodeInfo***
  Node information

22.1.6 __DMA_QListTypeDef

__DMA_QListTypeDef is defined in the stm32u5xx_hal_dma_ex.h

Data Fields

- ***DMA_NodeTypeDef * Head***
- ***DMA_NodeTypeDef * FirstCircularNode***
- ***uint32_t NodeNumber***
- ***__IO HAL_DMA_QStateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***__IO uint32_t Type***

Field Documentation

- ***DMA_NodeTypeDef* __DMA_QListTypeDef::Head***
  Specifies the queue head node
- ***DMA_NodeTypeDef* __DMA_QListTypeDef::FirstCircularNode***
  Specifies the queue first circular node
- ***uint32_t __DMA_QListTypeDef::NodeNumber***
  Specifies the queue node number
- ***__IO HAL_DMA_QStateTypeDef __DMA_QListTypeDef::State***
  Specifies the queue state
- ***__IO uint32_t __DMA_QListTypeDef::ErrorCode***
  Specifies the queue error code
- ***__IO uint32_t __DMA_QListTypeDef::Type***
  Specifies whether the queue is static or dynamic

22.1.7 DMA_NodeInQInfoTypeDef

DMA_NodeInQInfoTypeDef is defined in the stm32u5xx_hal_dma_ex.h

Data Fields

- ***uint32_t cllr_offset***
- ***uint32_t previousnode_addr***
- ***uint32_t currentnode_pos***
- ***uint32_t currentnode_addr***
- ***uint32_t nextnode_addr***

Field Documentation

- ***uint32_t DMA_NodeInQInfoTypeDef::cllr_offset***
- ***uint32_t DMA_NodeInQInfoTypeDef::previousnode_addr***
- ***uint32_t DMA_NodeInQInfoTypeDef::currentnode_pos***
- ***uint32_t DMA_NodeInQInfoTypeDef::currentnode_addr***
- ***uint32_t DMA_NodeInQInfoTypeDef::nextnode_addr***

22.2 DMAEx Firmware driver API description

The following section lists the various functions of the DMAEx library.

22.2.1 How to use this driver

Alternatively to the normal programming mode, a DMA channel can be programmed by a list of transfers, known as linked-list (list of Node items). Each node is defined by its data structure. Each node specifies a standalone DMA channel. When enabled, the DMA channel fetch the first linked-list node from SRAM (known as head node). When executed, the next linked list node will be fetched and executed. This operation is repeated until the end of the whole linked-list queue. Optionally, the linked-list can be linear where the last linked-list queue node is not linked to another queue node or circular where the last linked-list node is linked to any linked-list queue node.

- Linear linked-list: The DMA channel fetch and execute all DMA linked-list queue from first node (head node) to last node (tail node) ones. When the last node is completed, the DMA channel remains in idle state and another transfer can be lunched.
- Circular linked-list: The DMA channel fetch and execute all DMA linked-list queue from first node (head node) to last node (tail node). When last node is executed, the DMA channel fetches the first circular node another time and repeat the same sequence in an infinite loop (Circular transfer). To stop the DMA channel, an abort operation is required. This linked-list mode replaces the legacy circular transfers.

In order to reduce linked-list queue executing time and power consumption, the DMA channel supports executing the dynamic linked-list format. In fact, the DMA supports the execution of 2 types of linked-list formats : static and dynamic.

- Static linked-list: The static linked-list format refers to the full linked-list node where all DMA channel parameters are fetched and executed independently of the redundancy of information.
- Dynamic linked-list: The dynamic linked-list format refer to the customized linked-list node where only DMA channel necessary parameters are fetched and executed (Example: data size = 20 on previous node, and data size = 20 on the current node => No need to update it). For linked-list transfers, the DMA channel can execute the linked-list queue node by node. This feature is named link step mode. When activated, enabling the DMA channel first time allows to fetch the head node from memory then it stops. Then, another DMA channel enable is needed to execute the node. After that, keeping enabling the DMA channel is needed to execute each node until the end of linked-list queue. When the linked-list queue is circular, enabling the DMA channel in an infinite loop is required to keep the DMA channel running. This feature is useful for debug purpose or asynchronously executing queue nodes.

Each DMA channel transfer (normal or linked-list), is highly configurable according to DMA channel instance integrated in devices. These configuration can be :

- Repeated block configuration : If the feature is supported, the DMA channel can performs a repeated block transfers. Named also 2 dimension addressing transfers, this feature can transfer n iteration of programmed block transfer (Block transfer is the legacy data size). Additional to the repeat count of a block, DMA channel addresses can jump after at burst and block level. The jump length is a programmable parameter defined by DMA user.
  - Jump at burst level : The DMA channel keep an empty area, between each 2 consecutive bursts transmitted.
  - Jump at block level : The DMA channel keep an empty area, between each 2 consecutive blocks transmitted.
- Trigger : The DMA channel transfers can be conditioned by hardware signals edges (rising or falling) named hardware triggers. Trigger condition can be applied at :
  - Single/Burst level : Each single/burst data transmission is conditioned by a signal trigger hit.
  - Block level : Each block data transmission is conditioned by a signal trigger hit.
  - Repeated block level : Each repeated block data transmission is conditioned by a signal trigger hit.
  - Node level : Each node execution is conditioned by a signal trigger hit. The DMA channel can report a trigger overrun when detects more than 2 trigger signal edges before executing the current transfer.
- Data handling : The data handling feature is a FIFO capability that can be :
  - Padding pattern : Padding selected pattern (zero padding or sign extension) when the source data width is smaller than the destination data width at single level.
  - Truncation : Truncate section from the source data single when the source data width is bigger than the destination data width.
  - Pack/Unpack : Pack a set of data when source data width is smaller than the destination data width. Unpack a set of data when source data width is bigger than the destination data width.
  - Exchange : Exchange data at byte and half-word on the destination and at byte level on the source.

Each DMA channel transfer (normal or linked-list) when it is active, can be suspended and resumed at run time application. When trying to suspend an ongoing transfer, the DMA channel isn't suspended instantly but complete the current ongoing single/burst then it stops. When the DMA channel is suspended, the current transfer can be resumed instantly.

The DMA channel that supports FIFO, can report in real time the number of beats remains on destination (Output) FIFO level.

Linked-List Initialization and De-Initialization operation

Differently from normal transfers, DMA channel initialization and de-initialization need less parameters as the remaining transfer parameters are defined by linked-list nodes.

- Use HAL_DMAEx_List_Init() to initialize a DMA channel in linked-list mode according to programmed fields. When called, the DMA channel will be ready to execute linked-list queues.
- Use HAL_DMAEx_List_DeInit() to de-initialize a DMA channel in linked-list mode. When called, the DMA channel will be in reset. It is mandatory to reinitialize it for next transfer.

Linked-List I/O Operation

- Use HAL_DMAEx_List_Start() to start a DMA transfer in linked-list mode after the configuration of linked-list queue base address and offset in polling mode (Blocking mode).
- Use HAL_DMAEx_List_Start_IT() to start a DMA transfer in linked-list mode after the configuration of linked-list queue base address and offset in interrupt mode (Non-blocking mode).

Linked-List Management

The linked-list management is a software processing independently of DMA channel hardware. It allows to reset, build, create, insert, remove, replace, circularize, convert both nodes and queue in order to perform DMA channel transfers in linked-list mode. Linked-list APIs and types are adapted to reduce memory footprint.

Linked-list nodes building

At node level, the operations that can be done are building a new linked-list node or get a linked-list node information from a built node. The linked-list nodes have two forms according to 2 dimensions addressing capability. The linear addressing nodes contains the information of all DMA channel features except the 2 dimension addressing features and the 2 dimensions addressing nodes contain the information of all available features.

- Use HAL_DMAEx_List_BuildNode() to build the DMA linked-list node according to the specified parameters. Build operation allow to convert the specified parameter in values known by the DMA channel and place them in memory. Placing DMA linked-list in SRAM must be done in accordance to product specification to ensure that the link access port can access to the specified SRAM.
  - The DMA linked-list node parameter address should be 32bit aligned and should not exceed the 64 KByte addressable space.
- Use HAL_DMAEx_List_GetNodeConfig() to get the specified configuration parameter on building node. This API can be used when need to change few parameter to build new node.

Inserting nodes to linked-list queue

In order to build a sequence of DMA transaction with different configuration, we need to insert built node at linked-list queue (node present an elementary DMA transaction) in linked-list queue on any position to have the full flexibility of ordering nodes or extend the sequence of queue transactions.

- Use HAL_DMAEx_List_InsertNode() to insert new built node in any queue position of linked-list queue according to selecting previous node. When calling this API with previous node parameter is NULL, the inserted node will be placed at the head of the linked-list queue.
  - This API must be used after HAL_DMAEx_List_BuildNode() otherwise an error will be returned.
  - This API must be called for static queues format.
  - This API shall be avoided when adding new node at the head or the tail of queue (overhead of footprint and performance : use HAL_DMAEx_List_InsertNode_Head() or HAL_DMAEx_List_InsertNode_Tail() instead).

- Use HAL_DMAEx_List_InsertNode_Head() to insert new built node at the head of linked-list queue. The head node will not be overwritten but will be the second queue node.
  - This API must be used after HAL_DMAEx_List_BuildNode() otherwise an error will be returned.
  - This API must be called for static queues format.
- Use HAL_DMAEx_List_InsertNode_Tail() to insert new built node at the tail of linked-list queue. The tail node will not be overwritten but will be the penultimate queue node.
  - This API must be used after HAL_DMAEx_List_BuildNode() otherwise an error will be returned.
  - This API must be called for static queues format.

Removing nodes from linked-list queue

There is some cases when removing a node from linked-list queue is needed (need to remove an elementary DMA transaction). Removing node allows to unlink a node from DMA linked-list queue (NOT DELETED), so the removed node can be reused for another queue or to be added to the same queue without need to rebuild it in next step.

- Use HAL_DMAEx_List_RemoveNode() to remove any yet built and inserted node from linked-list queue according to selected node.
  - This API must be called for static queues format.
  - This API shall be avoided when removing the head or the tail of linked-list queue (overhead of footprint and performance : use HAL_DMAEx_List_RemoveNode_Head() or HAL_DMAEx_List_RemoveNode_Tail() instead).
- Use HAL_DMAEx_List_RemoveNode_Head() to remove the head node from linked-list queue.
  - This API must be called for static queues format.
- Use HAL_DMAEx_List_RemoveNode_Tail() to remove the tail node from linked-list queue.
  - This API must be called for static queues format.

Replacing nodes on linked-list queue

There is some cases when replacing a node from linked-list queue is needed (need to replace an elementary DMA transfer, by another one that have not the same configuration). Replacing node allows to unlink the node to be replaced from DMA linked-list queue (NOT DELETED) and link instead a new node. So the replaced node can be reused for another queue or to be added to the same queue without need to rebuild it in next step and the new node cannot be reused except when remove it or replaced in next step.

- Use HAL_DMAEx_List_ReplaceNode() to replace any yet built and inserted node on linked-list queue according to selected node.
  - This API must be called for static queues format.
  - This API shall be avoided when replacing the head or the tail linked-list queue (overhead of footprint and performance : use HAL_DMAEx_List_ReplaceNode_Head() or HAL_DMAEx_List_ReplaceNode_Tail() instead).
- Use HAL_DMAEx_List_ReplaceNode_Head() to replace the head node of linked-list queue.
  - This API must be called for static queues format.
- Use HAL_DMAEx_List_ReplaceNode_Tail() to replace the tail node from linked-list queue.
  - This API must be called for static queues format.

Reset linked-list queue

After finishing using a linked-list queue, it can be reset and cleared and it's content nodes will be unlinked (NOT DELETED) and reused on another queue.

- Use HAL_DMAEx_List_ResetQ() to reset a linked-list queue and unlink all it's content nodes.
  - This API must be called for ready state queues.
  - This API must be called for static queues format.

Inserting linked-list queue

To ensure the flexibility of building linked-list queue by their targeted functionalities (Example: 3 nodes for action 1 and 5 nodes for action 2), it is possible to build a queue for action 1 that contains action 1 nodes and a queue for action 2 that contains action 2 nodes then concatenating the 2 queues. So, there are some cases where the management of linked-list at queue granularity is needed.

- Use HAL_DMAEx_List_InsertQ() to insert source linked-list queue to a destination linked-list queue according to selecting previous node.
  - This API must be called for static queues format.
  - This API shall be avoided when inserting source linked-list queue at the head or the tail of destination queue (overhead of footprint and performance : use HAL_DMAEx_List_InsertQ_Head() or HAL_DMAEx_List_InsertQ_Tail() instead).
- Use HAL_DMAEx_List_InsertQ_Head() to insert a source linked-list queue at the head of linked-list destination queue.
  - This API must be called for static queues format.
- Use HAL_DMAEx_List_InsertQ_Tail() to insert a source linked-list queue at the tail of linked-list destination queue.
  - This API must be called for static queues format.

Circularizing linked-list queue

In order to perform tasks in infinite loop with DMA channel, it is possible to circularize the linked-list queues. Circularizing queue allows to link last linked-list queue node to any previous node of the same queue (This node is named first circular queue). When the first circular node is the head node, all linked-list queue nodes will be executed in infinite loop. When the first circular node is not the head nodes, all precedent nodes are executed once and all remaining nodes are executed in an infinite loop.

- Use HAL_DMAEx_List_SetCircularModeConfig() to circularize the linked-list queue according to first circular node selected.
  - This API must be called for static queues format.
  - This API shall be avoided when first circular node is the head linked-list queue node (overhead of footprint and performance : use HAL_DMAEx_List_SetCircularMode() instead).
- Use HAL_DMAEx_List_SetCircularMode() to circularize the linked-list queue with linking last queue node with first queue node.
  - This API must be called for static queues format.
- Use HAL_DMAEx_List_ClearCircularMode() to clear any linked-list queue circular configuration.
  - This API must be called for static queues format.

Converting linked-list queue

To have the best DMA channel linked-list queue execution, it is recommended to convert yet build linked-list queue to dynamic format (Static is the default format). When linked-list queue becomes dynamic, all queue nodes are optimized and only changed parameters will be updated between nodes. So, the DMA will fetch only changes parameters instead of the whole node.

- Use HAL_DMAEx_List_ConvertQToDynamic() to convert a linked-list queue to dynamic format.
  - This API must be called for ready state queues.
  - This API must be called for static queues format.
  - This API must be called as the last API before starting the DMA channel in linked-list mode.
- Use HAL_DMAEx_List_ConvertQToStatic() to convert a linked-list queue to static format.
  - This API must be called for ready state queues.
  - This API must be called for dynamic queues format.
  - This API must be called as the first API after the full execution of linked-list queue when the execution mode is linear (not circular) if it is dynamic and a linked-list queue management is needed.
  - This API must be called as the first API after the aborting the execution of the current linked-list queue when the execution mode is linear (not circular) if it is dynamic and a linked-list queue management is needed.

When converting a circular queue to dynamic format and when the first circular node is the last queue node, it is recommended to duplicate the last circular node in order to ensure the full optimization when calling HAL_DMAEx_List_ConvertQToDynamic() API. In this case, updated information are only addresses which allow to reduce 4 words of update for linear nodes per node execution and 6 words update for 2 dimensions addressing nodes per node execution.

Linking linked-list queue to DMA channel

In order to have the possibility of the creation of an infinity queues (limited by available memory size), the building of linked-list queue is fully independent from DMA channels. It is possible to build all needed queues if their size is less then available memory at startup time, then linking each time when needed a linked-list queue to an idle DMA channel.

- Use HAL_DMAEx_List_LinkQ() to link a ready linked-list queue to ready DMA channel.
  - This API supports the two format of linked-list (Static and dynamic).
  - This API must be called for ready state queues and DMA channels.
- Use HAL_DMAEx_List_ConvertQToStatic() to unlink a ready linked-list queue to ready DMA channel.
  - This API supports the two format of linked-list (Static and dynamic).
  - This API must be called for ready state queues and DMA channels.

User sequence

To use cleanly the DMA linked-list library, ensure to apply the following call sequences :

- Linear transfer : Linked-list queue building
  - HAL_DMAEx_List_BuildNode()
  - HAL_DMAEx_List_InsertNode_Tail() . . .
  - HAL_DMAEx_List_BuildNode()
  - HAL_DMAEx_List_InsertNode_Tail()
  - HAL_DMAEx_List_ConvertQToDynamic() Linked-list queue execution
  - HAL_DMAEx_List_Init()
  - HAL_DMAEx_List_LinkQ()
  - HAL_DMAEx_List_Start() / HAL_DMAEx_List_Start_IT()
  - HAL_DMAEx_List_UnLinkQ()
  - HAL_DMAEx_List_DeInit()
- Circular transfer : Linked-list queue building
  - HAL_DMAEx_List_BuildNode()
  - HAL_DMAEx_List_InsertNode_Tail() . . .
  - HAL_DMAEx_List_BuildNode()
  - HAL_DMAEx_List_InsertNode_Tail()
  - HAL_DMAEx_List_SetCircularModeConfig() / HAL_DMAEx_List_SetCircularMode()
  - HAL_DMAEx_List_ConvertQToDynamic() Linked-list queue execution
  - HAL_DMAEx_List_Init()
  - HAL_DMAEx_List_LinkQ()
  - HAL_DMAEx_List_Start() / HAL_DMAEx_List_Start_IT()
  - HAL_DMA_Abort() / HAL_DMA_Abort_IT()
  - HAL_DMAEx_List_UnLinkQ()
  - HAL_DMAEx_List_DeInit()

Data Handling

In order to avoid some CPU data processing in several cases, the DMA channel provides some features related to FIFO capabilities titled data handling. (++) Padding pattern Padding selected pattern (zero padding or sign extension) when the source data width is smaller than the destination data width at single level. Zero padding (Source : 0xABAB ------> Destination : 0xABAB0000) Sign bit extension (Source : 0x0ABA ------> Destination : 0x00000ABA) (Source : 0xFABA ------> Destination : 0xFFFFFABA) (++) Truncation : Truncate section from the source data single when the source data width is bigger than the destination data width. Left truncation (Source : 0xABABCDCD ------> Destination : 0xCDCD) Right truncation (Source : 0xABABCDCD ------> Destination : 0xABAB) (++) Pack/Unpack : Pack a set of data when source data width is smaller than the destination data width. Unpack a set of data when source data width is bigger than the destination data width. Pack (Source : 0xAB, 0xCD ------> Destination : 0xABCD) UnPack (Source : 0xABCD ------> Destination : 0xAB, 0xCD) (++) Exchange : Exchange data at byte and half-word on the destination and at byte level on the source. Considering source and destination are both word type. Exchange operation can be as follows. In examples below, one exchange setting is enabled at a time. Source byte exchange only (Source : 0xAB12CD34 ------> Destination : 0xABCD1234) Destination byte exchange only (Source : 0xAB12CD34 ------> Destination : 0x12AB34CD) Destination half-word exchange only (Source : 0xAB12CD34 ------> Destination : 0xCD34AB12)

- Use HAL_DMAEx_ConfigDataHandling() to configure data handling features. Previous elementary explained can be combined according to application needs.
  - This API is complementary of normal transfers.
  - This API must not be called for linked-list transfers as data handling information are configured at node level.

User sequence

To configure cleanly the DMA channel data handling, ensure to apply the following call sequence :

- Linear transfer :
  - HAL_DMA_Init()
  - HAL_DMAEx_ConfigDataHandling()
  - HAL_DMA_Start()

Repeated Block

When available, this feature is used when the data size is higher then 65535 bytes (Maximum block size) or for scattering / gathering data. (++) Gather data Source Destination 0xAA 0xAA 0xBB 0xAA 0xAA ==> 0xAA 0xCC 0xAA (++) Scatter data Source Destination 0xAA 0xAA 0xAA 0xBB 0xAA ==> 0xAA 0xBB 0xAA

- Use HAL_DMAEx_ConfigRepeatBlock() to configure data repeated block feature. Jump addresses and incrementing or decrementing on source and destination can be combined to have the need application behavior.
  - This API is complementary of normal transfers.
  - This API must not be called for linked-list transfers as repeated block information are configured at node level.
  - This API must be called only for DMA channel that supports repeated block feature.

User sequence

To configure cleanly the DMA channel repeated block, ensure to apply the following call sequence :

- Linear transfer :
  - HAL_DMA_Init()
  - HAL_DMAEx_ConfigRepeatBlock()
  - HAL_DMA_Start()

Trigger Configuration

When application needs that DMA transfers are conditioned by internal or external events, the trigger feature can do that. Trigger signals are a set of device signal that are linked to DMA trigger inputs that allows to start the DMA transfers. To setup a trigger transfers, three DMA channel parameters are needed:

- Trigger mode This parameter specifies the trig level.
  - Block level
  - Repeated block level
  - Node level
  - Single / Burst level
- Trigger polarity This parameter specifies the DMA trigger sensitivity (Rising or falling).
- Trigger selection This parameter specifies the DMA trigger hardware signal.
- Use HAL_DMAEx_ConfigTrigger() to configure trigger feature.
  - This API is complementary to normal transfers APIs.
  - This API must not be called for linked-list transfers as trigger information are configured at node level.

User sequence

To configure cleanly the DMA channel trigger, ensure to apply the following call sequence :

- Linear transfer :
  - HAL_DMA_Init()
  - HAL_DMAEx_ConfigTrigger()
  - HAL_DMA_Start()

Suspend and resume operation

There are several cases when needs to suspend a DMA current transfer (Example: liberate bandwidth for more priority DMA channel transfer). Suspending DMA channel (same as abort) is available in polling (blocking mode) and interrupt (non-blocking mode) modes. When suspended, a DMA channel can be instantly resumed.

- Use HAL_DMAEx_Suspend() to suspend an ongoing DMA channel transfer in polling mode (Blocking mode).
- Use HAL_DMAEx_Suspend_IT() to suspend an ongoing DMA channel transfer in interrupt mode (Non-blocking mode).
- Use HAL_DMAEx_Resume() to resume a suspended DMA channel transfer execution.

FIFO status

In several cases, the information of FIFO level is useful to inform at application level how to process remaining data. When not empty, the DMA channel FIFO cannot be flashed only by reset.

- Use HAL_DMAEx_GetFifoLevel() to get the DMA channel FIFO level (available beats in FIFO).

22.2.2 Linked-List Initialization and De-Initialization Functions

This section provides functions allowing to initialize and de-initialize the DMA channel in linked-list mode.

- The HAL_DMAEx_List_Init() function follows the DMA channel linked-list mode configuration procedures as described in reference manual.
- The HAL_DMAEx_List_DeInit() function allows to de-initialize the DMA channel in linked-list mode.

This section contains the following APIs:

- *HAL_DMAEx_List_Init()*
- *HAL_DMAEx_List_DeInit()*

22.2.3 Linked-List IO Operation Functions

This section provides functions allowing to :

- Configure to start DMA transfer in linked-list mode.
- The HAL_DMAEx_List_Start() function allows to start the DMA channel transfer in linked-list mode (Blocking mode).
- The HAL_DMAEx_List_Start_IT() function allows to start the DMA channel transfer in linked-list mode (Non-blocking mode).
  - It is mandatory to register a linked-list queue to be executed by a DMA channel before starting transfer otherwise a HAL_ERROR will be returned.

This section contains the following APIs:
- *HAL_DMAEx_List_Start()*
- *HAL_DMAEx_List_Start_IT()*

22.2.4 Linked-List Management Functions

This section provides functions allowing to :
- Build linked-list node.
- Get linked-list node configuration.
- Insert node to linked-list queue in any queue position.
- Remove any node from linked-list queue.
- Replace any node from linked-list queue.
- Reset linked-list queue.
- Insert linked-list queue in any queue position.
- Set circular mode configuration to linked-list queue.
- Clear circular mode configuration from linked-list queue.
- Convert static linked-list queue to dynamic format.
- Convert dynamic linked-list queue to static format.
- Link linked-list queue to DMA channel.
- Unlink linked-list queue from DMA channel.
- The HAL_DMAEx_List_BuildNode() function allows to build linked-list node. Node type can be :
  - 2 dimensions addressing node.
  - Linear addressing node.
- The HAL_DMAEx_List_GetNodeConfig() function allows to get the linked-list node configuration from built node.
- The HAL_DMAEx_List_InsertNode() function allows to insert built linked-list node to static linked-list queue according to selected position.
- The HAL_DMAEx_List_InsertNode_Head() and HAL_DMAEx_List_InsertNode_Tail() functions allow to insert built linked-list node to the head (respectively the tail) of static linked-list queue.
- The HAL_DMAEx_List_RemoveNode() function allows to remove selected built linked-list node from static linked-list queue.
- The HAL_DMAEx_List_RemoveNode_Head() and HAL_DMAEx_List_RemoveNode_Tail() functions allow to remove the head (respectively the tail) built linked-list node from static linked-list queue.
- The HAL_DMAEx_List_ReplaceNode() function allows to replace selected built linked-list node from static linked-list queue.
- The HAL_DMAEx_List_ReplaceNode_Head() and HAL_DMAEx_List_ReplaceNode_Tail() functions allow to replace the head (respectively the tail) built linked-list node of static linked-list queue.
- The HAL_DMAEx_List_ResetQ() function allows to reset static linked-list queue and unlink all built linked-list nodes.
- The HAL_DMAEx_List_InsertQ() function allows to insert static linked-list source queue to static linked-list destination queue according to selected position.
- The HAL_DMAEx_List_InsertQ_Head() and HAL_DMAEx_List_InsertQ_Tail() functions allow to insert static linked-list source queue to the head (respectively the tail) of static linked-list destination queue.
- The HAL_DMAEx_List_SetCircularModeConfig() function allows to link the last static linked-list queue node to the selected first circular node.
- The HAL_DMAEx_List_SetCircularMode() function allows to link the last static linked-list queue node to the first static linked-list queue node.
- The HAL_DMAEx_List_ClearCircularMode() function allows to unlink the last static linked-list queue node from any first circular node position.
- The HAL_DMAEx_List_ConvertQToDynamic() function allows to convert the static linked-list queue to dynamic format. (Optimized queue execution)
- The HAL_DMAEx_List_ConvertQToStatic() function allows to convert the dynamic linked-list queue to static format. (Not optimized queue execution)

- The HAL_DMAEx_List_LinkQ() function allows to link the (Dynamic / Static) linked-list queue to DMA channel to be executed.
- The HAL_DMAEx_List_UnLinkQ() function allows to unlink the (Dynamic / Static) linked-list queue from DMA channel when execution is completed.

This section contains the following APIs:
- *HAL_DMAEx_List_BuildNode()*
- *HAL_DMAEx_List_GetNodeConfig()*
- *HAL_DMAEx_List_InsertNode()*
- *HAL_DMAEx_List_InsertNode_Head()*
- *HAL_DMAEx_List_InsertNode_Tail()*
- *HAL_DMAEx_List_RemoveNode()*
- *HAL_DMAEx_List_RemoveNode_Head()*
- *HAL_DMAEx_List_RemoveNode_Tail()*
- *HAL_DMAEx_List_ReplaceNode()*
- *HAL_DMAEx_List_ReplaceNode_Head()*
- *HAL_DMAEx_List_ReplaceNode_Tail()*
- *HAL_DMAEx_List_ResetQ()*
- *HAL_DMAEx_List_InsertQ()*
- *HAL_DMAEx_List_InsertQ_Head()*
- *HAL_DMAEx_List_InsertQ_Tail()*
- *HAL_DMAEx_List_SetCircularModeConfig()*
- *HAL_DMAEx_List_SetCircularMode()*
- *HAL_DMAEx_List_ClearCircularMode()*
- *HAL_DMAEx_List_ConvertQToDynamic()*
- *HAL_DMAEx_List_ConvertQToStatic()*
- *HAL_DMAEx_List_LinkQ()*
- *HAL_DMAEx_List_UnLinkQ()*

22.2.5 Data handling, repeated block and trigger configuration functions

This section provides functions allowing to :
- Configure DMA channel data handling.
- Configure DMA channel repeated block.
- Configure DMA channel trigger.
- The HAL_DMAEx_ConfigDataHandling() function allows to configure DMA channel data handling.
  - GPDMA data handling : byte-based reordering, packing/unpacking, padding/truncation, sign extension and left/right alignment.
  - LPDMA data handling : byte-based padding/truncation, sign extension and left/right alignment.
- The HAL_DMAEx_ConfigTrigger() function allows to configure DMA channel HW triggers.
- The HAL_DMAEx_ConfigRepeatBlock() function allows to configure DMA channel repeated block.
  - This feature is available only for channel that supports 2 dimensions addressing capability.

This section contains the following APIs:
- *HAL_DMAEx_ConfigDataHandling()*
- *HAL_DMAEx_ConfigTrigger()*
- *HAL_DMAEx_ConfigRepeatBlock()*

22.2.6 Suspend and resume operation functions

This section provides functions allowing to :
- Suspend any ongoing DMA channel transfer.
- Resume any suspended DMA channel transfer.

- The HAL_DMAEx_Suspend() function allows to suspend any ongoing DMA channel transfer in polling mode (Blocking mode).
- The HAL_DMAEx_Suspend_IT() function allows to suspend any ongoing DMA channel transfer in interrupt mode (Non-blocking mode).
- The HAL_DMAEx_Resume() function allows to resume any suspended DMA channel transfer.

This section contains the following APIs:
- *HAL_DMAEx_Suspend()*
- *HAL_DMAEx_Suspend_IT()*
- *HAL_DMAEx_Resume()*

22.2.7 Fifo status function

This section provides function allowing to get DMA channel FIFO level.
- The HAL_DMAEx_GetFifoLevel() function allows to return the number of available write beats in the FIFO, in units of the programmed destination data.
  – This API is available only for DMA channels that supports FIFO.

This section contains the following APIs:
- *HAL_DMAEx_GetFifoLevel()*

22.2.8 Detailed description of functions

HAL_DMAEx_List_Init

Function name

HAL_StatusTypeDef HAL_DMAEx_List_Init (DMA_HandleTypeDef *const hdma)

Function description

Initialize the DMA channel in linked-list mode according to the specified parameters in the DMA_InitLinkedListTypeDef and create the associated handle.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_List_DeInit

Function name

HAL_StatusTypeDef HAL_DMAEx_List_DeInit (DMA_HandleTypeDef *const hdma)

Function description

DeInitialize the DMA channel when it is configured in linked-list mode.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_List_Start

Function name

HAL_StatusTypeDef HAL_DMAEx_List_Start (DMA_HandleTypeDef *const hdma)

Function description

Start the DMA channel transfer in linked-list mode (Blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_List_Start_IT

Function name

HAL_StatusTypeDef HAL_DMAEx_List_Start_IT (DMA_HandleTypeDef *const hdma)

Function description

Starts the DMA channel transfer in linked-list mode with interrupts enabled (Non-blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_List_BuildNode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_BuildNode (DMA_NodeConfTypeDef const *const pNodeConfig, DMA_NodeTypeDef *const pNode)

Function description

Build a DMA channel node according to the specified parameters in the DMA_NodeConfTypeDef.

Parameters

- **pNodeConfig:** : Pointer to a DMA_NodeConfTypeDef structure that contains the configuration information for the specified DMA linked-list Node.
- **pNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list node registers configurations.

Return values

- **HAL:** status.

Notes

- The DMA linked-list node parameter address should be 32bit aligned and should not exceed the 64 KByte addressable space.

HAL_DMAEx_List_GetNodeConfig

Function name

HAL_StatusTypeDef HAL_DMAEx_List_GetNodeConfig (DMA_NodeConfTypeDef *const pNodeConfig, DMA_NodeTypeDef const *const pNode)

Function description

Get a DMA channel node configuration.

Parameters

- **pNodeConfig:** : Pointer to a DMA_NodeConfTypeDef structure that contains the configuration information for the specified DMA linked-list Node.
- **pNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertNode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertNode (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pPrevNode, DMA_NodeTypeDef *const pNewNode)

Function description

Insert new node in any queue position of linked-list queue according to selecting previous node.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pPrevNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list previous node registers configurations.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertNode_Head

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertNode_Head (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pNewNode)

Function description

Insert new node at the head of linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertNode_Tail

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertNode_Tail (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pNewNode)

Function description

Insert new node at the tail of linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_RemoveNode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_RemoveNode (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pNode)

Function description

Remove node from any linked-list queue position.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list previous node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_RemoveNode_Head

Function name

HAL_StatusTypeDef HAL_DMAEx_List_RemoveNode_Head (DMA_QListTypeDef *const pQList)

Function description

Remove the head node from linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_RemoveNode_Tail

Function name

HAL_StatusTypeDef HAL_DMAEx_List_RemoveNode_Tail (DMA_QListTypeDef *const pQList)

Function description

Remove the tail node from linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_ReplaceNode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ReplaceNode (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pOldNode, DMA_NodeTypeDef *const pNewNode)

Function description

Replace node in linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pOldNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list old node registers configurations.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_ReplaceNode_Head

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ReplaceNode_Head (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pNewNode)

Function description

Replace the head node of linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_ReplaceNode_Tail

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ReplaceNode_Tail (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pNewNode)

Function description

Replace the tail node of linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pNewNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list new node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_ResetQ

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ResetQ (DMA_QListTypeDef *const pQList)

Function description

Reset the linked-list queue and unlink queue nodes.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertQ

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertQ (DMA_QListTypeDef *const pSrcQList, DMA_NodeTypeDef const *const pPrevNode, DMA_QListTypeDef *const pDestQList)

Function description

Insert a source linked-list queue to a destination linked-list queue according to selecting previous node.

Parameters

- **pSrcQList:** : Pointer to a DMA_QListTypeDef structure that contains source queue information.
- **pPrevNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list previous node registers configurations.
- **pDestQList:** : Pointer to a DMA_QListTypeDef structure that contains destination queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertQ_Head

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertQ_Head (DMA_QListTypeDef *const pSrcQList, DMA_QListTypeDef *const pDestQList)

Function description

Insert a source linked-list queue at the head of destination queue.

Parameters

- **pSrcQList:** : Pointer to a DMA_QListTypeDef structure that contains source queue information.
- **pDestQList:** : Pointer to a DMA_QListTypeDef structure that contains destination queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_InsertQ_Tail

Function name

HAL_StatusTypeDef HAL_DMAEx_List_InsertQ_Tail (DMA_QListTypeDef *const pSrcQList, DMA_QListTypeDef *const pDestQList)

Function description

Insert a source linked-list queue at the tail of destination queue.

Parameters

- **pSrcQList:** : Pointer to a DMA_QListTypeDef structure that contains source queue information.
- **pDestQList:** : Pointer to a DMA_QListTypeDef structure that contains destination queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_SetCircularModeConfig

Function name

HAL_StatusTypeDef HAL_DMAEx_List_SetCircularModeConfig (DMA_QListTypeDef *const pQList, DMA_NodeTypeDef *const pFirstCircularNode)

Function description

Set circular mode configuration for linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.
- **pFirstCircularNode:** : Pointer to a DMA_NodeTypeDef structure that contains linked-list first circular node registers configurations.

Return values

- **HAL:** status.

HAL_DMAEx_List_SetCircularMode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_SetCircularMode (DMA_QListTypeDef *const pQList)

Function description

Set circular mode for linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_ClearCircularMode

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ClearCircularMode (DMA_QListTypeDef *const pQList)

Function description

Clear circular mode for linked-list queue.

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_ConvertQToDynamic

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ConvertQToDynamic (DMA_QListTypeDef *const pQList)

Function description

Convert a linked-list queue to dynamic (Optimized DMA queue execution).

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_ConvertQToStatic

Function name

HAL_StatusTypeDef HAL_DMAEx_List_ConvertQToStatic (DMA_QListTypeDef *const pQList)

Function description

Convert a linked-list queue to static (Not optimized DMA queue execution).

Parameters

- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_LinkQ

Function name

HAL_StatusTypeDef HAL_DMAEx_List_LinkQ (DMA_HandleTypeDef *const hdma, DMA_QListTypeDef *const pQList)

Function description

Link linked-list queue to a DMA channel.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pQList:** : Pointer to a DMA_QListTypeDef structure that contains queue information.

Return values

- **HAL:** status.

HAL_DMAEx_List_UnLinkQ

Function name

HAL_StatusTypeDef HAL_DMAEx_List_UnLinkQ (DMA_HandleTypeDef *const hdma)

Function description

Unlink linked-list queue from a DMA channel.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_ConfigDataHandling

Function name

HAL_StatusTypeDef HAL_DMAEx_ConfigDataHandling (DMA_HandleTypeDef *const hdma, DMA_DataHandlingConfTypeDef const *const pConfigDataHandling)

Function description

Configure the DMA channel data handling according to the specified parameters in the DMA_DataHandlingConfTypeDef.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pConfigDataHandling:** : Pointer to a DMA_DataHandlingConfTypeDef structure that contains the data handling configuration.

Return values

- **HAL:** status.

HAL_DMAEx_ConfigTrigger

Function name

HAL_StatusTypeDef HAL_DMAEx_ConfigTrigger (DMA_HandleTypeDef *const hdma, DMA_TriggerConfTypeDef const *const pConfigTrigger)

Function description

Configure the DMA channel trigger according to the specified parameters in the DMA_TriggerConfTypeDef.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pConfigTrigger:** : Pointer to a DMA_TriggerConfTypeDef structure that contains the trigger configuration.

Return values

- **HAL:** status.

HAL_DMAEx_ConfigRepeatBlock

Function name

HAL_StatusTypeDef HAL_DMAEx_ConfigRepeatBlock (DMA_HandleTypeDef *const hdma, DMA_RepeatBlockConfTypeDef const *const pConfigRepeatBlock)

Function description

Configure the DMA channel repeated block according to the specified parameters in the DMA_RepeatBlockConfTypeDef.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.
- **pConfigRepeatBlock:** : Pointer to a DMA_RepeatBlockConfTypeDef structure that contains the repeated block configuration.

Return values

- **HAL:** status.

HAL_DMAEx_Suspend

Function name

HAL_StatusTypeDef HAL_DMAEx_Suspend (DMA_HandleTypeDef *const hdma)

Function description

Suspend any ongoing DMA channel transfer in polling mode (Blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA channel.

Return values

- **HAL:** status.

Notes

- After suspending a DMA channel, a check for wait until the DMA channel is effectively suspended is added. If a channel is suspended while a data transfer is ongoing, the current data will be transferred and the channel will be effectively suspended only after the transfer of this single/burst data is finished.

HAL_DMAEx_Suspend_IT

Function name

HAL_StatusTypeDef HAL_DMAEx_Suspend_IT (DMA_HandleTypeDef *const hdma)

Function description

Suspend any ongoing DMA channel transfer in polling mode (Non-blocking mode).

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_Resume

Function name

HAL_StatusTypeDef HAL_DMAEx_Resume (DMA_HandleTypeDef *const hdma)

Function description

Resume any suspended DMA channel transfer.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **HAL:** status.

HAL_DMAEx_GetFifoLevel

Function name

uint32_t HAL_DMAEx_GetFifoLevel (DMA_HandleTypeDef const *const hdma)

Function description

Get and returns the DMA channel FIFO level.

Parameters

- **hdma:** : Pointer to a DMA_HandleTypeDef structure that contains the configuration information for the specified DMA Channel.

Return values

- **Returns:** the number of available beats in FIFO.

22.3 DMAEx Firmware driver defines

The following section lists the various define and macros of the module.

22.3.1 DMAEx

DMAEx

DMAEx Data Alignment

DMA_DATA_RIGHTALIGN_ZEROPADDED

If source data width < destination data width => Right aligned padded with 0 up to destination data width

DMA_DATA_RIGHTALIGN_LEFTTRUNC

If source data width > destination data width => Right aligned left Truncated down to destination data width

DMA_DATA_RIGHTALIGN_SIGNEXT

If source data width < destination data width => Right Aligned padded with sign extended up to destination data width

DMA_DATA_LEFTALIGN_RIGHTTRUNC

If source data width > destination data width => Left Aligned Right Truncated down to the destination data width

DMA_DATA_PACK

If source data width < destination data width => Packed at the destination data width (Not available on LPDMA)

DMA_DATA_UNPACK

If source data width > destination data width => Unpacked at the destination data width (Not available on LPDMA)

DMAEx Data Exchange

DMA_EXCHANGE_NONE

No data exchange

DMA_EXCHANGE_DEST_BYTE

Destination Byte exchange when destination data width is > Byte

DMA_EXCHANGE_DEST_HALFWORD

Destination Half-Word exchange when destination data width is > Half-Word

DMA_EXCHANGE_SRC_BYTE

Source Byte endianness exchange when source data width is word

DMAEx LinkedList Mode

DMA_LINKEDLIST_NORMAL

Linear linked-list DMA channel transfer

DMA_LINKEDLIST_CIRCULAR

Circular linked-list DMA channel transfer

DMAEx Linked-List Allocated Port

DMA_LINK_ALLOCATED_PORT0

Link allocated port 0

DMA_LINK_ALLOCATED_PORT1

Link allocated port 1

DMAEx Link Step Mode

DMA_LSM_FULL_EXECUTION

Channel is executed for the full linked-list

DMA_LSM_1LINK_EXECUTION

Channel is executed once for the current LLI

DMAEx Node Type

DMA_LPDMA_LINEAR_NODE

Defines the LPDMA linear addressing node type

DMA_GPDMA_LINEAR_NODE

Defines the GPDMA linear addressing node type

DMA_GPDMA_2D_NODE

Defines the GPDMA 2 dimension addressing node type

DMAEx Trigger Mode

DMA_TRIGM_BLOCK_TRANSFER

A block transfer is conditioned by (at least) one hit trigger

DMA_TRIGM_REPEATED_BLOCK_TRANSFER

A repeated block transfer is conditioned by (at least) one hit trigger

DMA_TRIGM_LLI_LINK_TRANSFER

A LLI link transfer is conditioned by (at least) one hit trigger

DMA_TRIGM_SINGLE_BURST_TRANSFER

A single/burst transfer is conditioned by (at least) one hit trigger

DMAEx Trigger Polarity

DMA_TRIG_POLARITY_MASKED

No trigger of the selected DMA request. Masked trigger event

DMA_TRIG_POLARITY_RISING

Trigger of the selected DMA request on the rising edge of the selected trigger event input

DMA_TRIG_POLARITY_FALLING

Trigger of the selected DMA request on the falling edge of the selected trigger event input

DMAEx Trigger Selection

GPDMA1_TRIGGER_EXTI_LINE0

GPDMA1 HW Trigger signal is EXTI_LINE0

GPDMA1_TRIGGER_EXTI_LINE1

GPDMA1 HW Trigger signal is EXTI_LINE1

GPDMA1_TRIGGER_EXTI_LINE2

GPDMA1 HW Trigger signal is EXTI_LINE2

GPDMA1_TRIGGER_EXTI_LINE3

GPDMA1 HW Trigger signal is EXTI_LINE3

GPDMA1_TRIGGER_EXTI_LINE4

GPDMA1 HW Trigger signal is EXTI_LINE4

GPDMA1_TRIGGER_EXTI_LINE5

GPDMA1 HW Trigger signal is EXTI_LINE5

GPDMA1_TRIGGER_EXTI_LINE6

GPDMA1 HW Trigger signal is EXTI_LINE6

GPDMA1_TRIGGER_EXTI_LINE7
GPDMA1 HW Trigger signal is EXTI_LINE7

GPDMA1_TRIGGER_TAMP_TRG1
GPDMA1 HW Trigger signal is TAMP_TRG1

GPDMA1_TRIGGER_TAMP_TRG2
GPDMA1 HW Trigger signal is TAMP_TRG2

GPDMA1_TRIGGER_TAMP_TRG3
GPDMA1 HW Trigger signal is TAMP_TRG3

GPDMA1_TRIGGER_LPTIM1_CH1
GPDMA1 HW Trigger signal is LPTIM1_CH1

GPDMA1_TRIGGER_LPTIM1_CH2
GPDMA1 HW Trigger signal is LPTIM1_CH2

GPDMA1_TRIGGER_LPTIM2_CH1
GPDMA1 HW Trigger signal is LPTIM2_CH1

GPDMA1_TRIGGER_LPTIM2_CH2
GPDMA1 HW Trigger signal is LPTIM2_CH2

GPDMA1_TRIGGER_LPTIM4_OUT
GPDMA1 HW Trigger signal is LPTIM4_OUT

GPDMA1_TRIGGER_COMP1_OUT
GPDMA1 HW Trigger signal is COMP1_OUT

GPDMA1_TRIGGER_COMP2_OUT
GPDMA1 HW Trigger signal is COMP2_OUT

GPDMA1_TRIGGER_RTC_ALRA_TRG
GPDMA1 HW Trigger signal is RTC_ALRA_TRG

GPDMA1_TRIGGER_RTC_ALRB_TRG
GPDMA1 HW Trigger signal is RTC_ALRB_TRG

GPDMA1_TRIGGER_GPDMA1_CH12_TCF
GPDMA1 HW Trigger signal is GPDMA1_CH12_TCF

GPDMA1_TRIGGER_GPDMA1_CH13_TCF
GPDMA1 HW Trigger signal is GPDMA1_CH13_TCF

GPDMA1_TRIGGER_GPDMA1_CH14_TCF
GPDMA1 HW Trigger signal is GPDMA1_CH14_TCF

GPDMA1_TRIGGER_GPDMA1_CH15_TCF
GPDMA1 HW Trigger signal is GPDMA1_CH15_TCF

GPDMA1_TRIGGER_LPDMA1_CH0_TCF
GPDMA1 HW Trigger signal is LPDMA1_CH0_TCF

GPDMA1_TRIGGER_LPDMA1_CH1_TCF
GPDMA1 HW Trigger signal is LPDMA1_CH1_TCF

GPDMA1_TRIGGER_LPDMA1_CH2_TCF
GPDMA1 HW Trigger signal is LPDMA1_CH2_TCF

GPDMA1_TRIGGER_LPDMA1_CH3_TCF
GPDMA1 HW Trigger signal is LPDMA1_CH3_TCF

GPDMA1_TRIGGER_TIM2_TRGO
GPDMA1 HW Trigger signal is TIM2_TRGO

GPDMA1_TRIGGER_TIM15_TRGO
GPDMA1 HW Trigger signal is TIM15_TRGO

GPDMA1_TRIGGER_TIM3_TRGO
GPDMA1 HW Trigger signal is TIM3_TRGO

GPDMA1_TRIGGER_TIM4_TRGO
GPDMA1 HW Trigger signal is TIM4_TRGO

GPDMA1_TRIGGER_TIM5_TRGO
GPDMA1 HW Trigger signal is TIM5_TRGO

GPDMA1_TRIGGER_LTDC_LI
GPDMA1 HW Trigger signal is LTDC_LI

GPDMA1_TRIGGER_DSI_TE
GPDMA1 HW Trigger signal is DSI_TE

GPDMA1_TRIGGER_DSI_ER
GPDMA1 HW Trigger signal is DSI_ER

GPDMA1_TRIGGER_DMA2D_TC
GPDMA1 HW Trigger signal is DMA2D_TC

GPDMA1_TRIGGER_DMA2D_CTC
GPDMA1 HW Trigger signal is DMA2D_CTC

GPDMA1_TRIGGER_DMA2D_TW
GPDMA1 HW Trigger signal is DMA2D_TW

GPDMA1_TRIGGER_GPU2D_FLAG0
GPDMA1 HW Trigger signal is GPU2D_FLAG0

GPDMA1_TRIGGER_GPU2D_FLAG1
GPDMA1 HW Trigger signal is GPU2D_FLAG1

GPDMA1_TRIGGER_GPU2D_FLAG2
GPDMA1 HW Trigger signal is GPU2D_FLAG2

GPDMA1_TRIGGER_GPU2D_FLAG3
GPDMA1 HW Trigger signal is GPU2D_FLAG3

GPDMA1_TRIGGER_ADC4_AWD1
GPDMA1 HW Trigger signal is ADC4_AWD1

GPDMA1_TRIGGER_ADC1_AWD1
GPDMA1 HW Trigger signal is ADC1_AWD1

GPDMA1_TRIGGER_GFXTIM_EVT3
GPDMA1 HW Trigger signal is GFXTIM_EVT3

GPDMA1_TRIGGER_GFXTIM_EVT2
GPDMA1 HW Trigger signal is GFXTIM_EVT2

GPDMA1_TRIGGER_GFXTIM_EVT1
GPDMA1 HW Trigger signal is GFXTIM_EVT1

GPDMA1_TRIGGER_GFXTIM_EVT0
GPDMA1 HW Trigger signal is GFXTIM_EVT0

GPDMA1_TRIGGER_JPEG_EOC
GPDMA1 HW Trigger signal is JPEG_EOC

GPDMA1_TRIGGER_JPEG_IFNF
GPDMA1 HW Trigger signal is JPEG_IFNF

GPDMA1_TRIGGER_JPEG_IFT

GPDMA1 HW Trigger signal is JPEG_IFT

GPDMA1_TRIGGER_JPEG_OFNE

GPDMA1 HW Trigger signal is JPEG_OFNE

GPDMA1_TRIGGER_JPEG_OFT

GPDMA1 HW Trigger signal is JPEG_OFT

LPDMA1 HW Trigger signal is TIM15_TRGO

23 HAL DSI Generic Driver

23.1 DSI Firmware driver registers structures

23.1.1 DSI_InitTypeDef

DSI_InitTypeDef is defined in the stm32u5xx_hal_dsi.h

Data Fields

- ***uint32_t AutomaticClockLaneControl***
- ***uint32_t TXEscapeCkdiv***
- ***uint32_t NumberOfLanes***
- ***uint32_t PHYFrequencyRange***
- ***uint32_t PHYLowPowerOffset***

Field Documentation

- ***uint32_t DSI_InitTypeDef::AutomaticClockLaneControl***
  Automatic clock lane control This parameter can be any value of ***DSI_Automatic_Clk_Lane_Control***
- ***uint32_t DSI_InitTypeDef::TXEscapeCkdiv***
  TX Escape clock division The values 0 and 1 stop the TX_ESC clock generation
- ***uint32_t DSI_InitTypeDef::NumberOfLanes***
  Number of lanes This parameter can be any value of ***DSI_Number_Of_Lanes***
- ***uint32_t DSI_InitTypeDef::PHYFrequencyRange***
  PHY Frequency Range This parameter can be any value of
  - DSI_PHYFrequencyRange
- ***uint32_t DSI_InitTypeDef::PHYLowPowerOffset***
  PHY Low Power Offset This parameter can be any value of
  - PHYLowPowerOffset

23.1.2 DSI_PLLInitTypeDef

DSI_PLLInitTypeDef is defined in the stm32u5xx_hal_dsi.h

Data Fields

- ***uint32_t PLLNDIV***
- ***uint32_t PLLIDF***
- ***uint32_t PLLODF***
- ***uint32_t PLLVCORange***
- ***uint32_t PLLChargePump***
- ***uint32_t PLLTuning***

Field Documentation

- ***uint32_t DSI_PLLInitTypeDef::PLLNDIV***
  PLL Loop Division Factor This parameter must be a value between 10 and 125
- ***uint32_t DSI_PLLInitTypeDef::PLLIDF***
  PLL Input Division Factor This parameter can be any value of ***DSI_PLL_IDF***
- ***uint32_t DSI_PLLInitTypeDef::PLLODF***
  PLL Output Division Factor This parameter can be any value of ***DSI_PLL_ODF***
- ***uint32_t DSI_PLLInitTypeDef::PLLVCORange***
  PLLVCORange This parameter can be any value of ***DSI_DPHY_VCO_Frequency_RANGE***
- ***uint32_t DSI_PLLInitTypeDef::PLLChargePump***
  PLLChargePump This parameter can be any value of ***DSI_PLL_Charge_Pump***
- ***uint32_t DSI_PLLInitTypeDef::PLLTuning***
  PLLTuning This parameter can be any value of ***DSI_PLL_Tuning***

23.1.3 DSI_VidCfgTypeDef

DSI_VidCfgTypeDef is defined in the stm32u5xx_hal_dsi.h

Data Fields

- *uint32_t VirtualChannelID*
- *uint32_t ColorCoding*
- *uint32_t LooselyPacked*
- *uint32_t Mode*
- *uint32_t PacketSize*
- *uint32_t NumberOfChunks*
- *uint32_t NullPacketSize*
- *uint32_t HSPolarity*
- *uint32_t VSPolarity*
- *uint32_t DEPolarity*
- *uint32_t HorizontalSyncActive*
- *uint32_t HorizontalBackPorch*
- *uint32_t HorizontalLine*
- *uint32_t VerticalSyncActive*
- *uint32_t VerticalBackPorch*
- *uint32_t VerticalFrontPorch*
- *uint32_t VerticalActive*
- *uint32_t LPCommandEnable*
- *uint32_t LPLargestPacketSize*
- *uint32_t LPVACTLargestPacketSize*
- *uint32_t LPHorizontalFrontPorchEnable*
- *uint32_t LPHorizontalBackPorchEnable*
- *uint32_t LPVerticalActiveEnable*
- *uint32_t LPVerticalFrontPorchEnable*
- *uint32_t LPVerticalBackPorchEnable*
- *uint32_t LPVerticalSyncActiveEnable*
- *uint32_t FrameBTAAcknowledgeEnable*

Field Documentation

- ***uint32_t DSI_VidCfgTypeDef::VirtualChannelID***
  Virtual channel ID
- ***uint32_t DSI_VidCfgTypeDef::ColorCoding***
  Color coding for LTDC interface This parameter can be any value of *DSI_Color_Coding*
- ***uint32_t DSI_VidCfgTypeDef::LooselyPacked***
  Enable or disable loosely packed stream (needed only when using 18-bit configuration). This parameter can be any value of *DSI_LooselyPacked*
- ***uint32_t DSI_VidCfgTypeDef::Mode***
  Video mode type This parameter can be any value of *DSI_Video_Mode_Type*
- ***uint32_t DSI_VidCfgTypeDef::PacketSize***
  Video packet size
- ***uint32_t DSI_VidCfgTypeDef::NumberOfChunks***
  Number of chunks
- ***uint32_t DSI_VidCfgTypeDef::NullPacketSize***
  Null packet size
- ***uint32_t DSI_VidCfgTypeDef::HSPolarity***
  HSYNC pin polarity This parameter can be any value of *DSI_HSYNC_Polarity*
- ***uint32_t DSI_VidCfgTypeDef::VSPolarity***
  VSYNC pin polarity This parameter can be any value of *DSI_VSYNC_Active_Polarity*
- ***uint32_t DSI_VidCfgTypeDef::DEPolarity***
  Data Enable pin polarity This parameter can be any value of *DSI_DATA_ENABLE_Polarity*

- ***uint32_t DSI_VidCfgTypeDef::HorizontalSyncActive***
  Horizontal synchronism active duration (in lane byte clock cycles)
- ***uint32_t DSI_VidCfgTypeDef::HorizontalBackPorch***
  Horizontal back-porch duration (in lane byte clock cycles)
- ***uint32_t DSI_VidCfgTypeDef::HorizontalLine***
  Horizontal line duration (in lane byte clock cycles)
- ***uint32_t DSI_VidCfgTypeDef::VerticalSyncActive***
  Vertical synchronism active duration
- ***uint32_t DSI_VidCfgTypeDef::VerticalBackPorch***
  Vertical back-porch duration
- ***uint32_t DSI_VidCfgTypeDef::VerticalFrontPorch***
  Vertical front-porch duration
- ***uint32_t DSI_VidCfgTypeDef::VerticalActive***
  Vertical active duration
- ***uint32_t DSI_VidCfgTypeDef::LPCommandEnable***
  Low-power command enable This parameter can be any value of ***DSI_LP_Command***
- ***uint32_t DSI_VidCfgTypeDef::LPLargestPacketSize***
  The size, in bytes, of the low power largest packet that can fit in a line during VSA, VBP and VFP regions
- ***uint32_t DSI_VidCfgTypeDef::LPVACTLargestPacketSize***
  The size, in bytes, of the low power largest packet that can fit in a line during VACT region
- ***uint32_t DSI_VidCfgTypeDef::LPHorizontalFrontPorchEnable***
  Low-power horizontal front-porch enable This parameter can be any value of ***DSI_LP_HFP***
- ***uint32_t DSI_VidCfgTypeDef::LPHorizontalBackPorchEnable***
  Low-power horizontal back-porch enable This parameter can be any value of ***DSI_LP_HBP***
- ***uint32_t DSI_VidCfgTypeDef::LPVerticalActiveEnable***
  Low-power vertical active enable This parameter can be any value of ***DSI_LP_VACT***
- ***uint32_t DSI_VidCfgTypeDef::LPVerticalFrontPorchEnable***
  Low-power vertical front-porch enable This parameter can be any value of ***DSI_LP_VFP***
- ***uint32_t DSI_VidCfgTypeDef::LPVerticalBackPorchEnable***
  Low-power vertical back-porch enable This parameter can be any value of ***DSI_LP_VBP***
- ***uint32_t DSI_VidCfgTypeDef::LPVerticalSyncActiveEnable***
  Low-power vertical sync active enable This parameter can be any value of ***DSI_LP_VSYNC***
- ***uint32_t DSI_VidCfgTypeDef::FrameBTAAcknowledgeEnable***
  Frame bus-turn-around acknowledge enable This parameter can be any value of ***DSI_FBTA_acknowledge***

23.1.4 DSI_CmdCfgTypeDef

DSI_CmdCfgTypeDef is defined in the stm32u5xx_hal_dsi.h

Data Fields

- ***uint32_t VirtualChannelID***
- ***uint32_t ColorCoding***
- ***uint32_t CommandSize***
- ***uint32_t TearingEffectSource***
- ***uint32_t TearingEffectPolarity***
- ***uint32_t HSPolarity***
- ***uint32_t VSPolarity***
- ***uint32_t DEPolarity***
- ***uint32_t VSyncPol***
- ***uint32_t AutomaticRefresh***
- ***uint32_t TEAcknowledgeRequest***

Field Documentation

- ***uint32_t DSI_CmdCfgTypeDef::VirtualChannelID***
  Virtual channel ID

- ***uint32_t DSI_CmdCfgTypeDef::ColorCoding***
  Color coding for LTDC interface This parameter can be any value of ***DSI_Color_Coding***
- ***uint32_t DSI_CmdCfgTypeDef::CommandSize***
  Maximum allowed size for an LTDC write memory command, measured in pixels. This parameter can be any value between 0x00 and 0xFFFFU
- ***uint32_t DSI_CmdCfgTypeDef::TearingEffectSource***
  Tearing effect source This parameter can be any value of ***DSI_TearingEffectSource***
- ***uint32_t DSI_CmdCfgTypeDef::TearingEffectPolarity***
  Tearing effect pin polarity This parameter can be any value of ***DSI_TearingEffectPolarity***
- ***uint32_t DSI_CmdCfgTypeDef::HSPolarity***
  HSYNC pin polarity This parameter can be any value of ***DSI_HSYNC_Polarity***
- ***uint32_t DSI_CmdCfgTypeDef::VSPolarity***
  VSYNC pin polarity This parameter can be any value of ***DSI_VSYNC_Active_Polarity***
- ***uint32_t DSI_CmdCfgTypeDef::DEPolarity***
  Data Enable pin polarity This parameter can be any value of ***DSI_DATA_ENABLE_Polarity***
- ***uint32_t DSI_CmdCfgTypeDef::VSyncPol***
  VSync edge on which the LTDC is halted This parameter can be any value of ***DSI_Vsync_Polarity***
- ***uint32_t DSI_CmdCfgTypeDef::AutomaticRefresh***
  Automatic refresh mode This parameter can be any value of ***DSI_AutomaticRefresh***
- ***uint32_t DSI_CmdCfgTypeDef::TEAcknowledgeRequest***
  Tearing Effect Acknowledge Request Enable This parameter can be any value of ***DSI_TE_AcknowledgeRequest***

23.1.5 DSI_LPCmdTypeDef

DSI_LPCmdTypeDef is defined in the stm32u5xx_hal_dsi.h

Data Fields

- ***uint32_t LPGenShortWriteNoP***
- ***uint32_t LPGenShortWriteOneP***
- ***uint32_t LPGenShortWriteTwoP***
- ***uint32_t LPGenShortReadNoP***
- ***uint32_t LPGenShortReadOneP***
- ***uint32_t LPGenShortReadTwoP***
- ***uint32_t LPGenLongWrite***
- ***uint32_t LPDcsShortWriteNoP***
- ***uint32_t LPDcsShortWriteOneP***
- ***uint32_t LPDcsShortReadNoP***
- ***uint32_t LPDcsLongWrite***
- ***uint32_t LPMaxReadPacket***
- ***uint32_t AcknowledgeRequest***

Field Documentation

- ***uint32_t DSI_LPCmdTypeDef::LPGenShortWriteNoP***
  Generic Short Write Zero parameters Transmission This parameter can be any value of ***DSI_LP_LPGenShortWriteNoP***
- ***uint32_t DSI_LPCmdTypeDef::LPGenShortWriteOneP***
  Generic Short Write One parameter Transmission This parameter can be any value of ***DSI_LP_LPGenShortWriteOneP***
- ***uint32_t DSI_LPCmdTypeDef::LPGenShortWriteTwoP***
  Generic Short Write Two parameters Transmission This parameter can be any value of ***DSI_LP_LPGenShortWriteTwoP***
- ***uint32_t DSI_LPCmdTypeDef::LPGenShortReadNoP***
  Generic Short Read Zero parameters Transmission This parameter can be any value of ***DSI_LP_LPGenShortReadNoP***

- ***uint32_t DSI_LPCmdTypeDef::LPGenShortReadOneP***
  Generic Short Read One parameter Transmission This parameter can be any value of ***DSI_LP_LPGenShortReadOneP***
- ***uint32_t DSI_LPCmdTypeDef::LPGenShortReadTwoP***
  Generic Short Read Two parameters Transmission This parameter can be any value of ***DSI_LP_LPGenShortReadTwoP***
- ***uint32_t DSI_LPCmdTypeDef::LPGenLongWrite***
  Generic Long Write Transmission This parameter can be any value of ***DSI_LP_LPGenLongWrite***
- ***uint32_t DSI_LPCmdTypeDef::LPDcsShortWriteNoP***
  DCS Short Write Zero parameters Transmission This parameter can be any value of ***DSI_LP_LPDcsShortWriteNoP***
- ***uint32_t DSI_LPCmdTypeDef::LPDcsShortWriteOneP***
  DCS Short Write One parameter Transmission This parameter can be any value of ***DSI_LP_LPDcsShortWriteOneP***
- ***uint32_t DSI_LPCmdTypeDef::LPDcsShortReadNoP***
  DCS Short Read Zero parameters Transmission This parameter can be any value of ***DSI_LP_LPDcsShortReadNoP***
- ***uint32_t DSI_LPCmdTypeDef::LPDcsLongWrite***
  DCS Long Write Transmission This parameter can be any value of ***DSI_LP_LPDcsLongWrite***
- ***uint32_t DSI_LPCmdTypeDef::LPMaxReadPacket***
  Maximum Read Packet Size Transmission This parameter can be any value of ***DSI_LP_LPMaxReadPacket***
- ***uint32_t DSI_LPCmdTypeDef::AcknowledgeRequest***
  Acknowledge Request Enable This parameter can be any value of ***DSI_AcknowledgeRequest***

23.1.6 DSI_PHY_TimerTypeDef

DSI_PHY_TimerTypeDef is defined in the stm32u5xx_hal_dsi.h

Data Fields

- ***uint32_t ClockLaneHS2LPTime***
- ***uint32_t ClockLaneLP2HSTime***
- ***uint32_t DataLaneHS2LPTime***
- ***uint32_t DataLaneLP2HSTime***
- ***uint32_t DataLaneMaxReadTime***
- ***uint32_t StopWaitTime***

Field Documentation

- ***uint32_t DSI_PHY_TimerTypeDef::ClockLaneHS2LPTime***
  The maximum time that the D-PHY clock lane takes to go from high-speed to low-power transmission
- ***uint32_t DSI_PHY_TimerTypeDef::ClockLaneLP2HSTime***
  The maximum time that the D-PHY clock lane takes to go from low-power to high-speed transmission
- ***uint32_t DSI_PHY_TimerTypeDef::DataLaneHS2LPTime***
  The maximum time that the D-PHY data lanes takes to go from high-speed to low-power transmission
- ***uint32_t DSI_PHY_TimerTypeDef::DataLaneLP2HSTime***
  The maximum time that the D-PHY data lanes takes to go from low-power to high-speed transmission
- ***uint32_t DSI_PHY_TimerTypeDef::DataLaneMaxReadTime***
  The maximum time required to perform a read command
- ***uint32_t DSI_PHY_TimerTypeDef::StopWaitTime***
  The minimum wait period to request a High-Speed transmission after the Stop state

23.1.7 DSI_HOST_TimeoutTypeDef

DSI_HOST_TimeoutTypeDef is defined in the stm32u5xx_hal_dsi.h

Data Fields

- ***uint32_t TimeoutCkdiv***
- ***uint32_t HighSpeedTransmissionTimeout***
- ***uint32_t LowPowerReceptionTimeout***

- *uint32_t HighSpeedReadTimeout*
- *uint32_t LowPowerReadTimeout*
- *uint32_t HighSpeedWriteTimeout*
- *uint32_t HighSpeedWritePrespMode*
- *uint32_t LowPowerWriteTimeout*
- *uint32_t BTATimeout*

Field Documentation

- ***uint32_t DSI_HOST_TimeoutTypeDef::TimeoutCkdiv***
  Time-out clock division
- ***uint32_t DSI_HOST_TimeoutTypeDef::HighSpeedTransmissionTimeout***
  High-speed transmission time-out
- ***uint32_t DSI_HOST_TimeoutTypeDef::LowPowerReceptionTimeout***
  Low-power reception time-out
- ***uint32_t DSI_HOST_TimeoutTypeDef::HighSpeedReadTimeout***
  High-speed read time-out
- ***uint32_t DSI_HOST_TimeoutTypeDef::LowPowerReadTimeout***
  Low-power read time-out
- ***uint32_t DSI_HOST_TimeoutTypeDef::HighSpeedWriteTimeout***
  High-speed write time-out
- ***uint32_t DSI_HOST_TimeoutTypeDef::HighSpeedWritePrespMode***
  High-speed write presp mode This parameter can be any value of ***DSI_HS_PrespMode***
- ***uint32_t DSI_HOST_TimeoutTypeDef::LowPowerWriteTimeout***
  Low-speed write time-out
- ***uint32_t DSI_HOST_TimeoutTypeDef::BTATimeout***
  BTA time-out

23.1.8 __DSI_HandleTypeDef

__DSI_HandleTypeDef is defined in the stm32u5xx_hal_dsi.h

Data Fields

- ***DSI_TypeDef * Instance***
- ***DSI_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_DSI_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***uint32_t ErrorMsk***
- ***void(* TearingEffectCallback***
- ***void(* EndOfRefreshCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***DSI_TypeDef* __DSI_HandleTypeDef::Instance***
  Register base address
- ***DSI_InitTypeDef __DSI_HandleTypeDef::Init***
  DSI required parameters
- ***HAL_LockTypeDef __DSI_HandleTypeDef::Lock***
  DSI peripheral status
- ***__IO HAL_DSI_StateTypeDef __DSI_HandleTypeDef::State***
  DSI communication state
- ***__IO uint32_t __DSI_HandleTypeDef::ErrorCode***
  DSI Error code
- ***uint32_t __DSI_HandleTypeDef::ErrorMsk***
  DSI Error monitoring mask

- ***void(* __DSI_HandleTypeDef::TearingEffectCallback)(struct __DSI_HandleTypeDef *hdsi)***
  DSI Tearing Effect Callback
- ***void(* __DSI_HandleTypeDef::EndOfRefreshCallback)(struct __DSI_HandleTypeDef *hdsi)***
  DSI End Of Refresh Callback
- ***void(* __DSI_HandleTypeDef::ErrorCallback)(struct __DSI_HandleTypeDef *hdsi)***
  DSI Error Callback
- ***void(* __DSI_HandleTypeDef::MspInitCallback)(struct __DSI_HandleTypeDef *hdsi)***
  DSI Msp Init callback
- ***void(* __DSI_HandleTypeDef::MspDeInitCallback)(struct __DSI_HandleTypeDef *hdsi)***
  DSI Msp DeInit callback

23.2 DSI Firmware driver API description

The following section lists the various functions of the DSI library.

23.2.1 How to use this driver

The DSI HAL driver can be used as follows:

1. Declare a DSI_HandleTypeDef handle structure, for example: DSI_HandleTypeDef hdsi;
2. Initialize the DSI low level resources by implementing the HAL_DSI_MspInit() API:
   a. Enable the DSI interface clock
   b. NVIC configuration if you need to use interrupt process
      - Configure the DSI interrupt priority
      - Enable the NVIC DSI IRQ Channel
3. Initialize the DSI Host peripheral, the required PLL parameters, number of lances and TX Escape clock divider by calling the HAL_DSI_Init() API which calls HAL_DSI_MspInit().

Configuration

1. Use HAL_DSI_ConfigAdaptedCommandMode() function to configure the DSI host in adapted command mode.
2. When operating in video mode , use HAL_DSI_ConfigVideoMode() to configure the DSI host.
3. Function HAL_DSI_ConfigCommand() is used to configure the DSI commands behavior in low power mode.
4. To configure the DSI PHY timings parameters, use function HAL_DSI_ConfigPhyTimer().
5. The DSI Host can be started/stopped using respectively functions HAL_DSI_Start() and HAL_DSI_Stop(). Functions HAL_DSI_ShortWrite(), HAL_DSI_LongWrite() and HAL_DSI_Read() allows respectively to write DSI short packets, long packets and to read DSI packets.
6. The DSI Host Offers two Low power modes :
   – Low Power Mode on data lanes only: Only DSI data lanes are shut down. It is possible to enter/exit from this mode using respectively functions HAL_DSI_EnterULPMData() and HAL_DSI_ExitULPMData()
   – Low Power Mode on data and clock lanes : All DSI lanes are shut down including data and clock lanes. It is possible to enter/exit from this mode using respectively functions HAL_DSI_EnterULPM() and HAL_DSI_ExitULPM()
7. To control DSI state you can use the following function: HAL_DSI_GetState()

Error management

1. User can select the DSI errors to be reported/monitored using function HAL_DSI_ConfigErrorMonitor() When an error occurs, the callback HAL_DSI_ErrorCallback() is asserted and then user can retrieve the error code by calling function HAL_DSI_GetError()

DSI HAL driver macros list

Below the list of most used macros in DSI HAL driver.

- __HAL_DSI_ENABLE: Enable the DSI Host.
- __HAL_DSI_DISABLE: Disable the DSI Host.
- __HAL_DSI_WRAPPER_ENABLE: Enables the DSI wrapper.

- __HAL_DSI_WRAPPER_DISABLE: Disable the DSI wrapper.
- __HAL_DSI_PLL_ENABLE: Enables the DSI PLL.
- __HAL_DSI_PLL_DISABLE: Disables the DSI PLL.
- __HAL_DSI_REG_ENABLE: Enables the DSI regulator.
- __HAL_DSI_REG_DISABLE: Disables the DSI regulator.
- __HAL_DSI_GET_FLAG: Get the DSI pending flags.
- __HAL_DSI_CLEAR_FLAG: Clears the DSI pending flags.
- __HAL_DSI_ENABLE_IT: Enables the specified DSI interrupts.
- __HAL_DSI_DISABLE_IT: Disables the specified DSI interrupts.
- __HAL_DSI_GET_IT_SOURCE: Checks whether the specified DSI interrupt source is enabled or not.

Note: You can refer to the DSI HAL driver header file for more useful macros

Callback registration

The compilation define USE_HAL_DSI_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Function HAL_DSI_RegisterCallback() to register a callback.

Function HAL_DSI_RegisterCallback() allows to register following callbacks:

- TearingEffectCallback : DSI Tearing Effect Callback.
- EndOfRefreshCallback : DSI End Of Refresh Callback.
- ErrorCallback : DSI Error Callback
- MspInitCallback : DSI MspInit.
- MspDeInitCallback : DSI MspDeInit.

This function takes as parameters the HAL peripheral handle, the callback ID and a pointer to the user callback function.

Use function HAL_DSI_UnRegisterCallback() to reset a callback to the default weak function. HAL_DSI_UnRegisterCallback takes as parameters the HAL peripheral handle, and the callback ID.

This function allows to reset following callbacks:

- TearingEffectCallback : DSI Tearing Effect Callback.
- EndOfRefreshCallback : DSI End Of Refresh Callback.
- ErrorCallback : DSI Error Callback
- MspInitCallback : DSI MspInit.
- MspDeInitCallback : DSI MspDeInit.

By default, after the HAL_DSI_Init and when the state is HAL_DSI_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_DSI_TearingEffectCallback(), HAL_DSI_EndOfRefreshCallback(). Exception done for MspInit and MspDeInit functions that are respectively reset to the legacy weak (overridden) functions in the HAL_DSI_Init() and HAL_DSI_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_DSI_Init() and HAL_DSI_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in HAL_DSI_STATE_READY state only. Exception done MspInit/ MspDeInit that can be registered/unregistered in HAL_DSI_STATE_READY or HAL_DSI_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_DSI_RegisterCallback() before calling HAL_DSI_DeInit() or HAL_DSI_Init() function.

When The compilation define USE_HAL_DSI_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

23.2.2 Initialization and Configuration functions

This section provides functions allowing to:

- Initialize and configure the DSI
- De-initialize the DSI

This section contains the following APIs:

- *HAL_DSI_Init()*
- *HAL_DSI_DeInit()*

- *HAL_DSI_ConfigErrorMonitor()*
- *HAL_DSI_MspInit()*
- *HAL_DSI_MspDeInit()*
- *HAL_DSI_RegisterCallback()*
- *HAL_DSI_UnRegisterCallback()*

23.2.3 IO operation functions

This section provides function allowing to:

- Handle DSI interrupt request

This section contains the following APIs:

- *HAL_DSI_IRQHandler()*
- *HAL_DSI_TearingEffectCallback()*
- *HAL_DSI_EndOfRefreshCallback()*
- *HAL_DSI_ErrorCallback()*

23.2.4 Peripheral Control functions

This section provides functions allowing to:

- Configure the Generic interface read-back Virtual Channel ID
- Select video mode and configure the corresponding parameters
- Configure command transmission mode: High-speed or Low-power
- Configure the flow control
- Configure the DSI PHY timer
- Configure the DSI HOST timeout
- Configure the DSI HOST timeout
- Start/Stop the DSI module
- Refresh the display in command mode
- Controls the display color mode in Video mode
- Control the display shutdown in Video mode
- write short DCS or short Generic command
- write long DCS or long Generic command
- Read command (DCS or generic)
- Enter/Exit the Ultra Low Power Mode on data only (D-PHY PLL running)
- Enter/Exit the Ultra Low Power Mode on data only and clock (D-PHY PLL turned off)
- Start/Stop test pattern generation
- Slew-Rate And Delay Tuning
- Low-Power Reception Filter Tuning
- Activate an additional current path on all lanes to meet the SDDTx parameter
- Custom lane pins configuration
- Set custom timing for the PHY
- Force the Clock/Data Lane in TX Stop Mode
- Force LP Receiver in Low-Power Mode
- Force Data Lanes in RX Mode after a BTA
- Enable a pull-down on the lanes to prevent from floating states when unused
- Switch off the contention detection on data lanes

This section contains the following APIs:

- *HAL_DSI_SetGenericVCIDRX()*
- *HAL_DSI_SetGenericVCIDTX()*
- *HAL_DSI_SetGenericVCID()*
- *HAL_DSI_ConfigVideoMode()*

- *HAL_DSI_ConfigAdaptedCommandMode()*
- *HAL_DSI_ConfigCommand()*
- *HAL_DSI_ConfigFlowControl()*
- *HAL_DSI_ConfigPhyTimer()*
- *HAL_DSI_ConfigHostTimeouts()*
- *HAL_DSI_Start()*
- *HAL_DSI_Stop()*
- *HAL_DSI_Refresh()*
- *HAL_DSI_ColorMode()*
- *HAL_DSI_Shutdown()*
- *HAL_DSI_ShortWrite()*
- *HAL_DSI_LongWrite()*
- *HAL_DSI_Read()*
- *HAL_DSI_EnterULPMData()*
- *HAL_DSI_ExitULPMData()*
- *HAL_DSI_EnterULPM()*
- *HAL_DSI_ExitULPM()*
- *HAL_DSI_PatternGeneratorStart()*
- *HAL_DSI_PatternGeneratorStop()*
- *HAL_DSI_SetLanePinsConfiguration()*
- *HAL_DSI_ForceTXStopMode()*

23.2.5 Peripheral State and Errors functions

This subsection provides functions allowing to
- Check the DSI state.
- Get error code.

This section contains the following APIs:
- *HAL_DSI_GetState()*
- *HAL_DSI_GetError()*

23.2.6 Detailed description of functions

HAL_DSI_Init

Function name

HAL_StatusTypeDef HAL_DSI_Init (DSI_HandleTypeDef * hdsi, DSI_PLLInitTypeDef * PLLInit)

Function description

Initializes the DSI according to the specified parameters in the DSI_InitTypeDef and create the associated handle.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **PLLInit:** pointer to a DSI_PLLInitTypeDef structure that contains the PLL Clock structure definition for the DSI.

Return values

- **HAL:** status

HAL_DSI_DeInit

Function name

HAL_StatusTypeDef HAL_DSI_DeInit (DSI_HandleTypeDef * hdsi)

Function description

De-initializes the DSI peripheral registers to their default reset values.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_MspInit

Function name

void HAL_DSI_MspInit (DSI_HandleTypeDef * hdsi)

Function description

Initializes the DSI MSP.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **None:**

HAL_DSI_MspDeInit

Function name

void HAL_DSI_MspDeInit (DSI_HandleTypeDef * hdsi)

Function description

De-initializes the DSI MSP.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **None:**

HAL_DSI_ConfigErrorMonitor

Function name

HAL_StatusTypeDef HAL_DSI_ConfigErrorMonitor (DSI_HandleTypeDef * hdsi, uint32_t ActiveErrors)

Function description

Enable the error monitor flags.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **ActiveErrors:** indicates which error interrupts will be enabled. This parameter can be any combination of
  - DSI_Error_Data_Type.

Return values

- **HAL:** status

HAL_DSI_RegisterCallback

Function name

HAL_StatusTypeDef HAL_DSI_RegisterCallback (DSI_HandleTypeDef * hdsi, HAL_DSI_CallbackIDTypeDef CallbackID, pDSI_CallbackTypeDef pCallback)

Function description

Register a User DSI Callback To be used instead of the weak predefined callback.

Parameters

- **hdsi:** dsi handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  – HAL_DSI_TEARING_EFFECT_CB_ID Tearing Effect Callback ID
  – HAL_DSI_ENDOF_REFRESH_CB_ID End Of Refresh Callback ID
  – HAL_DSI_ERROR_CB_ID Error Callback ID
  – HAL_DSI_MSPINIT_CB_ID MspInit callback ID
  – HAL_DSI_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_DSI_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_DSI_UnRegisterCallback (DSI_HandleTypeDef * hdsi, HAL_DSI_CallbackIDTypeDef CallbackID)

Function description

Unregister a DSI Callback DSI callback is redirected to the weak predefined callback.

Parameters

- **hdsi:** dsi handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  – HAL_DSI_TEARING_EFFECT_CB_ID Tearing Effect Callback ID
  – HAL_DSI_ENDOF_REFRESH_CB_ID End Of Refresh Callback ID
  – HAL_DSI_ERROR_CB_ID Error Callback ID
  – HAL_DSI_MSPINIT_CB_ID MspInit callback ID
  – HAL_DSI_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **status:**

HAL_DSI_IRQHandler

Function name

void HAL_DSI_IRQHandler (DSI_HandleTypeDef * hdsi)

Function description

Handles DSI interrupt request.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_TearingEffectCallback

Function name

void HAL_DSI_TearingEffectCallback (DSI_HandleTypeDef * hdsi)

Function description

Tearing Effect DSI callback.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **None:**

HAL_DSI_EndOfRefreshCallback

Function name

void HAL_DSI_EndOfRefreshCallback (DSI_HandleTypeDef * hdsi)

Function description

End of Refresh DSI callback.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **None:**

HAL_DSI_ErrorCallback

Function name

void HAL_DSI_ErrorCallback (DSI_HandleTypeDef * hdsi)

Function description

Operation Error DSI callback.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **None:**

HAL_DSI_SetGenericVCIDRX

Function name

HAL_StatusTypeDef HAL_DSI_SetGenericVCIDRX (DSI_HandleTypeDef * hdsi, uint32_t VirtualChannelIdRx)

Function description

Configure the Generic interface read-back Virtual Channel ID.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **VirtualChannelIdRx:** Virtual channel ID

Return values

- **HAL:** status

HAL_DSI_SetGenericVCIDTX

Function name

HAL_StatusTypeDef HAL_DSI_SetGenericVCIDTX (DSI_HandleTypeDef * hdsi, uint32_t VirtualChannelIdTx)

Function description

Configure the Virtual channel ID for transmission.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **VirtualChannelIdTx:** Virtual channel ID

Return values

- **HAL:** status

HAL_DSI_SetGenericVCID

Function name

HAL_StatusTypeDef HAL_DSI_SetGenericVCID (DSI_HandleTypeDef * hdsi, uint32_t VirtualChannelID)

Function description

Configure the Generic interface read-back Virtual Channel ID.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **VirtualChannelID:** Virtual channel ID

Return values

- **HAL:** status

HAL_DSI_ConfigVideoMode

Function name

HAL_StatusTypeDef HAL_DSI_ConfigVideoMode (DSI_HandleTypeDef * hdsi, DSI_VidCfgTypeDef * VidCfg)

Function description

Select video mode and configure the corresponding parameters.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **VidCfg:** pointer to a DSI_VidCfgTypeDef structure that contains the DSI video mode configuration parameters

Return values

- **HAL:** status

HAL_DSI_ConfigAdaptedCommandMode

Function name

HAL_StatusTypeDef HAL_DSI_ConfigAdaptedCommandMode (DSI_HandleTypeDef * hdsi, DSI_CmdCfgTypeDef * CmdCfg)

Function description

Select adapted command mode and configure the corresponding parameters.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **CmdCfg:** pointer to a DSI_CmdCfgTypeDef structure that contains the DSI command mode configuration parameters

Return values

- **HAL:** status

HAL_DSI_ConfigCommand

Function name

HAL_StatusTypeDef HAL_DSI_ConfigCommand (DSI_HandleTypeDef * hdsi, DSI_LPCmdTypeDef * LPCmd)

Function description

Configure command transmission mode: High-speed or Low-power and enable/disable acknowledge request after packet transmission.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **LPCmd:** pointer to a DSI_LPCmdTypeDef structure that contains the DSI command transmission mode configuration parameters

Return values

- **HAL:** status

HAL_DSI_ConfigFlowControl

Function name

HAL_StatusTypeDef HAL_DSI_ConfigFlowControl (DSI_HandleTypeDef * hdsi, uint32_t FlowControl)

Function description

Configure the flow control parameters.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **FlowControl:** flow control feature(s) to be enabled. This parameter can be any combination of
  - DSI_FlowControl.

Return values

- **HAL:** status

HAL_DSI_ConfigPhyTimer

Function name

HAL_StatusTypeDef HAL_DSI_ConfigPhyTimer (DSI_HandleTypeDef * hdsi, DSI_PHY_TimerTypeDef * PhyTimers)

Function description

Configure the DSI PHY timer parameters.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **PhyTimers:** DSI_PHY_TimerTypeDef structure that contains the DSI PHY timing parameters

Return values

- **HAL:** status

HAL_DSI_ConfigHostTimeouts

Function name

HAL_StatusTypeDef HAL_DSI_ConfigHostTimeouts (DSI_HandleTypeDef * hdsi, DSI_HOST_TimeoutTypeDef * HostTimeouts)

Function description

Configure the DSI HOST timeout parameters.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **HostTimeouts:** DSI_HOST_TimeoutTypeDef structure that contains the DSI host timeout parameters

Return values

- **HAL:** status

HAL_DSI_Start

Function name

HAL_StatusTypeDef HAL_DSI_Start (DSI_HandleTypeDef * hdsi)

Function description

Start the DSI module.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_Stop

Function name

HAL_StatusTypeDef HAL_DSI_Stop (DSI_HandleTypeDef * hdsi)

Function description

Stop the DSI module.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_Refresh

Function name

HAL_StatusTypeDef HAL_DSI_Refresh (DSI_HandleTypeDef * hdsi)

Function description

Refresh the display in command mode.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_ColorMode

Function name

HAL_StatusTypeDef HAL_DSI_ColorMode (DSI_HandleTypeDef * hdsi, uint32_t ColorMode)

Function description

Controls the display color mode in Video mode.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **ColorMode:** Color mode (full or 8-colors). This parameter can be any value of
  – DSI_Color_Mode

Return values

- **HAL:** status

HAL_DSI_Shutdown

Function name

HAL_StatusTypeDef HAL_DSI_Shutdown (DSI_HandleTypeDef * hdsi, uint32_t Shutdown)

Function description

Control the display shutdown in Video mode.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **Shutdown:** Shut-down (Display-ON or Display-OFF). This parameter can be any value of
  – DSI_ShutDown

Return values

- **HAL:** status

HAL_DSI_ShortWrite

Function name

HAL_StatusTypeDef HAL_DSI_ShortWrite (DSI_HandleTypeDef * hdsi, uint32_t ChannelID, uint32_t Mode, uint32_t Param1, uint32_t Param2)

Function description

write short DCS or short Generic command

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **ChannelID:** Virtual channel ID.
- **Mode:** DSI short packet data type. This parameter can be any value of
  – DSI_SHORT_WRITE_PKT_Data_Type.
- **Param1:** DSC command or first generic parameter. This parameter can be any value of
  – DSI_DCS_Command or a generic command code.
- **Param2:** DSC parameter or second generic parameter.

Return values

- **HAL:** status

HAL_DSI_LongWrite

Function name

HAL_StatusTypeDef HAL_DSI_LongWrite (DSI_HandleTypeDef * hdsi, uint32_t ChannelID, uint32_t Mode, uint32_t NbParams, uint32_t Param1, uint8_t * ParametersTable)

Function description

write long DCS or long Generic command

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **ChannelID:** Virtual channel ID.
- **Mode:** DSI long packet data type. This parameter can be any value of
  – DSI_LONG_WRITE_PKT_Data_Type.
- **NbParams:** Number of parameters.
- **Param1:** DSC command or first generic parameter. This parameter can be any value of
  – DSI_DCS_Command or a generic command code
- **ParametersTable:** Pointer to parameter values table.

Return values

- **HAL:** status

HAL_DSI_Read

Function name

HAL_StatusTypeDef HAL_DSI_Read (DSI_HandleTypeDef * hdsi, uint32_t ChannelNbr, uint8_t * Array, uint32_t Size, uint32_t Mode, uint32_t DCSCmd, uint8_t * ParametersTable)

Function description

Read command (DCS or generic)

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **ChannelNbr:** Virtual channel ID
- **Array:** pointer to a buffer to store the payload of a read back operation.
- **Size:** Data size to be read (in byte).
- **Mode:** DSI read packet data type. This parameter can be any value of
  – DSI_SHORT_READ_PKT_Data_Type.
- **DCSCmd:** DCS get/read command.
- **ParametersTable:** Pointer to parameter values table.

Return values

- **HAL:** status

HAL_DSI_EnterULPMData

Function name

HAL_StatusTypeDef HAL_DSI_EnterULPMData (DSI_HandleTypeDef * hdsi)

Function description

Enter the ULPM (Ultra Low Power Mode) with the D-PHY PLL running (only data lanes are in ULPM)

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_ExitULPMData

Function name

HAL_StatusTypeDef HAL_DSI_ExitULPMData (DSI_HandleTypeDef * hdsi)

Function description

Exit the ULPM (Ultra Low Power Mode) with the D-PHY PLL running (only data lanes are in ULPM)

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_EnterULPM

Function name

HAL_StatusTypeDef HAL_DSI_EnterULPM (DSI_HandleTypeDef * hdsi)

Function description

Enter the ULPM (Ultra Low Power Mode) with the D-PHY PLL turned off (both data and clock lanes are in ULPM)

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_ExitULPM

Function name

HAL_StatusTypeDef HAL_DSI_ExitULPM (DSI_HandleTypeDef * hdsi)

Function description

Exit the ULPM (Ultra Low Power Mode) with the D-PHY PLL turned off (both data and clock lanes are in ULPM)

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_PatternGeneratorStart

Function name

HAL_StatusTypeDef HAL_DSI_PatternGeneratorStart (DSI_HandleTypeDef * hdsi, uint32_t Mode, uint32_t Orientation)

Function description

Start test pattern generation.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **Mode:** Pattern generator mode This parameter can be one of the following values: 0 : Color bars (horizontal or vertical) 1 : BER pattern (vertical only)
- **Orientation:** Pattern generator orientation This parameter can be one of the following values: 0 : Vertical color bars 1 : Horizontal color bars

Return values

- **HAL:** status

HAL_DSI_PatternGeneratorStop

Function name

HAL_StatusTypeDef HAL_DSI_PatternGeneratorStop (DSI_HandleTypeDef * hdsi)

Function description

Stop test pattern generation.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** status

HAL_DSI_SetLanePinsConfiguration

Function name

HAL_StatusTypeDef HAL_DSI_SetLanePinsConfiguration (DSI_HandleTypeDef * hdsi, uint32_t CustomLane, uint32_t Lane, FunctionalState State)

Function description

Custom lane pins configuration.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **CustomLane:** Function to be applied on selected lane. This parameter can be any value of
  – DSI_CustomLane
- **Lane:** select between clock or data lane 0 or data lane 1. This parameter can be any value of
  – DSI_Lane_Select
- **State:** ENABLE or DISABLE

Return values

- **HAL:** status

HAL_DSI_ForceTXStopMode

Function name

HAL_StatusTypeDef HAL_DSI_ForceTXStopMode (DSI_HandleTypeDef * hdsi, uint32_t Lane, FunctionalState State)

Function description

Force the Clock/Data Lane in TX Stop Mode.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.
- **Lane:** select between clock or data lanes. This parameter can be any value of
  – DSI_Lane_Group
- **State:** ENABLE or DISABLE

Return values

- **HAL:** status

HAL_DSI_GetError

Function name

uint32_t HAL_DSI_GetError (DSI_HandleTypeDef * hdsi)

Function description

Return the DSI error code.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **DSI:** Error Code

HAL_DSI_GetState

Function name

HAL_DSI_StateTypeDef HAL_DSI_GetState (DSI_HandleTypeDef * hdsi)

Function description

Return the DSI state.

Parameters

- **hdsi:** pointer to a DSI_HandleTypeDef structure that contains the configuration information for the DSI.

Return values

- **HAL:** state

23.3 DSI Firmware driver defines

The following section lists the various define and macros of the module.

23.3.1 DSI

DSI

DSI Acknowledge Request

DSI_ACKNOWLEDGE_DISABLE

DSI_ACKNOWLEDGE_ENABLE

DSI Automatic Refresh

DSI_AR_DISABLE

DSI_AR_ENABLE

DSI Automatic Clk Lane Control

DSI_AUTO_CLK_LANE_CTRL_DISABLE

DSI_AUTO_CLK_LANE_CTRL_ENABLE

DSI Color Coding

DSI_RGB565

The values 0x00000001 and 0x00000002 can also be used for the RGB565 color mode configuration

DSI_RGB666

The value 0x00000004 can also be used for the RGB666 color mode configuration

DSI_RGB888

DSI Color Mode

DSI_COLOR_MODE_FULL

DSI_COLOR_MODE_EIGHT

DSI CustomLane

DSI_SWAP_LANE_PINS

DSI DATA ENABLE Polarity

DSI_DATA_ENABLE_ACTIVE_HIGH

DSI_DATA_ENABLE_ACTIVE_LOW

DSI DCS Command

DSI_ENTER_IDLE_MODE

DSI_ENTER_INVERT_MODE

DSI_ENTER_NORMAL_MODE

DSI_ENTER_PARTIAL_MODE

DSI_ENTER_SLEEP_MODE

DSI_EXIT_IDLE_MODE

DSI_EXIT_INVERT_MODE

DSI_EXIT_SLEEP_MODE

DSI_GET_3D_CONTROL

DSI_GET_ADDRESS_MODE

DSI_GET_BLUE_CHANNEL

DSI_GET_DIAGNOSTIC_RESULT

DSI_GET_DISPLAY_MODE

DSI_GET_GREEN_CHANNEL

DSI_GET_PIXEL_FORMAT

DSI_GET_POWER_MODE

DSI_GET_RED_CHANNEL

DSI_GET_SCANLINE

DSI_GET_SIGNAL_MODE

DSI_NOP

DSI_READ_DDB_CONTINUE

DSI_READ_DDB_START

DSI_READ_MEMORY_CONTINUE

DSI_READ_MEMORY_START

DSI_SET_3D_CONTROL

DSI_SET_ADDRESS_MODE

DSI_SET_COLUMN_ADDRESS

DSI_SET_DISPLAY_OFF

DSI_SET_DISPLAY_ON

DSI_SET_GAMMA_CURVE

DSI_SET_PAGE_ADDRESS

DSI_SET_PARTIAL_COLUMNS

DSI_SET_PARTIAL_ROWS

DSI_SET_PIXEL_FORMAT

DSI_SET_SCROLL_AREA

DSI_SET_SCROLL_START

DSI_SET_TEAR_OFF

DSI_SET_TEAR_ON

DSI_SET_TEAR_SCANLINE

DSI_SET_VSYNC_TIMING

DSI_SOFT_RESET

DSI_WRITE_LUT

DSI_WRITE_MEMORY_CONTINUE

DSI_WRITE_MEMORY_START

DSI D-PHY Slew rate

DSI_DPHY_SLEW_HS_TX_SPEED

80-750Mbits/s

DSI DPHY VCO Frequency Range

DSI_DPHY_VCO_FRANGE_500MHZ_800MHZ

500-800 MHz

DSI_DPHY_VCO_FRANGE_800MHZ_1GHZ

800-1000 MHz

DSI Error Data Type

HAL_DSI_ERROR_NONE

HAL_DSI_ERROR_ACK

Acknowledge errors

HAL_DSI_ERROR_PHY

PHY related errors

HAL_DSI_ERROR_TX

DSI Exported Macros

__HAL_DSI_RESET_HANDLE_STATE

Description:

- Reset DSI handle state.

Parameters:

- __HANDLE__: DSI handle

Return value:

- None

__HAL_DSI_ENABLE

Description:

- Enables the DSI host.

Parameters:

- __HANDLE__: DSI handle

Return value:

- None.

__HAL_DSI_DISABLE

Description:

- Disables the DSI host.

Parameters:

- __HANDLE__: DSI handle

Return value:

- None.

__HAL_DSI_WRAPPER_ENABLE

Description:

- Enables the DSI wrapper.

Parameters:

- __HANDLE__: DSI handle

Return value:

- None.

__HAL_DSI_WRAPPER_DISABLE

Description:

- Disable the DSI wrapper.

Parameters:

- __HANDLE__: DSI handle

Return value:

- None.

__HAL_DSI_PLL_ENABLE

Description:
- Enables the DSI PLL.

Parameters:
- __HANDLE__: DSI handle

Return value:
- None.

__HAL_DSI_PLL_DISABLE

Description:
- Disables the DSI PLL.

Parameters:
- __HANDLE__: DSI handle

Return value:
- None.

__HAL_DSI_GET_FLAG

Description:
- Get the DSI pending flags.

Parameters:
- __HANDLE__: DSI handle.
- __FLAG__: Get the specified flag. This parameter can be any combination of the following values:
  - DSI_FLAG_TE : Tearing Effect Interrupt Flag
  - DSI_FLAG_ER : End of Refresh Interrupt Flag
  - DSI_FLAG_BUSY : Busy Flag
  - DSI_FLAG_PLLLS: PLL Lock Status
  - DSI_FLAG_PLLL : PLL Lock Interrupt Flag
  - DSI_FLAG_PLLU : PLL Unlock Interrupt Flag
  - DSI_FLAG_RRS : Regulator Ready Flag
  - DSI_FLAG_RR : Regulator Ready Interrupt Flag

Return value:
- The: state of FLAG (SET or RESET).

__HAL_DSI_CLEAR_FLAG

Description:
- Clears the DSI pending flags.

Parameters:
- __HANDLE__: DSI handle.
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - DSI_FLAG_TE : Tearing Effect Interrupt Flag
  - DSI_FLAG_ER : End of Refresh Interrupt Flag
  - DSI_FLAG_PLLL : PLL Lock Interrupt Flag
  - DSI_FLAG_PLLU : PLL Unlock Interrupt Flag
  - DSI_FLAG_RR : Regulator Ready Interrupt Flag

Return value:
- None

__HAL_DSI_ENABLE_IT

Description:

- Enables the specified DSI interrupts.

Parameters:

- __HANDLE__: DSI handle.
- __INTERRUPT__: specifies the DSI interrupt sources to be enabled. This parameter can be any combination of the following values:
  – DSI_IT_TE : Tearing Effect Interrupt
  – DSI_IT_ER : End of Refresh Interrupt
  – DSI_IT_PLLL: PLL Lock Interrupt
  – DSI_IT_PLLU: PLL Unlock Interrupt
  – DSI_IT_RR : Regulator Ready Interrupt

Return value:

- None

__HAL_DSI_DISABLE_IT

Description:

- Disables the specified DSI interrupts.

Parameters:

- __HANDLE__: DSI handle
- __INTERRUPT__: specifies the DSI interrupt sources to be disabled. This parameter can be any combination of the following values:
  – DSI_IT_TE : Tearing Effect Interrupt
  – DSI_IT_ER : End of Refresh Interrupt
  – DSI_IT_PLLL: PLL Lock Interrupt
  – DSI_IT_PLLU: PLL Unlock Interrupt
  – DSI_IT_RR : Regulator Ready Interrupt

Return value:

- None

__HAL_DSI_GET_IT_SOURCE

Description:

- Checks whether the specified DSI interrupt source is enabled or not.

Parameters:

- __HANDLE__: DSI handle
- __INTERRUPT__: specifies the DSI interrupt source to check. This parameter can be one of the following values:
  – DSI_IT_TE : Tearing Effect Interrupt
  – DSI_IT_ER : End of Refresh Interrupt
  – DSI_IT_PLLL: PLL Lock Interrupt
  – DSI_IT_PLLU: PLL Unlock Interrupt
  – DSI_IT_RR : Regulator Ready Interrupt

Return value:

- The: state of INTERRUPT (SET or RESET).

24 HAL EXTI Generic Driver

24.1 EXTI Firmware driver registers structures

24.1.1 EXTI_HandleTypeDef

EXTI_HandleTypeDef is defined in the stm32u5xx_hal_exti.h

Data Fields

- ***uint32_t Line***
- ***void(* RisingCallback***
- ***void(* FallingCallback***

Field Documentation

- ***uint32_t EXTI_HandleTypeDef::Line***
  Exti line number
- ***void(* EXTI_HandleTypeDef::RisingCallback)(void)***
  Exti rising callback
- ***void(* EXTI_HandleTypeDef::FallingCallback)(void)***
  Exti falling callback

24.1.2 EXTI_ConfigTypeDef

EXTI_ConfigTypeDef is defined in the stm32u5xx_hal_exti.h

Data Fields

- ***uint32_t Line***
- ***uint32_t Mode***
- ***uint32_t Trigger***
- ***uint32_t GPIOSel***

Field Documentation

- ***uint32_t EXTI_ConfigTypeDef::Line***
  The Exti line to be configured. This parameter can be a value of ***EXTI_Line***
- ***uint32_t EXTI_ConfigTypeDef::Mode***
  The Exit Mode to be configured for a core. This parameter can be a combination of ***EXTI_Mode***
- ***uint32_t EXTI_ConfigTypeDef::Trigger***
  The Exti Trigger to be configured. This parameter can be a value of ***EXTI_Trigger***
- ***uint32_t EXTI_ConfigTypeDef::GPIOSel***
  The Exti GPIO multiplexer selection to be configured. This parameter is only possible for line 0 to 15. It can be a value of ***EXTI_GPIOSel***

24.2 EXTI Firmware driver API description

The following section lists the various functions of the EXTI library.

24.2.1 EXTI Peripheral features

- Each Exti line can be configured within this driver.
- Exti line can be configured in 3 different modes
  - Interrupt
  - Event
  - Both of them
- Configurable Exti lines can be configured with 3 different triggers
  - Rising
  - Falling
  - Both of them

- When set in interrupt mode, configurable Exti lines have two diffenrents interrupt pending registers which allow to distinguish which transition occurs:
  - Rising edge pending interrupt
  - Falling
- Exti lines 0 to 15 are linked to gpio pin number 0 to 15. Gpio port can be selected through multiplexer.

24.2.2 How to use this driver

1. Configure the EXTI line using HAL_EXTI_SetConfigLine().
   - Choose the interrupt line number by setting "Line" member from EXTI_ConfigTypeDef structure.
   - Configure the interrupt and/or event mode using "Mode" member from EXTI_ConfigTypeDef structure.
   - For configurable lines, configure rising and/or falling trigger "Trigger" member from EXTI_ConfigTypeDef structure.
   - For Exti lines linked to gpio, choose gpio port using "GPIOSel" member from GPIO_InitTypeDef structure.
2. Get current Exti configuration of a dedicated line using HAL_EXTI_GetConfigLine().
   - Provide exiting handle as parameter.
   - Provide pointer on EXTI_ConfigTypeDef structure as second parameter.
3. Clear Exti configuration of a dedicated line using HAL_EXTI_GetConfigLine().
   - Provide exiting handle as parameter.
4. Register callback to treat Exti interrupts using HAL_EXTI_RegisterCallback().
   - Provide exiting handle as first parameter.
   - Provide which callback will be registered using one value from EXTI_CallbackIDTypeDef.
   - Provide callback function pointer.
5. Get interrupt pending bit using HAL_EXTI_GetPending().
6. Clear interrupt pending bit using HAL_EXTI_GetPending().
7. Generate software interrupt using HAL_EXTI_GenerateSWI().

24.2.3 EXTI attributes functions

This section contains the following APIs:

- *HAL_EXTI_ConfigLineAttributes()*
- *HAL_EXTI_GetConfigLineAttributes()*
- *HAL_EXTI_LockAttributes()*
- *HAL_EXTI_GetLockAttributes()*

24.2.4 Configuration functions

This section contains the following APIs:

- *HAL_EXTI_SetConfigLine()*
- *HAL_EXTI_GetConfigLine()*
- *HAL_EXTI_ClearConfigLine()*
- *HAL_EXTI_RegisterCallback()*
- *HAL_EXTI_GetHandle()*

24.2.5 Detailed description of functions

HAL_EXTI_SetConfigLine

Function name

HAL_StatusTypeDef HAL_EXTI_SetConfigLine (EXTI_HandleTypeDef * hexti, EXTI_ConfigTypeDef * pExtiConfig)

Function description

Set configuration of a dedicated Exti line.

Parameters

- **hexti:** Exti handle.
- **pExtiConfig:** Pointer on EXTI configuration to be set.

Return values

- **HAL:** Status.

HAL_EXTI_GetConfigLine

Function name

HAL_StatusTypeDef HAL_EXTI_GetConfigLine (EXTI_HandleTypeDef * hexti, EXTI_ConfigTypeDef * pExtiConfig)

Function description

Get configuration of a dedicated Exti line.

Parameters

- **hexti:** Exti handle.
- **pExtiConfig:** Pointer on structure to store Exti configuration.

Return values

- **HAL:** Status.

HAL_EXTI_ClearConfigLine

Function name

HAL_StatusTypeDef HAL_EXTI_ClearConfigLine (const EXTI_HandleTypeDef * hexti)

Function description

Clear whole configuration of a dedicated Exti line.

Parameters

- **hexti:** Exti handle.

Return values

- **HAL:** Status.

HAL_EXTI_RegisterCallback

Function name

HAL_StatusTypeDef HAL_EXTI_RegisterCallback (EXTI_HandleTypeDef * hexti, EXTI_CallbackIDTypeDef CallbackID, void(*)(void) pPendingCbfn)

Function description

Register callback for a dedicaated Exti line.

Parameters

- **hexti:** Exti handle.
- **CallbackID:** User callback identifier. This parameter can be one of
  - EXTI_CallbackIDTypeDef values.
- **pPendingCbfn:** function pointer to be stored as callback.

Return values

- **HAL:** Status.

HAL_EXTI_GetHandle

Function name

HAL_StatusTypeDef HAL_EXTI_GetHandle (EXTI_HandleTypeDef * hexti, uint32_t ExtiLine)

Function description

Store line number as handle private field.

Parameters

- **hexti:** Exti handle.
- **ExtiLine:** Exti line number. This parameter can be from 0 to EXTI_LINE_NB.

Return values

- **HAL:** Status.

HAL_EXTI_IRQHandler

Function name

void HAL_EXTI_IRQHandler (const EXTI_HandleTypeDef * hexti)

Function description

Handle EXTI interrupt request.

Parameters

- **hexti:** Exti handle.

Return values

- **none.:**

HAL_EXTI_GetPending

Function name

uint32_t HAL_EXTI_GetPending (const EXTI_HandleTypeDef * hexti, uint32_t Edge)

Function description

Get interrupt pending bit of a dedicated line.

Parameters

- **hexti:** Exti handle.
- **Edge:** Specify which pending edge as to be checked. This parameter can be one of the following values:
  - EXTI_TRIGGER_RISING
  - EXTI_TRIGGER_FALLING

Return values

- **1:** if interrupt is pending else 0.

HAL_EXTI_ClearPending

Function name

void HAL_EXTI_ClearPending (const EXTI_HandleTypeDef * hexti, uint32_t Edge)

Function description

Clear interrupt pending bit of a dedicated line.

Parameters

- **hexti:** Exti handle.
- **Edge:** Specify which pending edge as to be clear. This parameter can be one of the following values:
  – EXTI_TRIGGER_RISING
  – EXTI_TRIGGER_FALLING

Return values

- **None.:**

HAL_EXTI_GenerateSWI

Function name

void HAL_EXTI_GenerateSWI (const EXTI_HandleTypeDef * hexti)

Function description

Generate a software interrupt for a dedicated line.

Parameters

- **hexti:** Exti handle.

Return values

- **None.:**

HAL_EXTI_ConfigLineAttributes

Function name

void HAL_EXTI_ConfigLineAttributes (uint32_t ExtiLine, uint32_t LineAttributes)

Function description

Configure the EXTI line attribute(s).

Parameters

- **ExtiLine:** Exti line number. This parameter can be from 0 to EXTI_LINE_NB.
- **LineAttributes:** can be one or a combination of the following values:
  – EXTI_LINE_PRIV Privileged-only access
  – EXTI_LINE_NPRIV Privileged/Non-privileged access
  – EXTI_LINE_SEC Secure-only access
  – EXTI_LINE_NSEC Secure/Non-secure access

Return values

- **None:**

Notes

- Available attributes are to secure EXTI line and set EXT line as privileged. Default state is not secure and unprivileged access allowed.
- Secure and non-secure attributes can only be set from the secure state when the system implements the security (TZEN=1).
- Security and privilege attributes can be set independently.

HAL_EXTI_GetConfigLineAttributes

Function name

HAL_StatusTypeDef HAL_EXTI_GetConfigLineAttributes (uint32_t ExtiLine, uint32_t * pLineAttributes)

Function description

Get the EXTI line attribute(s).

Parameters

- **ExtiLine:** Exti line number. This parameter can be from 0 to EXTI_LINE_NB.
- **pLineAttributes:** pointer to return line attributes.

Return values

- **HAL:** Status.

Notes

- Secure and non-secure attributes are only available from secure state when the system implements the security (TZEN=1)

HAL_EXTI_LockAttributes

Function name

void HAL_EXTI_LockAttributes (void)

Function description

Lock the secure and privilege configuration registers.

Return values

- **None:**

HAL_EXTI_GetLockAttributes

Function name

uint32_t HAL_EXTI_GetLockAttributes (void)

Function description

Return the secure and privilege configuration registers LOCK status.

Return values

- **1:** if the secure and privilege configuration registers have been locked else 0.

25 HAL FDCAN Generic Driver

25.1 FDCAN Firmware driver registers structures

25.1.1 FDCAN_InitTypeDef

FDCAN_InitTypeDef is defined in the stm32u5xx_hal_fdcan.h

Data Fields

- ***uint32_t ClockDivider***
- ***uint32_t FrameFormat***
- ***uint32_t Mode***
- ***FunctionalState AutoRetransmission***
- ***FunctionalState TransmitPause***
- ***FunctionalState ProtocolException***
- ***uint32_t NominalPrescaler***
- ***uint32_t NominalSyncJumpWidth***
- ***uint32_t NominalTimeSeg1***
- ***uint32_t NominalTimeSeg2***
- ***uint32_t DataPrescaler***
- ***uint32_t DataSyncJumpWidth***
- ***uint32_t DataTimeSeg1***
- ***uint32_t DataTimeSeg2***
- ***uint32_t StdFiltersNbr***
- ***uint32_t ExtFiltersNbr***
- ***uint32_t TxFifoQueueMode***

Field Documentation

- ***uint32_t FDCAN_InitTypeDef::ClockDivider***
  Specifies the FDCAN kernel clock divider. The clock is common to all FDCAN instances. This parameter is applied only at initialisation of first FDCAN instance. This parameter can be a value of ***FDCAN_clock_divider***.
- ***uint32_t FDCAN_InitTypeDef::FrameFormat***
  Specifies the FDCAN frame format. This parameter can be a value of ***FDCAN_frame_format***
- ***uint32_t FDCAN_InitTypeDef::Mode***
  Specifies the FDCAN mode. This parameter can be a value of ***FDCAN_operating_mode***
- ***FunctionalState FDCAN_InitTypeDef::AutoRetransmission***
  Enable or disable the automatic retransmission mode. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState FDCAN_InitTypeDef::TransmitPause***
  Enable or disable the Transmit Pause feature. This parameter can be set to ENABLE or DISABLE
- ***FunctionalState FDCAN_InitTypeDef::ProtocolException***
  Enable or disable the Protocol Exception Handling. This parameter can be set to ENABLE or DISABLE
- ***uint32_t FDCAN_InitTypeDef::NominalPrescaler***
  Specifies the value by which the oscillator frequency is divided for generating the nominal bit time quanta. This parameter must be a number between 1 and 512
- ***uint32_t FDCAN_InitTypeDef::NominalSyncJumpWidth***
  Specifies the maximum number of time quanta the FDCAN hardware is allowed to lengthen or shorten a bit to perform resynchronization. This parameter must be a number between 1 and 128
- ***uint32_t FDCAN_InitTypeDef::NominalTimeSeg1***
  Specifies the number of time quanta in Bit Segment 1. This parameter must be a number between 2 and 256
- ***uint32_t FDCAN_InitTypeDef::NominalTimeSeg2***
  Specifies the number of time quanta in Bit Segment 2. This parameter must be a number between 2 and 128

- ***uint32_t FDCAN_InitTypeDef::DataPrescaler***
  Specifies the value by which the oscillator frequency is divided for generating the data bit time quanta. This parameter must be a number between 1 and 32
- ***uint32_t FDCAN_InitTypeDef::DataSyncJumpWidth***
  Specifies the maximum number of time quanta the FDCAN hardware is allowed to lengthen or shorten a data bit to perform resynchronization. This parameter must be a number between 1 and 16
- ***uint32_t FDCAN_InitTypeDef::DataTimeSeg1***
  Specifies the number of time quanta in Data Bit Segment 1. This parameter must be a number between 1 and 32
- ***uint32_t FDCAN_InitTypeDef::DataTimeSeg2***
  Specifies the number of time quanta in Data Bit Segment 2. This parameter must be a number between 1 and 16
- ***uint32_t FDCAN_InitTypeDef::StdFiltersNbr***
  Specifies the number of standard Message ID filters. This parameter must be a number between 0 and 28
- ***uint32_t FDCAN_InitTypeDef::ExtFiltersNbr***
  Specifies the number of extended Message ID filters. This parameter must be a number between 0 and 8
- ***uint32_t FDCAN_InitTypeDef::TxFifoQueueMode***
  Tx FIFO/Queue Mode selection. This parameter can be a value of ***FDCAN_txFifoQueue_Mode***

25.1.2 FDCAN_FilterTypeDef

FDCAN_FilterTypeDef is defined in the stm32u5xx_hal_fdcan.h

Data Fields

- ***uint32_t IdType***
- ***uint32_t FilterIndex***
- ***uint32_t FilterType***
- ***uint32_t FilterConfig***
- ***uint32_t FilterID1***
- ***uint32_t FilterID2***

Field Documentation

- ***uint32_t FDCAN_FilterTypeDef::IdType***
  Specifies the identifier type. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_FilterTypeDef::FilterIndex***
  Specifies the filter which will be initialized. This parameter must be a number between:
  – 0 and (SRAMCAN_FLS_NBR-1), if IdType is FDCAN_STANDARD_ID
  – 0 and (SRAMCAN_FLE_NBR-1), if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_FilterTypeDef::FilterType***
  Specifies the filter type. This parameter can be a value of ***FDCAN_filter_type***. The value FDCAN_FILTER_RANGE_NO_EIDM is permitted only when IdType is FDCAN_EXTENDED_ID.
- ***uint32_t FDCAN_FilterTypeDef::FilterConfig***
  Specifies the filter configuration. This parameter can be a value of ***FDCAN_filter_config***
- ***uint32_t FDCAN_FilterTypeDef::FilterID1***
  Specifies the filter identification 1. This parameter must be a number between:
  – 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  – 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_FilterTypeDef::FilterID2***
  Specifies the filter identification 2. This parameter must be a number between:
  – 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  – 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID

25.1.3 FDCAN_TxHeaderTypeDef

FDCAN_TxHeaderTypeDef is defined in the stm32u5xx_hal_fdcan.h

Data Fields

- ***uint32_t Identifier***

- ***uint32_t IdType***
- ***uint32_t TxFrameType***
- ***uint32_t DataLength***
- ***uint32_t ErrorStateIndicator***
- ***uint32_t BitRateSwitch***
- ***uint32_t FDFormat***
- ***uint32_t TxEventFifoControl***
- ***uint32_t MessageMarker***

Field Documentation

- ***uint32_t FDCAN_TxHeaderTypeDef::Identifier***
  Specifies the identifier. This parameter must be a number between:
  – 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  – 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_TxHeaderTypeDef::IdType***
  Specifies the identifier type for the message that will be transmitted. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_TxHeaderTypeDef::TxFrameType***
  Specifies the frame type of the message that will be transmitted. This parameter can be a value of ***FDCAN_frame_type***
- ***uint32_t FDCAN_TxHeaderTypeDef::DataLength***
  Specifies the length of the frame that will be transmitted. This parameter can be a value of ***FDCAN_data_length_code***
- ***uint32_t FDCAN_TxHeaderTypeDef::ErrorStateIndicator***
  Specifies the error state indicator. This parameter can be a value of ***FDCAN_error_state_indicator***
- ***uint32_t FDCAN_TxHeaderTypeDef::BitRateSwitch***
  Specifies whether the Tx frame will be transmitted with or without bit rate switching. This parameter can be a value of ***FDCAN_bit_rate_switching***
- ***uint32_t FDCAN_TxHeaderTypeDef::FDFormat***
  Specifies whether the Tx frame will be transmitted in classic or FD format. This parameter can be a value of ***FDCAN_format***
- ***uint32_t FDCAN_TxHeaderTypeDef::TxEventFifoControl***
  Specifies the event FIFO control. This parameter can be a value of ***Section 25.3.1: FDCAN_EFC***
- ***uint32_t FDCAN_TxHeaderTypeDef::MessageMarker***
  Specifies the message marker to be copied into Tx Event FIFO element for identification of Tx message status. This parameter must be a number between 0 and 0xFF

25.1.4 FDCAN_RxHeaderTypeDef

FDCAN_RxHeaderTypeDef is defined in the stm32u5xx_hal_fdcan.h

Data Fields

- ***uint32_t Identifier***
- ***uint32_t IdType***
- ***uint32_t RxFrameType***
- ***uint32_t DataLength***
- ***uint32_t ErrorStateIndicator***
- ***uint32_t BitRateSwitch***
- ***uint32_t FDFormat***
- ***uint32_t RxTimestamp***
- ***uint32_t FilterIndex***
- ***uint32_t IsFilterMatchingFrame***

Field Documentation

- ***uint32_t FDCAN_RxHeaderTypeDef::Identifier***
  Specifies the identifier. This parameter must be a number between:
  – 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  – 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_RxHeaderTypeDef::IdType***
  Specifies the identifier type of the received message. This parameter can be a value of ***FDCAN_id_type***
- ***uint32_t FDCAN_RxHeaderTypeDef::RxFrameType***
  Specifies the the received message frame type. This parameter can be a value of ***FDCAN_frame_type***
- ***uint32_t FDCAN_RxHeaderTypeDef::DataLength***
  Specifies the received frame length. This parameter can be a value of ***FDCAN_data_length_code***
- ***uint32_t FDCAN_RxHeaderTypeDef::ErrorStateIndicator***
  Specifies the error state indicator. This parameter can be a value of ***FDCAN_error_state_indicator***
- ***uint32_t FDCAN_RxHeaderTypeDef::BitRateSwitch***
  Specifies whether the Rx frame is received with or without bit rate switching. This parameter can be a value of ***FDCAN_bit_rate_switching***
- ***uint32_t FDCAN_RxHeaderTypeDef::FDFormat***
  Specifies whether the Rx frame is received in classic or FD format. This parameter can be a value of ***FDCAN_format***
- ***uint32_t FDCAN_RxHeaderTypeDef::RxTimestamp***
  Specifies the timestamp counter value captured on start of frame reception. This parameter must be a number between 0 and 0xFFFF
- ***uint32_t FDCAN_RxHeaderTypeDef::FilterIndex***
  Specifies the index of matching Rx acceptance filter element. This parameter must be a number between:
  – 0 and (SRAMCAN_FLS_NBR-1), if IdType is FDCAN_STANDARD_ID
  – 0 and (SRAMCAN_FLE_NBR-1), if IdType is FDCAN_EXTENDED_ID When the frame is a Non-Filter matching frame, this parameter is unused.
- ***uint32_t FDCAN_RxHeaderTypeDef::IsFilterMatchingFrame***
  Specifies whether the accepted frame did not match any Rx filter. Acceptance of non-matching frames may be enabled via **HAL_FDCAN_ConfigGlobalFilter()**. This parameter takes 0 if the frame matched an Rx filter or 1 if it did not match any Rx filter

25.1.5 FDCAN_TxEventFifoTypeDef

FDCAN_TxEventFifoTypeDef is defined in the stm32u5xx_hal_fdcan.h

Data Fields

- ***uint32_t Identifier***
- ***uint32_t IdType***
- ***uint32_t TxFrameType***
- ***uint32_t DataLength***
- ***uint32_t ErrorStateIndicator***
- ***uint32_t BitRateSwitch***
- ***uint32_t FDFormat***
- ***uint32_t TxTimestamp***
- ***uint32_t MessageMarker***
- ***uint32_t EventType***

Field Documentation

- ***uint32_t FDCAN_TxEventFifoTypeDef::Identifier***
  Specifies the identifier. This parameter must be a number between:
  – 0 and 0x7FF, if IdType is FDCAN_STANDARD_ID
  – 0 and 0x1FFFFFFF, if IdType is FDCAN_EXTENDED_ID
- ***uint32_t FDCAN_TxEventFifoTypeDef::IdType***
  Specifies the identifier type for the transmitted message. This parameter can be a value of ***FDCAN_id_type***

- ***uint32_t FDCAN_TxEventFifoTypeDef::TxFrameType***
  Specifies the frame type of the transmitted message. This parameter can be a value of ***FDCAN_frame_type***
- ***uint32_t FDCAN_TxEventFifoTypeDef::DataLength***
  Specifies the length of the transmitted frame. This parameter can be a value of ***FDCAN_data_length_code***
- ***uint32_t FDCAN_TxEventFifoTypeDef::ErrorStateIndicator***
  Specifies the error state indicator. This parameter can be a value of ***FDCAN_error_state_indicator***
- ***uint32_t FDCAN_TxEventFifoTypeDef::BitRateSwitch***
  Specifies whether the Tx frame is transmitted with or without bit rate switching. This parameter can be a value of ***FDCAN_bit_rate_switching***
- ***uint32_t FDCAN_TxEventFifoTypeDef::FDFormat***
  Specifies whether the Tx frame is transmitted in classic or FD format. This parameter can be a value of ***FDCAN_format***
- ***uint32_t FDCAN_TxEventFifoTypeDef::TxTimestamp***
  Specifies the timestamp counter value captured on start of frame transmission. This parameter must be a number between 0 and 0xFFFF
- ***uint32_t FDCAN_TxEventFifoTypeDef::MessageMarker***
  Specifies the message marker copied into Tx Event FIFO element for identification of Tx message status. This parameter must be a number between 0 and 0xFF
- ***uint32_t FDCAN_TxEventFifoTypeDef::EventType***
  Specifies the event type. This parameter can be a value of ***FDCAN_event_type***

25.1.6 FDCAN_HpMsgStatusTypeDef

FDCAN_HpMsgStatusTypeDef is defined in the stm32u5xx_hal_fdcan.h

Data Fields

- ***uint32_t FilterList***
- ***uint32_t FilterIndex***
- ***uint32_t MessageStorage***
- ***uint32_t MessageIndex***

Field Documentation

- ***uint32_t FDCAN_HpMsgStatusTypeDef::FilterList***
  Specifies the filter list of the matching filter element. This parameter can be:
  – 0 : Standard Filter List
  – 1 : Extended Filter List
- ***uint32_t FDCAN_HpMsgStatusTypeDef::FilterIndex***
  Specifies the index of matching filter element. This parameter can be a number between:
  – 0 and (SRAMCAN_FLS_NBR-1), if FilterList is 0 (Standard)
  – 0 and (SRAMCAN_FLE_NBR-1), if FilterList is 1 (Extended)
- ***uint32_t FDCAN_HpMsgStatusTypeDef::MessageStorage***
  Specifies the HP Message Storage. This parameter can be a value of ***FDCAN_hp_msg_storage***
- ***uint32_t FDCAN_HpMsgStatusTypeDef::MessageIndex***
  Specifies the Index of Rx FIFO element to which the message was stored. This parameter is valid only when MessageStorage is: FDCAN_HP_STORAGE_RXFIFO0 or FDCAN_HP_STORAGE_RXFIFO1

25.1.7 FDCAN_ProtocolStatusTypeDef

FDCAN_ProtocolStatusTypeDef is defined in the stm32u5xx_hal_fdcan.h

Data Fields

- ***uint32_t LastErrorCode***
- ***uint32_t DataLastErrorCode***
- ***uint32_t Activity***
- ***uint32_t ErrorPassive***
- ***uint32_t Warning***
- ***uint32_t BusOff***

- ***uint32_t RxESIflag***
- ***uint32_t RxBRSflag***
- ***uint32_t RxFDFflag***
- ***uint32_t ProtocolException***
- ***uint32_t TDCvalue***

Field Documentation

- ***uint32_t FDCAN_ProtocolStatusTypeDef::LastErrorCode***
  Specifies the type of the last error that occurred on the FDCAN bus. This parameter can be a value of ***FDCAN_protocol_error_code***
- ***uint32_t FDCAN_ProtocolStatusTypeDef::DataLastErrorCode***
  Specifies the type of the last error that occurred in the data phase of a CAN FD format frame with its BRS flag set. This parameter can be a value of ***FDCAN_protocol_error_code***
- ***uint32_t FDCAN_ProtocolStatusTypeDef::Activity***
  Specifies the FDCAN module communication state. This parameter can be a value of ***FDCAN_communication_state***
- ***uint32_t FDCAN_ProtocolStatusTypeDef::ErrorPassive***
  Specifies the FDCAN module error status. This parameter can be:
  - 0 : The FDCAN is in Error_Active state
  - 1 : The FDCAN is in Error_Passive state
- ***uint32_t FDCAN_ProtocolStatusTypeDef::Warning***
  Specifies the FDCAN module warning status. This parameter can be:
  - 0 : error counters (RxErrorCnt and TxErrorCnt) are below the Error_Warning limit of 96
  - 1 : at least one of error counters has reached the Error_Warning limit of 96
- ***uint32_t FDCAN_ProtocolStatusTypeDef::BusOff***
  Specifies the FDCAN module Bus_Off status. This parameter can be:
  - 0 : The FDCAN is not in Bus_Off state
  - 1 : The FDCAN is in Bus_Off state
- ***uint32_t FDCAN_ProtocolStatusTypeDef::RxESIflag***
  Specifies ESI flag of last received CAN FD message. This parameter can be:
  - 0 : Last received CAN FD message did not have its ESI flag set
  - 1 : Last received CAN FD message had its ESI flag set
- ***uint32_t FDCAN_ProtocolStatusTypeDef::RxBRSflag***
  Specifies BRS flag of last received CAN FD message. This parameter can be:
  - 0 : Last received CAN FD message did not have its BRS flag set
  - 1 : Last received CAN FD message had its BRS flag set
- ***uint32_t FDCAN_ProtocolStatusTypeDef::RxFDFflag***
  Specifies if CAN FD message (FDF flag set) has been received since last protocol status. This parameter can be:
  - 0 : No CAN FD message received
  - 1 : CAN FD message received
- ***uint32_t FDCAN_ProtocolStatusTypeDef::ProtocolException***
  Specifies the FDCAN module Protocol Exception status. This parameter can be:
  - 0 : No protocol exception event occurred since last read access
  - 1 : Protocol exception event occurred
- ***uint32_t FDCAN_ProtocolStatusTypeDef::TDCvalue***
  Specifies the Transmitter Delay Compensation Value. This parameter can be a number between 0 and 127

25.1.8 FDCAN_ErrorCountersTypeDef

FDCAN_ErrorCountersTypeDef is defined in the stm32u5xx_hal_fdcan.h

Data Fields

- ***uint32_t TxErrorCnt***
- ***uint32_t RxErrorCnt***
- ***uint32_t RxErrorPassive***

- ***uint32_t ErrorLogging***

Field Documentation

- ***uint32_t FDCAN_ErrorCountersTypeDef::TxErrorCnt***
  Specifies the Transmit Error Counter Value. This parameter can be a number between 0 and 255
- ***uint32_t FDCAN_ErrorCountersTypeDef::RxErrorCnt***
  Specifies the Receive Error Counter Value. This parameter can be a number between 0 and 127
- ***uint32_t FDCAN_ErrorCountersTypeDef::RxErrorPassive***
  Specifies the Receive Error Passive status. This parameter can be:
  - 0 : The Receive Error Counter (RxErrorCnt) is below the error passive level of 128
  - 1 : The Receive Error Counter (RxErrorCnt) has reached the error passive level of 128
- ***uint32_t FDCAN_ErrorCountersTypeDef::ErrorLogging***
  Specifies the Transmit/Receive error logging counter value. This parameter can be a number between 0 and 255. This counter is incremented each time when a FDCAN protocol error causes the TxErrorCnt or the RxErrorCnt to be incremented. The counter stops at 255; the next increment of TxErrorCnt or RxErrorCnt sets interrupt flag FDCAN_FLAG_ERROR_LOGGING_OVERFLOW

25.1.9 FDCAN_MsgRamAddressTypeDef

FDCAN_MsgRamAddressTypeDef is defined in the stm32u5xx_hal_fdcan.h

Data Fields

- ***uint32_t StandardFilterSA***
- ***uint32_t ExtendedFilterSA***
- ***uint32_t RxFIFO0SA***
- ***uint32_t RxFIFO1SA***
- ***uint32_t TxEventFIFOSA***
- ***uint32_t TxFIFOQSA***

Field Documentation

- ***uint32_t FDCAN_MsgRamAddressTypeDef::StandardFilterSA***
  Specifies the Standard Filter List Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::ExtendedFilterSA***
  Specifies the Extended Filter List Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::RxFIFO0SA***
  Specifies the Rx FIFO 0 Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::RxFIFO1SA***
  Specifies the Rx FIFO 1 Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::TxEventFIFOSA***
  Specifies the Tx Event FIFO Start Address. This parameter must be a 32-bit word address
- ***uint32_t FDCAN_MsgRamAddressTypeDef::TxFIFOQSA***
  Specifies the Tx FIFO/Queue Start Address. This parameter must be a 32-bit word address

25.1.10 __FDCAN_HandleTypeDef

__FDCAN_HandleTypeDef is defined in the stm32u5xx_hal_fdcan.h

Data Fields

- ***FDCAN_GlobalTypeDef * Instance***
- ***FDCAN_InitTypeDef Init***
- ***FDCAN_MsgRamAddressTypeDef msgRam***
- ***uint32_t LatestTxFifoQRequest***
- ***__IO HAL_FDCAN_StateTypeDef State***
- ***HAL_LockTypeDef Lock***
- ***__IO uint32_t ErrorCode***
- ***void(* TxEventFifoCallback***
- ***void(* RxFifo0Callback***
- ***void(* RxFifo1Callback***

- *void(* TxFifoEmptyCallback*
- *void(* TxBufferCompleteCallback*
- *void(* TxBufferAbortCallback*
- *void(* HighPriorityMessageCallback*
- *void(* TimestampWraparoundCallback*
- *void(* TimeoutOccurredCallback*
- *void(* ErrorCallback*
- *void(* ErrorStatusCallback*
- *void(* MspInitCallback*
- *void(* MspDeInitCallback*

Field Documentation

- ***FDCAN_GlobalTypeDef* __FDCAN_HandleTypeDef::Instance***
  Register base address
- ***FDCAN_InitTypeDef __FDCAN_HandleTypeDef::Init***
  FDCAN required parameters
- ***FDCAN_MsgRamAddressTypeDef __FDCAN_HandleTypeDef::msgRam***
  FDCAN Message RAM blocks
- ***uint32_t __FDCAN_HandleTypeDef::LatestTxFifoQRequest***
  FDCAN Tx buffer index of latest Tx FIFO/Queue request
- ***__IO HAL_FDCAN_StateTypeDef __FDCAN_HandleTypeDef::State***
  FDCAN communication state
- ***HAL_LockTypeDef __FDCAN_HandleTypeDef::Lock***
  FDCAN locking object
- ***__IO uint32_t __FDCAN_HandleTypeDef::ErrorCode***
  FDCAN Error code
- ***void(* __FDCAN_HandleTypeDef::TxEventFifoCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t TxEventFifoITs)***
  FDCAN Tx Event Fifo callback
- ***void(* __FDCAN_HandleTypeDef::RxFifo0Callback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t RxFifo0ITs)***
  FDCAN Rx Fifo 0 callback
- ***void(* __FDCAN_HandleTypeDef::RxFifo1Callback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t RxFifo1ITs)***
  FDCAN Rx Fifo 1 callback
- ***void(* __FDCAN_HandleTypeDef::TxFifoEmptyCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Tx Fifo Empty callback
- ***void(* __FDCAN_HandleTypeDef::TxBufferCompleteCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t BufferIndexes)***
  FDCAN Tx Buffer complete callback
- ***void(* __FDCAN_HandleTypeDef::TxBufferAbortCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t BufferIndexes)***
  FDCAN Tx Buffer abort callback
- ***void(* __FDCAN_HandleTypeDef::HighPriorityMessageCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN High priority message callback
- ***void(* __FDCAN_HandleTypeDef::TimestampWraparoundCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Timestamp wraparound callback
- ***void(* __FDCAN_HandleTypeDef::TimeoutOccurredCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Timeout occurred callback
- ***void(* __FDCAN_HandleTypeDef::ErrorCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Error callback

- ***void(* __FDCAN_HandleTypeDef::ErrorStatusCallback)(struct __FDCAN_HandleTypeDef *hfdcan, uint32_t ErrorStatusITs)***
  FDCAN Error status callback
- ***void(* __FDCAN_HandleTypeDef::MspInitCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Msp Init callback
- ***void(* __FDCAN_HandleTypeDef::MspDeInitCallback)(struct __FDCAN_HandleTypeDef *hfdcan)***
  FDCAN Msp DeInit callback

25.2 FDCAN Firmware driver API description

The following section lists the various functions of the FDCAN library.

25.2.1 How to use this driver

1. Initialize the FDCAN peripheral using HAL_FDCAN_Init function.
2. If needed , configure the reception filters and optional features using the following configuration functions:
   – HAL_FDCAN_ConfigFilter
   – HAL_FDCAN_ConfigGlobalFilter
   – HAL_FDCAN_ConfigExtendedIdMask
   – HAL_FDCAN_ConfigRxFifoOverwrite
   – HAL_FDCAN_ConfigRamWatchdog
   – HAL_FDCAN_ConfigTimestampCounter
   – HAL_FDCAN_EnableTimestampCounter
   – HAL_FDCAN_DisableTimestampCounter
   – HAL_FDCAN_ConfigTimeoutCounter
   – HAL_FDCAN_EnableTimeoutCounter
   – HAL_FDCAN_DisableTimeoutCounter
   – HAL_FDCAN_ConfigTxDelayCompensation
   – HAL_FDCAN_EnableTxDelayCompensation
   – HAL_FDCAN_DisableTxDelayCompensation
   – HAL_FDCAN_EnableISOMode
   – HAL_FDCAN_DisableISOMode
   – HAL_FDCAN_EnableEdgeFiltering
   – HAL_FDCAN_DisableEdgeFiltering
3. Start the FDCAN module using HAL_FDCAN_Start function. At this level the node is active on the bus: it can send and receive messages.
4. The following Tx control functions can only be called when the FDCAN module is started:
   – HAL_FDCAN_AddMessageToTxFifoQ
   – HAL_FDCAN_AbortTxRequest
5. After having submitted a Tx request in Tx Fifo or Queue, it is possible to get Tx buffer location used to place the Tx request thanks to HAL_FDCAN_GetLatestTxFifoQRequestBuffer API. It is then possible to abort later on the corresponding Tx Request using HAL_FDCAN_AbortTxRequest API.
6. When a message is received into the FDCAN message RAM, it can be retrieved using the HAL_FDCAN_GetRxMessage function.
7. Calling the HAL_FDCAN_Stop function stops the FDCAN module by entering it to initialization mode and re-enabling access to configuration registers through the configuration functions listed here above.
8. All other control functions can be called any time after initialization phase, no matter if the FDCAN module is started or stopped.

Polling mode operation

1. Reception and transmission states can be monitored via the following functions:
   – HAL_FDCAN_IsTxBufferMessagePending
   – HAL_FDCAN_GetRxFifoFillLevel
   – HAL_FDCAN_GetTxFifoFreeLevel

Interrupt mode operation

1. There are two interrupt lines: line 0 and 1. By default, all interrupts are assigned to line 0. Interrupt lines can be configured using HAL_FDCAN_ConfigInterruptLines function.
2. Notifications are activated using HAL_FDCAN_ActivateNotification function. Then, the process can be controlled through one of the available user callbacks: HAL_FDCAN_xxxCallback.

Callback registration

25.2.2 Initialization and de-initialization functions

This section provides functions allowing to:
- Initialize and configure the FDCAN.
- De-initialize the FDCAN.
- Enter FDCAN peripheral in power down mode.
- Exit power down mode.
- Register callbacks.
- Unregister callbacks.

This section contains the following APIs:
- *HAL_FDCAN_Init()*
- *HAL_FDCAN_DeInit()*
- *HAL_FDCAN_MspInit()*
- *HAL_FDCAN_MspDeInit()*
- *HAL_FDCAN_EnterPowerDownMode()*
- *HAL_FDCAN_ExitPowerDownMode()*
- *HAL_FDCAN_RegisterCallback()*
- *HAL_FDCAN_UnRegisterCallback()*
- *HAL_FDCAN_RegisterTxEventFifoCallback()*
- *HAL_FDCAN_UnRegisterTxEventFifoCallback()*
- *HAL_FDCAN_RegisterRxFifo0Callback()*
- *HAL_FDCAN_UnRegisterRxFifo0Callback()*
- *HAL_FDCAN_RegisterRxFifo1Callback()*
- *HAL_FDCAN_UnRegisterRxFifo1Callback()*
- *HAL_FDCAN_RegisterTxBufferCompleteCallback()*
- *HAL_FDCAN_UnRegisterTxBufferCompleteCallback()*
- *HAL_FDCAN_RegisterTxBufferAbortCallback()*
- *HAL_FDCAN_UnRegisterTxBufferAbortCallback()*
- *HAL_FDCAN_RegisterErrorStatusCallback()*
- *HAL_FDCAN_UnRegisterErrorStatusCallback()*
- *HAL_FDCAN_RegisterCallback()*

25.2.3 Configuration functions

This section provides functions allowing to:
- HAL_FDCAN_ConfigFilter : Configure the FDCAN reception filters
- HAL_FDCAN_ConfigGlobalFilter : Configure the FDCAN global filter
- HAL_FDCAN_ConfigExtendedIdMask : Configure the extended ID mask
- HAL_FDCAN_ConfigRxFifoOverwrite : Configure the Rx FIFO operation mode
- HAL_FDCAN_ConfigRamWatchdog : Configure the RAM watchdog
- HAL_FDCAN_ConfigTimestampCounter : Configure the timestamp counter
- HAL_FDCAN_EnableTimestampCounter : Enable the timestamp counter
- HAL_FDCAN_DisableTimestampCounter : Disable the timestamp counter

- HAL_FDCAN_GetTimestampCounter : Get the timestamp counter value
- HAL_FDCAN_ResetTimestampCounter : Reset the timestamp counter to zero
- HAL_FDCAN_ConfigTimeoutCounter : Configure the timeout counter
- HAL_FDCAN_EnableTimeoutCounter : Enable the timeout counter
- HAL_FDCAN_DisableTimeoutCounter : Disable the timeout counter
- HAL_FDCAN_GetTimeoutCounter : Get the timeout counter value
- HAL_FDCAN_ResetTimeoutCounter : Reset the timeout counter to its start value
- HAL_FDCAN_ConfigTxDelayCompensation : Configure the transmitter delay compensation
- HAL_FDCAN_EnableTxDelayCompensation : Enable the transmitter delay compensation
- HAL_FDCAN_DisableTxDelayCompensation : Disable the transmitter delay compensation
- HAL_FDCAN_EnableISOMode : Enable ISO 11898-1 protocol mode
- HAL_FDCAN_DisableISOMode : Disable ISO 11898-1 protocol mode
- HAL_FDCAN_EnableEdgeFiltering : Enable edge filtering during bus integration
- HAL_FDCAN_DisableEdgeFiltering : Disable edge filtering during bus integration

This section contains the following APIs:

- ***HAL_FDCAN_ConfigFilter()***
- ***HAL_FDCAN_ConfigGlobalFilter()***
- ***HAL_FDCAN_ConfigExtendedIdMask()***
- ***HAL_FDCAN_ConfigRxFifoOverwrite()***
- ***HAL_FDCAN_ConfigRamWatchdog()***
- ***HAL_FDCAN_ConfigTimestampCounter()***
- ***HAL_FDCAN_EnableTimestampCounter()***
- ***HAL_FDCAN_DisableTimestampCounter()***
- ***HAL_FDCAN_GetTimestampCounter()***
- ***HAL_FDCAN_ResetTimestampCounter()***
- ***HAL_FDCAN_ConfigTimeoutCounter()***
- ***HAL_FDCAN_EnableTimeoutCounter()***
- ***HAL_FDCAN_DisableTimeoutCounter()***
- ***HAL_FDCAN_GetTimeoutCounter()***
- ***HAL_FDCAN_ResetTimeoutCounter()***
- ***HAL_FDCAN_ConfigTxDelayCompensation()***
- ***HAL_FDCAN_EnableTxDelayCompensation()***
- ***HAL_FDCAN_DisableTxDelayCompensation()***
- ***HAL_FDCAN_EnableISOMode()***
- ***HAL_FDCAN_DisableISOMode()***
- ***HAL_FDCAN_EnableEdgeFiltering()***
- ***HAL_FDCAN_DisableEdgeFiltering()***

25.2.4 Control functions

This section provides functions allowing to:

- HAL_FDCAN_Start : Start the FDCAN module
- HAL_FDCAN_Stop : Stop the FDCAN module and enable access to configuration registers
- HAL_FDCAN_AddMessageToTxFifoQ : Add a message to the Tx FIFO/Queue and activate the corresponding transmission request
- HAL_FDCAN_GetLatestTxFifoQRequestBuffer : Get Tx buffer index of latest Tx FIFO/Queue request
- HAL_FDCAN_AbortTxRequest : Abort transmission request
- HAL_FDCAN_GetRxMessage : Get an FDCAN frame from the Rx FIFO zone into the message RAM
- HAL_FDCAN_GetTxEvent : Get an FDCAN Tx event from the Tx Event FIFO zone into the message RAM
- HAL_FDCAN_GetHighPriorityMessageStatus : Get high priority message status
- HAL_FDCAN_GetProtocolStatus : Get protocol status

- HAL_FDCAN_GetErrorCounters : Get error counter values
- HAL_FDCAN_IsTxBufferMessagePending : Check if a transmission request is pending on the selected Tx buffer
- HAL_FDCAN_GetRxFifoFillLevel : Return Rx FIFO fill level
- HAL_FDCAN_GetTxFifoFreeLevel : Return Tx FIFO free level
- HAL_FDCAN_IsRestrictedOperationMode : Check if the FDCAN peripheral entered Restricted Operation Mode
- HAL_FDCAN_ExitRestrictedOperationMode : Exit Restricted Operation Mode

This section contains the following APIs:
- ***HAL_FDCAN_Start()***
- ***HAL_FDCAN_Stop()***
- ***HAL_FDCAN_AddMessageToTxFifoQ()***
- ***HAL_FDCAN_GetLatestTxFifoQRequestBuffer()***
- ***HAL_FDCAN_AbortTxRequest()***
- ***HAL_FDCAN_GetRxMessage()***
- ***HAL_FDCAN_GetTxEvent()***
- ***HAL_FDCAN_GetHighPriorityMessageStatus()***
- ***HAL_FDCAN_GetProtocolStatus()***
- ***HAL_FDCAN_GetErrorCounters()***
- ***HAL_FDCAN_IsTxBufferMessagePending()***
- ***HAL_FDCAN_GetRxFifoFillLevel()***
- ***HAL_FDCAN_GetTxFifoFreeLevel()***
- ***HAL_FDCAN_IsRestrictedOperationMode()***
- ***HAL_FDCAN_ExitRestrictedOperationMode()***

25.2.5 Interrupts management

This section provides functions allowing to:
- HAL_FDCAN_ConfigInterruptLines : Assign interrupts to either Interrupt line 0 or 1
- HAL_FDCAN_ActivateNotification : Enable interrupts
- HAL_FDCAN_DeactivateNotification : Disable interrupts
- HAL_FDCAN_IRQHandler : Handles FDCAN interrupt request

This section contains the following APIs:
- ***HAL_FDCAN_ConfigInterruptLines()***
- ***HAL_FDCAN_ActivateNotification()***
- ***HAL_FDCAN_DeactivateNotification()***
- ***HAL_FDCAN_IRQHandler()***

25.2.6 Callback functions

This subsection provides the following callback functions:
- HAL_FDCAN_TxEventFifoCallback
- HAL_FDCAN_RxFifo0Callback
- HAL_FDCAN_RxFifo1Callback
- HAL_FDCAN_TxFifoEmptyCallback
- HAL_FDCAN_TxBufferCompleteCallback
- HAL_FDCAN_TxBufferAbortCallback
- HAL_FDCAN_HighPriorityMessageCallback
- HAL_FDCAN_TimestampWraparoundCallback
- HAL_FDCAN_TimeoutOccurredCallback
- HAL_FDCAN_ErrorCallback
- HAL_FDCAN_ErrorStatusCallback

This section contains the following APIs:
- *HAL_FDCAN_TxEventFifoCallback()*
- *HAL_FDCAN_RxFifo0Callback()*
- *HAL_FDCAN_RxFifo1Callback()*
- *HAL_FDCAN_TxFifoEmptyCallback()*
- *HAL_FDCAN_TxBufferCompleteCallback()*
- *HAL_FDCAN_TxBufferAbortCallback()*
- *HAL_FDCAN_TimestampWraparoundCallback()*
- *HAL_FDCAN_TimeoutOccurredCallback()*
- *HAL_FDCAN_HighPriorityMessageCallback()*
- *HAL_FDCAN_ErrorCallback()*
- *HAL_FDCAN_ErrorStatusCallback()*

25.2.7 Peripheral State functions

This subsection provides functions allowing to :
- HAL_FDCAN_GetState() : Return the FDCAN state.
- HAL_FDCAN_GetError() : Return the FDCAN error code if any.

This section contains the following APIs:
- *HAL_FDCAN_GetState()*
- *HAL_FDCAN_GetError()*

25.2.8 Detailed description of functions

HAL_FDCAN_Init

Function name

HAL_StatusTypeDef HAL_FDCAN_Init (FDCAN_HandleTypeDef * hfdcan)

Function description

Initializes the FDCAN peripheral according to the specified parameters in the FDCAN_InitTypeDef structure.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_DeInit

Function name

HAL_StatusTypeDef HAL_FDCAN_DeInit (FDCAN_HandleTypeDef * hfdcan)

Function description

Deinitializes the FDCAN peripheral registers to their default reset values.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_MspInit

Function name

void HAL_FDCAN_MspInit (FDCAN_HandleTypeDef * hfdcan)

Function description

Initializes the FDCAN MSP.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_MspDeInit

Function name

void HAL_FDCAN_MspDeInit (FDCAN_HandleTypeDef * hfdcan)

Function description

DeInitializes the FDCAN MSP.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_EnterPowerDownMode

Function name

HAL_StatusTypeDef HAL_FDCAN_EnterPowerDownMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Enter FDCAN peripheral in sleep mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_ExitPowerDownMode

Function name

HAL_StatusTypeDef HAL_FDCAN_ExitPowerDownMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Exit power down mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_RegisterCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterCallback (FDCAN_HandleTypeDef * hfdcan, HAL_FDCAN_CallbackIDTypeDef CallbackID, pFDCAN_CallbackTypeDef pCallback)

Function description

HAL_FDCAN_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterCallback (FDCAN_HandleTypeDef * hfdcan, HAL_FDCAN_CallbackIDTypeDef CallbackID)

Function description

Unregister a FDCAN CallBack.

Parameters

- **hfdcan:** pointer to a FDCAN_HandleTypeDef structure that contains the configuration information for FDCAN module
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_FDCAN_TX_FIFO_EMPTY_CB_ID Tx Fifo Empty callback ID
  - HAL_FDCAN_HIGH_PRIO_MESSAGE_CB_ID High priority message callback ID
  - HAL_FDCAN_TIMESTAMP_WRAPAROUND_CB_ID Timestamp wraparound callback ID
  - HAL_FDCAN_TIMEOUT_OCCURRED_CB_ID Timeout occurred callback ID
  - HAL_FDCAN_ERROR_CALLBACK_CB_ID Error callback ID
  - HAL_FDCAN_MSPINIT_CB_ID MspInit callback ID
  - HAL_FDCAN_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_FDCAN_RegisterTxEventFifoCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTxEventFifoCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TxEventFifoCallbackTypeDef pCallback)

Function description

Register Tx Event Fifo FDCAN Callback To be used instead of the weak HAL_FDCAN_TxEventFifoCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Tx Event Fifo Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterTxEventFifoCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTxEventFifoCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Tx Event Fifo FDCAN Callback Tx Event Fifo FDCAN Callback is redirected to the weak HAL_FDCAN_TxEventFifoCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterRxFifo0Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterRxFifo0Callback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_RxFifo0CallbackTypeDef pCallback)

Function description

Register Rx Fifo 0 FDCAN Callback To be used instead of the weak HAL_FDCAN_RxFifo0Callback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Rx Fifo 0 Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterRxFifo0Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterRxFifo0Callback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Rx Fifo 0 FDCAN Callback Rx Fifo 0 FDCAN Callback is redirected to the weak HAL_FDCAN_RxFifo0Callback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterRxFifo1Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterRxFifo1Callback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_RxFifo1CallbackTypeDef pCallback)

Function description

Register Rx Fifo 1 FDCAN Callback To be used instead of the weak HAL_FDCAN_RxFifo1Callback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Rx Fifo 1 Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterRxFifo1Callback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterRxFifo1Callback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Rx Fifo 1 FDCAN Callback Rx Fifo 1 FDCAN Callback is redirected to the weak HAL_FDCAN_RxFifo1Callback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterTxBufferCompleteCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTxBufferCompleteCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TxBufferCompleteCallbackTypeDef pCallback)

Function description

Register Tx Buffer Complete FDCAN Callback To be used instead of the weak HAL_FDCAN_TxBufferCompleteCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Tx Buffer Complete Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterTxBufferCompleteCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTxBufferCompleteCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Tx Buffer Complete FDCAN Callback Tx Buffer Complete FDCAN Callback is redirected to the weak HAL_FDCAN_TxBufferCompleteCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterTxBufferAbortCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterTxBufferAbortCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_TxBufferAbortCallbackTypeDef pCallback)

Function description

Register Tx Buffer Abort FDCAN Callback To be used instead of the weak HAL_FDCAN_TxBufferAbortCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Tx Buffer Abort Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterTxBufferAbortCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterTxBufferAbortCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Tx Buffer Abort FDCAN Callback Tx Buffer Abort FDCAN Callback is redirected to the weak HAL_FDCAN_TxBufferAbortCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_RegisterErrorStatusCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_RegisterErrorStatusCallback (FDCAN_HandleTypeDef * hfdcan, pFDCAN_ErrorStatusCallbackTypeDef pCallback)

Function description

Register Error Status FDCAN Callback To be used instead of the weak HAL_FDCAN_ErrorStatusCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle
- **pCallback:** pointer to the Error Status Callback function

Return values

- **HAL:** status

HAL_FDCAN_UnRegisterErrorStatusCallback

Function name

HAL_StatusTypeDef HAL_FDCAN_UnRegisterErrorStatusCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

UnRegister the Error Status FDCAN Callback Error Status FDCAN Callback is redirected to the weak HAL_FDCAN_ErrorStatusCallback() predefined callback.

Parameters

- **hfdcan:** FDCAN handle

Return values

- **HAL:** status

HAL_FDCAN_ConfigFilter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigFilter (FDCAN_HandleTypeDef * hfdcan, const FDCAN_FilterTypeDef * sFilterConfig)

Function description

Configure the FDCAN reception filter according to the specified parameters in the FDCAN_FilterTypeDef structure.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **sFilterConfig:** pointer to an FDCAN_FilterTypeDef structure that contains the filter configuration information

Return values

- **HAL:** status

HAL_FDCAN_ConfigGlobalFilter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigGlobalFilter (FDCAN_HandleTypeDef * hfdcan, uint32_t NonMatchingStd, uint32_t NonMatchingExt, uint32_t RejectRemoteStd, uint32_t RejectRemoteExt)

Function description

Configure the FDCAN global filter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **NonMatchingStd:** Defines how received messages with 11-bit IDs that do not match any element of the filter list are treated. This parameter can be a value of
  – FDCAN_Non_Matching_Frames.
- **NonMatchingExt:** Defines how received messages with 29-bit IDs that do not match any element of the filter list are treated. This parameter can be a value of
  – FDCAN_Non_Matching_Frames.
- **RejectRemoteStd:** Filter or reject all the remote 11-bit IDs frames. This parameter can be a value of
  – FDCAN_Reject_Remote_Frames.
- **RejectRemoteExt:** Filter or reject all the remote 29-bit IDs frames. This parameter can be a value of
  – FDCAN_Reject_Remote_Frames.

Return values

- **HAL:** status

HAL_FDCAN_ConfigExtendedIdMask

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigExtendedIdMask (FDCAN_HandleTypeDef * hfdcan, uint32_t Mask)

Function description

Configure the extended ID mask.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **Mask:** Extended ID Mask. This parameter must be a number between 0 and 0x1FFFFFFF.

Return values

- **HAL:** status

HAL_FDCAN_ConfigRxFifoOverwrite

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigRxFifoOverwrite (FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo, uint32_t OperationMode)

Function description

Configure the Rx FIFO operation mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxFifo:** Rx FIFO. This parameter can be one of the following values:
  - FDCAN_RX_FIFO0: Rx FIFO 0
  - FDCAN_RX_FIFO1: Rx FIFO 1
- **OperationMode:** operation mode. This parameter can be a value of
  - FDCAN_Rx_FIFO_operation_mode.

Return values

- **HAL:** status

HAL_FDCAN_ConfigRamWatchdog

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigRamWatchdog (FDCAN_HandleTypeDef * hfdcan, uint32_t CounterStartValue)

Function description

Configure the RAM watchdog.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **CounterStartValue:** Start value of the Message RAM Watchdog Counter, This parameter must be a number between 0x00 and 0xFF, with the reset value of 0x00 the counter is disabled.

Return values

- **HAL:** status

HAL_FDCAN_ConfigTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigTimestampCounter (FDCAN_HandleTypeDef * hfdcan, uint32_t TimestampPrescaler)

Function description

Configure the timestamp counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TimestampPrescaler:** Timestamp Counter Prescaler. This parameter can be a value of
  – FDCAN_Timestamp_Prescaler.

Return values

- **HAL:** status

HAL_FDCAN_EnableTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableTimestampCounter (FDCAN_HandleTypeDef * hfdcan, uint32_t TimestampOperation)

Function description

Enable the timestamp counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TimestampOperation:** Timestamp counter operation. This parameter can be a value of
  – FDCAN_Timestamp.

Return values

- **HAL:** status

HAL_FDCAN_DisableTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableTimestampCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable the timestamp counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_GetTimestampCounter

Function name

uint16_t HAL_FDCAN_GetTimestampCounter (const FDCAN_HandleTypeDef * hfdcan)

Function description

Get the timestamp counter value.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **Timestamp:** counter value

HAL_FDCAN_ResetTimestampCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_ResetTimestampCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Reset the timestamp counter to zero.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_ConfigTimeoutCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigTimeoutCounter (FDCAN_HandleTypeDef * hfdcan, uint32_t TimeoutOperation, uint32_t TimeoutPeriod)

Function description

Configure the timeout counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TimeoutOperation:** Timeout counter operation. This parameter can be a value of
  – FDCAN_Timeout_Operation.
- **TimeoutPeriod:** Start value of the timeout down-counter. This parameter must be a number between 0x0000 and 0xFFFF

Return values

- **HAL:** status

HAL_FDCAN_EnableTimeoutCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableTimeoutCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable the timeout counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_DisableTimeoutCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableTimeoutCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable the timeout counter.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_GetTimeoutCounter

Function name

uint16_t HAL_FDCAN_GetTimeoutCounter (const FDCAN_HandleTypeDef * hfdcan)

Function description

Get the timeout counter value.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **Timeout:** counter value

HAL_FDCAN_ResetTimeoutCounter

Function name

HAL_StatusTypeDef HAL_FDCAN_ResetTimeoutCounter (FDCAN_HandleTypeDef * hfdcan)

Function description

Reset the timeout counter to its start value.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_ConfigTxDelayCompensation

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigTxDelayCompensation (FDCAN_HandleTypeDef * hfdcan, uint32_t TdcOffset, uint32_t TdcFilter)

Function description

Configure the transmitter delay compensation.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TdcOffset:** Transmitter Delay Compensation Offset. This parameter must be a number between 0x00 and 0x7F.
- **TdcFilter:** Transmitter Delay Compensation Filter Window Length. This parameter must be a number between 0x00 and 0x7F.

Return values

- **HAL:** status

HAL_FDCAN_EnableTxDelayCompensation

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableTxDelayCompensation (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable the transmitter delay compensation.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_DisableTxDelayCompensation

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableTxDelayCompensation (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable the transmitter delay compensation.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_EnableISOMode

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableISOMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable ISO 11898-1 protocol mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_DisableISOMode

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableISOMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable ISO 11898-1 protocol mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_EnableEdgeFiltering

Function name

HAL_StatusTypeDef HAL_FDCAN_EnableEdgeFiltering (FDCAN_HandleTypeDef * hfdcan)

Function description

Enable edge filtering during bus integration.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_DisableEdgeFiltering

Function name

HAL_StatusTypeDef HAL_FDCAN_DisableEdgeFiltering (FDCAN_HandleTypeDef * hfdcan)

Function description

Disable edge filtering during bus integration.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_Start

Function name

HAL_StatusTypeDef HAL_FDCAN_Start (FDCAN_HandleTypeDef * hfdcan)

Function description

Start the FDCAN module.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_Stop

Function name

HAL_StatusTypeDef HAL_FDCAN_Stop (FDCAN_HandleTypeDef * hfdcan)

Function description

Stop the FDCAN module and enable access to configuration registers.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_AddMessageToTxFifoQ

Function name

HAL_StatusTypeDef HAL_FDCAN_AddMessageToTxFifoQ (FDCAN_HandleTypeDef * hfdcan, const FDCAN_TxHeaderTypeDef * pTxHeader, const uint8_t * pTxData)

Function description

Add a message to the Tx FIFO/Queue and activate the corresponding transmission request.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **pTxHeader:** pointer to a FDCAN_TxHeaderTypeDef structure.
- **pTxData:** pointer to a buffer containing the payload of the Tx frame.

Return values

- **HAL:** status

HAL_FDCAN_GetLatestTxFifoQRequestBuffer

Function name

uint32_t HAL_FDCAN_GetLatestTxFifoQRequestBuffer (const FDCAN_HandleTypeDef * hfdcan)

Function description

Get Tx buffer index of latest Tx FIFO/Queue request.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **Tx:** buffer index of last Tx FIFO/Queue request
  - Any value of
    - FDCAN_Tx_location if Tx request has been submitted.
  - 0 if no Tx FIFO/Queue request have been submitted.

HAL_FDCAN_AbortTxRequest

Function name

HAL_StatusTypeDef HAL_FDCAN_AbortTxRequest (FDCAN_HandleTypeDef * hfdcan, uint32_t BufferIndex)

Function description

Abort transmission request.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **BufferIndex:** buffer index. This parameter can be any combination of
  - FDCAN_Tx_location.

Return values

- **HAL:** status

HAL_FDCAN_GetRxMessage

Function name

HAL_StatusTypeDef HAL_FDCAN_GetRxMessage (FDCAN_HandleTypeDef * hfdcan, uint32_t RxLocation, FDCAN_RxHeaderTypeDef * pRxHeader, uint8_t * pRxData)

Function description

Get an FDCAN frame from the Rx FIFO zone into the message RAM.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxLocation:** Location of the received message to be read. This parameter can be a value of
  – FDCAN_Rx_location.
- **pRxHeader:** pointer to a FDCAN_RxHeaderTypeDef structure.
- **pRxData:** pointer to a buffer where the payload of the Rx frame will be stored.

Return values

- **HAL:** status

HAL_FDCAN_GetTxEvent

Function name

HAL_StatusTypeDef HAL_FDCAN_GetTxEvent (FDCAN_HandleTypeDef * hfdcan, FDCAN_TxEventFifoTypeDef * pTxEvent)

Function description

Get an FDCAN Tx event from the Tx Event FIFO zone into the message RAM.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **pTxEvent:** pointer to a FDCAN_TxEventFifoTypeDef structure.

Return values

- **HAL:** status

HAL_FDCAN_GetHighPriorityMessageStatus

Function name

HAL_StatusTypeDef HAL_FDCAN_GetHighPriorityMessageStatus (const FDCAN_HandleTypeDef * hfdcan, FDCAN_HpMsgStatusTypeDef * HpMsgStatus)

Function description

Get high priority message status.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **HpMsgStatus:** pointer to an FDCAN_HpMsgStatusTypeDef structure.

Return values

- **HAL:** status

HAL_FDCAN_GetProtocolStatus

Function name

HAL_StatusTypeDef HAL_FDCAN_GetProtocolStatus (const FDCAN_HandleTypeDef * hfdcan, FDCAN_ProtocolStatusTypeDef * ProtocolStatus)

Function description

Get protocol status.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ProtocolStatus:** pointer to an FDCAN_ProtocolStatusTypeDef structure.

Return values

- **HAL:** status

HAL_FDCAN_GetErrorCounters

Function name

HAL_StatusTypeDef HAL_FDCAN_GetErrorCounters (const FDCAN_HandleTypeDef * hfdcan, FDCAN_ErrorCountersTypeDef * ErrorCounters)

Function description

Get error counter values.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ErrorCounters:** pointer to an FDCAN_ErrorCountersTypeDef structure.

Return values

- **HAL:** status

HAL_FDCAN_IsTxBufferMessagePending

Function name

uint32_t HAL_FDCAN_IsTxBufferMessagePending (const FDCAN_HandleTypeDef * hfdcan, uint32_t TxBufferIndex)

Function description

Check if a transmission request is pending on the selected Tx buffer.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TxBufferIndex:** Tx buffer index. This parameter can be any combination of
  – FDCAN_Tx_location.

Return values

- **Status:**
  – 0 : No pending transmission request on TxBufferIndex list.
  – 1 : Pending transmission request on TxBufferIndex.

HAL_FDCAN_GetRxFifoFillLevel

Function name

uint32_t HAL_FDCAN_GetRxFifoFillLevel (const FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo)

Function description

Return Rx FIFO fill level.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxFifo:** Rx FIFO. This parameter can be one of the following values:
  – FDCAN_RX_FIFO0: Rx FIFO 0
  – FDCAN_RX_FIFO1: Rx FIFO 1

Return values

- **Rx:** FIFO fill level.

HAL_FDCAN_GetTxFifoFreeLevel

Function name

uint32_t HAL_FDCAN_GetTxFifoFreeLevel (const FDCAN_HandleTypeDef * hfdcan)

Function description

Return Tx FIFO free level: number of consecutive free Tx FIFO elements starting from Tx FIFO GetIndex.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **Tx:** FIFO free level.

HAL_FDCAN_IsRestrictedOperationMode

Function name

uint32_t HAL_FDCAN_IsRestrictedOperationMode (const FDCAN_HandleTypeDef * hfdcan)

Function description

Check if the FDCAN peripheral entered Restricted Operation Mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **Status:**
  – 0 : Normal FDCAN operation.
  – 1 : Restricted Operation Mode active.

HAL_FDCAN_ExitRestrictedOperationMode

Function name

HAL_StatusTypeDef HAL_FDCAN_ExitRestrictedOperationMode (FDCAN_HandleTypeDef * hfdcan)

Function description

Exit Restricted Operation Mode.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_ConfigInterruptLines

Function name

HAL_StatusTypeDef HAL_FDCAN_ConfigInterruptLines (FDCAN_HandleTypeDef * hfdcan, uint32_t ITList, uint32_t InterruptLine)

Function description

Assign interrupts to either Interrupt line 0 or 1.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ITList:** indicates which interrupts group will be assigned to the selected interrupt line. This parameter can be any combination of
  - FDCAN_Interrupts_Group.
- **InterruptLine:** Interrupt line. This parameter can be a value of
  - FDCAN_Interrupt_Line.

Return values

- **HAL:** status

HAL_FDCAN_ActivateNotification

Function name

HAL_StatusTypeDef HAL_FDCAN_ActivateNotification (FDCAN_HandleTypeDef * hfdcan, uint32_t ActiveITs, uint32_t BufferIndexes)

Function description

Enable interrupts.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ActiveITs:** indicates which interrupts will be enabled. This parameter can be any combination of
  - FDCAN_Interrupts.
- **BufferIndexes:** Tx Buffer Indexes. This parameter can be any combination of
  - FDCAN_Tx_location. This parameter is ignored if ActiveITs does not include one of the following:
    - FDCAN_IT_TX_COMPLETE
    - FDCAN_IT_TX_ABORT_COMPLETE

Return values

- **HAL:** status

HAL_FDCAN_DeactivateNotification

Function name

HAL_StatusTypeDef HAL_FDCAN_DeactivateNotification (FDCAN_HandleTypeDef * hfdcan, uint32_t InactiveITs)

Function description

Disable interrupts.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **InactiveITs:** indicates which interrupts will be disabled. This parameter can be any combination of
  – FDCAN_Interrupts.

Return values

- **HAL:** status

HAL_FDCAN_IRQHandler

Function name

void HAL_FDCAN_IRQHandler (FDCAN_HandleTypeDef * hfdcan)

Function description

Handles FDCAN interrupt request.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** status

HAL_FDCAN_TxEventFifoCallback

Function name

void HAL_FDCAN_TxEventFifoCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t TxEventFifoITs)

Function description

Tx Event callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **TxEventFifoITs:** indicates which Tx Event FIFO interrupts are signaled. This parameter can be any combination of
  – FDCAN_Tx_Event_Fifo_Interrupts.

Return values

- **None:**

HAL_FDCAN_RxFifo0Callback

Function name

void HAL_FDCAN_RxFifo0Callback (FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo0ITs)

Function description

Rx FIFO 0 callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxFifo0ITs:** indicates which Rx FIFO 0 interrupts are signaled. This parameter can be any combination of
  - FDCAN_Rx_Fifo0_Interrupts.

Return values

- **None:**

HAL_FDCAN_RxFifo1Callback

Function name

void HAL_FDCAN_RxFifo1Callback (FDCAN_HandleTypeDef * hfdcan, uint32_t RxFifo1ITs)

Function description

Rx FIFO 1 callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **RxFifo1ITs:** indicates which Rx FIFO 1 interrupts are signaled. This parameter can be any combination of
  - FDCAN_Rx_Fifo1_Interrupts.

Return values

- **None:**

HAL_FDCAN_TxFifoEmptyCallback

Function name

void HAL_FDCAN_TxFifoEmptyCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

Tx FIFO Empty callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_TxBufferCompleteCallback

Function name

void HAL_FDCAN_TxBufferCompleteCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t BufferIndexes)

Function description

Transmission Complete callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **BufferIndexes:** Indexes of the transmitted buffers. This parameter can be any combination of
  - FDCAN_Tx_location.

Return values

- **None:**

HAL_FDCAN_TxBufferAbortCallback

Function name

void HAL_FDCAN_TxBufferAbortCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t BufferIndexes)

Function description

Transmission Cancellation callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **BufferIndexes:** Indexes of the aborted buffers. This parameter can be any combination of
  - FDCAN_Tx_location.

Return values

- **None:**

HAL_FDCAN_HighPriorityMessageCallback

Function name

void HAL_FDCAN_HighPriorityMessageCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

High Priority Message callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_TimestampWraparoundCallback

Function name

void HAL_FDCAN_TimestampWraparoundCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

Timestamp Wraparound callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_TimeoutOccurredCallback

Function name

void HAL_FDCAN_TimeoutOccurredCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

Timeout Occurred callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_ErrorCallback

Function name

void HAL_FDCAN_ErrorCallback (FDCAN_HandleTypeDef * hfdcan)

Function description

Error callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **None:**

HAL_FDCAN_ErrorStatusCallback

Function name

void HAL_FDCAN_ErrorStatusCallback (FDCAN_HandleTypeDef * hfdcan, uint32_t ErrorStatusITs)

Function description

Error status callback.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.
- **ErrorStatusITs:** indicates which Error Status interrupts are signaled. This parameter can be any combination of
  – FDCAN_Error_Status_Interrupts.

Return values

- **None:**

HAL_FDCAN_GetError

Function name

uint32_t HAL_FDCAN_GetError (const FDCAN_HandleTypeDef * hfdcan)

Function description

Return the FDCAN error code.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **FDCAN:** Error Code

HAL_FDCAN_GetState

Function name

HAL_FDCAN_StateTypeDef HAL_FDCAN_GetState (const FDCAN_HandleTypeDef * hfdcan)

Function description

Return the FDCAN state.

Parameters

- **hfdcan:** pointer to an FDCAN_HandleTypeDef structure that contains the configuration information for the specified FDCAN.

Return values

- **HAL:** state

25.3 FDCAN Firmware driver defines

The following section lists the various define and macros of the module.

25.3.1 FDCAN

FDCAN

FDCAN Bit Rate Switching

FDCAN_BRS_OFF

FDCAN frames transmitted/received without bit rate switching

FDCAN_BRS_ON

FDCAN frames transmitted/received with bit rate switching

FDCAN Clock Divider

FDCAN_CLOCK_DIV1

Divide kernel clock by 1

FDCAN_CLOCK_DIV2

Divide kernel clock by 2

FDCAN_CLOCK_DIV4

Divide kernel clock by 4

FDCAN_CLOCK_DIV6

Divide kernel clock by 6

FDCAN_CLOCK_DIV8

Divide kernel clock by 8

FDCAN_CLOCK_DIV10

Divide kernel clock by 10

FDCAN_CLOCK_DIV12

Divide kernel clock by 12

FDCAN_CLOCK_DIV14

Divide kernel clock by 14

FDCAN_CLOCK_DIV16

Divide kernel clock by 16

FDCAN_CLOCK_DIV18

Divide kernel clock by 18

FDCAN_CLOCK_DIV20

Divide kernel clock by 20

FDCAN_CLOCK_DIV22

Divide kernel clock by 22

FDCAN_CLOCK_DIV24

Divide kernel clock by 24

FDCAN_CLOCK_DIV26

Divide kernel clock by 26

FDCAN_CLOCK_DIV28

Divide kernel clock by 28

FDCAN_CLOCK_DIV30

Divide kernel clock by 30

FDCAN communication state

FDCAN_COM_STATE_SYNC

Node is synchronizing on CAN communication

FDCAN_COM_STATE_IDLE

Node is neither receiver nor transmitter

FDCAN_COM_STATE_RX

Node is operating as receiver

FDCAN_COM_STATE_TX

Node is operating as transmitter

FDCAN Counter Interrupts

FDCAN_IT_TIMESTAMP_WRAPAROUND

Timestamp counter wrapped around

FDCAN_IT_TIMEOUT_OCCURRED

Timeout reached

FDCAN Data Length Code

FDCAN_DLC_BYTES_0

0 bytes data field

FDCAN_DLC_BYTES_1

1 bytes data field

FDCAN_DLC_BYTES_2

2 bytes data field

FDCAN_DLC_BYTES_3

3 bytes data field

FDCAN_DLC_BYTES_4

4 bytes data field

FDCAN_DLC_BYTES_5

5 bytes data field

FDCAN_DLC_BYTES_6

6 bytes data field

FDCAN_DLC_BYTES_7

7 bytes data field

FDCAN_DLC_BYTES_8

8 bytes data field

FDCAN_DLC_BYTES_12

12 bytes data field

FDCAN_DLC_BYTES_16

16 bytes data field

FDCAN_DLC_BYTES_20

20 bytes data field

FDCAN_DLC_BYTES_24

24 bytes data field

FDCAN_DLC_BYTES_32

32 bytes data field

FDCAN_DLC_BYTES_48

48 bytes data field

FDCAN_DLC_BYTES_64

64 bytes data field

FDCAN Error Interrupts

FDCAN_IT_RAM_ACCESS_FAILURE

Message RAM access failure occurred

FDCAN_IT_ERROR_LOGGING_OVERFLOW

Overflow of FDCAN Error Logging Counter occurred

FDCAN_IT_RAM_WATCHDOG

Message RAM Watchdog event due to missing READY

FDCAN_IT_ARB_PROTOCOL_ERROR

Protocol error in arbitration phase detected

FDCAN_IT_DATA_PROTOCOL_ERROR

Protocol error in data phase detected

FDCAN_IT_RESERVED_ADDRESS_ACCESS

Access to reserved address occurred

FDCAN Error State Indicator

FDCAN_ESI_ACTIVE

Transmitting node is error active

FDCAN_ESI_PASSIVE

Transmitting node is error passive

FDCAN Error Status Interrupts

FDCAN_IT_ERROR_PASSIVE

Error_Passive status changed

FDCAN_IT_ERROR_WARNING

Error_Warning status changed

FDCAN_IT_BUS_OFF

Bus_Off status changed

FDCAN Event Type

FDCAN_TX_EVENT

Tx event

FDCAN_TX_IN_SPITE_OF_ABORT

Transmission in spite of cancellation

FDCAN Exported Macros

__HAL_FDCAN_RESET_HANDLE_STATE

Description:
- Reset FDCAN handle state.

Parameters:
- __HANDLE__: FDCAN handle.

Return value:
- None

__HAL_FDCAN_ENABLE_IT

Description:
- Enable the specified FDCAN interrupts.

Parameters:
- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN interrupt. This parameter can be any combination of
  – FDCAN_Interrupts

Return value:
- None

__HAL_FDCAN_DISABLE_IT

Description:
- Disable the specified FDCAN interrupts.

Parameters:
- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN interrupt. This parameter can be any combination of
  – FDCAN_Interrupts

Return value:
- None

__HAL_FDCAN_GET_IT

Description:
- Check whether the specified FDCAN interrupt is set or not.

Parameters:
- __HANDLE__: FDCAN handle.
- __INTERRUPT__: FDCAN interrupt. This parameter can be one of
  - FDCAN_Interrupts

Return value:
- ITStatus

__HAL_FDCAN_CLEAR_IT

Description:
- Clear the specified FDCAN interrupts.

Parameters:
- __HANDLE__: FDCAN handle.
- __INTERRUPT__: specifies the interrupts to clear. This parameter can be any combination of
  - FDCAN_Interrupts

Return value:
- None

__HAL_FDCAN_GET_FLAG

Description:
- Check whether the specified FDCAN flag is set or not.

Parameters:
- __HANDLE__: FDCAN handle.
- __FLAG__: FDCAN flag. This parameter can be one of
  - FDCAN_flags

Return value:
- FlagStatus

__HAL_FDCAN_CLEAR_FLAG

Description:
- Clear the specified FDCAN flags.

Parameters:
- __HANDLE__: FDCAN handle.
- __FLAG__: specifies the flags to clear. This parameter can be any combination of
  - FDCAN_flags

Return value:
- None

__HAL_FDCAN_GET_IT_SOURCE

Description:
- Check if the specified FDCAN interrupt source is enabled or disabled.

Parameters:
- __HANDLE__: FDCAN handle.
- __INTERRUPT__: specifies the FDCAN interrupt source to check. This parameter can be a value of
  - FDCAN_Interrupts

Return value:
- ITStatus

FDCAN Filter Configuration

FDCAN_FILTER_DISABLE

Disable filter element

FDCAN_FILTER_TO_RXFIFO0

Store in Rx FIFO 0 if filter matches

FDCAN_FILTER_TO_RXFIFO1

Store in Rx FIFO 1 if filter matches

FDCAN_FILTER_REJECT

Reject ID if filter matches

FDCAN_FILTER_HP

Set high priority if filter matches

FDCAN_FILTER_TO_RXFIFO0_HP

Set high priority and store in FIFO 0 if filter matches

FDCAN_FILTER_TO_RXFIFO1_HP

Set high priority and store in FIFO 1 if filter matches

FDCAN Filter Type

FDCAN_FILTER_RANGE

Range filter from FilterID1 to FilterID2

FDCAN_FILTER_DUAL

Dual ID filter for FilterID1 or FilterID2

FDCAN_FILTER_MASK

Classic filter: FilterID1 = filter, FilterID2 = mask

FDCAN_FILTER_RANGE_NO_EIDM

Range filter from FilterID1 to FilterID2, EIDM mask not applied

FDCAN Flags

FDCAN_FLAG_TX_COMPLETE

Transmission Completed

FDCAN_FLAG_TX_ABORT_COMPLETE

Transmission Cancellation Finished

FDCAN_FLAG_TX_FIFO_EMPTY

Tx FIFO Empty

FDCAN_FLAG_RX_HIGH_PRIORITY_MSG

High priority message received

FDCAN_FLAG_TX_EVT_FIFO_ELT_LOST

Tx Event FIFO element lost

FDCAN_FLAG_TX_EVT_FIFO_FULL

Tx Event FIFO full

FDCAN_FLAG_TX_EVT_FIFO_NEW_DATA
Tx Handler wrote Tx Event FIFO element

FDCAN_FLAG_RX_FIFO0_MESSAGE_LOST
Rx FIFO 0 message lost

FDCAN_FLAG_RX_FIFO0_FULL
Rx FIFO 0 full

FDCAN_FLAG_RX_FIFO0_NEW_MESSAGE
New message written to Rx FIFO 0

FDCAN_FLAG_RX_FIFO1_MESSAGE_LOST
Rx FIFO 1 message lost

FDCAN_FLAG_RX_FIFO1_FULL
Rx FIFO 1 full

FDCAN_FLAG_RX_FIFO1_NEW_MESSAGE
New message written to Rx FIFO 1

FDCAN_FLAG_RAM_ACCESS_FAILURE
Message RAM access failure occurred

FDCAN_FLAG_ERROR_LOGGING_OVERFLOW
Overflow of FDCAN Error Logging Counter occurred

FDCAN_FLAG_ERROR_PASSIVE
Error_Passive status changed

FDCAN_FLAG_ERROR_WARNING
Error_Warning status changed

FDCAN_FLAG_BUS_OFF
Bus_Off status changed

FDCAN_FLAG_RAM_WATCHDOG
Message RAM Watchdog event due to missing READY

FDCAN_FLAG_ARB_PROTOCOL_ERROR
Protocol error in arbitration phase detected

FDCAN_FLAG_DATA_PROTOCOL_ERROR
Protocol error in data phase detected

FDCAN_FLAG_RESERVED_ADDRESS_ACCESS
Access to reserved address occurred

FDCAN_FLAG_TIMESTAMP_WRAPAROUND
Timestamp counter wrapped around

FDCAN_FLAG_TIMEOUT_OCCURRED
Timeout reached

FDCAN format

FDCAN_CLASSIC_CAN
Frame transmitted/received in Classic CAN format

FDCAN_FD_CAN

Frame transmitted/received in FDCAN format

FDCAN Frame Format

FDCAN_FRAME_CLASSIC

Classic mode

FDCAN_FRAME_FD_NO_BRS

FD mode without BitRate Switching

FDCAN_FRAME_FD_BRS

FD mode with BitRate Switching

FDCAN Frame Type

FDCAN_DATA_FRAME

Data frame

FDCAN_REMOTE_FRAME

Remote frame

FDCAN High Priority Message Storage

FDCAN_HP_STORAGE_NO_FIFO

No FIFO selected

FDCAN_HP_STORAGE_MSG_LOST

FIFO message lost

FDCAN_HP_STORAGE_RXFIFO0

Message stored in FIFO 0

FDCAN_HP_STORAGE_RXFIFO1

Message stored in FIFO 1

FDCAN ID Type

FDCAN_STANDARD_ID

Standard ID element

FDCAN_EXTENDED_ID

Extended ID element

FDCAN Interrupts Group

FDCAN_IT_GROUP_RX_FIFO0

RX FIFO 0 Interrupts Group: RF0LL: Rx FIFO 0 Message Lost RF0FL: Rx FIFO 0 is Full RF0NL: Rx FIFO 0 Has New Message

FDCAN_IT_GROUP_RX_FIFO1

RX FIFO 1 Interrupts Group: RF1LL: Rx FIFO 1 Message Lost RF1FL: Rx FIFO 1 is Full RF1NL: Rx FIFO 1 Has New Message

FDCAN_IT_GROUP_SMSG

Status Message Interrupts Group: TCFL: Transmission Cancellation Finished TCL: Transmission Completed HPML: High Priority Message

FDCAN_IT_GROUP_TX_FIFO_ERROR

TX FIFO Error Interrupts Group: TEFLL: Tx Event FIFO Element Lost TEFFL: Tx Event FIFO Full TEFNL: Tx Event FIFO New Entry TFEL: Tx FIFO Empty Interrupt Line

FDCAN_IT_GROUP_MISC

Misc. Interrupts Group: TOOL: Timeout Occurred MRAFL: Message RAM Access Failure TSWL: Timestamp Wraparound

FDCAN_IT_GROUP_BIT_LINE_ERROR

Bit and Line Error Interrupts Group: EPL: Error Passive ELOL: Error Logging Overflow

FDCAN_IT_GROUP_PROTOCOL_ERROR

Protocol Error Group: ARAL: Access to Reserved Address Line PEDL: Protocol Error in Data Phase Line PEAL: Protocol Error in Arbitration Phase Line WDIL: Watchdog Interrupt Line BOL: Bus_Off Status EWL: Warning Status

FDCAN Interrupts List

FDCAN_IT_LIST_RX_FIFO0

RX FIFO 0 Interrupts List

FDCAN_IT_LIST_RX_FIFO1

RX FIFO 1 Interrupts List

FDCAN_IT_LIST_SMSG

Status Message Interrupts List

FDCAN_IT_LIST_TX_FIFO_ERROR

TX FIFO Error Interrupts List

FDCAN_IT_LIST_MISC

Misc. Interrupts List

FDCAN_IT_LIST_BIT_LINE_ERROR

Bit and Line Error Interrupts List

FDCAN_IT_LIST_PROTOCOL_ERROR

Protocol Error Interrupts List

FDCAN interrupt line

FDCAN_INTERRUPT_LINE0

Interrupt Line 0

FDCAN_INTERRUPT_LINE1

Interrupt Line 1

FDCAN non-matching frames

FDCAN_ACCEPT_IN_RX_FIFO0

Accept in Rx FIFO 0

FDCAN_ACCEPT_IN_RX_FIFO1

Accept in Rx FIFO 1

FDCAN_REJECT

Reject

FDCAN Operating Mode

FDCAN_MODE_NORMAL
Normal mode

FDCAN_MODE_RESTRICTED_OPERATION
Restricted Operation mode

FDCAN_MODE_BUS_MONITORING
Bus Monitoring mode

FDCAN_MODE_INTERNAL_LOOPBACK
Internal LoopBack mode

FDCAN_MODE_EXTERNAL_LOOPBACK
External LoopBack mode

FDCAN protocol error code

FDCAN_PROTOCOL_ERROR_NONE
No error occurred

FDCAN_PROTOCOL_ERROR_STUFF
Stuff error

FDCAN_PROTOCOL_ERROR_FORM
Form error

FDCAN_PROTOCOL_ERROR_ACK
Acknowledge error

FDCAN_PROTOCOL_ERROR_BIT1
Bit 1 (recessive) error

FDCAN_PROTOCOL_ERROR_BIT0
Bit 0 (dominant) error

FDCAN_PROTOCOL_ERROR_CRC
CRC check sum error

FDCAN_PROTOCOL_ERROR_NO_CHANGE
No change since last read

FDCAN reject remote frames

FDCAN_FILTER_REMOTE
Filter remote frames

FDCAN_REJECT_REMOTE
Reject all remote frames

FDCAN Rx FIFO 0 Interrupts

FDCAN_IT_RX_FIFO0_MESSAGE_LOST
Rx FIFO 0 message lost

FDCAN_IT_RX_FIFO0_FULL
Rx FIFO 0 full

FDCAN_IT_RX_FIFO0_NEW_MESSAGE

New message written to Rx FIFO 0

FDCAN Rx FIFO 1 Interrupts

FDCAN_IT_RX_FIFO1_MESSAGE_LOST

Rx FIFO 1 message lost

FDCAN_IT_RX_FIFO1_FULL

Rx FIFO 1 full

FDCAN_IT_RX_FIFO1_NEW_MESSAGE

New message written to Rx FIFO 1

FDCAN FIFO operation mode

FDCAN_RX_FIFO_BLOCKING

Rx FIFO blocking mode

FDCAN_RX_FIFO_OVERWRITE

Rx FIFO overwrite mode

FDCAN Rx Interrupts

FDCAN_IT_RX_HIGH_PRIORITY_MSG

High priority message received

FDCAN Rx Location

FDCAN_RX_FIFO0

Get received message from Rx FIFO 0

FDCAN_RX_FIFO1

Get received message from Rx FIFO 1

FDCAN timeout operation

FDCAN_TIMEOUT_CONTINUOUS

Timeout continuous operation

FDCAN_TIMEOUT_TX_EVENT_FIFO

Timeout controlled by Tx Event FIFO

FDCAN_TIMEOUT_RX_FIFO0

Timeout controlled by Rx FIFO 0

FDCAN_TIMEOUT_RX_FIFO1

Timeout controlled by Rx FIFO 1

FDCAN timestamp

FDCAN_TIMESTAMP_INTERNAL

Timestamp counter value incremented according to TCP

FDCAN_TIMESTAMP_EXTERNAL

External timestamp counter value used

FDCAN timestamp prescaler

FDCAN_TIMESTAMP_PRESC_1

Timestamp counter time unit in equal to CAN bit time

FDCAN_TIMESTAMP_PRESC_2

Timestamp counter time unit in equal to CAN bit time multiplied by 2

FDCAN_TIMESTAMP_PRESC_3

Timestamp counter time unit in equal to CAN bit time multiplied by 3

FDCAN_TIMESTAMP_PRESC_4

Timestamp counter time unit in equal to CAN bit time multiplied by 4

FDCAN_TIMESTAMP_PRESC_5

Timestamp counter time unit in equal to CAN bit time multiplied by 5

FDCAN_TIMESTAMP_PRESC_6

Timestamp counter time unit in equal to CAN bit time multiplied by 6

FDCAN_TIMESTAMP_PRESC_7

Timestamp counter time unit in equal to CAN bit time multiplied by 7

FDCAN_TIMESTAMP_PRESC_8

Timestamp counter time unit in equal to CAN bit time multiplied by 8

FDCAN_TIMESTAMP_PRESC_9

Timestamp counter time unit in equal to CAN bit time multiplied by 9

FDCAN_TIMESTAMP_PRESC_10

Timestamp counter time unit in equal to CAN bit time multiplied by 10

FDCAN_TIMESTAMP_PRESC_11

Timestamp counter time unit in equal to CAN bit time multiplied by 11

FDCAN_TIMESTAMP_PRESC_12

Timestamp counter time unit in equal to CAN bit time multiplied by 12

FDCAN_TIMESTAMP_PRESC_13

Timestamp counter time unit in equal to CAN bit time multiplied by 13

FDCAN_TIMESTAMP_PRESC_14

Timestamp counter time unit in equal to CAN bit time multiplied by 14

FDCAN_TIMESTAMP_PRESC_15

Timestamp counter time unit in equal to CAN bit time multiplied by 15

FDCAN_TIMESTAMP_PRESC_16

Timestamp counter time unit in equal to CAN bit time multiplied by 16

FDCAN Tx FIFO/Queue Mode

FDCAN_TX_FIFO_OPERATION

FIFO mode

FDCAN_TX_QUEUE_OPERATION

Queue mode

FDCAN Tx Event FIFO Interrupts

FDCAN_IT_TX_EVT_FIFO_ELT_LOST

Tx Event FIFO element lost

FDCAN_IT_TX_EVT_FIFO_FULL

Tx Event FIFO full

FDCAN_IT_TX_EVT_FIFO_NEW_DATA

Tx Handler wrote Tx Event FIFO element

FDCAN Tx Interrupts

FDCAN_IT_TX_COMPLETE

Transmission Completed

FDCAN_IT_TX_ABORT_COMPLETE

Transmission Cancellation Finished

FDCAN_IT_TX_FIFO_EMPTY

Tx FIFO Empty

FDCAN Tx Location

FDCAN_TX_BUFFER0

Add message to Tx Buffer 0

FDCAN_TX_BUFFER1

Add message to Tx Buffer 1

FDCAN_TX_BUFFER2

Add message to Tx Buffer 2

26 HAL FLASH Generic Driver

26.1 FLASH Firmware driver registers structures

26.1.1 FLASH_EraseInitTypeDef

FLASH_EraseInitTypeDef is defined in the stm32u5xx_hal_flash.h

Data Fields

- ***uint32_t TypeErase***
- ***uint32_t Banks***
- ***uint32_t Page***
- ***uint32_t NbPages***

Field Documentation

- ***uint32_t FLASH_EraseInitTypeDef::TypeErase***
  Mass erase or page erase. This parameter can be a value of ***FLASH_Type_Erase***
- ***uint32_t FLASH_EraseInitTypeDef::Banks***
  Select bank to erase. This parameter must be a value of ***FLASH_Banks*** (FLASH_BANK_BOTH should be used only for mass erase)
- ***uint32_t FLASH_EraseInitTypeDef::Page***
  Initial Flash page to erase when page erase is disabled This parameter must be a value between 0 and (max number of pages in the bank - 1) (eg : 127 for 2MB dual bank)
- ***uint32_t FLASH_EraseInitTypeDef::NbPages***
  Number of pages to be erased. This parameter must be a value between 1 and (max number of pages in the bank - value of initial page)

26.1.2 FLASH_OBProgramInitTypeDef

FLASH_OBProgramInitTypeDef is defined in the stm32u5xx_hal_flash.h

Data Fields

- ***uint32_t OptionType***
- ***uint32_t WRPArea***
- ***uint32_t WRPStartOffset***
- ***uint32_t WRPEndOffset***
- ***FunctionalState WRPLock***
- ***uint32_t RDPLevel***
- ***uint32_t USERType***
- ***uint32_t USERConfig***
- ***uint32_t WMSecConfig***
- ***uint32_t WMSecStartPage***
- ***uint32_t WMSecEndPage***
- ***uint32_t WMHDPEndPage***
- ***uint32_t BootLock***
- ***uint32_t BootAddrConfig***
- ***uint32_t BootAddr***
- ***uint32_t RDPKeyType***
- ***uint32_t RDPKey1***
- ***uint32_t RDPKey2***

Field Documentation

- ***uint32_t FLASH_OBProgramInitTypeDef::OptionType***
  Option byte to be configured. This parameter can be a combination of the values of ***FLASH_OB_Type***

- ***uint32_t FLASH_OBProgramInitTypeDef::WRPArea***
  Write protection area to be programmed (used for OPTIONBYTE_WRP). Only one WRP area could be programmed at the same time. This parameter can be value of ***FLASH_OB_WRP_Area***
- ***uint32_t FLASH_OBProgramInitTypeDef::WRPStartOffset***
  Write protection start offset (used for OPTIONBYTE_WRP). This parameter must be a value between 0 and (max number of pages in the bank - 1)
- ***uint32_t FLASH_OBProgramInitTypeDef::WRPEndOffset***
  Write protection end offset (used for OPTIONBYTE_WRP). This parameter must be a value between WRPStartOffset and (max number of pages in the bank - 1)
- ***FunctionalState FLASH_OBProgramInitTypeDef::WRPLock***
  Write protection lock (used for OPTIONBYTE_WRP). This parameter can be set to ENABLE or DISABLE
- ***uint32_t FLASH_OBProgramInitTypeDef::RDPLevel***
  Set the read protection level (used for OPTIONBYTE_RDP). This parameter can be a value of ***FLASH_OB_Read_Protection***
- ***uint32_t FLASH_OBProgramInitTypeDef::USERType***
  User option byte(s) to be configured (used for OPTIONBYTE_USER). This parameter can be a combination of ***FLASH_OB_USER_Type***
- ***uint32_t FLASH_OBProgramInitTypeDef::USERConfig***
  Value of the user option byte (used for OPTIONBYTE_USER). This parameter can be a combination of ***FLASH_OB_USER_BOR_LEVEL***, ***FLASH_OB_USER_nRST_STOP***, ***FLASH_OB_USER_nRST_STANDBY***, ***FLASH_OB_USER_nRST_SHUTDOWN***, ***FLASH_OB_USER_SRAM_RST***, ***FLASH_OB_USER_IWDG_SW***, ***FLASH_OB_USER_IWDG_STOP***, ***FLASH_OB_USER_IWDG_STANDBY***, ***FLASH_OB_USER_WWDG_SW***, ***FLASH_OB_USER_SWAP_BANK***, ***FLASH_OB_USER_DUALBANK***, ***FLASH_OB_USER_BKPRAM_RST***, ***FLASH_OB_USER_SRAM3_ECC***, ***FLASH_OB_USER_SRAM2_ECC***, ***FLASH_OB_USER_SRAM2_RST***, ***FLASH_OB_USER_nSWBOOT0***, ***FLASH_OB_USER_nBOOT0***, ***FLASH_OB_USER_PA15_PUPEN***, ***FLASH_OB_USER_IO_VDD_HSLV***, ***FLASH_OB_USER_IO_VDDIO2_HSLV***, ***FLASH_OB_USER_TZEN***
- ***uint32_t FLASH_OBProgramInitTypeDef::WMSecConfig***
  Configuration of the Watermark-based Secure Area (used for OPTIONBYTE_WMSEC). This parameter must be a value of ***FLASH_OB_WMSEC***
- ***uint32_t FLASH_OBProgramInitTypeDef::WMSecStartPage***
  Start page of secure area (used for OPTIONBYTE_WMSEC). This parameter must be a value between 0 and (max number of pages in the bank - 1)
- ***uint32_t FLASH_OBProgramInitTypeDef::WMSecEndPage***
  End page of secure area (used for OPTIONBYTE_WMSEC). This parameter must be a value between WMSecStartPage and (max number of pages in the bank - 1)
- ***uint32_t FLASH_OBProgramInitTypeDef::WMHDPEndPage***
  End page of the secure hide protection (used for OPTIONBYTE_WMSEC). This parameter must be a value between WMSecStartPage and WMSecEndPage
- ***uint32_t FLASH_OBProgramInitTypeDef::BootLock***
  Configuration of the boot lock (used for OPTIONBYTE_BOOT_LOCK). This parameter must be a value of ***FLASH_OB_BOOT_LOCK***
- ***uint32_t FLASH_OBProgramInitTypeDef::BootAddrConfig***
  Configuration of the Boot address (used for OPTIONBYTE_BOOTADDR). This parameter must be a value of ***FLASH_OB_BOOTADDR***
- ***uint32_t FLASH_OBProgramInitTypeDef::BootAddr***
  Boot address (used for OPTIONBYTE_BOOTADDR). This parameter must be a value between 0x0 and 0xFFFFFF00
- ***uint32_t FLASH_OBProgramInitTypeDef::RDPKeyType***
  Configuration of the RDP OEM keys (used for OPTIONBYTE_RDPKEY). This parameter can be a value of ***FLASH_OB_RDP_Key_Type***
- ***uint32_t FLASH_OBProgramInitTypeDef::RDPKey1***
  Value of the RDP OEM key 1 (used for OPTIONBYTE_RDPKEY)
- ***uint32_t FLASH_OBProgramInitTypeDef::RDPKey2***
  Value of the RDP OEM key 2 (used for OPTIONBYTE_RDPKEY)

26.1.3 FLASH_ProcessTypeDef

FLASH_ProcessTypeDef is defined in the stm32u5xx_hal_flash.h

Data Fields

26.2 FLASH Firmware driver API description

The following section lists the various functions of the FLASH library.

26.2.1 FLASH peripheral features

The Flash memory interface manages CPU AHB C-Bus accesses to the Flash memory. It implements the erase and program Flash memory operations and the read and write protection mechanisms.

The Flash memory interface implements the TrustZone security features (TZ) supported by ARM Cortex-M33 core (CM33).

The FLASH main features are:

- Flash memory read operations
- Flash memory program/erase operations
- Read / write protections
- Option bytes programming
- TrustZone aware
- Watermark-based area protection including the secure hide area
- Block-based page protection
- Error code correction (ECC) : Data in flash are 137-bits word (9 bits added per quad-word)

26.2.2 How to use this driver

This driver provides functions and macros to configure and program the FLASH memory of all STM32U5xx devices.

1. Flash Memory IO Programming functions:
   – Lock and Unlock the FLASH interface using HAL_FLASH_Unlock() and HAL_FLASH_Lock() functions
   – Program functions: quad-words and burst program (8 quad-words)
   – There are two modes of programming :
     ◦ Polling mode using HAL_FLASH_Program() function
     ◦ Interrupt mode using HAL_FLASH_Program_IT() function

2. Interrupts and flags management functions :
   – Handle FLASH interrupts by calling HAL_FLASH_IRQHandler()
   – Callback functions are called when the flash operations are finished : HAL_FLASH_EndOfOperationCallback() when everything is ok, otherwise HAL_FLASH_OperationErrorCallback()
   – Get error flag status by calling HAL_GetError()
3. Option bytes management functions :
   – Lock and Unlock the option bytes using HAL_FLASH_OB_Unlock() and HAL_FLASH_OB_Lock() functions
   – Launch the reload of the option bytes using HAL_FLASH_Launch() function. In this case, a reset is generated

In addition to these functions, this driver includes a set of macros allowing to handle the following operations:
- Set the latency
- Enable/Disable the Flash power-down during low-power run and sleep modes
- Enable/Disable the Flash interrupts
- Monitor the Flash flags status

26.2.3 Programming operation functions

This subsection provides a set of functions allowing to manage the FLASH program operations.

This section contains the following APIs:
- *HAL_FLASH_Program()*
- *HAL_FLASH_Program_IT()*
- *HAL_FLASH_IRQHandler()*
- *HAL_FLASH_EndOfOperationCallback()*
- *HAL_FLASH_OperationErrorCallback()*

26.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the FLASH memory operations.

This section contains the following APIs:
- *HAL_FLASH_Unlock()*
- *HAL_FLASH_Lock()*
- *HAL_FLASH_OB_Unlock()*
- *HAL_FLASH_OB_Lock()*
- *HAL_FLASH_OB_Launch()*

26.2.5 Peripheral Errors functions

This subsection permits to get in run-time Errors of the FLASH peripheral.

This section contains the following APIs:
- *HAL_FLASH_GetError()*

26.2.6 Detailed description of functions

HAL_FLASH_Program

Function name

HAL_StatusTypeDef HAL_FLASH_Program (uint32_t TypeProgram, uint32_t Address, uint32_t DataAddress)

Function description

Program a quad-word or a burst of 8 quad-words at a specified address.

Parameters

- **TypeProgram:** Indicate the way to program at a specified address. This parameter can be a value of FLASH Program Type
- **Address:** specifies the address to be programmed. This parameter shall be aligned to the Flash word (128 bits)
- **DataAddress:** specifies the address of data to be programmed. This parameter shall be 32-bit aligned

Return values

- **HAL:** Status

HAL_FLASH_Program_IT

Function name

HAL_StatusTypeDef HAL_FLASH_Program_IT (uint32_t TypeProgram, uint32_t Address, uint32_t DataAddress)

Function description

Program a quad-word or a burst of 8 quad-words at a specified address with interrupt enabled.

Parameters

- **TypeProgram:** Indicate the way to program at a specified address. This parameter can be a value of FLASH Program Type
- **Address:** specifies the address to be programmed. This parameter shall be aligned to the Flash word (128 bits)
- **DataAddress:** specifies the address of data to be programmed. This parameter shall be 32-bit aligned

Return values

- **HAL:** Status

HAL_FLASH_IRQHandler

Function name

void HAL_FLASH_IRQHandler (void)

Function description

Handle FLASH interrupt request.

Return values

- **None:**

HAL_FLASH_EndOfOperationCallback

Function name

void HAL_FLASH_EndOfOperationCallback (uint32_t ReturnValue)

Function description

FLASH end of operation interrupt callback.

Parameters

- **ReturnValue:** The value saved in this parameter depends on the ongoing procedure Mass Erase: Bank number which has been requested to erase Page Erase: Page which has been erased (if 0xFFFFFFFF, it means that all the selected pages have been erased) Program: Address which was selected for data program

Return values

- **None:**

HAL_FLASH_OperationErrorCallback

Function name

void HAL_FLASH_OperationErrorCallback (uint32_t ReturnValue)

Function description

FLASH operation error interrupt callback.

Parameters

- **ReturnValue:** The value saved in this parameter depends on the ongoing procedure Mass Erase: Bank number which has been requested to erase Page Erase: Page number which returned an error Program: Address which was selected for data program

Return values

- **None:**

HAL_FLASH_Unlock

Function name

HAL_StatusTypeDef HAL_FLASH_Unlock (void)

Function description

Unlock the FLASH control register access.

Return values

- **HAL:** Status

HAL_FLASH_Lock

Function name

HAL_StatusTypeDef HAL_FLASH_Lock (void)

Function description

Lock the FLASH control register access.

Return values

- **HAL:** Status

HAL_FLASH_OB_Unlock

Function name

HAL_StatusTypeDef HAL_FLASH_OB_Unlock (void)

Function description

Unlock the FLASH Option Bytes Registers access.

Return values

- **HAL:** Status

HAL_FLASH_OB_Lock

Function name

HAL_StatusTypeDef HAL_FLASH_OB_Lock (void)

Function description

Lock the FLASH Option Bytes Registers access.

Return values

- **HAL:** Status

HAL_FLASH_OB_Launch

Function name

HAL_StatusTypeDef HAL_FLASH_OB_Launch (void)

Function description

Launch the option byte loading.

Return values

- **HAL:** Status

HAL_FLASH_GetError

Function name

uint32_t HAL_FLASH_GetError (void)

Function description

Get the specific FLASH error flag.

Return values

- **FLASH_ErrorCode:** The returned value can be:
  - HAL_FLASH_ERROR_NONE: No error set
  - HAL_FLASH_ERROR_OP: FLASH Operation error
  - HAL_FLASH_ERROR_PROG: FLASH Programming error
  - HAL_FLASH_ERROR_WRP: FLASH Write protection error
  - HAL_FLASH_ERROR_PGA: FLASH Programming alignment error
  - HAL_FLASH_ERROR_SIZ: FLASH Size error
  - HAL_FLASH_ERROR_PGS: FLASH Programming sequence error
  - HAL_FLASH_ERROR_OPTW: FLASH Option modification error

FLASH_WaitForLastOperation

Function name

HAL_StatusTypeDef FLASH_WaitForLastOperation (uint32_t Timeout)

Function description

Wait for a FLASH operation to complete.

Parameters

- **Timeout:** maximum flash operation timeout

Return values

- **HAL:** Status

26.3 FLASH Firmware driver defines

The following section lists the various define and macros of the module.

26.3.1 FLASH

FLASH

FLASH Banks

FLASH_BANK_1

Bank 1

FLASH_BANK_2

HAL_FLASH_ERROR_SIZ

HAL_FLASH_ERROR_PGS

HAL_FLASH_ERROR_OPTW

HAL_FLASH_ERROR_ECCC

HAL_FLASH_ERROR_ECCD

FLASH Exported Macros

__HAL_FLASH_SET_LATENCY

Description:

- Set the FLASH Latency.

Parameters:

- __LATENCY__: FLASH Latency This parameter can be one of the following values :
  - FLASH_LATENCY_0: FLASH Zero wait state
  - FLASH_LATENCY_1: FLASH One wait state
  - FLASH_LATENCY_2: FLASH Two wait states
  - FLASH_LATENCY_3: FLASH Three wait states
  - FLASH_LATENCY_4: FLASH Four wait states
  - FLASH_LATENCY_5: FLASH Five wait states
  - FLASH_LATENCY_6: FLASH Six wait states
  - FLASH_LATENCY_7: FLASH Seven wait states
  - FLASH_LATENCY_8: FLASH Eight wait states
  - FLASH_LATENCY_9: FLASH Nine wait states
  - FLASH_LATENCY_10: FLASH Ten wait states
  - FLASH_LATENCY_11: FLASH Eleven wait states
  - FLASH_LATENCY_12: FLASH Twelve wait states
  - FLASH_LATENCY_13: FLASH Thirteen wait states
  - FLASH_LATENCY_14: FLASH Fourteen wait states
  - FLASH_LATENCY_15: FLASH Fifteen wait states

Return value:

- None

__HAL_FLASH_GET_LATENCY

Description:

- Get the FLASH Latency.

Return value:

- FLASH: Latency This return value can be one of the following values :
  - FLASH_LATENCY_0: FLASH Zero wait state
  - FLASH_LATENCY_1: FLASH One wait state
  - FLASH_LATENCY_2: FLASH Two wait states
  - FLASH_LATENCY_3: FLASH Three wait states
  - FLASH_LATENCY_4: FLASH Four wait states
  - FLASH_LATENCY_5: FLASH Five wait states
  - FLASH_LATENCY_6: FLASH Six wait states
  - FLASH_LATENCY_7: FLASH Seven wait states
  - FLASH_LATENCY_8: FLASH Eight wait states
  - FLASH_LATENCY_9: FLASH Nine wait states
  - FLASH_LATENCY_10: FLASH Ten wait states
  - FLASH_LATENCY_11: FLASH Eleven wait states
  - FLASH_LATENCY_12: FLASH Twelve wait states
  - FLASH_LATENCY_13: FLASH Thirteen wait states
  - FLASH_LATENCY_14: FLASH Fourteen wait states
  - FLASH_LATENCY_15: FLASH Fifteen wait states

__HAL_FLASH_PREFETCH_BUFFER_ENABLE

Description:

- Enable the FLASH prefetch buffer.

Return value:

- None

__HAL_FLASH_PREFETCH_BUFFER_DISABLE

Description:

- Disable the FLASH prefetch buffer.

Return value:

- None

__HAL_FLASH_SLEEP_POWERDOWN_ENABLE

Description:

- Enable the FLASH power down during Low-Power sleep mode.

Return value:

- none

__HAL_FLASH_SLEEP_POWERDOWN_DISABLE

Description:

- Disable the FLASH power down during Low-Power sleep mode.

Return value:

- none

FLASH Flags Definition

FLASH_FLAG_EOP

FLASH End of operation flag

FLASH_FLAG_OPERR

FLASH Operation error flag

FLASH_FLAG_PROGERR

FLASH Programming error flag

FLASH_FLAG_WRPERR

FLASH Write protection error flag

FLASH_FLAG_PGAERR

FLASH Programming alignment error flag

FLASH_FLAG_SIZERR

FLASH Size error flag

FLASH_FLAG_PGSERR

FLASH Programming sequence error flag

FLASH_FLAG_OPTWERR

FLASH Option modification error flag

FLASH_FLAG_BSY

FLASH Busy flag

FLASH_FLAG_WDW

FLASH_FLAG_ECCC

FLASH ECC correction

FLASH_FLAG_ECCD

FLASH ECC detection

FLASH_FLAG_SR_ERRORS

FLASH_FLAG_ECCR_ERRORS

FLASH_FLAG_ALL_ERRORS

FLASH Interrupts Macros

__HAL_FLASH_ENABLE_IT

Description:

- Enable the specified FLASH interrupt.

Parameters:

- __INTERRUPT__: FLASH interrupt This parameter can be any combination of the following values:
  - FLASH_IT_EOP: End of FLASH Operation Interrupt
  - FLASH_IT_OPERR: Error Interrupt
  - FLASH_IT_ECCC: ECC Correction Interrupt

Return value:

- none

__HAL_FLASH_ENABLE_IT_NS

__HAL_FLASH_DISABLE_IT

Description:

- Disable the specified FLASH interrupt.

Parameters:

- __INTERRUPT__: FLASH interrupt This parameter can be any combination of the following values:
  - FLASH_IT_EOP: End of FLASH Operation Interrupt
  - FLASH_IT_OPERR: Error Interrupt
  - FLASH_IT_ECCC: ECC Correction Interrupt

Return value:

- none

__HAL_FLASH_DISABLE_IT_NS

__HAL_FLASH_GET_FLAG

Description:

- Check whether the specified FLASH flag is set or not.

Parameters:

- __FLAG__: specifies the FLASH flag to check. This parameter can be one of the following values:
  – FLASH_FLAG_EOP: FLASH End of Operation flag
  – FLASH_FLAG_OPERR: FLASH Operation error flag
  – FLASH_FLAG_PROGERR: FLASH Programming error flag
  – FLASH_FLAG_WRPERR: FLASH Write protection error flag
  – FLASH_FLAG_PGAERR: FLASH Programming alignment error flag
  – FLASH_FLAG_SIZERR: FLASH Size error flag
  – FLASH_FLAG_PGSERR: FLASH Programming sequence error flag
  – FLASH_FLAG_OPTWERR: FLASH Option modification error flag
  – FLASH_FLAG_BSY: FLASH write/erase operations in progress flag
  – FLASH_FLAG_WDW: FLASH Wait Data to Write flag
  – FLASH_FLAG_ECCC: FLASH one ECC error has been detected and corrected
  – FLASH_FLAG_ECCD: FLASH two ECC errors have been detected

Return value:

- The: new state of FLASH_FLAG (SET or RESET).

__HAL_FLASH_GET_FLAG_NS

__HAL_FLASH_CLEAR_FLAG

Description:

- Clear the FLASH's pending flags.

Parameters:

- __FLAG__: specifies the FLASH flags to clear. This parameter can be any combination of the following values:
  – FLASH_FLAG_EOP: FLASH End of Operation flag
  – FLASH_FLAG_OPERR: FLASH Operation error flag
  – FLASH_FLAG_PROGERR: FLASH Programming error flag
  – FLASH_FLAG_WRPERR: FLASH Write protection error flag
  – FLASH_FLAG_PGAERR: FLASH Programming alignment error flag
  – FLASH_FLAG_SIZERR: FLASH Size error flag
  – FLASH_FLAG_PGSERR: FLASH Programming sequence error flag
  – FLASH_FLAG_OPTWERR: FLASH Option modification error flag (Only in non-secure)
  – FLASH_FLAG_ECCC: FLASH one ECC error has been detected and corrected
  – FLASH_FLAG_ECCD: FLASH two ECC errors have been detected
  – FLASH_FLAG_ALL_ERRORS: FLASH All errors flags

Return value:

- None

FLASH Option Bytes User SRAM3 ECC check

OB_SRAM3_ECC_ENABLE

SRAM3 ECC check enable

OB_SRAM3_ECC_DISABLE

SRAM3 ECC check disable

FLASH Option Bytes User SRAM Erase On Reset Type

OB_SRAM_RST_ERASE

All SRAMs (except SRAM2 and BKPSRAM) erased when a system reset occurs

OB_SRAM_RST_NOT_ERASE

All SRAMs (except SRAM2 and BKPSRAM) not erased when a system reset occurs

FLASH Option Bytes User Swap banks

OB_SWAP_BANK_DISABLE

Bank 1 is located at address offset 0x0, Bank 2 is located at 0x100000

OB_SWAP_BANK_ENABLE

Bank 1 is located at address offset 0x100000, Bank 2 is located at 0x0

FLASH Option Bytes User Type

OB_USER_BOR_LEV

BOR reset Level

OB_USER_NRST_STOP

Reset generated when entering the stop mode

OB_USER_NRST_STDBY

Reset generated when entering the standby mode

OB_USER_NRST_SHDW

Reset generated when entering the shutdown mode

OB_USER_SRAM_RST

All SRAMs (except SRAM2 and BKPSRAM) erase upon system reset

OB_USER_IWDG_SW

Independent watchdog selection

OB_USER_IWDG_STOP

Independent watchdog counter freeze in stop mode

OB_USER_IWDG_STDBY

Independent watchdog counter freeze in standby mode

OB_USER_WWDG_SW

Window watchdog selection

OB_USER_SWAP_BANK

Swap banks

OB_USER_DUALBANK

Dual-Bank on 1MB/512kB Flash memory devices

OB_USER_BKPRAM_ECC

Backup RAM ECC detection and correction enable

OB_USER_SRAM3_ECC

SRAM3 ECC detection and correction enable

OB_USER_SRAM2_ECC
SRAM2 ECC detection and correction enable

OB_USER_SRAM2_RST
SRAM2 Erase when system reset

OB_USER_NSWBOOT0
Software BOOT0

OB_USER_NBOOT0
nBOOT0 option bit

OB_USER_PA15_PUPEN
PA15 pull-up enable option bit

OB_USER_IO_VDD_HSLV

Burst write operation

FLASH_OPERATION_TYPE_PAGEERASE

Page erase operation

FLASH_OPERATION_TYPE_BANKERASE

Bank erase operation

FLASH_OPERATION_TYPE_MASSERASE

Mass erase operation

FLASH_OPERATION_TYPE_OPTIONCHANGE

Option change operation

FLASH Erase Type

FLASH_TYPEERASE_PAGES

Secure pages erase activation

FLASH_TYPEERASE_PAGES_NS

Non-secure pages erase activation

FLASH_TYPEERASE_MASSERASE

Secure flash mass erase activation

FLASH_TYPEERASE_MASSERASE_NS

Non-secure flash mass erase activation

FLASH Program Type

FLASH_TYPEPROGRAM_QUADWORD

Program a quad-word (128-bit) at a specified secure address

FLASH_TYPEPROGRAM_QUADWORD_NS

Program a quad-word (128-bit) at a specified non-secure address

FLASH_TYPEPROGRAM_BURST

Program a burst (8xquad-word) at a specified secure address

FLASH_TYPEPROGRAM_BURST_NS

Program a burst (8xquad-word) at a specified non-secure address

27 HAL FLASH Extension Driver

27.1 FLASHEx Firmware driver registers structures

27.1.1 FLASH_BBAttributesTypeDef

FLASH_BBAttributesTypeDef is defined in the stm32u5xx_hal_flash_ex.h

Data Fields

- ***uint32_t Bank***
- ***uint32_t BBAttributesType***
- ***uint32_t BBAttributes_array***

Field Documentation

- ***uint32_t FLASH_BBAttributesTypeDef::Bank***
  Selection of the associated bank of Block-based Area. This parameter must be a value of ***FLASH_Banks***
- ***uint32_t FLASH_BBAttributesTypeDef::BBAttributesType***
  Block-Based Attributes type. This parameter must be a value of ***FLASH_BB_Attributes***
- ***uint32_t FLASH_BBAttributesTypeDef::BBAttributes_array[FLASH_BLOCKBASED_NB_REG]***
  Each bit specifies the block-based attribute configuration of a page: 0 means page non-protected, 1 means page protected. Protection (secure or privilege) depends on BBAttributesType value

27.1.2 FLASH_OperationTypeDef

FLASH_OperationTypeDef is defined in the stm32u5xx_hal_flash_ex.h

Data Fields

- ***uint32_t OperationType***
- ***uint32_t FlashArea***
- ***uint32_t Address***

Field Documentation

- ***uint32_t FLASH_OperationTypeDef::OperationType***
  Flash operation Type. This parameter must be a value of ***FLASH_Operation_Type***
- ***uint32_t FLASH_OperationTypeDef::FlashArea***
  Flash operation memory area. This parameter must be a value of ***FLASH_Operation_Area***
- ***uint32_t FLASH_OperationTypeDef::Address***
  Flash operation Address offset. This parameter is given by bank, and must be a value between 0x0 and 0xFFFF0

27.2 FLASHEx Firmware driver API description

The following section lists the various functions of the FLASHEx library.

27.2.1 Flash Extended features

Comparing to other previous devices, the FLASH interface for STM32U5xx devices contains the following additional features

- Capacity up to 2 Mbyte with dual bank architecture supporting read-while-write capability (RWW)
- Dual bank memory organization
- Watermark-based secure area including the secure hide areas
- Block-based secure pages

27.2.2 How to use this driver

This driver provides functions to configure and program the FLASH memory of all STM32U5xx devices. It includes:

1. Flash Memory Erase functions:
   – Lock and Unlock the FLASH interface using HAL_FLASH_Unlock() and HAL_FLASH_Lock() functions
   – Erase function: page Erase and Bank/Mass Erase
   – There are two modes of erase :
     ◦ Polling Mode using HAL_FLASHEx_Erase()
     ◦ Interrupt Mode using HAL_FLASHEx_Erase_IT()
2. Option Bytes Programming function: Use HAL_FLASHEx_OBProgram() to:
   – Configure the write protection for each area
   – Set the Read protection Level
   – Program the user Option Bytes
   – Configure the watermark security for each area including the secure hide areas
   – Configure the boot lock (BOOT_LOCK)
   – Configure the Boot addresses
3. Get Option Bytes Configuration function: Use HAL_FLASHEx_OBGetConfig() to:
   – Get the value of a write protection area
   – Know if the read protection is activated
   – Get the value of the user Option Bytes
   – Get the configuration of a watermark security area including the secure hide areas
   – Get the boot lock (BOOT_LOCK) configuration
   – Get the value of a boot address
4. Block-based secure / privilege area configuration function: Use HAL_FLASHEx_ConfigBBAttributes()
   – Bit-field allowing to secure or un-secure each page
   – Bit-field allowing to privilege or un-privilege each page
5. Get the block-based secure / privilege area configuration function: Use HAL_FLASHEx_GetBBSec()
   – Return the configuration of the block-based security and privilege for all the pages
6. Activation of the secure hide area function: Use HAL_FLASHEx_EnableSecHideProtection()
   – Deny the access to the secure hide area
7. Privilege mode configuration function: Use HAL_FLASHEx_ConfigPrivMode()
   – FLASH register can be protected against non-privilege accesses
8. Get the privilege mode configuration function: Use HAL_FLASHEx_GetPrivMode()
   – Return if the FLASH registers are protected against non-privilege accesses
9. Security inversion configuration function: Use HAL_FLASHEx_ConfigSecInversion()
   – FLASH secure state can be override
10. Get the security inversion configuration function: Use HAL_FLASHEx_GetSecInversion()
    – Return if FLASH secure state is override
11. Enable bank low-power mode function: Use HAL_FLASHEx_EnablePowerDown()
    – Enable low-power mode for Flash Bank 1 and/or Bank 2
12. Enable low-power read mode function: Use HAL_FLASHEx_ConfigLowPowerRead()
    – Enable low-power read mode for Flash memory
13. Get the low-power read mode configuration function: Use HAL_FLASHEx_GetLowPowerRead()
    – Return if FLASH is in low-power read mode or normal read mode
14. Get Flash operation function: Use HAL_FLASHEx_GetOperation()
    – Return information about the on-going Flash operation. After a system reset, return information about the interrupted Flash operation, if any.

27.2.3 Extended programming operation functions

This subsection provides a set of functions allowing to manage the Extended FLASH programming operations Operations.

This section contains the following APIs:

- *HAL_FLASHEx_Erase()*
- *HAL_FLASHEx_Erase_IT()*
- *HAL_FLASHEx_OBProgram()*
- *HAL_FLASHEx_OBGetConfig()*
- *HAL_FLASHEx_ConfigBBAttributes()*
- *HAL_FLASHEx_GetConfigBBAttributes()*
- *HAL_FLASHEx_EnableSecHideProtection()*

27.2.4 Detailed description of functions

HAL_FLASHEx_Erase

Function name

HAL_StatusTypeDef HAL_FLASHEx_Erase (FLASH_EraseInitTypeDef * pEraseInit, uint32_t * PageError)

Function description

Perform a mass erase or erase the specified FLASH memory pages.

Parameters

- **pEraseInit:** pointer to an FLASH_EraseInitTypeDef structure that contains the configuration information for the erasing.
- **PageError:** pointer to variable that contains the configuration information on faulty page in case of error (0xFFFFFFFF means that all the pages have been correctly erased).

Return values

- **HAL:** Status

HAL_FLASHEx_Erase_IT

Function name

HAL_StatusTypeDef HAL_FLASHEx_Erase_IT (FLASH_EraseInitTypeDef * pEraseInit)

Function description

Perform a mass erase or erase the specified FLASH memory pages with interrupt enabled.

Parameters

- **pEraseInit:** pointer to an FLASH_EraseInitTypeDef structure that contains the configuration information for the erasing.

Return values

- **HAL:** Status

HAL_FLASHEx_OBProgram

Function name

HAL_StatusTypeDef HAL_FLASHEx_OBProgram (FLASH_OBProgramInitTypeDef * pOBInit)

Function description

Program Option bytes.

Parameters

- **pOBInit:** pointer to an FLASH_OBInitStruct structure that contains the configuration information for the programming.

Return values

- **HAL:** Status

Notes

- To configure any option bytes, the option lock bit OPTLOCK must be cleared with the call of HAL_FLASH_OB_Unlock() function.
- New option bytes configuration will be taken into account in two cases: after an option bytes launch through the call of HAL_FLASH_OB_Launch()after a power reset (BOR reset or exit from Standby/ Shutdown modes)

HAL_FLASHEx_OBGetConfig

Function name

void HAL_FLASHEx_OBGetConfig (FLASH_OBProgramInitTypeDef * pOBInit)

Function description

Get the Option bytes configuration.

Parameters

- **pOBInit:** pointer to an FLASH_OBInitStruct structure that contains the configuration information.

Return values

- **None:**

Notes

- The fields pOBInit->WRPArea, pOBInit->WMSecConfig and pOBInit->BootAddrConfig should indicate which area/address is requested for the WRP, WM Security or Boot Address, else no information will be returned

HAL_FLASHEx_ConfigBBAttributes

Function name

HAL_StatusTypeDef HAL_FLASHEx_ConfigBBAttributes (FLASH_BBAttributesTypeDef * pBBAttributes)

Function description

Configure the block-based secure area.

Parameters

- **pBBAttributes:** pointer to an FLASH_BBAttributesTypeDef structure that contains the configuration information for the programming.

Return values

- **HAL:** Status

Notes

- The field pBBAttributes->Bank should indicate which area is requested for the block-based attributes.
- The field pBBAttributes->BBAttributesType should indicate which block-base attribute type is requested: Secure or Privilege.

HAL_FLASHEx_GetConfigBBAttributes

Function name

void HAL_FLASHEx_GetConfigBBAttributes (FLASH_BBAttributesTypeDef * pBBAttributes)

Function description

Return the block-based attributes.

Parameters

- **pBBAttributes:** [in/out] pointer to an FLASH_BBAttributesTypeDef structure that contains the configuration information.

Return values

- **None:**

Notes

- The field pBBAttributes->Bank should indicate which area is requested for the block-based attributes.
- The field pBBAttributes->BBAttributesType should indicate which block-base attribute type is requested: Secure or Privilege.

HAL_FLASHEx_EnableSecHideProtection

Function name

void HAL_FLASHEx_EnableSecHideProtection (uint32_t Banks)

Function description

Activation of the protection of the secure hide area.

Parameters

- **Banks:** indicate the bank concerned by the activation This parameter can be one of the following values:
  – FLASH_BANK_1: Bank1 to be protected
  – FLASH_BANK_2: Bank2 to be protected
  – FLASH_BANK_BOTH: Bank1 and Bank2 to be protected

Return values

- **None:**

HAL_FLASHEx_ConfigPrivMode

Function name

void HAL_FLASHEx_ConfigPrivMode (uint32_t PrivMode)

Function description

Configuration of the privilege attribute.

Parameters

- **PrivMode:** indicate privilege mode configuration This parameter can be one of the following values:
  – FLASH_SPRIV_GRANTED: access to secure Flash registers is granted to privileged or unprivileged access
  – FLASH_SPRIV_DENIED: access to secure Flash registers is denied to unprivileged access
  – FLASH_NSPRIV_GRANTED: access to non-secure Flash registers is granted to privileged or unprivileged access
  – FLASH_NSPRIV_DENIED: access to non-secure Flash registers is denied to unprivilege access

Return values

- **None:**

HAL_FLASHEx_GetPrivMode

Function name

uint32_t HAL_FLASHEx_GetPrivMode (void)

Function description

Return the value of the privilege attribute.

Return values

- **It:** indicates the privilege mode configuration. This return value can be one of the following values:
  - FLASH_SPRIV_GRANTED: access to secure Flash registers is granted to privileged or unprivileged access
  - FLASH_SPRIV_DENIED: access to secure Flash registers is denied to unprivileged access
  - FLASH_NSPRIV_GRANTED: access to non-secure Flash registers is granted to privileged or unprivileged access
  - FLASH_NSPRIV_DENIED: access to Flash registers is denied to unprivilege accessP

HAL_FLASHEx_ConfigSecInversion

Function name

HAL_StatusTypeDef HAL_FLASHEx_ConfigSecInversion (uint32_t SecInvState)

Function description

Configuration of the security inversion.

Parameters

- **SecInvState:** indicate the flash security state configuration This parameter can be one of the following values:
  - FLASH_SEC_INV_DISABLE: Security state of Flash is not inverted
  - FLASH_SEC_INV_ENABLE: Security state of Flash is inverted

Return values

- **HAL:** Status

HAL_FLASHEx_GetSecInversion

Function name

uint32_t HAL_FLASHEx_GetSecInversion (void)

Function description

Return the value of the security inversion.

Return values

- **It:** indicates the flash security state configuration This return value can be one of the following values:
  - FLASH_SEC_INV_DISABLE: Security state of Flash is not inverted
  - FLASH_SEC_INV_ENABLE: Security state of Flash is inverted

HAL_FLASHEx_EnablePowerDown

Function name

HAL_StatusTypeDef HAL_FLASHEx_EnablePowerDown (uint32_t Banks)

Function description

Enable the Power-down Mode for Flash Banks.

Parameters

- **Banks:** indicate which bank to put in power-down mode This parameter can be one of the following values:
  - FLASH_BANK_1: Flash Bank 1
  - FLASH_BANK_2: Flash Bank 2
  - FLASH_BANK_BOTH: Flash Bank 1 and Bank 2

Return values

- **HAL:** Status

HAL_FLASHEx_ConfigLowPowerRead

Function name

HAL_StatusTypeDef HAL_FLASHEx_ConfigLowPowerRead (uint32_t ConfigLPM)

Function description

Configuration of the Low-Power read Mode.

Parameters

- **ConfigLPM:** indicate the Low-Power read Mode configuration. This parameter can be one of the following values:
  – FLASH_LPM_ENABLE: Flash is in low-power read mode
  – FLASH_LPM_DISABLE: Flash is in normal read mode

Return values

- **HAL:** Status

HAL_FLASHEx_GetLowPowerRead

Function name

uint32_t HAL_FLASHEx_GetLowPowerRead (void)

Function description

Return the value of the Low-Power read Mode.

Return values

- **It:** indicates the flash low-power read mode configuration This return value can be one of the following values:
  – FLASH_LPM_ENABLE: Flash is in low-power read mode
  – FLASH_LPM_DISABLE: Flash is in normal read mode

HAL_FLASHEx_GetOperation

Function name

void HAL_FLASHEx_GetOperation (FLASH_OperationTypeDef * pFlashOperation)

Function description

Return the on-going Flash Operation.

Parameters

- **pFlashOperation:** [out] pointer to a FLASH_OperationTypeDef structure that contains the Flash operation information.

Return values

- **None:**

FLASH_PageErase

Function name

void FLASH_PageErase (uint32_t Page, uint32_t Banks)

Function description

Erase the specified FLASH memory page.

Parameters

- **Page:** FLASH page to erase This parameter must be a value between 0 and (max number of pages in the bank - 1)
- **Banks:** Bank(s) where the page will be erased This parameter can be one of the following values:
  - FLASH_BANK_1: Page in bank 1 to be erased
  - FLASH_BANK_2: Page in bank 2 to be erased

Return values

- **None:**

27.3 FLASHEx Firmware driver defines

The following section lists the various define and macros of the module.

27.3.1 FLASHEx

FLASHEx

28 HAL FMAC Generic Driver

28.1 FMAC Firmware driver registers structures

28.1.1 __FMAC_HandleTypeDef

__FMAC_HandleTypeDef is defined in the stm32u5xx_hal_fmac.h

Data Fields

- ***FMAC_TypeDef * Instance***
- ***uint32_t FilterParam***
- ***uint8_t InputAccess***
- ***uint8_t OutputAccess***
- ***int16_t * pInput***
- ***uint16_t InputCurrentSize***
- ***uint16_t * pInputSize***
- ***int16_t * pOutput***
- ***uint16_t OutputCurrentSize***
- ***uint16_t * pOutputSize***
- ***DMA_HandleTypeDef * hdmaIn***
- ***DMA_HandleTypeDef * hdmaOut***
- ***DMA_HandleTypeDef * hdmaPreload***
- ***void(* ErrorCallback***
- ***void(* HalfGetDataCallback***
- ***void(* GetDataCallback***
- ***void(* HalfOutputDataReadyCallback***
- ***void(* OutputDataReadyCallback***
- ***void(* FilterConfigCallback***
- ***void(* FilterPreloadCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_FMAC_StateTypeDef State***
- ***__IO HAL_FMAC_StateTypeDef RdState***
- ***__IO HAL_FMAC_StateTypeDef WrState***
- ***__IO uint32_t ErrorCode***

Field Documentation

- ***FMAC_TypeDef* __FMAC_HandleTypeDef::Instance***
  Register base address
- ***uint32_t __FMAC_HandleTypeDef::FilterParam***
  Filter configuration (operation and parameters). Set to 0 if no valid configuration was applied.
- ***uint8_t __FMAC_HandleTypeDef::InputAccess***
  Access to the input buffer (internal memory area): DMA, IT, Polling, None. This parameter can be a value of ***FMAC_Buffer_Access***.
- ***uint8_t __FMAC_HandleTypeDef::OutputAccess***
  Access to the output buffer (internal memory area): DMA, IT, Polling, None. This parameter can be a value of ***FMAC_Buffer_Access***.
- ***int16_t* __FMAC_HandleTypeDef::pInput***
  Pointer to FMAC input data buffer
- ***uint16_t __FMAC_HandleTypeDef::InputCurrentSize***
  Number of the input elements already written into FMAC

- ***uint16_t* __FMAC_HandleTypeDef::pInputSize***
  Number of input elements to write (memory allocated to pInput). In case of early interruption of the filter operation, its value will be updated.
- ***int16_t* __FMAC_HandleTypeDef::pOutput***
  Pointer to FMAC output data buffer
- ***uint16_t __FMAC_HandleTypeDef::OutputCurrentSize***
  Number of the output elements already read from FMAC
- ***uint16_t* __FMAC_HandleTypeDef::pOutputSize***
  Number of output elements to read (memory allocated to pOutput). In case of early interruption of the filter operation, its value will be updated.
- ***DMA_HandleTypeDef* __FMAC_HandleTypeDef::hdmaIn***
  FMAC peripheral input data DMA handle parameters
- ***DMA_HandleTypeDef* __FMAC_HandleTypeDef::hdmaOut***
  FMAC peripheral output data DMA handle parameters
- ***DMA_HandleTypeDef* __FMAC_HandleTypeDef::hdmaPreload***
  FMAC peripheral preloaded data (X1, X2 and Y) DMA handle parameters
- ***void(* __FMAC_HandleTypeDef::ErrorCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC error callback
- ***void(* __FMAC_HandleTypeDef::HalfGetDataCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC get half data callback
- ***void(* __FMAC_HandleTypeDef::GetDataCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC get data callback
- ***void(* __FMAC_HandleTypeDef::HalfOutputDataReadyCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC half output data ready callback
- ***void(* __FMAC_HandleTypeDef::OutputDataReadyCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC output data ready callback
- ***void(* __FMAC_HandleTypeDef::FilterConfigCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC filter configuration callback
- ***void(* __FMAC_HandleTypeDef::FilterPreloadCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC filter preload callback
- ***void(* __FMAC_HandleTypeDef::MspInitCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC Msp Init callback
- ***void(* __FMAC_HandleTypeDef::MspDeInitCallback)(struct __FMAC_HandleTypeDef *hfmac)***
  FMAC Msp DeInit callback
- ***HAL_LockTypeDef __FMAC_HandleTypeDef::Lock***
  FMAC locking object
- ***__IO HAL_FMAC_StateTypeDef __FMAC_HandleTypeDef::State***
  FMAC state related to global handle management This parameter can be a value of **HAL_FMAC_StateTypeDef**
- ***__IO HAL_FMAC_StateTypeDef __FMAC_HandleTypeDef::RdState***
  FMAC state related to read operations (access to Y buffer) This parameter can be a value of **HAL_FMAC_StateTypeDef**
- ***__IO HAL_FMAC_StateTypeDef __FMAC_HandleTypeDef::WrState***
  FMAC state related to write operations (access to X1 buffer) This parameter can be a value of **HAL_FMAC_StateTypeDef**
- ***__IO uint32_t __FMAC_HandleTypeDef::ErrorCode***
  FMAC peripheral error code This parameter can be a value of ***FMAC_Error_Code***

28.1.2 FMAC_FilterConfigTypeDef

FMAC_FilterConfigTypeDef is defined in the stm32u5xx_hal_fmac.h

Data Fields

- ***uint8_t InputBaseAddress***
- ***uint8_t InputBufferSize***
- ***uint32_t InputThreshold***

- ***uint8_t CoeffBaseAddress***
- ***uint8_t CoeffBufferSize***
- ***uint8_t OutputBaseAddress***
- ***uint8_t OutputBufferSize***
- ***uint32_t OutputThreshold***
- ***int16_t * pCoeffA***
- ***uint8_t CoeffASize***
- ***int16_t * pCoeffB***
- ***uint8_t CoeffBSize***
- ***uint8_t InputAccess***
- ***uint8_t OutputAccess***
- ***uint32_t Clip***
- ***uint32_t Filter***
- ***uint8_t P***
- ***uint8_t Q***
- ***uint8_t R***

Field Documentation

- ***uint8_t FMAC_FilterConfigTypeDef::InputBaseAddress***
  Base address of the input buffer (X1) within the internal memory (0x00 to 0xFF). Ignored if InputBufferSize is set to 0 (previous configuration kept). Note: the buffers can overlap or even coincide exactly.
- ***uint8_t FMAC_FilterConfigTypeDef::InputBufferSize***
  Number of 16-bit words allocated to the input buffer (including the optional "headroom"). 0 if a previous configuration should be kept.
- ***uint32_t FMAC_FilterConfigTypeDef::InputThreshold***
  Input threshold: the buffer full flag will be set if the number of free spaces in the buffer is lower than this threshold. This parameter can be a value of ***FMAC_Data_Buffer_Threshold***.
- ***uint8_t FMAC_FilterConfigTypeDef::CoeffBaseAddress***
  Base address of the coefficient buffer (X2) within the internal memory (0x00 to 0xFF). Ignored if CoeffBufferSize is set to 0 (previous configuration kept). Note: the buffers can overlap or even coincide exactly.
- ***uint8_t FMAC_FilterConfigTypeDef::CoeffBufferSize***
  Number of 16-bit words allocated to the coefficient buffer. 0 if a previous configuration should be kept.
- ***uint8_t FMAC_FilterConfigTypeDef::OutputBaseAddress***
  Base address of the output buffer (Y) within the internal memory (0x00 to 0xFF). Ignored if OuputBufferSize is set to 0 (previous configuration kept). Note: the buffers can overlap or even coincide exactly.
- ***uint8_t FMAC_FilterConfigTypeDef::OutputBufferSize***
  Number of 16-bit words allocated to the output buffer (including the optional "headroom"). 0 if a previous configuration should be kept.
- ***uint32_t FMAC_FilterConfigTypeDef::OutputThreshold***
  Output threshold: the buffer empty flag will be set if the number of unread values in the buffer is lower than this threshold. This parameter can be a value of ***FMAC_Data_Buffer_Threshold***.
- ***int16_t* FMAC_FilterConfigTypeDef::pCoeffA***
  [IIR only] Initialization of the coefficient vector A. If not needed, it should be set to NULL.
- ***uint8_t FMAC_FilterConfigTypeDef::CoeffASize***
  Size of the coefficient vector A.
- ***int16_t* FMAC_FilterConfigTypeDef::pCoeffB***
  Initialization of the coefficient vector B. If not needed (re-use of a previously loaded buffer), it should be set to NULL.
- ***uint8_t FMAC_FilterConfigTypeDef::CoeffBSize***
  Size of the coefficient vector B.
- ***uint8_t FMAC_FilterConfigTypeDef::InputAccess***
  Access to the input buffer (internal memory area): DMA, IT, Polling, None. This parameter can be a value of ***FMAC_Buffer_Access***.

- ***uint8_t FMAC_FilterConfigTypeDef::OutputAccess***
  Access to the output buffer (internal memory area): DMA, IT, Polling, None. This parameter can be a value of ***FMAC_Buffer_Access***.
- ***uint32_t FMAC_FilterConfigTypeDef::Clip***
  Enable or disable the clipping feature. If the q1.15 range is exceeded, wrapping is done when the clipping feature is disabled and saturation is done when the clipping feature is enabled. This parameter can be a value of ***FMAC_Clip_State***.
- ***uint32_t FMAC_FilterConfigTypeDef::Filter***
  Filter type. This parameter can be a value of ***FMAC_Functions*** (filter related values).
- ***uint8_t FMAC_FilterConfigTypeDef::P***
  Parameter P (vector length, number of filter taps, etc.).
- ***uint8_t FMAC_FilterConfigTypeDef::Q***
  Parameter Q (vector length, etc.). Ignored if not needed.
- ***uint8_t FMAC_FilterConfigTypeDef::R***
  Parameter R (gain, etc.). Ignored if not needed.

28.2 FMAC Firmware driver API description

The following section lists the various functions of the FMAC library.

28.2.1 How to use this driver

The FMAC HAL driver can be used as follows:

1. Initialize the FMAC low level resources by implementing the HAL_FMAC_MspInit():
   - Enable the FMAC interface clock using __HAL_RCC_FMAC_CLK_ENABLE().
   - In case of using interrupts (e.g. access configured as FMAC_BUFFER_ACCESS_IT):
     - Configure the FMAC interrupt priority using HAL_NVIC_SetPriority().
     - Enable the FMAC IRQ handler using HAL_NVIC_EnableIRQ().
     - In FMAC IRQ handler, call HAL_FMAC_IRQHandler().
   - In case of using DMA to control data transfer (e.g. access configured as FMAC_BUFFER_ACCESS_DMA):
     - Enable the DMA interface clock using __HAL_RCC_DMA1_CLK_ENABLE() or __HAL_RCC_DMA2_CLK_ENABLE() depending on the used DMA instance.
     - Enable the DMAMUX1 interface clock using __HAL_RCC_DMAMUX1_CLK_ENABLE().
     - If the initialization of the internal buffers (coefficients, input, output) is done via DMA, configure and enable one DMA channel for managing data transfer from memory to memory (preload channel).
     - If the input buffer is accessed via DMA, configure and enable one DMA channel for managing data transfer from memory to peripheral (input channel).
     - If the output buffer is accessed via DMA, configure and enable one DMA channel for managing data transfer from peripheral to memory (output channel).
     - Associate the initialized DMA handle(s) to the FMAC DMA handle(s) using __HAL_LINKDMA().
     - Configure the priority and enable the NVIC for the transfer complete interrupt on the enabled DMA channel(s) using HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().
2. Initialize the FMAC HAL using HAL_FMAC_Init(). This function resorts to HAL_FMAC_MspInit() for low-level initialization.

3. Configure the FMAC processing (filter) using HAL_FMAC_FilterConfig() or HAL_FMAC_FilterConfig_DMA(). This function:
   – Defines the memory area within the FMAC internal memory (input, coefficients, output) and the associated threshold (input, output).
   – Configures the filter and its parameters:
     ◦ Finite Impulse Response (FIR) filter (also known as convolution).
     ◦ Infinite Impulse Response (IIR) filter (direct form 1).
   – Choose the way to access to the input and output buffers: none, polling, DMA, IT. "none" means the input and/or output data will be handled by another IP (ADC, DAC, etc.).
   – Enable the error interruptions in the input access and/or the output access is done through IT/DMA. If an error occurs, the interruption will be triggered in loop. In order to recover, the user will have to reset the IP with the sequence HAL_FMAC_DeInit / HAL_FMAC_Init. Optionally, he can also disable the interrupt using __HAL_FMAC_DISABLE_IT; the error status will be kept, but no more interrupt will be triggered.
   – Write the provided coefficients into the internal memory using polling mode (HAL_FMAC_FilterConfig()) or DMA (HAL_FMAC_FilterConfig_DMA()). In the DMA case, HAL_FMAC_FilterConfigCallback() is called when the handling is over.
4. Optionally, the user can enable the error interruption related to saturation by calling __HAL_FMAC_ENABLE_IT. This helps in debugging the filter. If a saturation occurs, the interruption will be triggered in loop. In order to recover, the user will have to:
   – Disable the interruption by calling __HAL_FMAC_DISABLE_IT if the user wishes to continue all the same.
   – Reset the IP with the sequence HAL_FMAC_DeInit / HAL_FMAC_Init.
5. Optionally, preload input (FIR, IIR) and output (IIR) data using HAL_FMAC_FilterPreload() or HAL_FMAC_FilterPreload_DMA(). In the DMA case, HAL_FMAC_FilterPreloadCallback() is called when the handling is over. This step is optional as the filter can be started without preloaded data.
6. Start the FMAC processing (filter) using HAL_FMAC_FilterStart(). This function also configures the output buffer that will be filled from the circular internal output buffer. The function returns immediately without updating the provided buffer. The IP processing will be active until HAL_FMAC_FilterStop() is called.
7. If the input internal buffer is accessed via DMA, HAL_FMAC_HalfGetDataCallback() will be called to indicate that half of the input buffer has been handled.
8. If the input internal buffer is accessed via DMA or interrupt, HAL_FMAC_GetDataCallback() will be called to require new input data. It will be provided through HAL_FMAC_AppendFilterData() if the DMA isn't in circular mode.
9. If the output internal buffer is accessed via DMA, HAL_FMAC_HalfOutputDataReadyCallback() will be called to indicate that half of the output buffer has been handled.
10. If the output internal buffer is accessed via DMA or interrupt, HAL_FMAC_OutputDataReadyCallback() will be called to require a new output buffer. It will be provided through HAL_FMAC_ConfigFilterOutputBuffer() if the DMA isn't in circular mode.
11. In all modes except none, provide new input data to be processed via HAL_FMAC_AppendFilterData(). This function should only be called once the previous input data has been handled (the preloaded input data isn't concerned).
12. In all modes except none, provide a new output buffer to be filled via HAL_FMAC_ConfigFilterOutputBuffer(). This function should only be called once the previous user's output buffer has been filled.
13. In polling mode, handle the input and output data using HAL_FMAC_PollFilterData(). This function:
    – Write the user's input data (provided via HAL_FMAC_AppendFilterData()) into the FMAC input memory area.
    – Read the FMAC output memory area and write it into the user's output buffer. It will return either when:
    – the user's output buffer is filled.
    – the user's input buffer has been handled. The unused data (unread input data or free output data) will not be saved. The user will have to use the updated input and output sizes to keep track of them.
14. Stop the FMAC processing (filter) using HAL_FMAC_FilterStop().
15. Call HAL_FMAC_DeInit() to de-initialize the FMAC peripheral. This function resorts to HAL_FMAC_MspDeInit() for low-level de-initialization.

28.2.2 Callback registration

The compilation define USE_HAL_FMAC_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use Function HAL_FMAC_RegisterCallback() to register a user callback. Function HAL_FMAC_RegisterCallback() allows to register following callbacks:

- ErrorCallback : Error Callback.
- HalfGetDataCallback : Get Half Data Callback.
- GetDataCallback : Get Data Callback.
- HalfOutputDataReadyCallback : Half Output Data Ready Callback.
- OutputDataReadyCallback : Output Data Ready Callback.
- FilterConfigCallback : Filter Configuration Callback.
- FilterPreloadCallback : Filter Preload Callback.
- MspInitCallback : FMAC MspInit.
- MspDeInitCallback : FMAC MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_FMAC_UnRegisterCallback() to reset a callback to the default weak function. HAL_FMAC_UnRegisterCallback() takes as parameters the HAL peripheral handle and the Callback ID. This function allows to reset following callbacks:

- ErrorCallback : Error Callback.
- HalfGetDataCallback : Get Half Data Callback.
- GetDataCallback : Get Data Callback.
- HalfOutputDataReadyCallback : Half Output Data Ready Callback.
- OutputDataReadyCallback : Output Data Ready Callback.
- FilterConfigCallback : Filter Configuration Callback.
- FilterPreloadCallback : Filter Preload Callback.
- MspInitCallback : FMAC MspInit.
- MspDeInitCallback : FMAC MspDeInit.

By default, after the HAL_FMAC_Init() and when the state is HAL_FMAC_STATE_RESET all callbacks are set to the corresponding weak functions: examples GetDataCallback(), OutputDataReadyCallback(). Exception done for MspInit and MspDeInit functions that are respectively reset to the legacy weak functions in the HAL_FMAC_Init() and HAL_FMAC_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_FMAC_Init() and HAL_FMAC_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in HAL_FMAC_STATE_READY state only. Exception done MspInit/ MspDeInit that can be registered/unregistered in HAL_FMAC_STATE_READY or HAL_FMAC_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_FMAC_RegisterCallback() before calling HAL_FMAC_DeInit() or HAL_FMAC_Init() function.

When the compilation define USE_HAL_FMAC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and weak callbacks are used.

28.2.3 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the FMAC peripheral and the associated handle
- DeInitialize the FMAC peripheral
- Initialize the FMAC MSP (MCU Specific Package)
- De-Initialize the FMAC MSP
- Register a User FMAC Callback
- Unregister a FMAC CallBack

This section contains the following APIs:

- ***HAL_FMAC_Init()***
- ***HAL_FMAC_DeInit()***
- ***HAL_FMAC_MspInit()***

- *HAL_FMAC_MspDeInit()*
- *HAL_FMAC_RegisterCallback()*
- *HAL_FMAC_UnRegisterCallback()*

28.2.4 Peripheral Control functions

This section provides functions allowing to:

- Configure the FMAC peripheral: memory area, filter type and parameters, way to access to the input and output memory area (none, polling, IT, DMA).
- Start the FMAC processing (filter).
- Handle the input data that will be provided into FMAC.
- Handle the output data provided by FMAC.
- Stop the FMAC processing (filter).

This section contains the following APIs:

- *HAL_FMAC_FilterConfig()*
- *HAL_FMAC_FilterConfig_DMA()*
- *HAL_FMAC_FilterPreload()*
- *HAL_FMAC_FilterPreload_DMA()*
- *HAL_FMAC_FilterStart()*
- *HAL_FMAC_AppendFilterData()*
- *HAL_FMAC_ConfigFilterOutputBuffer()*
- *HAL_FMAC_PollFilterData()*
- *HAL_FMAC_FilterStop()*

28.2.5 Callback functions

This section provides Interruption and DMA callback functions:

- DMA or Interrupt: the user's input data is half written (DMA only) or completely written.
- DMA or Interrupt: the user's output buffer is half filled (DMA only) or completely filled.
- DMA or Interrupt: error handling.

This section contains the following APIs:

- *HAL_FMAC_ErrorCallback()*
- *HAL_FMAC_HalfGetDataCallback()*
- *HAL_FMAC_GetDataCallback()*
- *HAL_FMAC_HalfOutputDataReadyCallback()*
- *HAL_FMAC_OutputDataReadyCallback()*
- *HAL_FMAC_FilterConfigCallback()*
- *HAL_FMAC_FilterPreloadCallback()*

28.2.6 IRQ handler management

This section provides IRQ handler function.

This section contains the following APIs:

- *HAL_FMAC_IRQHandler()*

28.2.7 Peripheral State and Error functions

This subsection provides functions allowing to

- Check the FMAC state
- Get error code

This section contains the following APIs:

- *HAL_FMAC_GetState()*
- *HAL_FMAC_GetError()*

28.2.8 Detailed description of functions

HAL_FMAC_Init

Function name

HAL_StatusTypeDef HAL_FMAC_Init (FMAC_HandleTypeDef * hfmac)

Function description

Initialize the FMAC peripheral and the associated handle.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure.

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_DeInit

Function name

HAL_StatusTypeDef HAL_FMAC_DeInit (FMAC_HandleTypeDef * hfmac)

Function description

De-initialize the FMAC peripheral.

Parameters

- **hfmac:** pointer to a FMAC structure.

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_MspInit

Function name

void HAL_FMAC_MspInit (FMAC_HandleTypeDef * hfmac)

Function description

Initialize the FMAC MSP.

Parameters

- **hfmac:** FMAC handle.

Return values

- **None:**

HAL_FMAC_MspDeInit

Function name

void HAL_FMAC_MspDeInit (FMAC_HandleTypeDef * hfmac)

Function description

De-initialize the FMAC MSP.

Parameters

- **hfmac:** FMAC handle.

Return values

- **None:**

HAL_FMAC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_FMAC_RegisterCallback (FMAC_HandleTypeDef * hfmac, HAL_FMAC_CallbackIDTypeDef CallbackID, pFMAC_CallbackTypeDef pCallback)

Function description

Register a User FMAC Callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **CallbackID:** ID of the callback to be registered. This parameter can be one of the following values:
  - HAL_FMAC_ERROR_CB_ID Error Callback ID
  - HAL_FMAC_HALF_GET_DATA_CB_ID Get Half Data Callback ID
  - HAL_FMAC_GET_DATA_CB_ID Get Data Callback ID
  - HAL_FMAC_HALF_OUTPUT_DATA_READY_CB_ID Half Output Data Ready Callback ID
  - HAL_FMAC_OUTPUT_DATA_READY_CB_ID Output Data Ready Callback ID
  - HAL_FMAC_FILTER_CONFIG_CB_ID Filter Configuration Callback ID
  - HAL_FMAC_FILTER_PRELOAD_CB_ID Filter Preload Callback ID
  - HAL_FMAC_MSPINIT_CB_ID FMAC MspInit ID
  - HAL_FMAC_MSPDEINIT_CB_ID FMAC MspDeInit ID
- **pCallback:** pointer to the Callback function.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The User FMAC Callback is to be used instead of the weak predefined callback.
- The HAL_FMAC_RegisterCallback() may be called before HAL_FMAC_Init() in HAL_FMAC_STATE_RESET to register callbacks for HAL_FMAC_MSPINIT_CB_ID and HAL_FMAC_MSPDEINIT_CB_ID.

HAL_FMAC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_FMAC_UnRegisterCallback (FMAC_HandleTypeDef * hfmac, HAL_FMAC_CallbackIDTypeDef CallbackID)

Function description

Unregister a FMAC CallBack.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module
- **CallbackID:** ID of the callback to be unregistered. This parameter can be one of the following values:
  - HAL_FMAC_ERROR_CB_ID Error Callback ID
  - HAL_FMAC_HALF_GET_DATA_CB_ID Get Half Data Callback ID
  - HAL_FMAC_GET_DATA_CB_ID Get Data Callback ID
  - HAL_FMAC_HALF_OUTPUT_DATA_READY_CB_ID Half Output Data Ready Callback ID
  - HAL_FMAC_OUTPUT_DATA_READY_CB_ID Output Data Ready Callback ID
  - HAL_FMAC_FILTER_CONFIG_CB_ID Filter Configuration Callback ID
  - HAL_FMAC_FILTER_PRELOAD_CB_ID Filter Preload Callback ID
  - HAL_FMAC_MSPINIT_CB_ID FMAC MspInit ID
  - HAL_FMAC_MSPDEINIT_CB_ID FMAC MspDeInit ID

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The FMAC callback is redirected to the weak predefined callback.
- The HAL_FMAC_UnRegisterCallback() may be called before HAL_FMAC_Init() in HAL_FMAC_STATE_RESET to register callbacks for HAL_FMAC_MSPINIT_CB_ID and HAL_FMAC_MSPDEINIT_CB_ID.

HAL_FMAC_FilterConfig

Function name

HAL_StatusTypeDef HAL_FMAC_FilterConfig (FMAC_HandleTypeDef * hfmac, FMAC_FilterConfigTypeDef * pConfig)

Function description

Configure the FMAC filter.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pConfig:** pointer to a FMAC_FilterConfigTypeDef structure that contains the FMAC configuration information.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The configuration is done according to the parameters specified in the FMAC_FilterConfigTypeDef structure. The provided data will be loaded using polling mode.

HAL_FMAC_FilterConfig_DMA

Function name

HAL_StatusTypeDef HAL_FMAC_FilterConfig_DMA (FMAC_HandleTypeDef * hfmac, FMAC_FilterConfigTypeDef * pConfig)

Function description

Configure the FMAC filter.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pConfig:** pointer to a FMAC_FilterConfigTypeDef structure that contains the FMAC configuration information.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The configuration is done according to the parameters specified in the FMAC_FilterConfigTypeDef structure. The provided data will be loaded using DMA.

HAL_FMAC_FilterPreload

Function name

HAL_StatusTypeDef HAL_FMAC_FilterPreload (FMAC_HandleTypeDef * hfmac, int16_t * pInput, uint8_t InputSize, int16_t * pOutput, uint8_t OutputSize)

Function description

Preload the input (FIR, IIR) and output data (IIR) of the FMAC filter.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pInput:** Preloading of the first elements of the input buffer (X1). If not needed (no data available when starting), it should be set to NULL.
- **InputSize:** Size of the input vector. As pInput is used for preloading data, it cannot be bigger than the input memory area.
- **pOutput:** [IIR] Preloading of the first elements of the output vector (Y). If not needed, it should be set to NULL.
- **OutputSize:** Size of the output vector. As pOutput is used for preloading data, it cannot be bigger than the output memory area.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The set(s) of data will be used by FMAC as soon as HAL_FMAC_FilterStart is called. The provided data will be loaded using polling mode.
- The input and the output buffers can be filled by calling several times HAL_FMAC_FilterPreload (each call filling partly the buffers). In case of overflow (too much data provided through all these calls), an error will be returned.

HAL_FMAC_FilterPreload_DMA

Function name

HAL_StatusTypeDef HAL_FMAC_FilterPreload_DMA (FMAC_HandleTypeDef * hfmac, int16_t * pInput, uint8_t InputSize, int16_t * pOutput, uint8_t OutputSize)

Function description

Preload the input (FIR, IIR) and output data (IIR) of the FMAC filter.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pInput:** Preloading of the first elements of the input buffer (X1). If not needed (no data available when starting), it should be set to NULL.
- **InputSize:** Size of the input vector. As pInput is used for preloading data, it cannot be bigger than the input memory area.
- **pOutput:** [IIR] Preloading of the first elements of the output vector (Y). If not needed, it should be set to NULL.
- **OutputSize:** Size of the output vector. As pOutput is used for preloading data, it cannot be bigger than the output memory area.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- The set(s) of data will be used by FMAC as soon as HAL_FMAC_FilterStart is called. The provided data will be loaded using DMA.
- The input and the output buffers can be filled by calling several times HAL_FMAC_FilterPreload (each call filling partly the buffers). In case of overflow (too much data provided through all these calls), an error will be returned.

HAL_FMAC_FilterStart

Function name

HAL_StatusTypeDef HAL_FMAC_FilterStart (FMAC_HandleTypeDef * hfmac, int16_t * pOutput, uint16_t * pOutputSize)

Function description

Start the FMAC processing according to the existing FMAC configuration.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pOutput:** pointer to buffer where output data of FMAC processing will be stored in the next steps. If it is set to NULL, the output will not be read and it will be up to an external IP to empty the output buffer.
- **pOutputSize:** pointer to the size of the output buffer. The number of read data will be written here.

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_AppendFilterData

Function name

HAL_StatusTypeDef HAL_FMAC_AppendFilterData (FMAC_HandleTypeDef * hfmac, int16_t * pInput, uint16_t * pInputSize)

Function description

Provide a new input buffer that will be loaded into the FMAC input memory area.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pInput:** New input vector (additional input data).
- **pInputSize:** Size of the input vector (if all the data can't be written, it will be updated with the number of data read from FMAC).

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_ConfigFilterOutputBuffer

Function name

HAL_StatusTypeDef HAL_FMAC_ConfigFilterOutputBuffer (FMAC_HandleTypeDef * hfmac, int16_t * pOutput, uint16_t * pOutputSize)

Function description

Provide a new output buffer to be filled with the data computed by FMAC unit.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **pOutput:** New output vector.
- **pOutputSize:** Size of the output vector (if the vector can't be entirely filled, pOutputSize will be updated with the number of data read from FMAC).

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_PollFilterData

Function name

HAL_StatusTypeDef HAL_FMAC_PollFilterData (FMAC_HandleTypeDef * hfmac, uint32_t Timeout)

Function description

Handle the input and/or output data in polling mode.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.
- **Timeout:** timeout value.

Return values

- **HAL_StatusTypeDef:** HAL status

Notes

- This function writes the previously provided user's input data and fills the previously provided user's output buffer, according to the existing FMAC configuration (polling mode only). The function returns when the input data has been handled or when the output data is filled. The possible unused data isn't kept. It will be up to the user to handle it. The previously provided pInputSize and pOutputSize will be used to indicate to the size of the read/written data to the user.

HAL_FMAC_FilterStop

Function name

HAL_StatusTypeDef HAL_FMAC_FilterStop (FMAC_HandleTypeDef * hfmac)

Function description

Stop the FMAC processing.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **HAL_StatusTypeDef:** HAL status

HAL_FMAC_ErrorCallback

Function name

void HAL_FMAC_ErrorCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC error callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_HalfGetDataCallback

Function name

void HAL_FMAC_HalfGetDataCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC get half data callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_GetDataCallback

Function name

void HAL_FMAC_GetDataCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC get data callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_HalfOutputDataReadyCallback

Function name

void HAL_FMAC_HalfOutputDataReadyCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC half output data ready callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_OutputDataReadyCallback

Function name

void HAL_FMAC_OutputDataReadyCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC output data ready callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_FilterConfigCallback

Function name

void HAL_FMAC_FilterConfigCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC filter configuration callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_FilterPreloadCallback

Function name

void HAL_FMAC_FilterPreloadCallback (FMAC_HandleTypeDef * hfmac)

Function description

FMAC filter preload callback.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_IRQHandler

Function name

void HAL_FMAC_IRQHandler (FMAC_HandleTypeDef * hfmac)

Function description

Handle FMAC interrupt request.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **None:**

HAL_FMAC_GetState

Function name

HAL_FMAC_StateTypeDef HAL_FMAC_GetState (const FMAC_HandleTypeDef * hfmac)

Function description

Return the FMAC state.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **HAL_FMAC_StateTypeDef:** FMAC state

HAL_FMAC_GetError

Function name

uint32_t HAL_FMAC_GetError (const FMAC_HandleTypeDef * hfmac)

Function description

Return the FMAC peripheral error.

Parameters

- **hfmac:** pointer to a FMAC_HandleTypeDef structure that contains the configuration information for FMAC module.

Return values

- **uint32_t:** Error bit-map based on FMAC Error code

Notes

- The returned error is a bit-map combination of possible errors.

28.3 FMAC Firmware driver defines

The following section lists the various define and macros of the module.

28.3.1 FMAC

FMAC

FMAC Buffer Access

FMAC_BUFFER_ACCESS_NONE

Buffer handled by an external IP (ADC for instance)

FMAC_BUFFER_ACCESS_DMA

Buffer accessed through DMA

FMAC_BUFFER_ACCESS_POLLING

Buffer accessed through polling

FMAC_BUFFER_ACCESS_IT

Buffer accessed through interruptions

FMAC Clip State

FMAC_CLIP_DISABLED

Clipping disabled

FMAC_CLIP_ENABLED

Clipping enabled

FMAC Data Buffer Threshold

FMAC_THRESHOLD_1

Input: Buffer full flag set if the number of free spaces in the buffer is less than 1. Output: Buffer empty flag set if the number of unread values in the buffer is less than 1.

FMAC_THRESHOLD_2

Input: Buffer full flag set if the number of free spaces in the buffer is less than 2. Output: Buffer empty flag set if the number of unread values in the buffer is less than 2.

FMAC_THRESHOLD_4

Input: Buffer full flag set if the number of free spaces in the buffer is less than 4. Output: Buffer empty flag set if the number of unread values in the buffer is less than 4.

FMAC_THRESHOLD_8

Input: Buffer full flag set if the number of free spaces in the buffer is less than 8. Output: Buffer empty flag set if the number of unread values in the buffer is less than 8.

FMAC_THRESHOLD_NO_VALUE

The configured threshold value shouldn't be changed

FMAC Error code

HAL_FMAC_ERROR_NONE

No error

HAL_FMAC_ERROR_SAT

Saturation error

HAL_FMAC_ERROR_UNFL

Underflow error

HAL_FMAC_ERROR_OVFL

Overflow error

HAL_FMAC_ERROR_DMA

DMA error

HAL_FMAC_ERROR_RESET

Reset error

HAL_FMAC_ERROR_PARAM

Parameter error

HAL_FMAC_ERROR_INVALID_CALLBACK

Invalid Callback error

HAL_FMAC_ERROR_TIMEOUT

Timeout error

FMAC Exported Macros

__HAL_FMAC_RESET_HANDLE_STATE

Description:
- Reset FMAC handle state.

Parameters:
- __HANDLE__: FMAC handle.

Return value:
- None

__HAL_FMAC_ENABLE_IT

Description:
- Enable the specified FMAC interrupt.

Parameters:
- __HANDLE__: FMAC handle.
- __INTERRUPT__: FMAC Interrupt. This parameter can be any combination of the following values:
  - FMAC_IT_RIEN Read interrupt enable
  - FMAC_IT_WIEN Write interrupt enable
  - FMAC_IT_OVFLIEN Overflow error interrupt enable
  - FMAC_IT_UNFLIEN Underflow error interrupt enable
  - FMAC_IT_SATIEN Saturation error interrupt enable (this helps in debugging a filter)

Return value:
- None

__HAL_FMAC_DISABLE_IT

Description:
- Disable the FMAC interrupt.

Parameters:
- __HANDLE__: FMAC handle.
- __INTERRUPT__: FMAC Interrupt. This parameter can be any combination of the following values:
  - FMAC_IT_RIEN Read interrupt enable
  - FMAC_IT_WIEN Write interrupt enable
  - FMAC_IT_OVFLIEN Overflow error interrupt enable
  - FMAC_IT_UNFLIEN Underflow error interrupt enable
  - FMAC_IT_SATIEN Saturation error interrupt enable (this helps in debugging a filter)

Return value:
- None

__HAL_FMAC_GET_IT

Description:

- Check whether the specified FMAC interrupt occurred or not.

Parameters:

- __HANDLE__: FMAC handle.
- __INTERRUPT__: FMAC interrupt to check. This parameter can be any combination of the following values:
  – FMAC_FLAG_YEMPTY Y Buffer Empty Flag
  – FMAC_FLAG_X1FULL X1 Buffer Full Flag
  – FMAC_FLAG_OVFL Overflow Error Flag
  – FMAC_FLAG_UNFL Underflow Error Flag
  – FMAC_FLAG_SAT Saturation Error Flag

Return value:

- SET: (interrupt occurred) or RESET (interrupt did not occurred)

__HAL_FMAC_CLEAR_IT

Description:

- Clear specified FMAC interrupt status.

Parameters:

- __HANDLE__: FMAC handle.
- __INTERRUPT__: FMAC interrupt to clear.

Return value:

- None

__HAL_FMAC_GET_FLAG

Description:

- Check whether the specified FMAC status flag is set or not.

Parameters:

- __HANDLE__: FMAC handle.
- __FLAG__: FMAC flag to check. This parameter can be any combination of the following values:
  – FMAC_FLAG_YEMPTY Y Buffer Empty Flag
  – FMAC_FLAG_X1FULL X1 Buffer Full Flag
  – FMAC_FLAG_OVFL Overflow Error Flag
  – FMAC_FLAG_UNFL Underflow Error Flag
  – FMAC_FLAG_SAT Saturation error Flag

Return value:

- SET: (flag is set) or RESET (flag is reset)

__HAL_FMAC_CLEAR_FLAG

Description:

- Clear specified FMAC status flag.

Parameters:

- __HANDLE__: FMAC handle.
- __FLAG__: FMAC flag to clear.

Return value:

- None

__HAL_FMAC_GET_IT_SOURCE

Description:

- Check whether the specified FMAC interrupt is enabled or not.

Parameters:

- __HANDLE__: FMAC handle.
- __INTERRUPT__: FMAC interrupt to check. This parameter can be one of the following values:
  - FMAC_IT_RIEN Read interrupt enable
  - FMAC_IT_WIEN Write interrupt enable
  - FMAC_IT_OVFLIEN Overflow error interrupt enable
  - FMAC_IT_UNFLIEN Underflow error interrupt enable
  - FMAC_IT_SATIEN Saturation error interrupt enable (this helps in debugging a filter)

Return value:

- FlagStatus

FMAC status flags

FMAC_FLAG_YEMPTY

Y Buffer Empty Flag

FMAC_FLAG_X1FULL

X1 Buffer Full Flag

FMAC_FLAG_OVFL

Overflow Error Flag

FMAC_FLAG_UNFL

Underflow Error Flag

FMAC_FLAG_SAT

Saturation Error Flag (this helps in debugging a filter)

FMAC Functions

FMAC_FUNC_LOAD_X1

Load X1 buffer

FMAC_FUNC_LOAD_X2

Load X2 buffer

FMAC_FUNC_LOAD_Y

Load Y buffer

FMAC_FUNC_CONVO_FIR

Convolution (FIR filter)

FMAC_FUNC_IIR_DIRECT_FORM_1

IIR filter (direct form 1)

FMAC Interrupts Enable bit

FMAC_IT_RIEN

Read Interrupt Enable

FMAC_IT_WIEN

Write Interrupt Enable

FMAC_IT_OVFLIEN

Overflow Error Interrupt Enable

FMAC_IT_UNFLIEN

Underflow Error Interrupt Enable

FMAC_IT_SATIEN

Saturation Error Interrupt Enable (this helps in debugging a filter)

29 HAL GFXMMU Generic Driver

29.1 GFXMMU Firmware driver registers structures

29.1.1 GFXMMU_BuffersTypeDef

GFXMMU_BuffersTypeDef is defined in the stm32u5xx_hal_gfxmmu.h

Data Fields

- ***uint32_t Buf0Address***
- ***uint32_t Buf1Address***
- ***uint32_t Buf2Address***
- ***uint32_t Buf3Address***

Field Documentation

- ***uint32_t GFXMMU_BuffersTypeDef::Buf0Address***
  Physical address of buffer 0.
- ***uint32_t GFXMMU_BuffersTypeDef::Buf1Address***
  Physical address of buffer 1.
- ***uint32_t GFXMMU_BuffersTypeDef::Buf2Address***
  Physical address of buffer 2.
- ***uint32_t GFXMMU_BuffersTypeDef::Buf3Address***
  Physical address of buffer 3.

29.1.2 GFXMMU_AddressCacheTypeDef

GFXMMU_AddressCacheTypeDef is defined in the stm32u5xx_hal_gfxmmu.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t AddressCacheLockBuffer***

Field Documentation

- ***FunctionalState GFXMMU_AddressCacheTypeDef::Activation***
  Address Cache and enable/disable.
  Note:
  – : All following parameters are useful only if address cache is enabled.
- ***uint32_t GFXMMU_AddressCacheTypeDef::AddressCacheLockBuffer***
  Buffer on which the address cache is locked. This parameter can be a value of ***GFXMMU_AddressCacheLockBuffer***.
  Note:
  – : Useful only when lock of the address cache is enabled.

29.1.3 GFXMMU_InterruptsTypeDef

GFXMMU_InterruptsTypeDef is defined in the stm32u5xx_hal_gfxmmu.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t UsedInterrupts***

Field Documentation

- ***FunctionalState GFXMMU_InterruptsTypeDef::Activation***
  Interrupts enable/disable.
- ***uint32_t GFXMMU_InterruptsTypeDef::UsedInterrupts***
  Interrupts used. This parameter can be a values combination of ***GFXMMU_Interrupts***.
  Note:
  – : Useful only when interrupts are enabled.

29.1.4 GFXMMU_InitTypeDef

GFXMMU_InitTypeDef is defined in the stm32u5xx_hal_gfxmmu.h

Data Fields

- ***uint32_t BlocksPerLine***
- ***uint32_t DefaultValue***
- ***GFXMMU_BuffersTypeDef Buffers***
- ***GFXMMU_AddressCacheTypeDef AddressCache***
- ***GFXMMU_InterruptsTypeDef Interrupts***

Field Documentation

- ***uint32_t GFXMMU_InitTypeDef::BlocksPerLine***
  Number of blocks of 16 bytes per line. This parameter can be a value of ***GFXMMU_BlocksPerLine***.
- ***uint32_t GFXMMU_InitTypeDef::DefaultValue***
  Value returned when virtual memory location not physically mapped.
- ***GFXMMU_BuffersTypeDef GFXMMU_InitTypeDef::Buffers***
  Physical buffers addresses.
- ***GFXMMU_AddressCacheTypeDef GFXMMU_InitTypeDef::AddressCache***
  Address Cache parameters.
- ***GFXMMU_InterruptsTypeDef GFXMMU_InitTypeDef::Interrupts***
  Interrupts parameters.

29.1.5 __GFXMMU_HandleTypeDef

__GFXMMU_HandleTypeDef is defined in the stm32u5xx_hal_gfxmmu.h

Data Fields

- ***GFXMMU_TypeDef * Instance***
- ***GFXMMU_InitTypeDef Init***
- ***HAL_GFXMMU_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***GFXMMU_TypeDef* __GFXMMU_HandleTypeDef::Instance***
  GFXMMU instance.
- ***GFXMMU_InitTypeDef __GFXMMU_HandleTypeDef::Init***
  GFXMMU init parameters.
- ***HAL_GFXMMU_StateTypeDef __GFXMMU_HandleTypeDef::State***
  GFXMMU state.
- ***__IO uint32_t __GFXMMU_HandleTypeDef::ErrorCode***
  GFXMMU error code.
- ***void(* __GFXMMU_HandleTypeDef::ErrorCallback)(struct __GFXMMU_HandleTypeDef *hgfxmmu)***
  GFXMMU error callback.
- ***void(* __GFXMMU_HandleTypeDef::MspInitCallback)(struct __GFXMMU_HandleTypeDef *hgfxmmu)***
  GFXMMU MSP init callback.
- ***void(* __GFXMMU_HandleTypeDef::MspDeInitCallback)(struct __GFXMMU_HandleTypeDef *hgfxmmu)***
  GFXMMU MSP de-init callback.

29.1.6 GFXMMU_LutLineTypeDef

GFXMMU_LutLineTypeDef is defined in the stm32u5xx_hal_gfxmmu.h

Data Fields

- ***uint32_t LineNumber***
- ***uint32_t LineStatus***

- ***uint32_t FirstVisibleBlock***
- ***uint32_t LastVisibleBlock***
- ***int32_t LineOffset***

Field Documentation

- ***uint32_t GFXMMU_LutLineTypeDef::LineNumber***
  LUT line number. This parameter must be a number between Min_Data = 0 and Max_Data = 1023.
- ***uint32_t GFXMMU_LutLineTypeDef::LineStatus***
  LUT line enable/disable. This parameter can be a value of ***GFXMMU_LutLineStatus***.
- ***uint32_t GFXMMU_LutLineTypeDef::FirstVisibleBlock***
  First visible block on this line. This parameter must be a number between Min_Data = 0 and Max_Data = 255.
- ***uint32_t GFXMMU_LutLineTypeDef::LastVisibleBlock***
  Last visible block on this line. This parameter must be a number between Min_Data = 0 and Max_Data = 255.
- ***int32_t GFXMMU_LutLineTypeDef::LineOffset***
  Offset of block 0 of the current line in physical buffer. This parameter must be a number between Min_Data = -4080 and Max_Data = 4190208.
  Note:
  – : Line offset has to be computed with the following formula: LineOffset = [(Blocks already used) - (1st visible block)]*BlockSize.

29.2 GFXMMU Firmware driver API description

The following section lists the various functions of the GFXMMU library.

29.2.1 How to use this driver

Initialization

1. As prerequisite, fill in the HAL_GFXMMU_MspInit() :
   – Enable GFXMMU clock interface with __HAL_RCC_GFXMMU_CLK_ENABLE().
   – If interrupts are used, enable and configure GFXMMU global interrupt with HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().
2. Configure the number of blocks per line, default value, physical buffer addresses, cache and pre-fetch parameters and interrupts using the HAL_GFXMMU_Init() function.

LUT configuration

1. Use HAL_GFXMMU_DisableLutLines() to deactivate all LUT lines (or a range of lines).
2. Use HAL_GFXMMU_ConfigLut() to copy LUT from flash to look up RAM.
3. Use HAL_GFXMMU_ConfigLutLine() to configure one line of LUT.

Force flush and/or invalidate of cache

1. Use HAL_GFXMMU_ConfigForceCache() to flush and/or invalidate cache.

Modify physical buffer addresses

1. Use HAL_GFXMMU_ModifyBuffers() to modify physical buffer addresses.

Modify cache and pre-fetch parameters

1. Use HAL_GFXMMU_ModifyCachePrefetch() to modify cache and pre-fetch parameters.

Modify address cache parameters

NOTE : This feature is only available on STM32U5F9/STM32U5G9 devices.

1. Use HAL_GFXMMU_ModifyAddressCache() to modify address cache parameters.

Error management

1. If interrupts are used, HAL_GFXMMU_IRQHandler() will be called when an error occurs. This function will call HAL_GFXMMU_ErrorCallback(). Use HAL_GFXMMU_GetError() to get the error code.

De-initialization

1. As prerequisite, fill in the HAL_GFXMMU_MspDeInit() :
   – Disable GFXMMU clock interface with __HAL_RCC_GFXMMU_CLK_ENABLE().
   – If interrupts has been used, disable GFXMMU global interrupt with HAL_NVIC_DisableIRQ().
2. De-initialize GFXMMU using the HAL_GFXMMU_DeInit() function.

Callback registration

The compilation define USE_HAL_GFXMMU_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use functions HAL_GFXMMU_RegisterCallback() to register a user callback.

Function HAL_GFXMMU_RegisterCallback() allows to register following callbacks:

- ErrorCallback : GFXMMU error.
- MspInitCallback : GFXMMU MspInit.
- MspDeInitCallback : GFXMMU MspDeInit.

This function takes as parameters the HAL peripheral handle, the callback ID and a pointer to the user callback function.

Use function HAL_GFXMMU_UnRegisterCallback() to reset a callback to the default weak (overridden) function. HAL_GFXMMU_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the callback ID.

This function allows to reset following callbacks:

- ErrorCallback : GFXMMU error.
- MspInitCallback : GFXMMU MspInit.
- MspDeInitCallback : GFXMMU MspDeInit.

By default, after the HAL_GFXMMU_Init and if the state is HAL_GFXMMU_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions: examples HAL_GFXMMU_ErrorCallback(). Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_GFXMMU_Init and HAL_GFXMMU_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_GFXMMU_Init and HAL_GFXMMU_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_GFXMMU_RegisterCallback before calling HAL_GFXMMU_DeInit or HAL_GFXMMU_Init function.

When the compilation define USE_HAL_GFXMMU_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

29.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the GFXMMU.
- De-initialize the GFXMMU.

This section contains the following APIs:

- *HAL_GFXMMU_Init()*
- *HAL_GFXMMU_DeInit()*
- *HAL_GFXMMU_MspInit()*
- *HAL_GFXMMU_MspDeInit()*
- *HAL_GFXMMU_RegisterCallback()*
- *HAL_GFXMMU_UnRegisterCallback()*

29.2.3 Operation functions

This section provides functions allowing to:
- Configure LUT.
- Force flush and/or invalidate of cache.
- Modify physical buffer addresses.
- Modify cache and pre-fetch parameters.
- Manage error.

This section contains the following APIs:
- *HAL_GFXMMU_ConfigLut()*
- *HAL_GFXMMU_DisableLutLines()*
- *HAL_GFXMMU_ConfigLutLine()*
- *HAL_GFXMMU_ModifyBuffers()*
- *HAL_GFXMMU_ModifyAddressCache()*
- *HAL_GFXMMU_IRQHandler()*
- *HAL_GFXMMU_ErrorCallback()*

29.2.4 State functions

This section provides functions allowing to:
- Get GFXMMU handle state.
- Get GFXMMU error code.

This section contains the following APIs:
- *HAL_GFXMMU_GetState()*
- *HAL_GFXMMU_GetError()*

29.2.5 Detailed description of functions

HAL_GFXMMU_Init

Function name

HAL_StatusTypeDef HAL_GFXMMU_Init (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

Initialize the GFXMMU according to the specified parameters in the GFXMMU_InitTypeDef structure and initialize the associated handle.

Parameters
- **hgfxmmu:** GFXMMU handle.

Return values
- **HAL:** status.

HAL_GFXMMU_DeInit

Function name

HAL_StatusTypeDef HAL_GFXMMU_DeInit (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

De-initialize the GFXMMU.

Parameters
- **hgfxmmu:** GFXMMU handle.

Return values
- **HAL:** status.

HAL_GFXMMU_MspInit

Function name

void HAL_GFXMMU_MspInit (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

Initialize the GFXMMU MSP.

Parameters

- **hgfxmmu:** GFXMMU handle.

Return values

- **None.:**

HAL_GFXMMU_MspDeInit

Function name

void HAL_GFXMMU_MspDeInit (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

De-initialize the GFXMMU MSP.

Parameters

- **hgfxmmu:** GFXMMU handle.

Return values

- **None.:**

HAL_GFXMMU_RegisterCallback

Function name

HAL_StatusTypeDef HAL_GFXMMU_RegisterCallback (GFXMMU_HandleTypeDef * hgfxmmu, HAL_GFXMMU_CallbackIDTypeDef CallbackID, pGFXMMU_CallbackTypeDef pCallback)

Function description

Register a user GFXMMU callback to be used instead of the weak predefined callback.

Parameters

- **hgfxmmu:** GFXMMU handle.
- **CallbackID:** ID of the callback to be registered. This parameter can be one of the following values:
  - HAL_GFXMMU_ERROR_CB_ID error callback ID.
  - HAL_GFXMMU_MSPINIT_CB_ID MSP init callback ID.
  - HAL_GFXMMU_MSPDEINIT_CB_ID MSP de-init callback ID.
- **pCallback:** pointer to the callback function.

Return values

- **HAL:** status.

HAL_GFXMMU_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_GFXMMU_UnRegisterCallback (GFXMMU_HandleTypeDef * hgfxmmu, HAL_GFXMMU_CallbackIDTypeDef CallbackID)

Function description

Unregister a user GFXMMU callback.

Parameters

- **hgfxmmu:** GFXMMU handle.
- **CallbackID:** ID of the callback to be unregistered. This parameter can be one of the following values:
  - HAL_GFXMMU_ERROR_CB_ID error callback ID.
  - HAL_GFXMMU_MSPINIT_CB_ID MSP init callback ID.
  - HAL_GFXMMU_MSPDEINIT_CB_ID MSP de-init callback ID.

Return values

- **HAL:** status.

HAL_GFXMMU_ConfigLut

Function name

HAL_StatusTypeDef HAL_GFXMMU_ConfigLut (GFXMMU_HandleTypeDef * hgfxmmu, uint32_t FirstLine, uint32_t LinesNumber, uint32_t Address)

Function description

This function allows to copy LUT from flash to look up RAM.

Parameters

- **hgfxmmu:** GFXMMU handle.
- **FirstLine:** First line enabled on LUT. This parameter must be a number between Min_Data = 0 and Max_Data = 1023.
- **LinesNumber:** Number of lines enabled on LUT. This parameter must be a number between Min_Data = 1 and Max_Data = 1024.
- **Address:** Start address of LUT in flash.

Return values

- **HAL:** status.

HAL_GFXMMU_DisableLutLines

Function name

HAL_StatusTypeDef HAL_GFXMMU_DisableLutLines (GFXMMU_HandleTypeDef * hgfxmmu, uint32_t FirstLine, uint32_t LinesNumber)

Function description

This function allows to disable a range of LUT lines.

Parameters

- **hgfxmmu:** GFXMMU handle.
- **FirstLine:** First line to disable on LUT. This parameter must be a number between Min_Data = 0 and Max_Data = 1023.
- **LinesNumber:** Number of lines to disable on LUT. This parameter must be a number between Min_Data = 1 and Max_Data = 1024.

Return values

- **HAL:** status.

HAL_GFXMMU_ConfigLutLine

Function name

HAL_StatusTypeDef HAL_GFXMMU_ConfigLutLine (GFXMMU_HandleTypeDef * hgfxmmu, GFXMMU_LutLineTypeDef * lutLine)

Function description

This function allows to configure one line of LUT.

Parameters

- **hgfxmmu:** GFXMMU handle.
- **lutLine:** LUT line parameters.

Return values

- **HAL:** status.

HAL_GFXMMU_ModifyBuffers

Function name

HAL_StatusTypeDef HAL_GFXMMU_ModifyBuffers (GFXMMU_HandleTypeDef * hgfxmmu, GFXMMU_BuffersTypeDef * Buffers)

Function description

This function allows to modify physical buffer addresses.

Parameters

- **hgfxmmu:** GFXMMU handle.
- **Buffers:** Buffers parameters.

Return values

- **HAL:** status.

Notes

- This function is only available on STM32U599/STM32U5A9 devices.

HAL_GFXMMU_ModifyAddressCache

Function name

HAL_StatusTypeDef HAL_GFXMMU_ModifyAddressCache (GFXMMU_HandleTypeDef * hgfxmmu, GFXMMU_AddressCacheTypeDef * AddressCache)

Function description

This function allows to modify address cache parameters.

Parameters

- **hgfxmmu:** GFXMMU handle.
- **AddressCache:** address cache parameters.

Return values

- **HAL:** status.

Notes

- This function is only available on STM32U5F9/STM32U5G9 devices.

HAL_GFXMMU_IRQHandler

Function name

void HAL_GFXMMU_IRQHandler (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

This function handles the GFXMMU interrupts.

Parameters

- **hgfxmmu:** GFXMMU handle.

Return values

- **None.:**

HAL_GFXMMU_ErrorCallback

Function name

void HAL_GFXMMU_ErrorCallback (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

Error callback.

Parameters

- **hgfxmmu:** GFXMMU handle.

Return values

- **None.:**

HAL_GFXMMU_GetState

Function name

HAL_GFXMMU_StateTypeDef HAL_GFXMMU_GetState (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

This function allows to get the current GFXMMU handle state.

Parameters

- **hgfxmmu:** GFXMMU handle.

Return values

- **GFXMMU:** state.

HAL_GFXMMU_GetError

Function name

uint32_t HAL_GFXMMU_GetError (GFXMMU_HandleTypeDef * hgfxmmu)

Function description

This function allows to get the current GFXMMU error code.

Parameters

- **hgfxmmu:** GFXMMU handle.

Return values

- **GFXMMU:** error code.

29.3 GFXMMU Firmware driver defines

The following section lists the various define and macros of the module.

29.3.1 GFXMMU

GFXMMU

GFXMMU address cache lock buffer

GFXMMU_ADDRESSCACHE_LOCK_BUFFER0

Address Cache locked to buffer 0

GFXMMU_ADDRESSCACHE_LOCK_BUFFER1

Address Cache locked to buffer 1

GFXMMU_ADDRESSCACHE_LOCK_BUFFER2

Address Cache locked to buffer 2

GFXMMU_ADDRESSCACHE_LOCK_BUFFER3

Address Cache locked to buffer 3

GFXMMU blocks per line

GFXMMU_256BLOCKS

256 blocks of 16 bytes per line

GFXMMU_192BLOCKS

192 blocks of 16 bytes per line

GFXMMU cache force

GFXMMU_CACHE_FORCE_DISABLE

Caching not forced

GFXMMU_CACHE_FORCE_ENABLE

Caching forced

GFXMMU cache force parameter

GFXMMU_CACHE_FORCE_FLUSH

Force cache flush

GFXMMU_CACHE_FORCE_INVALIDATE

Force cache invalidate

GFXMMU cache lock

GFXMMU_CACHE_LOCK_DISABLE

Cache not locked to a buffer

GFXMMU_CACHE_LOCK_ENABLE

Cache locked to a buffer

GFXMMU cache lock buffer

GFXMMU_CACHE_LOCK_BUFFER0

Cache locked to buffer 0

GFXMMU_CACHE_LOCK_BUFFER1

Cache locked to buffer 1

GFXMMU_CACHE_LOCK_BUFFER2

Cache locked to buffer 2

GFXMMU_CACHE_LOCK_BUFFER3

Cache locked to buffer 3

GFXMMU Error Code

GFXMMU_ERROR_NONE

No error.

GFXMMU_ERROR_BUFFER0_OVERFLOW
Buffer 0 overflow.

GFXMMU_ERROR_BUFFER1_OVERFLOW
Buffer 1 overflow.

GFXMMU_ERROR_BUFFER2_OVERFLOW
Buffer 2 overflow.

GFXMMU_ERROR_BUFFER3_OVERFLOW
Buffer 3 overflow.

GFXMMU_ERROR_AHB_MASTER
AHB master error.

GFXMMU_ERROR_INVALID_CALLBACK
Invalid callback error.

GFXMMU Exported Macros

__HAL_GFXMMU_RESET_HANDLE_STATE

Description:
- Reset GFXMMU handle state.

Parameters:
- __HANDLE__: GFXMMU handle.

Return value:
- None

GFXMMU interrupts

GFXMMU_AHB_MASTER_ERROR_IT
AHB master error interrupt.

GFXMMU_BUFFER0_OVERFLOW_IT
Buffer 0 overflow interrupt.

GFXMMU_BUFFER1_OVERFLOW_IT
Buffer 1 overflow interrupt.

GFXMMU_BUFFER2_OVERFLOW_IT
Buffer 2 overflow interrupt.

GFXMMU_BUFFER3_OVERFLOW_IT
Buffer 3 overflow interrupt.

GFXMMU LUT line status

GFXMMU_LUT_LINE_DISABLE
LUT line disabled.

GFXMMU_LUT_LINE_ENABLE
LUT line enabled.

GFXMMU outer bufferability

GFXMMU_OUTTER_BUFFERABILITY_DISABLE
No bufferable

GFXMMU_OUTTER_BUFFERABILITY_ENABLE

Bufferable

GFXMMU outer cachability

GFXMMU_OUTTER_CACHABILITY_DISABLE

No cacheable

GFXMMU_OUTTER_CACHABILITY_ENABLE

Cacheable

GFXMMU pre-fetch

GFXMMU_PREFETCH_DISABLE

Pre-fetch disable

GFXMMU_PREFETCH_ENABLE

Pre-fetch enable

30 HAL GFXTIM Generic Driver

30.1 GFXTIM Firmware driver registers structures

30.1.1 GFXTIM_InitTypeDef

GFXTIM_InitTypeDef is defined in the stm32u5xx_hal_gfxtim.h

Data Fields

- ***uint32_t SynchroSrc***
- ***uint32_t TearingEffectSrc***
- ***uint32_t TearingEffectPolarity***
- ***uint32_t TearingEffectInterrupt***

Field Documentation

- ***uint32_t GFXTIM_InitTypeDef::SynchroSrc***
  Synchronization signals (HSYNC and VSYNC) sources. This parameter can be a value of ***GFXTIM_SynchroSrc***
- ***uint32_t GFXTIM_InitTypeDef::TearingEffectSrc***
  Tearing effect source This parameter can be a value of ***GFXTIM_TearingEffectSrc***
- ***uint32_t GFXTIM_InitTypeDef::TearingEffectPolarity***
  Tearing effect source This parameter can be a value of ***GFXTIM_TearingEffectPolarity***
- ***uint32_t GFXTIM_InitTypeDef::TearingEffectInterrupt***
  Tearing effect interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***

30.1.2 __GFXTIM_HandleTypeDef

__GFXTIM_HandleTypeDef is defined in the stm32u5xx_hal_gfxtim.h

Data Fields

- ***GFXTIM_TypeDef * Instance***
- ***__IO HAL_GFXTIM_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***GFXTIM_InitTypeDef Init***
- ***void(* HAL_GFXTIM_AbsoluteTimer_AFCC1Callback***
- ***void(* HAL_GFXTIM_AbsoluteTimer_AFCOFCallback***
- ***void(* HAL_GFXTIM_AbsoluteTimer_ALCC1Callback***
- ***void(* HAL_GFXTIM_AbsoluteTimer_ALCC2Callback***
- ***void(* HAL_GFXTIM_AbsoluteTimer_ALCOFCallback***
- ***void(* HAL_GFXTIM_RelativeTimer_RFC1RCallback***
- ***void(* HAL_GFXTIM_RelativeTimer_RFC2RCallback***
- ***void(* HAL_GFXTIM_TECallback***
- ***void(* HAL_GFXTIM_EventGenerator_EV1Callback***
- ***void(* HAL_GFXTIM_EventGenerator_EV2Callback***
- ***void(* HAL_GFXTIM_EventGenerator_EV3Callback***
- ***void(* HAL_GFXTIM_EventGenerator_EV4Callback***
- ***void(* HAL_GFXTIM_WatchdogTimer_AlarmCallback***
- ***void(* HAL_GFXTIM_WatchdogTimer_PreAlarmCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***GFXTIM_TypeDef* __GFXTIM_HandleTypeDef::Instance***
  GFXTIM instance

- ***__IO HAL_GFXTIM_StateTypeDef __GFXTIM_HandleTypeDef::State***
  GFXTIM state
- ***__IO uint32_t __GFXTIM_HandleTypeDef::ErrorCode***
  GFXTIM error code
- ***GFXTIM_InitTypeDef __GFXTIM_HandleTypeDef::Init***
  GFXTIM initialization
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_AbsoluteTimer_AFCC1Callback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Absolute frame counter compare 1 callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_AbsoluteTimer_AFCOFCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Absolute frame counter overflow callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_AbsoluteTimer_ALCC1Callback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Absolute line counter compare 1 callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_AbsoluteTimer_ALCC2Callback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Absolute line counter compare 2 callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_AbsoluteTimer_ALCOFCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Absolute line counter overflow callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_RelativeTimer_RFC1RCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Relative frame counter 1 reload callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_RelativeTimer_RFC2RCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Relative frame counter 2 reload callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_TECallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Tearing effect callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_EventGenerator_EV1Callback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Event events 1 callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_EventGenerator_EV2Callback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Event events 2 callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_EventGenerator_EV3Callback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Event events 3 callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_EventGenerator_EV4Callback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Event events 4 callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_WatchdogTimer_AlarmCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Watchdog alarm callback
- ***void(* __GFXTIM_HandleTypeDef::HAL_GFXTIM_WatchdogTimer_PreAlarmCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM Watchdog pre alarm callback
- ***void(* __GFXTIM_HandleTypeDef::ErrorCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM error callback
- ***void(* __GFXTIM_HandleTypeDef::MspInitCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM MSP initialization user callback
- ***void(* __GFXTIM_HandleTypeDef::MspDeInitCallback)(struct __GFXTIM_HandleTypeDef *hgfxtim)***
  GFXTIM MSP de-initialization user callback

30.1.3 GFXTIM_ClockGeneratorConfigTypeDef

GFXTIM_ClockGeneratorConfigTypeDef is defined in the stm32u5xx_hal_gfxtim.h

Data Fields

- *uint32_t LCCHwReloadSrc*
- *uint32_t LCCReloadValue*
- *uint32_t LCCClockSrc*
- *uint32_t LineClockSrc*
- *uint32_t FCCHwReloadSrc*
- *uint32_t FCCReloadValue*
- *uint32_t FCCClockSrc*
- *uint32_t FrameClockSrc*
- *uint32_t LineClockCalib*
- *uint32_t FrameClockCalib*

Field Documentation

- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::LCCHwReloadSrc***
  Line Clock Counter hardware reload source This parameter can be a value of ***GFXTIM_LCCHwReloadSrc***
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::LCCReloadValue***
  Line Clock Counter reload value (22 bits) This parameter must be a number between Min_Data = 1 and Max_Data = 4194303
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::LCCClockSrc***
  Line Clock Counter Clock Source This parameter can be a value of ***GFXTIM_LCCClockSrc***
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::LineClockSrc***
  Line Clock Source This parameter can be a value of ***GFXTIM_LineClockSrc***
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::FCCHwReloadSrc***
  Frame Clock Counter hardware reload source This parameter can be a value of ***GFXTIM_FCCHwReloadSrc***
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::FCCReloadValue***
  Frame Clock Counter reload value (12 bits) This parameter must be a number between Min_Data = 1 and Max_Data = 4095
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::FCCClockSrc***
  Frame Clock Counter Clock Source This parameter can be a value of ***GFXTIM_FCCClockSrc***
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::FrameClockSrc***
  Frame Clock Source This parameter can be a value of ***GFXTIM_FrameClockSrc***
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::LineClockCalib***
  Debug purpose This parameter can be a value of ***GFXTIM_LineClockCalib***
- ***uint32_t GFXTIM_ClockGeneratorConfigTypeDef::FrameClockCalib***
  Debug purpose This parameter can be a value of ***GFXTIM_FrameClockCalib***

30.1.4 GFXTIM_AbsoluteTimerConfigTypeDef

GFXTIM_AbsoluteTimerConfigTypeDef is defined in the stm32u5xx_hal_gfxtim.h

Data Fields

- *uint32_t FrameCompare1Value*
- *uint32_t FrameCounterValue*
- *uint32_t FrameOverflowInterrupt*
- *uint32_t FrameCompare1Interrupt*
- *uint32_t LineCompare1Value*
- *uint32_t LineCompare2Value*
- *uint32_t LineCounterValue*
- *uint32_t LineOverflowInterrupt*
- *uint32_t LineCompare1Interrupt*
- *uint32_t LineCompare2Interrupt*

Field Documentation

- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::FrameCompare1Value***
  Absolute Frame Compare 1 value (20 bits) This parameter must be a number between 1 and 1048575

- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::FrameCounterValue***
  Absolute Frame Counter initial value (20 bits) This parameter must be a number between 1 and 1048575
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::FrameOverflowInterrupt***
  Absolute Frame Counter Overflow Interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::FrameCompare1Interrupt***
  Absolute Frame Compare 1 Interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::LineCompare1Value***
  Absolute Line Compare 1 value (12 bits) This parameter must be a number between 1 and 4095
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::LineCompare2Value***
  Absolute Line Compare 2 value (12 bits) This parameter must be a number between 1 and 4095
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::LineCounterValue***
  Absolute Line Counter value (12 bits) This parameter must be a number between 1 and 4095
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::LineOverflowInterrupt***
  Absolute Line Counter Overflow Interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::LineCompare1Interrupt***
  Absolute Line Compare 1 Interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***
- ***uint32_t GFXTIM_AbsoluteTimerConfigTypeDef::LineCompare2Interrupt***
  Absolute Line Compare 2 Interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***

30.1.5 GFXTIM_RelativeTimerConfigTypeDef

GFXTIM_RelativeTimerConfigTypeDef is defined in the stm32u5xx_hal_gfxtim.h

Data Fields

- ***uint32_t AutoReloadValue***
- ***uint32_t CounterMode***
- ***uint32_t ReloadInterrupt***

Field Documentation

- ***uint32_t GFXTIM_RelativeTimerConfigTypeDef::AutoReloadValue***
  Auto reload value (12 bits) This parameter must be a number between 1 and 4095
- ***uint32_t GFXTIM_RelativeTimerConfigTypeDef::CounterMode***
  Counter Mode This parameter can be a value of GFXTIM_RelativeCounterMode
- ***uint32_t GFXTIM_RelativeTimerConfigTypeDef::ReloadInterrupt***
  Relative Frame Counter Reload Interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***

30.1.6 GFXTIM_EventGeneratorConfigTypeDef

GFXTIM_EventGeneratorConfigTypeDef is defined in the stm32u5xx_hal_gfxtim.h

Data Fields

- ***uint32_t LineEvent***
- ***uint32_t FrameEvent***
- ***uint32_t EventInterrupt***

Field Documentation

- ***uint32_t GFXTIM_EventGeneratorConfigTypeDef::LineEvent***
  Line event selection This parameter can be a value of GFXTIM_EventLine
- ***uint32_t GFXTIM_EventGeneratorConfigTypeDef::FrameEvent***
  Frmae event selection This parameter can be a value of GFXTIM_EventFrame
- ***uint32_t GFXTIM_EventGeneratorConfigTypeDef::EventInterrupt***
  Event interrupt Enable or Disable This parameter can be a value of ***GFXTIM_Interrupt***

30.1.7 GFXTIM_WatchdogConfigTypeDef

GFXTIM_WatchdogConfigTypeDef is defined in the stm32u5xx_hal_gfxtim.h

Data Fields

- ***uint32_t ClockSrc***
- ***uint32_t AutoReloadValue***
- ***uint32_t HwReloadConfig***
- ***uint32_t PreAlarmValue***
- ***uint32_t AlarmInterrupt***
- ***uint32_t PreAlarmInterrupt***

Field Documentation

- ***uint32_t GFXTIM_WatchdogConfigTypeDef::ClockSrc***
  Clock source This parameter can be a value of GFXTIM_WatchdogClockSrc
- ***uint32_t GFXTIM_WatchdogConfigTypeDef::AutoReloadValue***
  Reload value (16 bits) This parameter must be a number between 1 and 65535
- ***uint32_t GFXTIM_WatchdogConfigTypeDef::HwReloadConfig***
  Hardware reload configuration This parameter can be a value of GFXTIM_WatchdogHwReloadConfig
- ***uint32_t GFXTIM_WatchdogConfigTypeDef::PreAlarmValue***
  Pre-alarm value (16 bits) This parameter must be a number between 1 and 65535
- ***uint32_t GFXTIM_WatchdogConfigTypeDef::AlarmInterrupt***
  Interrupt Enable or Disable when watchdog counter reaches 0 This parameter can be a value of ***GFXTIM_Interrupt***
- ***uint32_t GFXTIM_WatchdogConfigTypeDef::PreAlarmInterrupt***
  Interrupt Enable or Disable when watchdog counter reaches pre-alarm value This parameter can be a value of ***GFXTIM_Interrupt***

30.2 GFXTIM Firmware driver API description

The following section lists the various functions of the GFXTIM library.

30.2.1 How to use this driver

Initialization and de-initialization

1. User has first to initialize GFXTIM.
2. As prerequisite, fill in the HAL_GFXTIM_MspInit() :
   – Enable GFXTIM with __HAL_RCC_GFXTIM_CLK_ENABLE
   – Enable the clocks for the used GPIOS with __HAL_RCC_GPIOx_CLK_ENABLE().
   – Configure these pins in alternate mode using HAL_GPIO_Init().
   – If interrupt mode is used, enable and configure GFXTIM interrupt with HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().
1. User can de-initialize GFXTIM with HAL_GFXTIM_DeInit() function.

generic functions

1. HAL_GFXTIM_IRQHandler will be called when GFXTIM interrupt occurs.
2. HAL_GFXTIM_ErrorCallback will be called when GFXTIM or ADF error occurs.
3. Use HAL_GFXTIM_GetState() to get the current GFXTIM or ADF instance state.
4. Use HAL_GFXTIM_GetErrorCode() to get the current GFXTIM or ADF instance error code. #if defined(GENERATOR_CALLBACKS_REGISTERING_AVAILABLE)

Callback registration

30.2.2 Initialization and de-initialization functions

This section provides functions allowing to :

- Initialize the GFXTIM instance.
- De-initialize the GFXTIM instance.
- Register and unregister callbacks.

This section contains the following APIs:

- *HAL_GFXTIM_Init()*
- *HAL_GFXTIM_DeInit()*
- *HAL_GFXTIM_MspInit()*
- *HAL_GFXTIM_MspDeInit()*
- *HAL_GFXTIM_RegisterCallback()*
- *HAL_GFXTIM_UnRegisterCallback()*
- *HAL_GFXTIM_TECallback()*

30.2.3 Clock Generator functions

This section provides functions allowing to :

- Configure the clock generator.
- Force reload of FCC and LCC.

This section contains the following APIs:

- *HAL_GFXTIM_ClockGenerator_Config()*
- *HAL_GFXTIM_ClockGenerator_Reload()*
- *HAL_GFXTIM_TECallback()*

30.2.4 Absolute Timers functions

This section provides functions allowing to :

- Configure the absolute timer.
- Start the absolute timer.
- Stop the absolute timer.
- Reset the absolute timer counters.
- Get the absolute time value.
- Set the absolute frame compare value.
- Set the absolute line compare value.

This section contains the following APIs:

- *HAL_GFXTIM_AbsoluteTimer_Config()*
- *HAL_GFXTIM_AbsoluteTimer_Start()*
- *HAL_GFXTIM_AbsoluteTimer_Stop()*
- *HAL_GFXTIM_AbsoluteTimer_Reset()*
- *HAL_GFXTIM_AbsoluteTimer_GetCounter()*
- *HAL_GFXTIM_AbsoluteTimer_SetFrameCompare()*
- *HAL_GFXTIM_AbsoluteTimer_SetLineCompare()*
- *HAL_GFXTIM_AbsoluteTimer_AFCOFCallback()*
- *HAL_GFXTIM_AbsoluteTimer_AFCC1Callback()*
- *HAL_GFXTIM_AbsoluteTimer_ALCC1Callback()*
- *HAL_GFXTIM_AbsoluteTimer_ALCC2Callback()*
- *HAL_GFXTIM_AbsoluteTimer_ALCOFCallback()*

30.2.5 Relative Timer functions

This section provides functions allowing to :

- Configure a relative timer.
- Start a relative timer counter.
- Stop a relative timer counter.
- Force a relative timer counter reload.
- Set a relative timer reload value.
- Get a relative timer counter value.

This section contains the following APIs:

- *HAL_GFXTIM_RelativeTimer_Config()*
- *HAL_GFXTIM_RelativeTimer_Start()*
- *HAL_GFXTIM_RelativeTimer_Stop()*
- *HAL_GFXTIM_RelativeTimer_ForceReload()*
- *HAL_GFXTIM_RelativeTimer_SetReload()*
- *HAL_GFXTIM_RelativeTimer_GetCounter()*
- *HAL_GFXTIM_RelativeTimer_RFC1RCallback()*
- *HAL_GFXTIM_RelativeTimer_RFC2RCallback()*

30.2.6 Event Generator functions

This section provides functions allowing to :
- Configure an Event Generator.
- Enable an Event Generator.
- Disable an Event Generator.

This section contains the following APIs:
- *HAL_GFXTIM_EventGenerator_Config()*
- *HAL_GFXTIM_EventGenerator_Enable()*
- *HAL_GFXTIM_EventGenerator_Disable()*
- *HAL_GFXTIM_EventGenerator_EV1Callback()*
- *HAL_GFXTIM_EventGenerator_EV2Callback()*
- *HAL_GFXTIM_EventGenerator_EV3Callback()*
- *HAL_GFXTIM_EventGenerator_EV4Callback()*

30.2.7 Watchdog functions

This section provides functions allowing to :
- Configure the Watchdog.
- Enable the Watchdog
- Disable the Watchdog.
- Refresh the Watchdog.

This section contains the following APIs:
- *HAL_GFXTIM_WatchdogTimer_Config()*
- *HAL_GFXTIM_WatchdogTimer_Enable()*
- *HAL_GFXTIM_WatchdogTimer_Disable()*
- *HAL_GFXTIM_WatchdogTimer_Refresh()*
- *HAL_GFXTIM_WatchdogTimer_AlarmCallback()*
- *HAL_GFXTIM_WatchdogTimer_PreAlarmCallback()*

30.2.8 Generic functions

This section provides functions allowing to :
- Handle GFXTIM interrupt.
- Inform user that error occurs.
- Get the current GFXTIM instance state
- Get the current GFXTIM instance error code.

This section contains the following APIs:
- *HAL_GFXTIM_IRQHandler()*
- *HAL_GFXTIM_ErrorCallback()*
- *HAL_GFXTIM_GetState()*
- *HAL_GFXTIM_GetError()*

30.2.9 Detailed description of functions

HAL_GFXTIM_Init

Function name

HAL_StatusTypeDef HAL_GFXTIM_Init (GFXTIM_HandleTypeDef * hgfxtim)

Function description

Initialize the GFXTIM instance according to the specified parameters in the GFXTIM_InitTypeDef structure and initialize the associated handle.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **HAL:** status.

HAL_GFXTIM_DeInit

Function name

HAL_StatusTypeDef HAL_GFXTIM_DeInit (GFXTIM_HandleTypeDef * hgfxtim)

Function description

De-initialize the GFXTIM instance.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **HAL:** status.

HAL_GFXTIM_MspInit

Function name

void HAL_GFXTIM_MspInit (GFXTIM_HandleTypeDef * hgfxtim)

Function description

Initialize the GFXTIM instance MSP.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_MspDeInit

Function name

void HAL_GFXTIM_MspDeInit (GFXTIM_HandleTypeDef * hgfxtim)

Function description

De-initialize the GFXTIM instance MSP.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_RegisterCallback

Function name

HAL_StatusTypeDef HAL_GFXTIM_RegisterCallback (GFXTIM_HandleTypeDef * hgfxtim, HAL_GFXTIM_CallbackIDTypeDef CallbackID, pGFXTIM_CallbackTypeDef pCallback)

Function description

Register a user GFXTIM callback to be used instead of the weak predefined callback.

Parameters

- **hgfxtim:** GFXTIM handle.
- **CallbackID:** ID of the callback to be registered. This parameter can be one of the following values:
  - HAL_GFXTIM_AFC_COMPARE1_CB_ID Absolute frame counter compare 1 callback ID
  - HAL_GFXTIM_AFC_OVERFLOW_CB_ID Absolute frame counter overflow callback ID
  - HAL_GFXTIM_ALC_COMPARE1_CB_ID Absolute line counter compare 1 callback ID
  - HAL_GFXTIM_ALC_COMPARE2_CB_ID Absolute line counter compare 2 callback ID
  - HAL_GFXTIM_ALC_OVERFLOW_CB_ID Absolute line counter overflow callback ID
  - HAL_GFXTIM_RFC1_RELOAD_CB_ID Relative frame counter 1 reload callback ID
  - HAL_GFXTIM_RFC2_RELOAD_CB_ID Relative frame counter 2 reload callback ID
  - HAL_GFXTIM_TE_CB_ID External tearing effect callback ID
  - HAL_GFXTIM_EVENT1_CB_ID Event events 1 callback ID
  - HAL_GFXTIM_EVENT2_CB_ID Event events 2 callback ID
  - HAL_GFXTIM_EVENT3_CB_ID Event events 3 callback ID
  - HAL_GFXTIM_EVENT4_CB_ID Event events 4 callback ID
  - HAL_GFXTIM_WDG_ALARM_CB_ID Watchdog alarm callback ID
  - HAL_GFXTIM_WDG_PREALARM_CB_ID Watchdog pre alarm callback ID
  - HAL_GFXTIM_ERROR_CB_ID error callback ID
  - HAL_GFXTIM_MSP_INIT_CB_ID MSP initialization user callback ID
  - HAL_GFXTIM_MSP_DEINIT_CB_ID MSP de-initialization user callback ID
- **pCallback:** pointer to the callback function.

Return values

- **HAL:** status.

HAL_GFXTIM_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_GFXTIM_UnRegisterCallback (GFXTIM_HandleTypeDef * hgfxtim, HAL_GFXTIM_CallbackIDTypeDef CallbackID)

Function description

Unregister a user GFXTIM callback.

Parameters

- **hgfxtim:** GFXTIM handle.
- **CallbackID:** ID of the callback to be unregistered. This parameter can be one of the following values:
  – HAL_GFXTIM_AFC_COMPARE1_CB_ID Absolute frame counter compare 1 callback ID
  – HAL_GFXTIM_AFC_OVERFLOW_CB_ID Absolute frame counter overflow callback ID
  – HAL_GFXTIM_ALC_COMPARE1_CB_ID Absolute line counter compare 1 callback ID
  – HAL_GFXTIM_ALC_COMPARE2_CB_ID Absolute line counter compare 2 callback ID
  – HAL_GFXTIM_ALC_OVERFLOW_CB_ID Absolute line counter overflow callback ID
  – HAL_GFXTIM_RFC1_RELOAD_CB_ID Relative frame counter 1 reload callback ID
  – HAL_GFXTIM_RFC2_RELOAD_CB_ID Relative frame counter 2 reload callback ID
  – HAL_GFXTIM_TE_CB_ID External tearing effect callback ID
  – HAL_GFXTIM_EVENT1_CB_ID Event events 1 callback ID
  – HAL_GFXTIM_EVENT2_CB_ID Event events 2 callback ID
  – HAL_GFXTIM_EVENT3_CB_ID Event events 3 callback ID
  – HAL_GFXTIM_EVENT4_CB_ID Event events 4 callback ID
  – HAL_GFXTIM_WDG_ALARM_CB_ID Watchdog alarm callback ID
  – HAL_GFXTIM_WDG_PREALARM_CB_ID Watchdog pre alarm callback ID
  – HAL_GFXTIM_ERROR_CB_ID error callback ID
  – HAL_GFXTIM_MSP_INIT_CB_ID MSP initialization user callback ID
  – HAL_GFXTIM_MSP_DEINIT_CB_ID MSP de-initialization user callback ID

Return values

- **HAL:** status.

HAL_GFXTIM_TECallback

Function name

void HAL_GFXTIM_TECallback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

GFXTIM Tearing effect callback.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_ClockGenerator_Config

Function name

HAL_StatusTypeDef HAL_GFXTIM_ClockGenerator_Config (GFXTIM_HandleTypeDef * hgfxtim, const GFXTIM_ClockGeneratorConfigTypeDef * pClockGeneratorConfig)

Function description

This function configures the clock generator.

Parameters

- **hgfxtim:** GFXTIM handle.
- **pClockGeneratorConfig:** Clock Generator configuration parameters.

Return values

- **HAL:** status.

HAL_GFXTIM_ClockGenerator_Reload

Function name

HAL_StatusTypeDef HAL_GFXTIM_ClockGenerator_Reload (GFXTIM_HandleTypeDef * hgfxtim, uint32_t ClockGeneratorCounter)

Function description

This function force clock generator counter(s) reload.

Parameters

- **hgfxtim:** GFXTIM handle.
- **ClockGeneratorCounter:** Clock Generator counter This parameter can be a value of GFXTIM Clock Generator Counter.

Return values

- **HAL:** status.

HAL_GFXTIM_AbsoluteTimer_Config

Function name

HAL_StatusTypeDef HAL_GFXTIM_AbsoluteTimer_Config (GFXTIM_HandleTypeDef * hgfxtim, const GFXTIM_AbsoluteTimerConfigTypeDef * pAbsoluteTimerConfig)

Function description

This function configures an absolute Timer.

Parameters

- **hgfxtim:** GFXTIM handle.
- **pAbsoluteTimerConfig:** pointer to a GFXTIM_AbsoluteTimerConfigTypeDef structure that contains absoluite timer comparators and counters values.

Return values

- **HAL:** status.

HAL_GFXTIM_AbsoluteTimer_Start

Function name

HAL_StatusTypeDef HAL_GFXTIM_AbsoluteTimer_Start (GFXTIM_HandleTypeDef * hgfxtim)

Function description

This function starts absolute timer.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **HAL:** status.

HAL_GFXTIM_AbsoluteTimer_Stop

Function name

HAL_StatusTypeDef HAL_GFXTIM_AbsoluteTimer_Stop (GFXTIM_HandleTypeDef * hgfxtim)

Function description

This function stops absolute timer counter(s).

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **HAL:** status.

HAL_GFXTIM_AbsoluteTimer_Reset

Function name

HAL_StatusTypeDef HAL_GFXTIM_AbsoluteTimer_Reset (GFXTIM_HandleTypeDef * hgfxtim)

Function description

This function resets absolute timer counters.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **HAL:** status.

HAL_GFXTIM_AbsoluteTimer_GetCounter

Function name

HAL_StatusTypeDef HAL_GFXTIM_AbsoluteTimer_GetCounter (const GFXTIM_HandleTypeDef * hgfxtim, uint32_t AbsoluteTime, uint32_t * pValue)

Function description

This function gets absolute timer value.

Parameters

- **hgfxtim:** GFXTIM handle.
- **AbsoluteTime:** absolute time This parameter can be a value of GFXTIM Absolute Time.
- **pValue:** Absolute time value

Return values

- **HAL:** status.

HAL_GFXTIM_AbsoluteTimer_SetFrameCompare

Function name

HAL_StatusTypeDef HAL_GFXTIM_AbsoluteTimer_SetFrameCompare (GFXTIM_HandleTypeDef * hgfxtim, uint32_t Value)

Function description

This function sets absolute frame compare value.

Parameters

- **hgfxtim:** GFXTIM handle.
- **Value:** Absolute frame compare 1 value This parameter can be a number between Min_Data = 0x00000 and Max_Data = 0xFFFFF

Return values

- **HAL:** status.

HAL_GFXTIM_AbsoluteTimer_SetLineCompare

Function name

HAL_StatusTypeDef HAL_GFXTIM_AbsoluteTimer_SetLineCompare (GFXTIM_HandleTypeDef * hgfxtim, uint32_t AbsoluteLineComparator, uint32_t Value)

Function description

This function sets line compare value.

Parameters

- **hgfxtim:** GFXTIM handle.
- **AbsoluteLineComparator:** Absolute line compare value This parameter can be a value of GFXTIM Absolute Line Comparator.
- **Value:** Absolute line compare value This parameter can be a number between Min_Data = 0x000 and Max_Data = 0xFFF

Return values

- **HAL:** status.

HAL_GFXTIM_AbsoluteTimer_AFCC1Callback

Function name

void HAL_GFXTIM_AbsoluteTimer_AFCC1Callback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

GFXTIM Absolute frame counter compare 1 callback.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_AbsoluteTimer_AFCOFCallback

Function name

void HAL_GFXTIM_AbsoluteTimer_AFCOFCallback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

GFXTIM Absolute frame counter overflow callback.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_AbsoluteTimer_ALCC1Callback

Function name

void HAL_GFXTIM_AbsoluteTimer_ALCC1Callback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

GFXTIM Absolute line counter compare 1 callback.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_AbsoluteTimer_ALCC2Callback

Function name

void HAL_GFXTIM_AbsoluteTimer_ALCC2Callback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

GFXTIM Absolute line counter compare 2 callback.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_AbsoluteTimer_ALCOFCallback

Function name

void HAL_GFXTIM_AbsoluteTimer_ALCOFCallback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

GFXTIM Absolute line counter overflow callback.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_RelativeTimer_Config

Function name

HAL_StatusTypeDef HAL_GFXTIM_RelativeTimer_Config (GFXTIM_HandleTypeDef * hgfxtim, const GFXTIM_RelativeTimerConfigTypeDef * pRelativeTimerConfig, uint32_t RelativeTimer)

Function description

This function configures a Relative Timer.

Parameters

- **hgfxtim:** GFXTIM handle.
- **pRelativeTimerConfig:** pointer to a GFXTIM_RelativeTimerConfigTypeDef structure that contains relative timer comparators and counters values.
- **RelativeTimer:** Relative Timer identifier This parameter can be a value of GFXTIM Relative Timer.

Return values

- **HAL:** status.

HAL_GFXTIM_RelativeTimer_Start

Function name

HAL_StatusTypeDef HAL_GFXTIM_RelativeTimer_Start (GFXTIM_HandleTypeDef * hgfxtim, uint32_t RelativeTimer)

Function description

This function starts a relative Timer.

Parameters

- **hgfxtim:** GFXTIM handle.
- **RelativeTimer:** Relative timer counter to Enable This parameter can be a value of GFXTIM Relative Timer.

Return values

- **HAL:** status.

HAL_GFXTIM_RelativeTimer_Stop

Function name

HAL_StatusTypeDef HAL_GFXTIM_RelativeTimer_Stop (GFXTIM_HandleTypeDef * hgfxtim, uint32_t RelativeTimer)

Function description

This function stops a relative Timer counter.

Parameters

- **hgfxtim:** GFXTIM handle.
- **RelativeTimer:** Relative timer counter to Disable This parameter can be a value of GFXTIM Relative Timer.

Return values

- **HAL:** status.

HAL_GFXTIM_RelativeTimer_ForceReload

Function name

HAL_StatusTypeDef HAL_GFXTIM_RelativeTimer_ForceReload (GFXTIM_HandleTypeDef * hgfxtim, uint32_t RelativeTimer)

Function description

This function force a relative Timer reload.

Parameters

- **hgfxtim:** GFXTIM handle.
- **RelativeTimer:** Relative timer to Foce Reload This parameter can be a value of GFXTIM Relative Timer.

Return values

- **HAL:** status.

HAL_GFXTIM_RelativeTimer_SetReload

Function name

HAL_StatusTypeDef HAL_GFXTIM_RelativeTimer_SetReload (GFXTIM_HandleTypeDef * hgfxtim, uint32_t RelativeTimer, uint32_t Value)

Function description

This function sets Relative frame timer reload value.

Parameters

- **hgfxtim:** GFXTIM handle.
- **RelativeTimer:** specifies the Auto-reload register to be modified. This parameter can be a value of GFXTIM Relative Timer.
- **Value:** Reload value This parameter can be a number between Min_Data = 0x000 and Max_Data = 0xFFF

Return values

- **HAL:** status.

HAL_GFXTIM_RelativeTimer_GetCounter

Function name

HAL_StatusTypeDef HAL_GFXTIM_RelativeTimer_GetCounter (const GFXTIM_HandleTypeDef * hgfxtim, uint32_t RelativeTimer, uint32_t * pValue)

Function description

This function sets Relative frame timer compare value.

Parameters

- **hgfxtim:** GFXTIM handle.
- **RelativeTimer:** Relative frame counter reload This parameter can be a value of GFXTIM Relative Timer.
- **pValue:** pointer to a relative frame counter value

Return values

- **HAL:** status.

HAL_GFXTIM_RelativeTimer_RFC1RCallback

Function name

void HAL_GFXTIM_RelativeTimer_RFC1RCallback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

GFXTIM Relative frame counter 1 reload callback.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_RelativeTimer_RFC2RCallback

Function name

void HAL_GFXTIM_RelativeTimer_RFC2RCallback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

GFXTIM Relative frame counter 2 reload callback.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_EventGenerator_Config

Function name

HAL_StatusTypeDef HAL_GFXTIM_EventGenerator_Config (GFXTIM_HandleTypeDef * hgfxtim, uint32_t EventGenerator, const GFXTIM_EventGeneratorConfigTypeDef * pEventGeneratorConfig)

Function description

This function configures an Event Generator.

Parameters

- **hgfxtim:** GFXTIM handle.
- **EventGenerator:** Event Generator This parameter can be a value of GFXTIM Event Generator ID.
- **pEventGeneratorConfig:** pointer to a GFXTIM_EventGeneratorConfigTypeDef structure that contains Event Generator configuration parameters.

Return values

- **HAL:** status.

HAL_GFXTIM_EventGenerator_Enable

Function name

HAL_StatusTypeDef HAL_GFXTIM_EventGenerator_Enable (GFXTIM_HandleTypeDef * hgfxtim, uint32_t EventGenerator)

Function description

This function enables an Event Generator.

Parameters

- **hgfxtim:** GFXTIM handle.
- **EventGenerator:** Event Generator This parameter can be a value of GFXTIM Event Generator ID.

Return values

- **HAL:** status.

HAL_GFXTIM_EventGenerator_Disable

Function name

HAL_StatusTypeDef HAL_GFXTIM_EventGenerator_Disable (GFXTIM_HandleTypeDef * hgfxtim, uint32_t EventGenerator)

Function description

This function disables an Event Generator.

Parameters

- **hgfxtim:** GFXTIM handle.
- **EventGenerator:** Event Generator This parameter can be a value of GFXTIM Event Generator ID.

Return values

- **HAL:** status.

HAL_GFXTIM_EventGenerator_EV1Callback

Function name

void HAL_GFXTIM_EventGenerator_EV1Callback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

GFXTIM Combined events 1 callback.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_EventGenerator_EV2Callback

Function name

void HAL_GFXTIM_EventGenerator_EV2Callback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

GFXTIM Combined events 2 callback.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_EventGenerator_EV3Callback

Function name

void HAL_GFXTIM_EventGenerator_EV3Callback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

GFXTIM Combined events 3 callback.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_EventGenerator_EV4Callback

Function name

void HAL_GFXTIM_EventGenerator_EV4Callback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

GFXTIM Combined events 4 callback.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_WatchdogTimer_Config

Function name

HAL_StatusTypeDef HAL_GFXTIM_WatchdogTimer_Config (GFXTIM_HandleTypeDef * hgfxtim, const GFXTIM_WatchdogConfigTypeDef * pWatchdogConfig)

Function description

This function configures the Watchdog.

Parameters

- **hgfxtim:** GFXTIM handle.
- **pWatchdogConfig:** Watchdog configuration parameters.

Return values

- **HAL:** status.

HAL_GFXTIM_WatchdogTimer_Enable

Function name

HAL_StatusTypeDef HAL_GFXTIM_WatchdogTimer_Enable (GFXTIM_HandleTypeDef * hgfxtim)

Function description

This function Enable the Watchdog Counter.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **HAL:** status.

HAL_GFXTIM_WatchdogTimer_Disable

Function name

HAL_StatusTypeDef HAL_GFXTIM_WatchdogTimer_Disable (GFXTIM_HandleTypeDef * hgfxtim)

Function description

This function Disable the Watchdog Counter.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **HAL:** status.

HAL_GFXTIM_WatchdogTimer_Refresh

Function name

HAL_StatusTypeDef HAL_GFXTIM_WatchdogTimer_Refresh (GFXTIM_HandleTypeDef * hgfxtim)

Function description

This function refresh the Watchdog counter.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **HAL:** status.

HAL_GFXTIM_WatchdogTimer_AlarmCallback

Function name

void HAL_GFXTIM_WatchdogTimer_AlarmCallback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

GFXTIM Watchdog alarm callback.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_WatchdogTimer_PreAlarmCallback

Function name

void HAL_GFXTIM_WatchdogTimer_PreAlarmCallback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

GFXTIM Watchdog pre alarm callback.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_IRQHandler

Function name

void HAL_GFXTIM_IRQHandler (GFXTIM_HandleTypeDef * hgfxtim)

Function description

This function handles the GFXTIM interrupts.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_ErrorCallback

Function name

void HAL_GFXTIM_ErrorCallback (GFXTIM_HandleTypeDef * hgfxtim)

Function description

GFXTIM error callback.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **None.:**

HAL_GFXTIM_GetError

Function name

uint32_t HAL_GFXTIM_GetError (const GFXTIM_HandleTypeDef * hgfxtim)

Function description

This function get the current GFXTIM error.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **GFXTIM:** error code.

HAL_GFXTIM_GetState

Function name

HAL_GFXTIM_StateTypeDef HAL_GFXTIM_GetState (const GFXTIM_HandleTypeDef * hgfxtim)

Function description

This function get the current GFXTIM state.

Parameters

- **hgfxtim:** GFXTIM handle.

Return values

- **GFXTIM:** state.

30.3 GFXTIM Firmware driver defines

The following section lists the various define and macros of the module.

30.3.1 GFXTIM

GFXTIM

GFXTIM Absolute Line Comparator

GFXTIM Exported Macros

__HAL_GFXTIM_RESET_HANDLE_STATE

Description:

- Reset GFXTIM handle state.

Parameters:

- __HANDLE__: GFXTIM handle.

Return value:

- None

__HAL_GFXTIM_GET_FLAG

Description:

- Check whether the specified GFXTIM flag is set or not.

Parameters:

- __HANDLE__: GFXTIM handle
- __FLAG__: GFXTIM flag This parameter can be one or a combination of the following values:
  - GFXTIM_FLAG_AFCO Absolute Frame Counter Overflow Flag
  - GFXTIM_FLAG_ALCO Absolute Line Counter Overflow Flag
  - GFXTIM_FLAG_TE Tearing Effect Flag
  - GFXTIM_FLAG_AFCC1 Absolute Frame Counter Compare 1 Flag
  - GFXTIM_FLAG_ALCC1 Absolute Line Counter Compare 1 Flag

  - GFXTIM_FLAG_EV4 Event 4 Flag
  - GFXTIM_FLAG_WDGA Watchdog Alarm Flag
  - GFXTIM_FLAG_WDGP Watchdog Pre-alarm Flag

Return value:

- State: of flag (TRUE or FALSE).

__HAL_GFXTIM_CLEAR_FLAG

Description:

- Clear the specified GFXTIM flag.

Parameters:

- __HANDLE__: GFXTIM handle
- __FLAG__: GFXTIM flag This parameter can be one or a combination of the following values:
  - GFXTIM_FLAG_AFCO Absolute Frame Counter Overflow Flag
  - GFXTIM_FLAG_ALCO Absolute Line Counter Overflow Flag
  - GFXTIM_FLAG_TE Tearing Effect Flag
  - GFXTIM_FLAG_AFCC1 Absolute Frame Counter Compare 1 Flag

31 HAL GPIO Generic Driver

31.1 GPIO Firmware driver registers structures

31.1.1 GPIO_InitTypeDef

GPIO_InitTypeDef is defined in the stm32u5xx_hal_gpio.h

Data Fields

- ***uint32_t Pin***
- ***uint32_t Mode***
- ***uint32_t Pull***
- ***uint32_t Speed***
- ***uint32_t Alternate***

Field Documentation

- ***uint32_t GPIO_InitTypeDef::Pin***
  Specifies the GPIO pins to be configured. This parameter can be a value of ***GPIO_pins***
- ***uint32_t GPIO_InitTypeDef::Mode***
  Specifies the operating mode for the selected pins. This parameter can be a value of ***GPIO_mode***
- ***uint32_t GPIO_InitTypeDef::Pull***
  Specifies the Pull-up or Pull-Down activation for the selected pins. This parameter can be a value of ***GPIO_pull***
- ***uint32_t GPIO_InitTypeDef::Speed***
  Specifies the speed for the selected pins. This parameter can be a value of ***GPIO_speed***
- ***uint32_t GPIO_InitTypeDef::Alternate***
  Peripheral to be connected to the selected pins This parameter can be a value of ***GPIOEx_Alternate_function_selection***

31.2 GPIO Firmware driver API description

The following section lists the various functions of the GPIO library.

31.2.1 GPIO Peripheral features

- Each port bit of the general-purpose I/O (GPIO) ports can be individually configured by software in several modes:
  - Input mode
  - Analog mode
  - Output mode
  - Alternate function mode
  - External interrupt/event lines
- During and just after reset, the alternate functions and external interrupt lines are not active and the I/O ports are configured in input floating mode.
- All GPIO pins have weak internal pull-up and pull-down resistors, which can be activated or not.
- In Output or Alternate mode, each IO can be configured on open-drain or push-pull type and the IO speed can be selected depending on the VDD value.
- The microcontroller IO pins are connected to onboard peripherals/modules through a multiplexer that allows only one peripheral alternate function (AF) connected to an IO pin at a time. In this way, there can be no conflict between peripherals sharing the same IO pin.
- All ports have external interrupt/event capability. To use external interrupt lines, the port must be configured in input mode. All available GPIO pins are connected to the 16 external interrupt/event lines from EXTI0 to EXTI15.

- The external interrupt/event controller consists of up to 39 edge detectors (16 lines are connected to GPIO) for generating event/interrupt requests (each input line can be independently configured to select the type (interrupt or event) and the corresponding trigger event (rising or falling or both). Each line can also be masked independently.

31.2.2 How to use this driver

1. Enable the GPIO AHB clock using the following function: __HAL_RCC_GPIOx_CLK_ENABLE().
2. Configure the GPIO pin(s) using HAL_GPIO_Init().
   – Configure the IO mode using "Mode" member from GPIO_InitTypeDef structure
   – Activate Pull-up, Pull-down resistor using "Pull" member from GPIO_InitTypeDef structure.
   – In case of Output or alternate function mode selection: the speed is configured through "Speed" member from GPIO_InitTypeDef structure.
   – In alternate mode is selection, the alternate function connected to the IO is configured through "Alternate" member from GPIO_InitTypeDef structure.
   – Analog mode is required when a pin is to be used as ADC channel or DAC output.
   – In case of external interrupt/event selection the "Mode" member from GPIO_InitTypeDef structure select the type (interrupt or event) and the corresponding trigger event (rising or falling or both).
3. In case of external interrupt/event mode selection, configure NVIC IRQ priority mapped to the EXTI line using HAL_NVIC_SetPriority() and enable it using HAL_NVIC_EnableIRQ().
4. To get the level of a pin configured in input mode use HAL_GPIO_ReadPin().
5. To set/reset the level of a pin configured in output mode use HAL_GPIO_WritePin()/HAL_GPIO_TogglePin().
6. To set the level of several pins and reset level of several other pins in same cycle, use HAL_GPIO_WriteMultipleStatePin().
7. To lock pin configuration until next reset use HAL_GPIO_LockPin().
8. During and just after reset, the alternate functions are not active and the GPIO pins are configured in input floating mode (except JTAG pins).
9. The LSE oscillator pins OSC32_IN and OSC32_OUT can be used as general purpose (PC14 and PC15, respectively) when the LSE oscillator is off. The LSE has priority over the GPIO function.
10. The HSE oscillator pins OSC_IN/OSC_OUT can be used as general purpose PH0 and PH1, respectively, when the HSE oscillator is off. The HSE has priority over the GPIO function.

31.2.3 Initialization and de-initialization functions

This section contains the following APIs:

- *HAL_GPIO_Init()*
- *HAL_GPIO_DeInit()*

31.2.4 IO attributes functions

This section contains the following APIs:

- *HAL_GPIO_ConfigPinAttributes()*
- *HAL_GPIO_GetConfigPinAttributes()*

31.2.5 Detailed description of functions

HAL_GPIO_Init

Function name

void HAL_GPIO_Init (GPIO_TypeDef * GPIOx, const GPIO_InitTypeDef * pGPIO_Init)

Function description

Initialize the GPIOx/LPGPIOx peripheral according to the specified parameters in the pGPIO_Init.

Parameters

- **GPIOx:** or LPGPIOx: where x can be (A..I) for the GPIO and (1) for LPGPIO to select the corresponding peripheral for STM32U5 family
- **pGPIO_Init:** pointer to a GPIO_InitTypeDef structure that contains the configuration information for the specified GPIO peripheral.

Return values

- **None:**

Notes

- If GPIOx/LPGPIOx peripheral pin is used in EXTI_MODE and the pin is secure in case the system implements the security (TZEN=1), it is up to the secure application to insure that the corresponding EXTI line is set secure.

HAL_GPIO_DeInit

Function name

void HAL_GPIO_DeInit (GPIO_TypeDef * GPIOx, uint32_t GPIO_Pin)

Function description

De-initialize the GPIOx peripheral registers to their default reset values.

Parameters

- **GPIOx:** or LPGPIOx: where x can be (A..I) for the GPIO and (1) for LPGPIO to select the the corresponding peripheral for STM32U5 family
- **GPIO_Pin:** specifies the port bit to be written. This parameter can be one of GPIO_PIN_x where x can be (0..15).

Return values

- **None:**

HAL_GPIO_ReadPin

Function name

GPIO_PinState HAL_GPIO_ReadPin (const GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Read the specified input port pin.

Parameters

- **GPIOx:** or LPGPIOx: where x can be (A..I) for the GPIO and (1) for LPGPIO to select the the corresponding peripheral for STM32U5 family
- **GPIO_Pin:** specifies the port bit to read. This parameter can be GPIO_PIN_x where x can be (0..15).

Return values

- **The:** input port pin value.

HAL_GPIO_WritePin

Function name

void HAL_GPIO_WritePin (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin, GPIO_PinState PinState)

Function description

Set or clear the selected data port bit.

Parameters

- **GPIOx:** or LPGPIOx: where x can be (A..I) for the GPIO and (1) for LPGPIO to select the the corresponding peripheral for STM32U5 family
- **GPIO_Pin:** specifies the port bit to be written. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).
- **PinState:** specifies the value to be written to the selected bit. This parameter can be one of the GPIO_PinState enum values:
  – GPIO_PIN_RESET: to clear the port pin
  – GPIO_PIN_SET: to set the port pin

Return values

- **None:**

Notes

- This function uses GPIOx_BSRR/LPGPIOx_BSRR and GPIOx_BRR/LPGPIOx_BRR registers to allow atomic read/modify accesses. In this way, there is no risk of an IRQ occurring between the read and the modify access.

HAL_GPIO_WriteMultipleStatePin

Function name

void HAL_GPIO_WriteMultipleStatePin (GPIO_TypeDef * GPIOx, uint16_t PinReset, uint16_t PinSet)

Function description

Set and clear several pins of a dedicated port in same cycle.

Parameters

- **GPIOx:** or LPGPIOx: where x can be (A..I) for the GPIO and (1) for LPGPIO to select the the corresponding peripheral for STM32U5 family
- **PinReset:** specifies the port bits to be reset This parameter can be any combination of GPIO_Pin_x where x can be (0..15) or zero.
- **PinSet:** specifies the port bits to be set This parameter can be any combination of GPIO_Pin_x where x can be (0..15) or zero.

Return values

- **None:**

Notes

- This function uses GPIOx_BSRR and GPIOx_BRR registers to allow atomic read/modify accesses.
- Both PinReset and PinSet combinations shall not get any common bit, else assert would be triggered.
- At least one of the two parameters used to set or reset shall be different from zero.

HAL_GPIO_TogglePin

Function name

void HAL_GPIO_TogglePin (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Toggle the specified GPIO pin.

Parameters

- **GPIOx:** or LPGPIOx: where x can be (A..I) for the GPIO and (1) for LPGPIO to select the the corresponding peripheral for STM32U5 family
- **GPIO_Pin:** specifies the pin to be toggled. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).

Return values

- **None:**

HAL_GPIO_EnableHighSPeedLowVoltage

Function name

void HAL_GPIO_EnableHighSPeedLowVoltage (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Enable speed optimization for several pin of dedicated port.

Parameters

- **GPIOx:** or LPGPIOx: where x can be (A..I) for the GPIO and (1) for LPGPIO to select the the corresponding peripheral for STM32U5 family
- **GPIO_Pin:** specifies the port bit to be written. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).

Return values

- **None:**

Notes

- Not all I/Os support the HSLV mode. Refer to the I/O structure in the corresponding datasheet for the list of I/Os supporting this feature. Other I/Os HSLV configuration must be kept at reset value.
- It must be used only if the I/O supply voltage is below 2.7 V.

HAL_GPIO_DisableHighSPeedLowVoltage

Function name

void HAL_GPIO_DisableHighSPeedLowVoltage (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Disable speed optimization for several pin of dedicated port.

Parameters

- **GPIOx:** or LPGPIOx: where x can be (A..I) for the GPIO and (1) for LPGPIO to select the the corresponding peripheral for STM32U5 family
- **GPIO_Pin:** specifies the port bit to be written. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).

Return values

- **None:**

Notes

- Not all I/Os support the HSLV mode. Refer to the I/O structure in the corresponding datasheet for the list of I/Os supporting this feature. Other I/Os HSLV configuration must be kept at reset value.
- It must be used only if the I/O supply voltage is below 2.7 V.

HAL_GPIO_LockPin

Function name

HAL_StatusTypeDef HAL_GPIO_LockPin (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin)

Function description

Lock GPIO Pins configuration registers.

Parameters

- **GPIOx:** or LPGPIOx: where x can be (A..I) for the GPIO and (1) for LPGPIO to select the the corresponding peripheral for STM32U5 family
- **GPIO_Pin:** specifies the port bits to be locked. This parameter can be any combination of GPIO_Pin_x where x can be (0..15).

Return values

- **None:**

Notes

- The locked registers are GPIOx_MODER, GPIOx_OTYPER, GPIOx_OSPEEDR, GPIOx_PUPDR, GPIOx_AFRL and GPIOx_AFRH.
- The configuration of the locked GPIO pins can no longer be modified until the next reset.

HAL_GPIO_EXTI_IRQHandler

Function name

void HAL_GPIO_EXTI_IRQHandler (uint16_t GPIO_Pin)

Function description

Handle EXTI interrupt request.

Parameters

- **GPIO_Pin:** Specifies the port pin connected to corresponding EXTI line.

Return values

- **None:**

HAL_GPIO_EXTI_Rising_Callback

Function name

void HAL_GPIO_EXTI_Rising_Callback (uint16_t GPIO_Pin)

Function description

EXTI line rising detection callback.

Parameters

- **GPIO_Pin:** Specifies the port pin connected to corresponding EXTI line.

Return values

- **None:**

HAL_GPIO_EXTI_Falling_Callback

Function name

void HAL_GPIO_EXTI_Falling_Callback (uint16_t GPIO_Pin)

Function description

EXTI line falling detection callback.

Parameters

- **GPIO_Pin:** Specifies the port pin connected to corresponding EXTI line.

Return values

- **None:**

HAL_GPIO_ConfigPinAttributes

Function name

void HAL_GPIO_ConfigPinAttributes (GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin, uint32_t PinAttributes)

Function description

Configure the GPIO pins attributes.

Parameters

- **GPIOx:** or LPGPIOx: where x can be (A..I) for the GPIO and (1) for LPGPIO to select the the corresponding peripheral for STM32U5 family
- **GPIO_Pin:** specifies the pin(s) to configure the secure attribute
- **PinAttributes:** specifies the pin(s) to be set in secure mode, other being set non secured.

Return values

- **None:**

Notes

- Available attributes are to secure GPIO pin(s), so this function is only available in secure

HAL_GPIO_GetConfigPinAttributes

Function name

HAL_StatusTypeDef HAL_GPIO_GetConfigPinAttributes (const GPIO_TypeDef * GPIOx, uint16_t GPIO_Pin, uint32_t * pPinAttributes)

Function description

Get the GPIO pins attributes.

Parameters

- **GPIOx:** or LPGPIOx: where x can be (A..I) for the GPIO and (1) for LPGPIO to select the the corresponding peripheral for STM32U5 family
- **GPIO_Pin:** specifies the single pin to get the secure attribute from
- **pPinAttributes:** pointer to return the pin attributes.

Return values

- **HAL:** Status.

Notes

- Available attributes are to secure GPIO pin(s), so this function is only available in secure

31.3 GPIO Firmware driver defines

The following section lists the various define and macros of the module.

31.3.1 GPIO

GPIO

GPIO attributes

GPIO_PIN_SEC

Secure pin attribute

GPIO_PIN_NSEC

Non-secure pin attribute

GPIO Exported Macros

__HAL_GPIO_EXTI_GET_RISING_IT

Description:

- Check whether the specified EXTI line is rising edge asserted or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTI_CLEAR_RISING_IT

Description:

- Clear the EXTI's line rising pending bits.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

__HAL_GPIO_EXTI_GET_FALLING_IT

Description:

- Check whether the specified EXTI line is falling edge asserted or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTI_CLEAR_FALLING_IT

Description:

- Clear the EXTI's line falling pending bits.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

__HAL_GPIO_EXTI_GET_IT

Description:

- Check whether the specified EXTI line is asserted or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTI_CLEAR_IT

Description:

- Clear the EXTI's line pending bits.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

__HAL_GPIO_EXTI_GENERATE_SWIT

Description:

- Generate a Software interrupt on selected EXTI line(s).

Parameters:

- __EXTI_LINE__: specifies the EXTI line to set. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

__HAL_GPIO_EXTI_GET_FLAG

Description:

- Check whether the specified EXTI line flag is set or not.

Parameters:

- __EXTI_LINE__: specifies the EXTI line flag to check. This parameter can be GPIO_PIN_x where x can be(0..15)

Return value:

- The: new state of __EXTI_LINE__ (SET or RESET).

__HAL_GPIO_EXTI_CLEAR_FLAG

Description:

- Clear the EXTI line pending flags.

Parameters:

- __EXTI_LINE__: specifies the EXTI lines flags to clear. This parameter can be any combination of GPIO_PIN_x where x can be (0..15)

Return value:

- None

GPIO mode

33.2 GPU2D Firmware driver API description

The following section lists the various functions of the GPU2D library.

33.2.1 How to use this driver

1. Peripheral control is exclusively done by the accompanying middleware library.

Interrupt mode IO operation

1. Configure the GPU2D hardware to perform graphics operation using the Third Party MW Library APIs.
2. Submit command List to the hardware.
3. Wait indefinitely for the completion of submitted Command List by GPU2D hardware.
4. Use HAL_GPU2D_IRQHandler() called under GPU2D_IRQHandler() interrupt subroutine.
5. At the end of Command List execution HAL_GPU2D_IRQHandler() function is executed and user can add his own function by customization of function pointer
6. CommandListCpltCallback (member of GPU2D handle structure) to notify the upper level about the completion of Command List execution.

7. Callback HAL_GPU2D_CommandListCpltCallback is invoked when the GPU2D hardware executes the programmed command list (Command List execution completion).
   – This callback is called when the compilation defines USE_HAL_GPU2D_REGISTER_CALLBACKS is set to 0 or not defined.
   – This callback should be implemented in the application side. It should notify the upper level that the programmed command list is completed.
8. To control the GPU2D state, use the following function: HAL_GPU2D_GetState().
9. To read the GPU2D error code, use the following function: HAL_GPU2D_GetError().

GPU2D HAL driver macros list

Below the list of most used macros in GPU2D HAL driver :

- __HAL_GPU2D_RESET_HANDLE_STATE: Reset GPU2D handle state.
- __HAL_GPU2D_GET_FLAG: Get the GPU2D pending flags.
- __HAL_GPU2D_CLEAR_FLAG: Clear the GPU2D pending flags.
- __HAL_GPU2D_GET_IT_SOURCE: Check whether the specified GPU2D interrupt is enabled or not.

Callback registration

1. The compilation define USE_HAL_GPU2D_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use function @ref HAL_GPU2D_RegisterCallback() to register a user callback.
2. Function @ref HAL_GPU2D_RegisterCallback() allows to register following callbacks: (+) CommandListCpltCallback : callback for Command List completion. (+) MspInitCallback : GPU2D MspInit. (+) MspDeInitCallback : GPU2D MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.
3. Use function @ref HAL_GPU2D_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. @ref HAL_GPU2D_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks: (+) CommandListCpltCallback : callback for Command List completion. (+) MspInitCallback : GPU2D MspInit. (+) MspDeInitCallback : GPU2D MspDeInit. Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using @ref HAL_GPU2D_RegisterCallback before calling @ref HAL_GPU2D_DeInit or @ref HAL_GPU2D_Init function. When The compilation define USE_HAL_GPU2D_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

(#) The compilation define USE_HAL_GPU2D_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use function @ref HAL_GPU2D_RegisterCallback() to register a user callback. (#) Function @ref HAL_GPU2D_RegisterCallback() allows to register following callbacks:

- CommandListCpltCallback : callback for Command List completion.
- MspInitCallback : GPU2D MspInit.
- MspDeInitCallback : GPU2D MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. (#) Use function @ref HAL_GPU2D_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. @ref HAL_GPU2D_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:
- CommandListCpltCallback : callback for Command List completion.
- MspInitCallback : GPU2D MspInit.
- MspDeInitCallback : GPU2D MspDeInit. Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using @ref HAL_GPU2D_RegisterCallback before calling @ref HAL_GPU2D_DeInit or @ref HAL_GPU2D_Init function. When The compilation define USE_HAL_GPU2D_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

Note: You can refer to the GPU2D HAL driver header file for more useful macros

33.2.2 Initialization and Configuration functions

This section provides functions allowing to:
- Initialize and configure the GPU2D
- De-initialize the GPU2D

This section contains the following APIs:
- *HAL_GPU2D_Init()*
- *HAL_GPU2D_DeInit()*
- *HAL_GPU2D_MspInit()*
- *HAL_GPU2D_MspDeInit()*
- *HAL_GPU2D_RegisterCallback()*
- *HAL_GPU2D_UnRegisterCallback()*
- *HAL_GPU2D_RegisterCommandListCpltCallback()*
- *HAL_GPU2D_UnRegisterCommandListCpltCallback()*

33.2.3 IO operation functions

This section provides functions allowing to:
- Read GPU2D Register value.
- Write a value to GPU2D Register.
- handle GPU2D interrupt request.
- Command List Complete Transfer Complete callback.

This section contains the following APIs:
- *HAL_GPU2D_ReadRegister()*
- *HAL_GPU2D_WriteRegister()*
- *HAL_GPU2D_IRQHandler()*
- *HAL_GPU2D_ER_IRQHandler()*
- *HAL_GPU2D_CommandListCpltCallback()*
- *HAL_GPU2D_ErrorCallback()*

33.2.4 Peripheral State and Errors functions

This subsection provides functions allowing to:
- Get the GPU2D state
- Get the GPU2D error code

This section contains the following APIs:
- *HAL_GPU2D_GetState()*
- *HAL_GPU2D_GetError()*

33.2.5 Detailed description of functions

HAL_GPU2D_Init

Function name

HAL_StatusTypeDef HAL_GPU2D_Init (GPU2D_HandleTypeDef * hgpu2d)

Function description

Initialize the GPU2D according to the specified parameters in the GPU2D_InitTypeDef and create the associated handle.

Parameters

- **hgpu2d:** pointer to a GPU2D_HandleTypeDef structure that contains the configuration information for the GPU2D.

Return values

- **HAL:** status

HAL_GPU2D_DeInit

Function name

HAL_StatusTypeDef HAL_GPU2D_DeInit (GPU2D_HandleTypeDef * hgpu2d)

Function description

Deinitializes the GPU2D peripheral registers to their default reset values.

Parameters

- **hgpu2d:** pointer to a GPU2D_HandleTypeDef structure that contains the configuration information for the GPU2D.

Return values

- **None:**

HAL_GPU2D_MspInit

Function name

void HAL_GPU2D_MspInit (GPU2D_HandleTypeDef * hgpu2d)

Function description

Initializes the GPU2D MSP.

Parameters

- **hgpu2d:** pointer to a GPU2D_HandleTypeDef structure that contains the configuration information for the GPU2D.

Return values

- **None:**

HAL_GPU2D_MspDeInit

Function name

void HAL_GPU2D_MspDeInit (GPU2D_HandleTypeDef * hgpu2d)

Function description

DeInitializes the GPU2D MSP.

Parameters

- **hgpu2d:** pointer to a GPU2D_HandleTypeDef structure that contains the configuration information for the GPU2D.

Return values

- **None:**

HAL_GPU2D_RegisterCallback

Function name

HAL_StatusTypeDef HAL_GPU2D_RegisterCallback (GPU2D_HandleTypeDef * hgpu2d, HAL_GPU2D_CallbackIDTypeDef CallbackID, pGPU2D_CallbackTypeDef pCallback)

Function description

Register a User GPU2D callback To be used instead of the weak (surcharged) predefined callback.

Parameters

- **hgpu2d:** GPU2D handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  – HAL_GPU2D_MSPINIT_CB_ID GPU2D MspInit callback ID
  – HAL_GPU2D_MSPDEINIT_CB_ID GPU2D MspDeInit callback ID
- **pCallback:** pointer to the callback function

Return values

- **HAL:** status

Notes

- Weak predefined callback is defined for HAL_GPU2D_MSPINIT_CB_ID and HAL_GPU2D_MSPDEINIT_CB_ID

HAL_GPU2D_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_GPU2D_UnRegisterCallback (GPU2D_HandleTypeDef * hgpu2d, HAL_GPU2D_CallbackIDTypeDef CallbackID)

Function description

Unregister a GPU2D callback GPU2D Callback is redirected to the weak (surcharged) predefined callback.

Parameters

- **hgpu2d:** GPU2D handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  – HAL_GPU2D_MSPINIT_CB_ID GPU2D MspInit callback ID
  – HAL_GPU2D_MSPDEINIT_CB_ID GPU2D MspDeInit callback ID

Return values

- **status:**

Notes

- Callback pointers will be set to legacy weak predefined callbacks for HAL_GPU2D_MSPINIT_CB_ID and HAL_GPU2D_MSPDEINIT_CB_ID

HAL_GPU2D_RegisterCommandListCpltCallback

Function name

HAL_StatusTypeDef HAL_GPU2D_RegisterCommandListCpltCallback (GPU2D_HandleTypeDef * hgpu2d, pGPU2D_CommandListCpltCallbackTypeDef pCallback)

Function description

Register GPU2D Command List Complete Callback To be used instead of the weak (surcharged) predefined callback.

Parameters

- **hgpu2d:** GPU2D handle
- **pCallback:** pointer to the Command List Complete Callback function

Return values

- **status:**

Notes

- Weak predefined callback is defined for Command List Complete

HAL_GPU2D_UnRegisterCommandListCpltCallback

Function name

HAL_StatusTypeDef HAL_GPU2D_UnRegisterCommandListCpltCallback (GPU2D_HandleTypeDef * hgpu2d)

Function description

Unregister a GPU2D Command List Complete Callback GPU2D Command List Complete Callback is redirected to the weak (surcharged) predefined callback.

Parameters

- **hgpu2d:** GPU2D handle

Return values

- **status:**

Notes

- Callback pointer will be invalidate (NULL value)

HAL_GPU2D_ReadRegister

Function name

uint32_t HAL_GPU2D_ReadRegister (GPU2D_HandleTypeDef * hgpu2d, uint32_t offset)

Function description

Read GPU2D Register.

Parameters

- **hgpu2d:** Pointer to a GPU2D_HandleTypeDef structure that contains the configuration information for the GPU2D.
- **offset:** The register offset from GPU2D base address to read.

Return values

- **Register:** value

HAL_GPU2D_WriteRegister

Function name

HAL_StatusTypeDef HAL_GPU2D_WriteRegister (GPU2D_HandleTypeDef * hgpu2d, uint32_t offset, uint32_t value)

Function description

Write a value to GPU2D Register.

Parameters

- **hgpu2d:** Pointer to a GPU2D_HandleTypeDef structure that contains the configuration information for the GPU2D.
- **offset:** The register offset from GPU2D base address to write.
- **value:** The value to be written to provided register.

Return values

- **HAL:** status

HAL_GPU2D_IRQHandler

Function name

void HAL_GPU2D_IRQHandler (GPU2D_HandleTypeDef * hgpu2d)

Function description

Handle GPU2D interrupt request.

Parameters

- **hgpu2d:** Pointer to a GPU2D_HandleTypeDef structure that contains the configuration information for the GPU2D.

Return values

- **None:**

HAL_GPU2D_ER_IRQHandler

Function name

void HAL_GPU2D_ER_IRQHandler (GPU2D_HandleTypeDef * hgpu2d)

Function description

Handle GPU2D Error interrupt request.

Parameters

- **hgpu2d:** Pointer to a GPU2D_HandleTypeDef structure that contains the configuration information for the GPU2D.

Return values

- **None:**

HAL_GPU2D_CommandListCpltCallback

Function name

void HAL_GPU2D_CommandListCpltCallback (GPU2D_HandleTypeDef * hgpu2d, uint32_t CmdListID)

Function description

Command List Complete callback.

Parameters

- **hgpu2d:** pointer to a GPU2D_HandleTypeDef structure that contains the configuration information for the GPU2D.
- **CmdListID:** Command list ID that got completed.

Return values

- **None:**

HAL_GPU2D_ErrorCallback

Function name

void HAL_GPU2D_ErrorCallback (GPU2D_HandleTypeDef * hgpu2d)

Function description

Error handler callback.

Parameters

- **hgpu2d:** pointer to a GPU2D_HandleTypeDef structure that contains the configuration information for the GPU2D.

Return values

- **None:**

HAL_GPU2D_GetState

Function name

HAL_GPU2D_StateTypeDef HAL_GPU2D_GetState (GPU2D_HandleTypeDef const *const hgpu2d)

Function description

Return the GPU2D state.

Parameters

- **hgpu2d:** pointer to a GPU2D_HandleTypeDef structure that contains the configuration information for the GPU2D.

Return values

- **GPU2D:** state

HAL_GPU2D_GetError

Function name

uint32_t HAL_GPU2D_GetError (GPU2D_HandleTypeDef const *const hgpu2d)

Function description

Return the GPU2D error code.

Parameters

- **hgpu2d:** pointer to a GPU2D_HandleTypeDef structure that contains the configuration information for GPU2D.

Return values

- **GPU2D:** Error Code

33.3 GPU2D Firmware driver defines

The following section lists the various define and macros of the module.

33.3.1 GPU2D

GPU2D

GPU2D Error Code definition

HAL_GPU2D_ERROR_NONE

No error

HAL_GPU2D_ERROR_TIMEOUT

Timeout error

HAL_GPU2D_ERROR_INVALID_CALLBACK

Invalid callback error

GPU2D Exported Macros

__HAL_GPU2D_RESET_HANDLE_STATE

Description:

- Reset GPU2D handle state.

Parameters:

- __HANDLE__: specifies the GPU2D handle.

Return value:

- None

__HAL_GPU2D_GET_FLAG

Description:
- Get the GPU2D pending flags.

Parameters:
- __HANDLE__: GPU2D handle
- __FLAG__: flag to check. This parameter can be one of the following values:
  - GPU2D_FLAG_CLC: Command List Complete interrupt mask

Return value:
- The: state of FLAG.

__HAL_GPU2D_CLEAR_FLAG

Description:
- Clear the GPU2D pending flags.

Parameters:
- __HANDLE__: GPU2D handle
- __FLAG__: specifies the flag to clear. This parameter can be one of the following values:
  - GPU2D_FLAG_CLC: Command List Complete interrupt mask

Return value:
- None

__HAL_GPU2D_GET_IT_SOURCE

Description:
- Check whether the specified GPU2D interrupt source is enabled or not.

Parameters:
- __HANDLE__: GPU2D handle
- __INTERRUPT__: specifies the GPU2D interrupt source to check. This parameter can be one of the following values:
  - GPU2D_IT_CLC: Command List Complete interrupt mask

Return value:
- The: state of INTERRUPT source.

GPU2D Flag definition

GPU2D_FLAG_CLC

Command List Complete Interrupt Flag

GPU2D Interrupt configuration definition

GPU2D_IT_CLC

Command List Complete Interrupt

GPU2D Last Register Offset

GPU2D_OFFSET

Last GPU2D Register Offset

Common write and read registers Macros

GPU2D_WriteReg

Description:
- Write a value in GPU2D register.

Parameters:
- __INSTANCE__: GPU2D Instance
- __REG__: Register to be written
- __VALUE__: Value to be written in the register

Return value:
- None

GPU2D_ReadReg

Description:
- Read a value in GPU2D register.

Parameters:
- __INSTANCE__: GPU2D Instance
- __REG__: Register to be read

Return value:
- Register: value

34 HAL GTZC Generic Driver

34.1 GTZC Firmware driver registers structures

34.1.1 MPCBB_Attribute_ConfigTypeDef

MPCBB_Attribute_ConfigTypeDef is defined in the stm32u5xx_hal_gtzc.h

Data Fields

- ***uint32_t MPCBB_SecConfig_array***
- ***uint32_t MPCBB_PrivConfig_array***
- ***uint32_t MPCBB_LockConfig_array***

Field Documentation

- ***uint32_t MPCBB_Attribute_ConfigTypeDef::MPCBB_SecConfig_array[GTZC_MPCBB_NB_VCTR_REG_MAX]***
  Each element specifies secure access mode for a super-block. Each bit corresponds to a block inside the super-block. 0 means non-secure, 1 means secure
- ***uint32_t MPCBB_Attribute_ConfigTypeDef::MPCBB_PrivConfig_array[GTZC_MPCBB_NB_VCTR_REG_MAX]***
  Each element specifies privilege access mode for a super-block. Each bit corresponds to a block inside the super-block. 0 means non-privilege, 1 means privilege
- ***uint32_t MPCBB_Attribute_ConfigTypeDef::MPCBB_LockConfig_array[GTZC_MPCBB_NB_LCK_VCTR_REG_MAX]***
  Each bit specifies the lock configuration of a super-block (32 blocks). 0 means unlocked, 1 means locked

34.1.2 MPCBB_ConfigTypeDef

MPCBB_ConfigTypeDef is defined in the stm32u5xx_hal_gtzc.h

Data Fields

- ***uint32_t SecureRWIllegalMode***
- ***uint32_t InvertSecureState***
- ***MPCBB_Attribute_ConfigTypeDef AttributeConfig***

Field Documentation

- ***uint32_t MPCBB_ConfigTypeDef::SecureRWIllegalMode***
  Secure read/write illegal access field. It can be a value of ***GTZC_MPCBB_SecureRWIllegalMode***
- ***uint32_t MPCBB_ConfigTypeDef::InvertSecureState***
  Default security state field (can be inverted or not). It can be a value of ***GTZC_MPCBB_InvertSecureState***
- ***MPCBB_Attribute_ConfigTypeDef MPCBB_ConfigTypeDef::AttributeConfig***
  MPCBB attribute configuration sub-structure

34.1.3 MPCWM_ConfigTypeDef

MPCWM_ConfigTypeDef is defined in the stm32u5xx_hal_gtzc.h

Data Fields

- ***uint32_t AreaId***
- ***uint32_t Offset***
- ***uint32_t Length***
- ***uint32_t Attribute***
- ***uint32_t Lock***
- ***uint32_t AreaStatus***

Field Documentation

- ***uint32_t MPCWM_ConfigTypeDef::AreaId***
  Area identifier field. It can be a value of ***GTZC_MPCWM_AreaId***

- ***uint32_t MPCWM_ConfigTypeDef::Offset***
  Offset of the watermark area, starting from the selected memory base address. It must aligned on 128KB for FMC and OCTOSPI memories, and on 32-byte for BKPSRAM
- ***uint32_t MPCWM_ConfigTypeDef::Length***
  Length of the watermark area, starting from the selected Offset. It must aligned on 128KB for FMC and OCTOSPI memories, and on 32-byte for BKPSRAM
- ***uint32_t MPCWM_ConfigTypeDef::Attribute***
  Attributes of the watermark area. It can be a value of ***GTZC_MPCWM_Attribute***
- ***uint32_t MPCWM_ConfigTypeDef::Lock***
  Lock of the watermark area. It can be a value of ***GTZC_MPCWM_Lock***
- ***uint32_t MPCWM_ConfigTypeDef::AreaStatus***
  Status of the watermark area. It can be set to ENABLE or DISABLE

34.2 GTZC Firmware driver API description

The following section lists the various functions of the GTZC library.

34.2.1 GTZC main features

- Global TrustZone Controller (GTZC) composed of three sub-blocks:
  - TZSC: TrustZone security controller This sub-block defines the secure/privileged state of master and slave peripherals. It also controls the secure/privileged state of subregions for the watermark memory peripheral controller (MPCWM).
  - MPCBB: Block-Based memory protection controller This sub-block defines the secure/privileged state of all blocks (512-byte pages) of the associated SRAM.
  - TZIC: TrustZone illegal access controller This sub-block gathers all illegal access events in the system and generates a secure interrupt towards NVIC.
- These sub-blocks are used to configure TrustZone system security in a product having bus agents with programmable-security and privileged attributes (securable) such as:
  - on-chip RAM with programmable secure and/or privilege blocks (pages)
  - AHB and APB peripherals with programmable security and/or privilege access
  - AHB master granted as secure and/or privilege
  - off-chip memories with secure and/or privilege areas
- TZIC accessible only with secure privileged transactions.
- Secure and non-secure access supported for privileged and unprivileged part of TZSC and MPCBB
- Set of registers to define product security settings:
  - Secure and privilege blocks for internal memories
  - Secure and privilege regions for external memories
  - Secure and privileged access mode for securable peripherals
    ==

34.2.2 How to use this driver

The GTZC HAL driver can be used as follows:

1. Configure or get back securable peripherals attributes using HAL_GTZC_TZSC_ConfigPeriphAttributes() / HAL_GTZC_TZSC_GetConfigPeriphAttributes()
2. Configure or get back MPCWM memories attributes using HAL_GTZC_TZSC_MPCWM_ConfigMemAttributes() / HAL_GTZC_TZSC_MPCWM_GetConfigMemAttributes()
3. Lock TZSC sub-block or get lock status using HAL_GTZC_TZSC_Lock() / HAL_GTZC_TZSC_GetLock()
4. Configure or get back MPCBB memories complete configuration using HAL_GTZC_MPCBB_ConfigMem() / HAL_GTZC_MPCBB_GetConfigMem()
5. Configure or get back MPCBB memories attributes using HAL_GTZC_MPCBB_ConfigMemAttributes() / HAL_GTZC_MPCBB_GetConfigMemAttributes()

6. Lock MPCBB configuration or get lock status using HAL_GTZC_MPCBB_Lock() / HAL_GTZC_MPCBB_GetLock()
7. Lock MPCBB super-blocks or get lock status using HAL_GTZC_MPCBB_LockConfig() / HAL_GTZC_MPCBB_GetLockConfig()
8. Illegal access detection can be configured through TZIC sub-block using following functions: HAL_GTZC_TZIC_DisableIT() / HAL_GTZC_TZIC_EnableIT()
9. Illegal access flags can be retrieved through HAL_GTZC_TZIC_GetFlag() and HAL_GTZC_TZIC_ClearFlag() functions
10. Illegal access interrupt service routines are served by HAL_GTZC_IRQHandler() and user can add his own code using HAL_GTZC_TZIC_Callback()

34.2.3 Detailed description of functions

HAL_GTZC_TZSC_ConfigPeriphAttributes

Function name

HAL_StatusTypeDef HAL_GTZC_TZSC_ConfigPeriphAttributes (uint32_t PeriphId, uint32_t PeriphAttributes)

Function description

Configure TZSC on a single peripheral or on all peripherals.

Parameters

- **PeriphId:** Peripheral identifier This parameter can be a value of GTZC TZSC and TZIC Peripheral identifier values. Use GTZC_PERIPH_ALL to select all peripherals.
- **PeriphAttributes:** Peripheral attributes, see GTZC TZSC peripheral attribute values.

Return values

- **HAL:** status.

Notes

- Secure and non-secure attributes can only be set from the secure state when the system implements the security (TZEN=1).
- Privilege and non-privilege attributes can only be set from the privilege state when TZEN=0 or TZEN=1
- Security and privilege attributes can be set independently.
- Default state is non-secure and unprivileged access allowed.

HAL_GTZC_TZSC_GetConfigPeriphAttributes

Function name

HAL_StatusTypeDef HAL_GTZC_TZSC_GetConfigPeriphAttributes (uint32_t PeriphId, uint32_t * PeriphAttributes)

Function description

Get TZSC configuration on a single peripheral or on all peripherals.

Parameters

- **PeriphId:** Peripheral identifier. This parameter can be a value of GTZC TZSC and TZIC Peripheral identifier values. Use GTZC_PERIPH_ALL to select all peripherals.
- **PeriphAttributes:** Peripheral attribute pointer. This parameter can be a value of GTZC TZSC peripheral attribute values. If PeriphId target a single peripheral, pointer on a single element. If all peripherals selected (GTZC_PERIPH_ALL), pointer to an array of GTZC_TZSC_PERIPH_NUMBER elements is to be provided.

Return values

- **HAL:** status.

HAL_GTZC_TZSC_MPCWM_ConfigMemAttributes

Function name

HAL_StatusTypeDef HAL_GTZC_TZSC_MPCWM_ConfigMemAttributes (uint32_t MemBaseAddress, const MPCWM_ConfigTypeDef * pMPCWM_Desc)

Function description

Configure a TZSC-MPCWM area.

Parameters

- **MemBaseAddress:** WM identifier.
- **pMPCWM_Desc:** TZSC-MPCWM descriptor pointer. The structure description is available in GTZC Exported Types.

Return values

- **HAL:** status.

HAL_GTZC_TZSC_MPCWM_GetConfigMemAttributes

Function name

HAL_StatusTypeDef HAL_GTZC_TZSC_MPCWM_GetConfigMemAttributes (uint32_t MemBaseAddress, MPCWM_ConfigTypeDef * pMPCWM_Desc)

Function description

Get a TZSC-MPCWM area configuration.

Parameters

- **MemBaseAddress:** WM identifier.
- **pMPCWM_Desc:** pointer to a TZSC-MPCWM descriptor. When the WaterMark memory supports two sub-regions A and B. pMPCWM_Desc argument must point to an array of two MPCWM_ConfigTypeDef structures. The structure description is available in GTZC Exported Types.

Return values

- **HAL:** status.

HAL_GTZC_TZSC_Lock

Function name

void HAL_GTZC_TZSC_Lock (GTZC_TZSC_TypeDef * TZSC_Instance)

Function description

Lock TZSC configuration.

Parameters

- **TZSC_Instance:** TZSC sub-block instance.

Notes

- This function locks the configuration of TZSC_SECCFGRx and TZSC_PRIVCFGRx registers until next reset

HAL_GTZC_TZSC_GetLock

Function name

uint32_t HAL_GTZC_TZSC_GetLock (const GTZC_TZSC_TypeDef * TZSC_Instance)

Function description

Get TZSC configuration lock state.

Parameters

- **TZSC_Instance:** TZSC sub-block instance.

Return values

- **Lock:** State (GTZC_TZSC_LOCK_OFF or GTZC_TZSC_LOCK_ON)

HAL_GTZC_MPCBB_ConfigMem

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_ConfigMem (uint32_t MemBaseAddress, const MPCBB_ConfigTypeDef * pMPCBB_desc)

Function description

Set a complete MPCBB configuration on the SRAM passed as parameter.

Parameters

- **MemBaseAddress:** MPCBB identifier.
- **pMPCBB_desc:** pointer to MPCBB descriptor. The structure description is available in GTZC Exported Types.

Return values

- **HAL:** status.

HAL_GTZC_MPCBB_GetConfigMem

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_GetConfigMem (uint32_t MemBaseAddress, MPCBB_ConfigTypeDef * pMPCBB_desc)

Function description

Get a complete MPCBB configuration on the SRAM passed as parameter.

Parameters

- **MemBaseAddress:** MPCBB identifier.
- **pMPCBB_desc:** pointer to a MPCBB descriptor. The structure description is available in GTZC Exported Types.

Return values

- **HAL:** status.

HAL_GTZC_MPCBB_ConfigMemAttributes

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_ConfigMemAttributes (uint32_t MemAddress, uint32_t NbBlocks, const uint32_t * pMemAttributes)

Function description

Set a MPCBB attribute configuration on the SRAM passed as parameter for a number of blocks.

Parameters

- **MemAddress:** MPCBB identifier, and start block to configure (must be 512 Bytes aligned).
- **NbBlocks:** Number of blocks to configure (Block size is 512 Bytes).
- **pMemAttributes:** pointer to an array (containing "NbBlocks" elements), with each element must be GTZC_MPCBB_BLOCK_NSEC or GTZC_MPCBB_BLOCK_SEC, and GTZC_MPCBB_BLOCK_NPRIV or GTZC_MPCBB_BLOCK_PRIV.

Return values

- **HAL:** status.

HAL_GTZC_MPCBB_GetConfigMemAttributes

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_GetConfigMemAttributes (uint32_t MemAddress, uint32_t NbBlocks, uint32_t * pMemAttributes)

Function description

Get a MPCBB attribute configuration on the SRAM passed as parameter for a number of blocks.

Parameters

- **MemAddress:** MPCBB identifier, and start block to get configuration (must be 512 Bytes aligned).
- **NbBlocks:** Number of blocks to get configuration.
- **pMemAttributes:** pointer to an array (containing "NbBlocks" elements), with each element will be GTZC_MPCBB_BLOCK_NSEC or GTZC_MPCBB_BLOCK_SEC, and GTZC_MPCBB_BLOCK_NPRIV or GTZC_MPCBB_BLOCK_PRIV.

Return values

- **HAL:** status.

HAL_GTZC_MPCBB_LockConfig

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_LockConfig (uint32_t MemAddress, uint32_t NbSuperBlocks, const uint32_t * pLockAttributes)

Function description

Lock MPCBB super-blocks on the SRAM passed as parameter.

Parameters

- **MemAddress:** MPCBB start-address of super-block to configure (must be 16KBytes aligned).
- **NbSuperBlocks:** Number of super-blocks to configure.
- **pLockAttributes:** pointer to an array (containing "NbSuperBlocks" elements), with for each element: value 0 super-block is unlocked, value 1 super-block is locked (corresponds to GTZC_MPCBB_SUPERBLOCK_UNLOCKED and GTZC_MPCBB_SUPERBLOCK_LOCKED values).

Return values

- **HAL:** status.

HAL_GTZC_MPCBB_GetLockConfig

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_GetLockConfig (uint32_t MemAddress, uint32_t NbSuperBlocks, uint32_t * pLockAttributes)

Function description

Get MPCBB super-blocks lock configuration on the SRAM passed as parameter.

Parameters

- **MemAddress:** MPCBB start-address of super-block to get configuration (must be 16KBytes aligned).
- **NbSuperBlocks:** Number of super-blocks to get configuration.
- **pLockAttributes:** pointer to an array (containing "NbSuperBlocks" elements), with for each element: value 0 super-block is unlocked, value 1 super-block is locked (corresponds to GTZC_MPCBB_SUPERBLOCK_UNLOCKED and GTZC_MPCBB_SUPERBLOCK_LOCKED values).

Return values

- **HAL:** status.

HAL_GTZC_MPCBB_Lock

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_Lock (uint32_t MemBaseAddress)

Function description

Lock a MPCBB configuration on the SRAM base address passed as parameter.

Parameters

- **MemBaseAddress:** MPCBB identifier.

Return values

- **HAL:** status.

Notes

- This functions locks the control register of the MPCBB until next reset.

HAL_GTZC_MPCBB_GetLock

Function name

HAL_StatusTypeDef HAL_GTZC_MPCBB_GetLock (uint32_t MemBaseAddress, uint32_t * pLockState)

Function description

Get MPCBB configuration lock state on the SRAM base address passed as parameter.

Parameters

- **MemBaseAddress:** MPCBB identifier.
- **pLockState:** pointer to Lock State (GTZC_MPCBB_LOCK_OFF or GTZC_MPCBB_LOCK_ON).

Return values

- **HAL:** status.

HAL_GTZC_TZIC_DisableIT

Function name

HAL_StatusTypeDef HAL_GTZC_TZIC_DisableIT (uint32_t PeriphId)

Function description

Disable the interrupt associated to a single TZIC peripheral or on all peripherals.

Parameters

- **PeriphId:** Peripheral identifier. This parameter can be a value of GTZC TZSC and TZIC Peripheral identifier values. Use GTZC_PERIPH_ALL to select all peripherals.

Return values

- **HAL:** status.

HAL_GTZC_TZIC_EnableIT

Function name

HAL_StatusTypeDef HAL_GTZC_TZIC_EnableIT (uint32_t PeriphId)

Function description

Enable the interrupt associated to a single TZIC peripheral or on all peripherals.

Parameters

- **PeriphId:** Peripheral identifier. This parameter can be a value of GTZC TZSC and TZIC Peripheral identifier values. Use GTZC_PERIPH_ALL to select all peripherals.

Return values

- **HAL:** status.

HAL_GTZC_TZIC_GetFlag

Function name

HAL_StatusTypeDef HAL_GTZC_TZIC_GetFlag (uint32_t PeriphId, uint32_t * pFlag)

Function description

Get TZIC flag on a single TZIC peripheral or on all peripherals.

Parameters

- **PeriphId:** Peripheral identifier. This parameter can be a value of GTZC TZSC and TZIC Peripheral identifier values. Use GTZC_PERIPH_ALL to select all peripherals.
- **pFlag:** Pointer to the flags. If PeriphId target a single peripheral, pointer on a single element. If all peripherals selected (GTZC_PERIPH_ALL), pointer to an array of GTZC_TZIC_PERIPH_NUMBER elements. Element content is either GTZC_TZIC_NO_ILA_EVENT or GTZC_TZSC_ILA_EVENT_PENDING.

Return values

- **HAL:** status

HAL_GTZC_TZIC_ClearFlag

Function name

HAL_StatusTypeDef HAL_GTZC_TZIC_ClearFlag (uint32_t PeriphId)

Function description

Clear TZIC flag on a single TZIC peripheral or on all peripherals.

Parameters

- **PeriphId:** Peripheral identifier. This parameter can be a value of GTZC TZSC and TZIC Peripheral identifier values. Use GTZC_PERIPH_ALL to select all peripherals.

Return values

- **HAL:** status.

HAL_GTZC_IRQHandler

Function name

void HAL_GTZC_IRQHandler (void)

Function description

This function handles GTZC TZIC interrupt request.

Return values

- **None.:**

HAL_GTZC_TZIC_Callback

Function name

void HAL_GTZC_TZIC_Callback (uint32_t PeriphId)

Function description

GTZC TZIC sub-block interrupt callback.

Parameters

- **PeriphId:** Peripheral identifier triggering the illegal access. This parameter can be a value of GTZC TZSC and TZIC Peripheral identifier values

Return values

- **None.:**

35 HAL HASH Generic Driver

35.1 HASH Firmware driver registers structures

35.1.1 HASH_InitTypeDef

HASH_InitTypeDef is defined in the stm32u5xx_hal_hash.h

Data Fields

- ***uint32_t DataType***
- ***uint32_t KeySize***
- ***uint8_t * pKey***

Field Documentation

- ***uint32_t HASH_InitTypeDef::DataType***
  32-bit data, 16-bit data, 8-bit data or 1-bit data. This parameter can be a value of ***HASH_Data_Type***.
- ***uint32_t HASH_InitTypeDef::KeySize***
  The key size is used only in HMAC operation.
- ***uint8_t* HASH_InitTypeDef::pKey***
  The key is used only in HMAC operation.

35.1.2 __HASH_HandleTypeDef

__HASH_HandleTypeDef is defined in the stm32u5xx_hal_hash.h

Data Fields

- ***HASH_InitTypeDef Init***
- ***uint8_t * pHashInBuffPtr***
- ***uint8_t * pHashOutBuffPtr***
- ***uint8_t * pHashKeyBuffPtr***
- ***uint8_t * pHashMsgBuffPtr***
- ***uint32_t HashBuffSize***
- ***__IO uint32_t HashInCount***
- ***__IO uint32_t HashITCounter***
- ***__IO uint32_t HashKeyCount***

- ***__IO uint32_t Accumulation***
- ***void(* InCpltCallback***
- ***void(* DgstCpltCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***HASH_InitTypeDef __HASH_HandleTypeDef::Init***
  HASH required parameters

- ***uint8_t* __HASH_HandleTypeDef::pHashInBuffPtr***
  Pointer to input buffer
- ***uint8_t* __HASH_HandleTypeDef::pHashOutBuffPtr***
  Pointer to output buffer (digest)
- ***uint8_t* __HASH_HandleTypeDef::pHashKeyBuffPtr***
  Pointer to key buffer (HMAC only)
- ***uint8_t* __HASH_HandleTypeDef::pHashMsgBuffPtr***
  Pointer to message buffer (HMAC only)
- ***uint32_t __HASH_HandleTypeDef::HashBuffSize***
  Size of buffer to be processed
- ***__IO uint32_t __HASH_HandleTypeDef::HashInCount***
  Counter of inputted data
- ***__IO uint32_t __HASH_HandleTypeDef::HashITCounter***
  Counter of issued interrupts
- ***__IO uint32_t __HASH_HandleTypeDef::HashKeyCount***
  Counter for Key inputted data (HMAC only)
- ***HAL_StatusTypeDef __HASH_HandleTypeDef::Status***
  HASH peripheral status
- ***HAL_HASH_PhaseTypeDef __HASH_HandleTypeDef::Phase***
  HASH peripheral phase
- ***DMA_HandleTypeDef* __HASH_HandleTypeDef::hdmain***
  HASH In DMA Handle parameters
- ***HAL_LockTypeDef __HASH_HandleTypeDef::Lock***
  Locking object
- ***__IO HAL_HASH_StateTypeDef __HASH_HandleTypeDef::State***
  HASH peripheral state
- ***HAL_HASH_SuspendTypeDef __HASH_HandleTypeDef::SuspendRequest***
  HASH peripheral suspension request flag
- ***FlagStatus __HASH_HandleTypeDef::DigestCalculationDisable***
  Digest calculation phase skip (MDMAT bit control) for multi-buffers DMA-based HMAC computation
- ***__IO uint32_t __HASH_HandleTypeDef::NbWordsAlreadyPushed***
  Numbers of words already pushed in FIFO before inputting new block
- ***__IO uint32_t __HASH_HandleTypeDef::ErrorCode***
  HASH Error code
- ***__IO uint32_t __HASH_HandleTypeDef::Accumulation***
  HASH multi buffers accumulation flag
- ***void(* __HASH_HandleTypeDef::InCpltCallback)(struct __HASH_HandleTypeDef *hhash)***
  HASH input completion callback
- ***void(* __HASH_HandleTypeDef::DgstCpltCallback)(struct __HASH_HandleTypeDef *hhash)***
  HASH digest computation completion callback
- ***void(* __HASH_HandleTypeDef::ErrorCallback)(struct __HASH_HandleTypeDef *hhash)***
  HASH error callback
- ***void(* __HASH_HandleTypeDef::MspInitCallback)(struct __HASH_HandleTypeDef *hhash)***
  HASH Msp Init callback
- ***void(* __HASH_HandleTypeDef::MspDeInitCallback)(struct __HASH_HandleTypeDef *hhash)***
  HASH Msp DeInit callback

35.2 HASH Firmware driver API description

The following section lists the various functions of the HASH library.

35.2.1 How to use this driver

The HASH HAL driver can be used as follows:

1. Initialize the HASH low level resources by implementing the HAL_HASH_MspInit():
   a. Enable the HASH interface clock using __HASH_CLK_ENABLE()
   b. When resorting to interrupt-based APIs (e.g. HAL_HASH_xxx_Start_IT())
      - Configure the HASH interrupt priority using HAL_NVIC_SetPriority()
      - Enable the HASH IRQ handler using HAL_NVIC_EnableIRQ()
      - In HASH IRQ handler, call HAL_HASH_IRQHandler() API
   c. When resorting to DMA-based APIs (e.g. HAL_HASH_xxx_Start_DMA())
      - Enable the DMAx interface clock using __DMAx_CLK_ENABLE()
      - Configure and enable one DMA channel to manage data transfer from memory to peripheral (input channel). Managing data transfer from peripheral to memory can be performed only using CPU.
      - Associate the initialized DMA handle to the HASH DMA handle using __HAL_LINKDMA()
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA channel: use HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ()
2. Initialize the HASH HAL using HAL_HASH_Init(). This function:
   a. resorts to HAL_HASH_MspInit() for low-level initialization,
   b. configures the data type: 1-bit, 8-bit, 16-bit or 32-bit.
3. Three processing schemes are available:
   a. Polling mode: processing APIs are blocking functions i.e. they process the data and wait till the digest computation is finished, e.g. HAL_HASH_xxx_Start() for HASH or HAL_HMAC_xxx_Start() for HMAC
   b. Interrupt mode: processing APIs are not blocking functions i.e. they process the data under interrupt, e.g. HAL_HASH_xxx_Start_IT() for HASH or HAL_HMAC_xxx_Start_IT() for HMAC
   c. DMA mode: processing APIs are not blocking functions and the CPU is not used for data transfer i.e. the data transfer is ensured by DMA, e.g. HAL_HASH_xxx_Start_DMA() for HASH or HAL_HMAC_xxx_Start_DMA() for HMAC. Note that in DMA mode, a call to HAL_HASH_xxx_Finish() is then required to retrieve the digest.
4. When the processing function is called after HAL_HASH_Init(), the HASH peripheral is initialized and processes the buffer fed in input. When the input data have all been fed to the Peripheral, the digest computation can start.
5. Multi-buffer processing is possible in polling, interrupt and DMA modes.
   a. In polling mode, only multi-buffer HASH processing is possible. API HAL_HASH_xxx_Accumulate() must be called for each input buffer, except for the last one. User must resort to HAL_HASH_xxx_Accumulate_End() to enter the last one and retrieve as well the computed digest.
   b. In interrupt mode, API HAL_HASH_xxx_Accumulate_IT() must be called for each input buffer, except for the last one. User must resort to HAL_HASH_xxx_Accumulate_End_IT() to enter the last one and retrieve as well the computed digest.
   c. In DMA mode, multi-buffer HASH and HMAC processing are possible.
      - HASH processing: once initialization is done, MDMAT bit must be set through __HAL_HASH_SET_MDMAT() macro. From that point, each buffer can be fed to the Peripheral through HAL_HASH_xxx_Start_DMA() API. Before entering the last buffer, reset the MDMAT bit with __HAL_HASH_RESET_MDMAT() macro then wrap-up the HASH processing in feeding the last input buffer through the same API HAL_HASH_xxx_Start_DMA(). The digest can then be retrieved with a call to API HAL_HASH_xxx_Finish().
      - HMAC processing (requires to resort to extended functions): after initialization, the key and the first input buffer are entered in the Peripheral with the API HAL_HMACEx_xxx_Step1_2_DMA(). This carries out HMAC step 1 and starts step 2. The following buffers are next entered with the API HAL_HMACEx_xxx_Step2_DMA(). At this point, the HMAC processing is still carrying out step 2. Then, step 2 for the last input buffer and step 3 are carried out by a single call to HAL_HMACEx_xxx_Step2_3_DMA(). The digest can finally be retrieved with a call to API HAL_HASH_xxx_Finish().

6. Context swapping.
   a. Two APIs are available to suspend HASH or HMAC processing:
      - HAL_HASH_SwFeed_ProcessSuspend() when data are entered by software (polling or IT mode),
      - HAL_HASH_DMAFeed_ProcessSuspend() when data are entered by DMA.
   b. When HASH or HMAC processing is suspended, HAL_HASH_ContextSaving() allows to save in memory the Peripheral context. This context can be restored afterwards to resume the HASH processing thanks to HAL_HASH_ContextRestoring().
   c. Once the HASH Peripheral has been restored to the same configuration as that at suspension time, processing can be restarted with the same API call (same API, same handle, same parameters) as done before the suspension. Relevant parameters to restart at the proper location are internally saved in the HASH handle.
7. Call HAL_HASH_DeInit() to deinitialize the HASH peripheral.

Remarks on message length

1. HAL in interruption mode (interruptions driven)
   a. Due to HASH peripheral hardware design, the peripheral interruption is triggered every 64 bytes. This is why, for driver implementation simplicity's sake, user is requested to enter a message the length of which is a multiple of 4 bytes.
   b. When the message length (in bytes) is not a multiple of words, a specific field exists in HASH_STR to specify which bits to discard at the end of the complete message to process only the message bits and not extra bits.
   c. If user needs to perform a hash computation of a large input buffer that is spread around various places in memory and where each piece of this input buffer is not necessarily a multiple of 4 bytes in size, it becomes necessary to use a temporary buffer to format the data accordingly before feeding them to the Peripheral. It is advised to the user to
      - achieve the first formatting operation by software then enter the data
      - while the Peripheral is processing the first input set, carry out the second formatting operation by software, to be ready when DINIS occurs.
      - repeat step 2 until the whole message is processed.
1. HAL in DMA mode
   a. Again, due to hardware design, the DMA transfer to feed the data can only be done on a word-basis. The same field described above in HASH_STR is used to specify which bits to discard at the end of the DMA transfer to process only the message bits and not extra bits. Due to hardware implementation, this is possible only at the end of the complete message. When several DMA transfers are needed to enter the message, this is not applicable at the end of the intermediary transfers.
   b. Similarly to the interruption-driven mode, it is suggested to the user to format the consecutive chunks of data by software while the DMA transfer and processing is on-going for the first parts of the message. Due to the 32-bit alignment required for the DMA transfer, it is underlined that the software formatting operation is more complex than in the IT mode.

Callback registration

1. The compilation define USE_HAL_HASH_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use function HAL_HASH_RegisterCallback() to register a user callback.
2. Function HAL_HASH_RegisterCallback() allows to register following callbacks: (+) InCpltCallback : callback for input completion. (+) DgstCpltCallback : callback for digest computation completion. (+) ErrorCallback : callback for error. (+) MspInitCallback : HASH MspInit. (+) MspDeInitCallback : HASH MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.
3. Use function HAL_HASH_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. HAL_HASH_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks: (+) InCpltCallback : callback for input completion. (+) DgstCpltCallback : callback for digest computation completion. (+) ErrorCallback : callback for error. (+) MspInitCallback : HASH MspInit. (+) MspDeInitCallback : HASH MspDeInit.

4. By default, after the HAL_HASH_Init and if the state is HAL_HASH_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions: examples HAL_HASH_InCpltCallback(), HAL_HASH_DgstCpltCallback() Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the HAL_HASH_Init and HAL_HASH_DeInit only when these callbacks are null (not registered beforehand) If not, MspInit or MspDeInit are not null, the HAL_HASH_Init and HAL_HASH_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand). Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_HASH_RegisterCallback before calling HAL_HASH_DeInit or HAL_HASH_Init function. When The compilation define USE_HAL_HASH_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

(#) The compilation define USE_HAL_HASH_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use function HAL_HASH_RegisterCallback() to register a user callback. (#) Function HAL_HASH_RegisterCallback() allows to register following callbacks:

- InCpltCallback : callback for input completion.
- DgstCpltCallback : callback for digest computation completion.
- ErrorCallback : callback for error.
- MspInitCallback : HASH MspInit.
- MspDeInitCallback : HASH MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. (#) Use function HAL_HASH_UnRegisterCallback() to reset a callback to the default weak (surcharged) function. HAL_HASH_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:
- InCpltCallback : callback for input completion.
- DgstCpltCallback : callback for digest computation completion.
- ErrorCallback : callback for error.
- MspInitCallback : HASH MspInit.
- MspDeInitCallback : HASH MspDeInit. (#) By default, after the HAL_HASH_Init and if the state is HAL_HASH_STATE_RESET all callbacks are reset to the corresponding legacy weak (surcharged) functions: examples HAL_HASH_InCpltCallback(), HAL_HASH_DgstCpltCallback() Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (surcharged) functions in the HAL_HASH_Init and HAL_HASH_DeInit only when these callbacks are null (not registered beforehand) If not, MspInit or MspDeInit are not null, the HAL_HASH_Init and HAL_HASH_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand). Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_HASH_RegisterCallback before calling HAL_HASH_DeInit or HAL_HASH_Init function. When The compilation define USE_HAL_HASH_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (surcharged) callbacks are used.

35.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the HASH according to the specified parameters in the HASH_InitTypeDef and create the associated handle
- DeInitialize the HASH peripheral
- Initialize the HASH MCU Specific Package (MSP)
- DeInitialize the HASH MSP

This section provides as well call back functions definitions for user code to manage:

- Input data transfer to Peripheral completion
- Calculated digest retrieval completion
- Error management

This section contains the following APIs:

- *HAL_HASH_Init()*
- *HAL_HASH_DeInit()*

- *HAL_HASH_MspInit()*
- *HAL_HASH_MspDeInit()*
- *HAL_HASH_InCpltCallback()*
- *HAL_HASH_DgstCpltCallback()*
- *HAL_HASH_ErrorCallback()*
- *HAL_HASH_RegisterCallback()*
- *HAL_HASH_UnRegisterCallback()*

35.2.3 Polling mode HASH processing functions

This section provides functions allowing to calculate in polling mode the hash value using one of the following algorithms:

- MD5
  - HAL_HASH_MD5_Start()
  - HAL_HASH_MD5_Accmlt()
  - HAL_HASH_MD5_Accmlt_End()
- SHA1
  - HAL_HASH_SHA1_Start()
  - HAL_HASH_SHA1_Accmlt()
  - HAL_HASH_SHA1_Accmlt_End()

For a single buffer to be hashed, user can resort to HAL_HASH_xxx_Start().

In case of multi-buffer HASH processing (a single digest is computed while several buffers are fed to the Peripheral), the user can resort to successive calls to HAL_HASH_xxx_Accumulate() and wrap-up the digest computation by a call to HAL_HASH_xxx_Accumulate_End().

This section contains the following APIs:

- *HAL_HASH_MD5_Start()*
- *HAL_HASH_MD5_Accmlt()*
- *HAL_HASH_MD5_Accmlt_End()*
- *HAL_HASH_SHA1_Start()*
- *HAL_HASH_SHA1_Accmlt()*
- *HAL_HASH_SHA1_Accmlt_End()*

35.2.4 Interruption mode HASH processing functions

This section provides functions allowing to calculate in interrupt mode the hash value using one of the following algorithms:

- MD5
  - HAL_HASH_MD5_Start_IT()
  - HAL_HASH_MD5_Accmlt_IT()
  - HAL_HASH_MD5_Accmlt_End_IT()
- SHA1
  - HAL_HASH_SHA1_Start_IT()
  - HAL_HASH_SHA1_Accmlt_IT()
  - HAL_HASH_SHA1_Accmlt_End_IT()

API HAL_HASH_IRQHandler() manages each HASH interruption.

Note that HAL_HASH_IRQHandler() manages as well HASH Peripheral interruptions when in HMAC processing mode.

This section contains the following APIs:

- *HAL_HASH_MD5_Start_IT()*
- *HAL_HASH_MD5_Accmlt_IT()*
- *HAL_HASH_MD5_Accmlt_End_IT()*
- *HAL_HASH_SHA1_Start_IT()*

- *HAL_HASH_SHA1_Accmlt_IT()*
- *HAL_HASH_SHA1_Accmlt_End_IT()*
- *HAL_HASH_IRQHandler()*

35.2.5 DMA mode HASH processing functions

This section provides functions allowing to calculate in DMA mode the hash value using one of the following algorithms:

- MD5
  - HAL_HASH_MD5_Start_DMA()
  - HAL_HASH_MD5_Finish()
- SHA1
  - HAL_HASH_SHA1_Start_DMA()
  - HAL_HASH_SHA1_Finish()

When resorting to DMA mode to enter the data in the Peripheral, user must resort to HAL_HASH_xxx_Start_DMA() then read the resulting digest with HAL_HASH_xxx_Finish().

In case of multi-buffer HASH processing, MDMAT bit must first be set before the successive calls to HAL_HASH_xxx_Start_DMA(). Then, MDMAT bit needs to be reset before the last call to HAL_HASH_xxx_Start_DMA(). Digest is finally retrieved thanks to HAL_HASH_xxx_Finish().

This section contains the following APIs:

- *HAL_HASH_MD5_Start_DMA()*
- *HAL_HASH_MD5_Finish()*
- *HAL_HASH_SHA1_Start_DMA()*
- *HAL_HASH_SHA1_Finish()*

35.2.6 Polling mode HMAC processing functions

This section provides functions allowing to calculate in polling mode the HMAC value using one of the following algorithms:

- MD5
  - HAL_HMAC_MD5_Start()
- SHA1
  - HAL_HMAC_SHA1_Start()

This section contains the following APIs:

- *HAL_HMAC_MD5_Start()*
- *HAL_HMAC_SHA1_Start()*

35.2.7 Interrupt mode HMAC processing functions

This section provides functions allowing to calculate in interrupt mode the HMAC value using one of the following algorithms:

- MD5
  - HAL_HMAC_MD5_Start_IT()
- SHA1
  - HAL_HMAC_SHA1_Start_IT()

This section contains the following APIs:

- *HAL_HMAC_MD5_Start_IT()*
- *HAL_HMAC_SHA1_Start_IT()*

35.2.8 DMA mode HMAC processing functions

This section provides functions allowing to calculate in DMA mode the HMAC value using one of the following algorithms:

- MD5
  - HAL_HMAC_MD5_Start_DMA()
- SHA1
  - HAL_HMAC_SHA1_Start_DMA()

When resorting to DMA mode to enter the data in the Peripheral for HMAC processing, user must resort to HAL_HMAC_xxx_Start_DMA() then read the resulting digest with HAL_HASH_xxx_Finish().

This section contains the following APIs:

- *HAL_HMAC_MD5_Start_DMA()*
- *HAL_HMAC_SHA1_Start_DMA()*

35.2.9 Peripheral State methods

This section permits to get in run-time the state and the peripheral handle status of the peripheral:

- HAL_HASH_GetState()
- HAL_HASH_GetStatus()

Additionally, this subsection provides functions allowing to save and restore the HASH or HMAC processing context in case of calculation suspension:

- HAL_HASH_ContextSaving()
- HAL_HASH_ContextRestoring()

This subsection provides functions allowing to suspend the HASH processing

- when input are fed to the Peripheral by software
  - HAL_HASH_SwFeed_ProcessSuspend()
- when input are fed to the Peripheral by DMA
  - HAL_HASH_DMAFeed_ProcessSuspend()

This section contains the following APIs:

- *HAL_HASH_GetState()*
- *HAL_HASH_GetStatus()*
- *HAL_HASH_ContextSaving()*
- *HAL_HASH_ContextRestoring()*
- *HAL_HASH_SwFeed_ProcessSuspend()*
- *HAL_HASH_DMAFeed_ProcessSuspend()*
- *HAL_HASH_GetError()*

35.2.10 Detailed description of functions

HAL_HASH_Init

Function name

HAL_StatusTypeDef HAL_HASH_Init (HASH_HandleTypeDef * hhash)

Function description

Initialize the HASH according to the specified parameters in the HASH_HandleTypeDef and create the associated handle.

Parameters

- **hhash:** HASH handle

Return values

- **HAL:** status

Notes

- Only MDMAT and DATATYPE bits of HASH Peripheral are set by HAL_HASH_Init(), other configuration bits are set by HASH or HMAC processing APIs.
- MDMAT bit is systematically reset by HAL_HASH_Init(). To set it for multi-buffer HASH processing, user needs to resort to __HAL_HASH_SET_MDMAT() macro. For HMAC multi-buffer processing, the relevant APIs manage themselves the MDMAT bit.

HAL_HASH_DeInit

Function name

HAL_StatusTypeDef HAL_HASH_DeInit (HASH_HandleTypeDef * hhash)

Function description

DeInitialize the HASH peripheral.

Parameters

- **hhash:** HASH handle.

Return values

- **HAL:** status

HAL_HASH_MspInit

Function name

void HAL_HASH_MspInit (HASH_HandleTypeDef * hhash)

Function description

Initialize the HASH MSP.

Parameters

- **hhash:** HASH handle.

Return values

- **None:**

HAL_HASH_MspDeInit

Function name

void HAL_HASH_MspDeInit (HASH_HandleTypeDef * hhash)

Function description

DeInitialize the HASH MSP.

Parameters

- **hhash:** HASH handle.

Return values

- **None:**

HAL_HASH_InCpltCallback

Function name

void HAL_HASH_InCpltCallback (HASH_HandleTypeDef * hhash)

Function description

Input data transfer complete call back.

Parameters

- **hhash:** HASH handle.

Return values

- **None:**

Notes

- HAL_HASH_InCpltCallback() is called when the complete input message has been fed to the Peripheral. This API is invoked only when input data are entered under interruption or through DMA.
- In case of HASH or HMAC multi-buffer DMA feeding case (MDMAT bit set), HAL_HASH_InCpltCallback() is called at the end of each buffer feeding to the Peripheral.

HAL_HASH_DgstCpltCallback

Function name

void HAL_HASH_DgstCpltCallback (HASH_HandleTypeDef * hhash)

Function description

Digest computation complete call back.

Parameters

- **hhash:** HASH handle.

Return values

- **None:**

Notes

- HAL_HASH_DgstCpltCallback() is used under interruption, is not relevant with DMA.

HAL_HASH_ErrorCallback

Function name

void HAL_HASH_ErrorCallback (HASH_HandleTypeDef * hhash)

Function description

Error callback.

Parameters

- **hhash:** HASH handle.

Return values

- **None:**

Notes

- Code user can resort to hhash->Status (HAL_ERROR, HAL_TIMEOUT,...) to retrieve the error type.

HAL_HASH_RegisterCallback

Function name

HAL_StatusTypeDef HAL_HASH_RegisterCallback (HASH_HandleTypeDef * hhash, HAL_HASH_CallbackIDTypeDef CallbackID, pHASH_CallbackTypeDef pCallback)

Function description

Register a User HASH Callback To be used instead of the weak (surcharged) predefined callback.

Parameters

- **hhash:** HASH handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  – HAL_HASH_INPUTCPLT_CB_ID HASH input completion Callback ID
  – HAL_HASH_DGSTCPLT_CB_ID HASH digest computation completion Callback ID
  – HAL_HASH_ERROR_CB_ID HASH error Callback ID
  – HAL_HASH_MSPINIT_CB_ID HASH MspInit callback ID
  – HAL_HASH_MSPDEINIT_CB_ID HASH MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_HASH_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_HASH_UnRegisterCallback (HASH_HandleTypeDef * hhash, HAL_HASH_CallbackIDTypeDef CallbackID)

Function description

Unregister a HASH Callback HASH Callback is redirected to the weak (surcharged) predefined callback.

Parameters

- **hhash:** HASH handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  – HAL_HASH_INPUTCPLT_CB_ID HASH input completion Callback ID
  – HAL_HASH_DGSTCPLT_CB_ID HASH digest computation completion Callback ID
  – HAL_HASH_ERROR_CB_ID HASH error Callback ID
  – HAL_HASH_MSPINIT_CB_ID HASH MspInit callback ID
  – HAL_HASH_MSPDEINIT_CB_ID HASH MspDeInit callback ID

Return values

- **status:**

HAL_HASH_SHA1_Start

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in SHA1 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 20 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_MD5_Start

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in MD5 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 16 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_MD5_Accmlt

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Accmlt (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in MD5 mode then processes pInBuffer.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASH_MD5_Accmlt() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASH_MD5_Accmlt_End().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- Digest is not retrieved by this API, user must resort to HAL_HASH_MD5_Accmlt_End() to read it, feeding at the same time the last input buffer to the Peripheral.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASH_MD5_Accmlt_End() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASH_SHA1_Accmlt

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Accmlt (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in SHA1 mode then processes pInBuffer.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASH_SHA1_Accmlt() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASH_SHA1_Accmlt_End().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- Digest is not retrieved by this API, user must resort to HAL_HASH_SHA1_Accmlt_End() to read it, feeding at the same time the last input buffer to the Peripheral.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASH_SHA1_Accmlt_End() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASH_MD5_Accmlt_End

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Accmlt_End (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

End computation of a single HASH signature after several calls to HAL_HASH_MD5_Accmlt() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 16 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_SHA1_Accmlt_End

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Accmlt_End (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

End computation of a single HASH signature after several calls to HAL_HASH_SHA1_Accmlt() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 20 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_SHA1_Start_IT

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in SHA1 mode, next process pInBuffer then read the computed digest in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 20 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_SHA1_Accmlt_IT

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Accmlt_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in SHA1 mode then processes pInBuffer in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASH_SHA1_Accmlt_IT() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASH_SHA1_Accmlt_End_IT().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASH_SHA1_Accmlt_End_IT() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASH_SHA1_Accmlt_End_IT

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Accmlt_End_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

End computation of a single HASH signature after several calls to HAL_HASH_SHA1_Accmlt_IT() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 20 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_MD5_Start_IT

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in MD5 mode, next process pInBuffer then read the computed digest in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 16 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_MD5_Accmlt_IT

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Accmlt_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in MD5 mode then processes pInBuffer in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASH_MD5_Accmlt_IT() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASH_MD5_Accmlt_End_IT().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASH_MD5_Accmlt_End_IT() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASH_MD5_Accmlt_End_IT

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Accmlt_End_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

End computation of a single HASH signature after several calls to HAL_HASH_MD5_Accmlt_IT() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 16 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASH_IRQHandler

Function name

void HAL_HASH_IRQHandler (HASH_HandleTypeDef * hhash)

Function description

Handle HASH interrupt request.

Parameters

- **hhash:** HASH handle.

Return values

- **None:**

Notes

- HAL_HASH_IRQHandler() handles interrupts in HMAC processing as well.
- In case of error reported during the HASH interruption processing, HAL_HASH_ErrorCallback() API is called so that user code can manage the error. The error type is available in hhash->Status field.

HAL_HASH_SHA1_Start_DMA

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in SHA1 mode then initiate a DMA transfer to feed the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfer is finished, HAL_HASH_SHA1_Finish() API must be called to retrieve the computed digest.

HAL_HASH_SHA1_Finish

Function name

HAL_StatusTypeDef HAL_HASH_SHA1_Finish (HASH_HandleTypeDef * hhash, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Return the computed digest in SHA1 mode.

Parameters

- **hhash:** HASH handle.
- **pOutBuffer:** pointer to the computed digest. Digest size is 20 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- The API waits for DCIS to be set then reads the computed digest.
- HAL_HASH_SHA1_Finish() can be used as well to retrieve the digest in HMAC SHA1 mode.

HAL_HASH_MD5_Start_DMA

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in MD5 mode then initiate a DMA transfer to feed the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfer is finished, HAL_HASH_MD5_Finish() API must be called to retrieve the computed digest.

HAL_HASH_MD5_Finish

Function name

HAL_StatusTypeDef HAL_HASH_MD5_Finish (HASH_HandleTypeDef * hhash, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Return the computed digest in MD5 mode.

Parameters

- **hhash:** HASH handle.
- **pOutBuffer:** pointer to the computed digest. Digest size is 16 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- The API waits for DCIS to be set then reads the computed digest.
- HAL_HASH_MD5_Finish() can be used as well to retrieve the digest in HMAC MD5 mode.

HAL_HMAC_SHA1_Start

Function name

HAL_StatusTypeDef HAL_HMAC_SHA1_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in HMAC SHA1 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 20 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMAC_MD5_Start

Function name

HAL_StatusTypeDef HAL_HMAC_MD5_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in HMAC MD5 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 16 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMAC_MD5_Start_IT

Function name

HAL_StatusTypeDef HAL_HMAC_MD5_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in HMAC MD5 mode, next process pInBuffer then read the computed digest in interrupt mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 16 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMAC_SHA1_Start_IT

Function name

HAL_StatusTypeDef HAL_HMAC_SHA1_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in HMAC SHA1 mode, next process pInBuffer then read the computed digest in interrupt mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 20 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMAC_SHA1_Start_DMA

Function name

HAL_StatusTypeDef HAL_HMAC_SHA1_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in HMAC SHA1 mode then initiate the required DMA transfers to feed the key and the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASH_SHA1_Finish() API must be called to retrieve the computed digest.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- If MDMAT bit is set before calling this function (multi-buffer HASH processing case), the input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. For the processing of the last buffer of the thread, MDMAT bit must be reset and the buffer length (in bytes) doesn't have to be a multiple of 4.

HAL_HMAC_MD5_Start_DMA

Function name

HAL_StatusTypeDef HAL_HMAC_MD5_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in HMAC MD5 mode then initiate the required DMA transfers to feed the key and the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASH_MD5_Finish() API must be called to retrieve the computed digest.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- If MDMAT bit is set before calling this function (multi-buffer HASH processing case), the input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. For the processing of the last buffer of the thread, MDMAT bit must be reset and the buffer length (in bytes) doesn't have to be a multiple of 4.

HAL_HASH_GetState

Function name

HAL_HASH_StateTypeDef HAL_HASH_GetState (HASH_HandleTypeDef * hhash)

Function description

Return the HASH handle state.

Parameters

- **hhash:** HASH handle.

Return values

- **HAL:** HASH state

Notes

- The API yields the current state of the handle (BUSY, READY,...).

HAL_HASH_GetStatus

Function name

HAL_StatusTypeDef HAL_HASH_GetStatus (HASH_HandleTypeDef * hhash)

Function description

Return the HASH HAL status.

Parameters

- **hhash:** HASH handle.

Return values

- **HAL:** status

Notes

- The API yields the HAL status of the handle: it is the result of the latest HASH processing and allows to report any issue (e.g. HAL_TIMEOUT).

HAL_HASH_ContextSaving

Function name

void HAL_HASH_ContextSaving (HASH_HandleTypeDef * hhash, uint8_t * pMemBuffer)

Function description

Save the HASH context in case of processing suspension.

Parameters

- **hhash:** HASH handle.
- **pMemBuffer:** pointer to the memory buffer where the HASH context is saved.

Return values

- **None:**

Notes

- The IMR, STR, CR then all the CSR registers are saved in that order. Only the r/w bits are read to be restored later on.
- By default, all the context swap registers (there are HASH_NUMBER_OF_CSR_REGISTERS of those) are saved.
- pMemBuffer points to a buffer allocated by the user. The buffer size must be at least (HASH_NUMBER_OF_CSR_REGISTERS + 3) * 4 uint8 long.

HAL_HASH_ContextRestoring

Function name

void HAL_HASH_ContextRestoring (HASH_HandleTypeDef * hhash, uint8_t * pMemBuffer)

Function description

Restore the HASH context in case of processing resumption.

Parameters

- **hhash:** HASH handle.
- **pMemBuffer:** pointer to the memory buffer where the HASH context is stored.

Return values

- **None:**

Notes

- The IMR, STR, CR then all the CSR registers are restored in that order. Only the r/w bits are restored.
- By default, all the context swap registers (HASH_NUMBER_OF_CSR_REGISTERS of those) are restored (all of them have been saved by default beforehand).

HAL_HASH_SwFeed_ProcessSuspend

Function name

void HAL_HASH_SwFeed_ProcessSuspend (HASH_HandleTypeDef * hhash)

Function description

Initiate HASH processing suspension when in polling or interruption mode.

Parameters

- **hhash:** HASH handle.

Return values

- **None:**

Notes

- Set the handle field SuspendRequest to the appropriate value so that the on-going HASH processing is suspended as soon as the required conditions are met. Note that the actual suspension is carried out by the functions HASH_WriteData() in polling mode and HASH_IT() in interruption mode.

HAL_HASH_DMAFeed_ProcessSuspend

Function name

HAL_StatusTypeDef HAL_HASH_DMAFeed_ProcessSuspend (HASH_HandleTypeDef * hhash)

Function description

Suspend the HASH processing when in DMA mode.

Parameters

- **hhash:** HASH handle.

Return values

- **HAL:** status

Notes

- When suspension attempt occurs at the very end of a DMA transfer and all the data have already been entered in the Peripheral, hhash->State is set to HAL_HASH_STATE_READY and the API returns HAL_ERROR. It is recommended to wrap-up the processing in reading the digest as usual.

HAL_HASH_GetError

Function name

uint32_t HAL_HASH_GetError (HASH_HandleTypeDef * hhash)

Function description

Return the HASH handle error code.

Parameters

- **hhash:** pointer to a HASH_HandleTypeDef structure.

Return values

- **HASH:** Error Code

HASH_Start

Function name

HAL_StatusTypeDef HASH_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout, uint32_t Algorithm)

Function description

Initialize the HASH peripheral, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.
- **Timeout:** Timeout value.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HASH_Accumulate

Function name

HAL_StatusTypeDef HASH_Accumulate (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint32_t Algorithm)

Function description

If not already done, initialize the HASH peripheral then processes pInBuffer.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HASH_Accumulate_IT

Function name

HAL_StatusTypeDef HASH_Accumulate_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint32_t Algorithm)

Function description

If not already done, initialize the HASH peripheral then processes pInBuffer in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HASH_Start_IT

Function name

HAL_StatusTypeDef HASH_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Algorithm)

Function description

Initialize the HASH peripheral, next process pInBuffer then read the computed digest in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HASH_Start_DMA

Function name

HAL_StatusTypeDef HASH_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint32_t Algorithm)

Function description

Initialize the HASH peripheral then initiate a DMA transfer to feed the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- If MDMAT bit is set before calling this function (multi-buffer HASH processing case), the input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. For the processing of the last buffer of the thread, MDMAT bit must be reset and the buffer length (in bytes) doesn't have to be a multiple of 4.

HASH_Finish

Function name

HAL_StatusTypeDef HASH_Finish (HASH_HandleTypeDef * hhash, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Return the computed digest.

Parameters

- **hhash:** HASH handle.
- **pOutBuffer:** pointer to the computed digest.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- The API waits for DCIS to be set then reads the computed digest.

HMAC_Start

Function name

HAL_StatusTypeDef HMAC_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout, uint32_t Algorithm)

Function description

Initialize the HASH peripheral in HMAC mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.
- **Timeout:** Timeout value.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HMAC_Start_IT

Function name

HAL_StatusTypeDef HMAC_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Algorithm)

Function description

Initialize the HASH peripheral in HMAC mode, next process pInBuffer then read the computed digest in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HMAC_Start_DMA

Function name

HAL_StatusTypeDef HMAC_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint32_t Algorithm)

Function description

Initialize the HASH peripheral in HMAC mode then initiate the required DMA transfers to feed the key and the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **Algorithm:** HASH algorithm.

Return values

- **HAL:** status

Notes

- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- In case of multi-buffer HMAC processing, the input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only the length of the last buffer of the thread doesn't have to be a multiple of 4.

35.3 HASH Firmware driver defines

The following section lists the various define and macros of the module.

35.3.1 HASH

HASH

HASH algorithm mode

HASH_ALGOMODE_HASH

Algorithm is HASH

HASH_ALGOMODE_HMAC

Algorithm is HMAC

HASH algorithm selection

HASH_ALGOSELECTION_SHA1

HASH function is SHA1

HASH_ALGOSELECTION_MD5

HASH function is MD5

HASH_ALGOSELECTION_SHA224

HASH function is SHA224

HASH_ALGOSELECTION_SHA256

HASH function is SHA256

HASH input data type

HASH_DATATYPE_32B

32-bit data. No swapping

HASH_DATATYPE_16B

16-bit data. Each half word is swapped

HASH_DATATYPE_8B

8-bit data. All bytes are swapped

HASH_DATATYPE_1B

1-bit data. In the word all bits are swapped

HASH Digest Calculation Status

HASH_DIGEST_CALCULATION_NOT_STARTED

DCAL not set after input data written in DIN register

HASH_DIGEST_CALCULATION_STARTED

DCAL set after input data written in DIN register

HASH DMA suspension words limit

HASH_DMA_SUSPENSION_WORDS_LIMIT

Number of words below which DMA suspension is aborted

HASH Error Definition

HAL_HASH_ERROR_NONE

No error

HAL_HASH_ERROR_IT

IT-based process error

HAL_HASH_ERROR_DMA

DMA-based process error

HAL_HASH_ERROR_INVALID_CALLBACK

Invalid Callback error

HASH Exported Macros

__HAL_HASH_GET_FLAG

Description:
- Check whether or not the specified HASH flag is set.

Parameters:
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - HASH_FLAG_DINIS A new block can be entered into the input buffer.
  - HASH_FLAG_DCIS Digest calculation complete.
  - HASH_FLAG_DMAS DMA interface is enabled (DMAE=1) or a transfer is ongoing.
  - HASH_FLAG_BUSY The hash core is Busy : processing a block of data.
  - HASH_FLAG_DINNE DIN not empty : the input buffer contains at least one word of data.

Return value:
- The: new state of __FLAG__ (TRUE or FALSE).

__HAL_HASH_CLEAR_FLAG

Description:
- Clear the specified HASH flag.

Parameters:
- __FLAG__: specifies the flag to clear. This parameter can be one of the following values:
  - HASH_FLAG_DINIS A new block can be entered into the input buffer.
  - HASH_FLAG_DCIS Digest calculation complete

Return value:
- None

__HAL_HASH_ENABLE_IT

Description:
- Enable the specified HASH interrupt.

Parameters:
- __INTERRUPT__: specifies the HASH interrupt source to enable. This parameter can be one of the following values:
  - HASH_IT_DINI A new block can be entered into the input buffer (DIN)
  - HASH_IT_DCI Digest calculation complete

Return value:
- None

__HAL_HASH_DISABLE_IT

Description:
- Disable the specified HASH interrupt.

Parameters:
- __INTERRUPT__: specifies the HASH interrupt source to disable. This parameter can be one of the following values:
  - HASH_IT_DINI A new block can be entered into the input buffer (DIN)
  - HASH_IT_DCI Digest calculation complete

Return value:
- None

__HAL_HASH_RESET_HANDLE_STATE

Description:
- Reset HASH handle state.

Parameters:
- __HANDLE__: HASH handle.

Return value:
- None

__HAL_HASH_RESET_HANDLE_STATUS

Description:
- Reset HASH handle status.

Parameters:
- __HANDLE__: HASH handle.

Return value:
- None

__HAL_HASH_SET_MDMAT

Description:
- Enable the multi-buffer DMA transfer mode.

Return value:
- None

Notes:
- This bit is set when hashing large files when multiple DMA transfers are needed.

__HAL_HASH_RESET_MDMAT

Description:
- Disable the multi-buffer DMA transfer mode.

Return value:
- None

__HAL_HASH_START_DIGEST

Description:
- Start the digest computation.

Return value:
- None

__HAL_HASH_SET_NBVALIDBITS

Description:
- Set the number of valid bits in the last word written in data register DIN.

Parameters:
- __SIZE__: size in bytes of last data written in Data register.

Return value:
- None

__HAL_HASH_INIT

Description:
- Reset the HASH core.

Return value:
- None

HASH flags definitions

HASH_FLAG_DINIS

16 locations are free in the DIN : a new block can be entered in the Peripheral

HASH_FLAG_DCIS

Digest calculation complete

HASH_FLAG_DMAS

DMA interface is enabled (DMAE=1) or a transfer is ongoing

HASH_FLAG_BUSY

The hash core is Busy, processing a block of data

HASH_FLAG_DINNE

DIN not empty : the input buffer contains at least one word of data

HMAC key length type

HASH_HMAC_KEYTYPE_SHORTKEY

HMAC Key size is <= 64 bytes

HASH_HMAC_KEYTYPE_LONGKEY

HMAC Key size is > 64 bytes

HASH interrupts definitions

HASH_IT_DINI

A new block can be entered into the input buffer (DIN)

HASH_IT_DCI

Digest calculation complete

HASH Number of Context Swap Registers

HASH_NUMBER_OF_CSR_REGISTERS

Number of Context Swap Registers

HASH TimeOut Value

HASH_TIMEOUTVALUE

Time-out value

36 HAL HASH Extension Driver

36.1 HASHEx Firmware driver API description

The following section lists the various functions of the HASHEx library.

36.1.1 HASH peripheral extended features

The SHA-224 and SHA-256 HASH and HMAC processing can be carried out exactly the same way as for SHA-1 or MD-5 algorithms.

1. Three modes are available.
   a. Polling mode: processing APIs are blocking functions i.e. they process the data and wait till the digest computation is finished, e.g. HAL_HASHEx_xxx_Start()
   b. Interrupt mode: processing APIs are not blocking functions i.e. they process the data under interrupt, e.g. HAL_HASHEx_xxx_Start_IT()
   c. DMA mode: processing APIs are not blocking functions and the CPU is not used for data transfer i.e. the data transfer is ensured by DMA, e.g. HAL_HASHEx_xxx_Start_DMA(). Note that in DMA mode, a call to HAL_HASHEx_xxx_Finish() is then required to retrieve the digest.
2. Multi-buffer processing is possible in polling, interrupt and DMA modes.
   a. In polling mode, only multi-buffer HASH processing is possible. API HAL_HASHEx_xxx_Accumulate() must be called for each input buffer, except for the last one. User must resort to HAL_HASHEx_xxx_Accumulate_End() to enter the last one and retrieve as well the computed digest.
   b. In interrupt mode, API HAL_HASHEx_xxx_Accumulate_IT() must be called for each input buffer, except for the last one. User must resort to HAL_HASHEx_xxx_Accumulate_End_IT() to enter the last one and retrieve as well the computed digest.
   c. In DMA mode, multi-buffer HASH and HMAC processing are possible.
      - HASH processing: once initialization is done, MDMAT bit must be set through __HAL_HASH_SET_MDMAT() macro. From that point, each buffer can be fed to the Peripheral through HAL_HASHEx_xxx_Start_DMA() API. Before entering the last buffer, reset the MDMAT bit with __HAL_HASH_RESET_MDMAT() macro then wrap-up the HASH processing in feeding the last input buffer through the same API HAL_HASHEx_xxx_Start_DMA(). The digest can then be retrieved with a call to API HAL_HASHEx_xxx_Finish().
      - HMAC processing (MD-5, SHA-1, SHA-224 and SHA-256 must all resort to extended functions): after initialization, the key and the first input buffer are entered in the Peripheral with the API HAL_HMACEx_xxx_Step1_2_DMA(). This carries out HMAC step 1 and starts step 2. The following buffers are next entered with the API HAL_HMACEx_xxx_Step2_DMA(). At this point, the HMAC processing is still carrying out step 2. Then, step 2 for the last input buffer and step 3 are carried out by a single call to HAL_HMACEx_xxx_Step2_3_DMA(). The digest can finally be retrieved with a call to API HAL_HASH_xxx_Finish() for MD-5 and SHA-1, to HAL_HASHEx_xxx_Finish() for SHA-224 and SHA-256.

36.1.2 Polling mode HASH extended processing functions

This section provides functions allowing to calculate in polling mode the hash value using one of the following algorithms:

- SHA224
  – HAL_HASHEx_SHA224_Start()
  – HAL_HASHEx_SHA224_Accmlt()
  – HAL_HASHEx_SHA224_Accmlt_End()
- SHA256
  – HAL_HASHEx_SHA256_Start()
  – HAL_HASHEx_SHA256_Accmlt()
  – HAL_HASHEx_SHA256_Accmlt_End()

For a single buffer to be hashed, user can resort to HAL_HASH_xxx_Start().

In case of multi-buffer HASH processing (a single digest is computed while several buffers are fed to the Peripheral), the user can resort to successive calls to HAL_HASHEx_xxx_Accumulate() and wrap-up the digest computation by a call to HAL_HASHEx_xxx_Accumulate_End().

This section contains the following APIs:

- *HAL_HASHEx_SHA224_Start()*
- *HAL_HASHEx_SHA224_Accmlt()*
- *HAL_HASHEx_SHA224_Accmlt_End()*
- *HAL_HASHEx_SHA256_Start()*
- *HAL_HASHEx_SHA256_Accmlt()*
- *HAL_HASHEx_SHA256_Accmlt_End()*

36.1.3 Interruption mode HASH extended processing functions

This section provides functions allowing to calculate in interrupt mode the hash value using one of the following algorithms:

- SHA224
  – HAL_HASHEx_SHA224_Start_IT()
  – HAL_HASHEx_SHA224_Accmlt_IT()
  – HAL_HASHEx_SHA224_Accmlt_End_IT()
- SHA256
  – HAL_HASHEx_SHA256_Start_IT()
  – HAL_HASHEx_SHA256_Accmlt_IT()
  – HAL_HASHEx_SHA256_Accmlt_End_IT()

This section contains the following APIs:

- *HAL_HASHEx_SHA224_Start_IT()*
- *HAL_HASHEx_SHA224_Accmlt_IT()*
- *HAL_HASHEx_SHA224_Accmlt_End_IT()*
- *HAL_HASHEx_SHA256_Start_IT()*
- *HAL_HASHEx_SHA256_Accmlt_IT()*
- *HAL_HASHEx_SHA256_Accmlt_End_IT()*

36.1.4 DMA mode HASH extended processing functions

This section provides functions allowing to calculate in DMA mode the hash value using one of the following algorithms:

- SHA224
  – HAL_HASHEx_SHA224_Start_DMA()
  – HAL_HASHEx_SHA224_Finish()
- SHA256
  – HAL_HASHEx_SHA256_Start_DMA()
  – HAL_HASHEx_SHA256_Finish()

When resorting to DMA mode to enter the data in the Peripheral, user must resort to HAL_HASHEx_xxx_Start_DMA() then read the resulting digest with HAL_HASHEx_xxx_Finish().

In case of multi-buffer HASH processing, MDMAT bit must first be set before the successive calls to HAL_HASHEx_xxx_Start_DMA(). Then, MDMAT bit needs to be reset before the last call to HAL_HASHEx_xxx_Start_DMA(). Digest is finally retrieved thanks to HAL_HASHEx_xxx_Finish().

This section contains the following APIs:

- *HAL_HASHEx_SHA224_Start_DMA()*
- *HAL_HASHEx_SHA224_Finish()*
- *HAL_HASHEx_SHA256_Start_DMA()*
- *HAL_HASHEx_SHA256_Finish()*

36.1.5 Polling mode HMAC extended processing functions

This section provides functions allowing to calculate in polling mode the HMAC value using one of the following algorithms:

- SHA224
  - HAL_HMACEx_SHA224_Start()
- SHA256
  - HAL_HMACEx_SHA256_Start()

This section contains the following APIs:

- ***HAL_HMACEx_SHA224_Start()***
- ***HAL_HMACEx_SHA256_Start()***

36.1.6 Interrupt mode HMAC extended processing functions

This section provides functions allowing to calculate in interrupt mode the HMAC value using one of the following algorithms:

- SHA224
  - HAL_HMACEx_SHA224_Start_IT()
- SHA256
  - HAL_HMACEx_SHA256_Start_IT()

This section contains the following APIs:

- ***HAL_HMACEx_SHA224_Start_IT()***
- ***HAL_HMACEx_SHA256_Start_IT()***

36.1.7 DMA mode HMAC extended processing functions

This section provides functions allowing to calculate in DMA mode the HMAC value using one of the following algorithms:

- SHA224
  - HAL_HMACEx_SHA224_Start_DMA()
- SHA256
  - HAL_HMACEx_SHA256_Start_DMA()

When resorting to DMA mode to enter the data in the Peripheral for HMAC processing, user must resort to HAL_HMACEx_xxx_Start_DMA() then read the resulting digest with HAL_HASHEx_xxx_Finish().

This section contains the following APIs:

- ***HAL_HMACEx_SHA224_Start_DMA()***
- ***HAL_HMACEx_SHA256_Start_DMA()***

36.1.8 Multi-buffer DMA mode HMAC extended processing functions

This section provides functions to manage HMAC multi-buffer DMA-based processing for MD5, SHA1, SHA224 and SHA256 algorithms.

- MD5
  - HAL_HMACEx_MD5_Step1_2_DMA()
  - HAL_HMACEx_MD5_Step2_DMA()
  - HAL_HMACEx_MD5_Step2_3_DMA()

  - HAL_HMACEx_SHA1_Step1_2_DMA()
  - HAL_HMACEx_SHA1_Step2_DMA()
  - HAL_HMACEx_SHA1_Step2_3_DMA()

- SHA256
  - HAL_HMACEx_SHA224_Step1_2_DMA()
  - HAL_HMACEx_SHA224_Step2_DMA()
  - HAL_HMACEx_SHA224_Step2_3_DMA()
- SHA256
  - HAL_HMACEx_SHA256_Step1_2_DMA()
  - HAL_HMACEx_SHA256_Step2_DMA()
  - HAL_HMACEx_SHA256_Step2_3_DMA()

User must first start-up the multi-buffer DMA-based HMAC computation in calling HAL_HMACEx_xxx_Step1_2_DMA(). This carries out HMAC step 1 and intiates step 2 with the first input buffer.

The following buffers are next fed to the Peripheral with a call to the API HAL_HMACEx_xxx_Step2_DMA(). There may be several consecutive calls to this API.

Multi-buffer DMA-based HMAC computation is wrapped up by a call to HAL_HMACEx_xxx_Step2_3_DMA(). This finishes step 2 in feeding the last input buffer to the Peripheral then carries out step 3.

Digest is retrieved by a call to HAL_HASH_xxx_Finish() for MD-5 or SHA-1, to HAL_HASHEx_xxx_Finish() for SHA-224 or SHA-256.

If only two buffers need to be consecutively processed, a call to HAL_HMACEx_xxx_Step1_2_DMA() followed by a call to HAL_HMACEx_xxx_Step2_3_DMA() is sufficient.

This section contains the following APIs:
- *HAL_HMACEx_MD5_Step1_2_DMA()*
- *HAL_HMACEx_MD5_Step2_DMA()*

- *HAL_HMACEx_SHA256_Step2_DMA()*
- *HAL_HMACEx_SHA256_Step2_3_DMA()*

36.1.9 Detailed description of functions

HAL_HASHEx_SHA224_Start

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in SHA224 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 28 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA224_Accmlt

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Accmlt (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in SHA224 mode then processes pInBuffer.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASHEx_SHA224_Accmlt() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASHEx_SHA224_Accmlt_End().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- Digest is not retrieved by this API, user must resort to HAL_HASHEx_SHA224_Accmlt_End() to read it, feeding at the same time the last input buffer to the Peripheral.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASHEx_SHA224_Accmlt_End() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASHEx_SHA224_Accmlt_End

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Accmlt_End (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

End computation of a single HASH signature after several calls to HAL_HASHEx_SHA224_Accmlt() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 28 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA256_Start

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in SHA256 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 32 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA256_Accmlt

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Accmlt (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in SHA256 mode then processes pInBuffer.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASHEx_SHA256_Accmlt() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASHEx_SHA256_Accmlt_End().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- Digest is not retrieved by this API, user must resort to HAL_HASHEx_SHA256_Accmlt_End() to read it, feeding at the same time the last input buffer to the Peripheral.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASHEx_SHA256_Accmlt_End() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASHEx_SHA256_Accmlt_End

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Accmlt_End (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

End computation of a single HASH signature after several calls to HAL_HASHEx_SHA256_Accmlt() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 32 bytes.
- **Timeout:** Timeout value

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA224_Start_IT

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in SHA224 mode, next process pInBuffer then read the computed digest in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 28 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA224_Accmlt_IT

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Accmlt_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in SHA224 mode then processes pInBuffer in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASHEx_SHA224_Accmlt_IT() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASHEx_SHA224_Accmlt_End_IT().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASHEx_SHA224_Accmlt_End_IT() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASHEx_SHA224_Accmlt_End_IT

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Accmlt_End_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

End computation of a single HASH signature after several calls to HAL_HASHEx_SHA224_Accmlt_IT() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 28 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA256_Start_IT

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in SHA256 mode, next process pInBuffer then read the computed digest in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 32 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA256_Accmlt_IT

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Accmlt_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

If not already done, initialize the HASH peripheral in SHA256 mode then processes pInBuffer in interruption mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes, must be a multiple of 4.

Return values

- **HAL:** status

Notes

- Consecutive calls to HAL_HASHEx_SHA256_Accmlt_IT() can be used to feed several input buffers back-to-back to the Peripheral that will yield a single HASH signature once all buffers have been entered. Wrap-up of input buffers feeding and retrieval of digest is done by a call to HAL_HASHEx_SHA256_Accmlt_End_IT().
- Field hhash->Phase of HASH handle is tested to check whether or not the Peripheral has already been initialized.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. Only HAL_HASHEx_SHA256_Accmlt_End_IT() is able to manage the ending buffer with a length in bytes not a multiple of 4.

HAL_HASHEx_SHA256_Accmlt_End_IT

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Accmlt_End_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

End computation of a single HASH signature after several calls to HAL_HASHEx_SHA256_Accmlt_IT() API.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 32 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.

HAL_HASHEx_SHA224_Start_DMA

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in SHA224 mode then initiate a DMA transfer to feed the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfer is finished, HAL_HASHEx_SHA224_Finish() API must be called to retrieve the computed digest.

HAL_HASHEx_SHA224_Finish

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA224_Finish (HASH_HandleTypeDef * hhash, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Return the computed digest in SHA224 mode.

Parameters

- **hhash:** HASH handle.
- **pOutBuffer:** pointer to the computed digest. Digest size is 28 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- The API waits for DCIS to be set then reads the computed digest.
- HAL_HASHEx_SHA224_Finish() can be used as well to retrieve the digest in HMAC SHA224 mode.

HAL_HASHEx_SHA256_Start_DMA

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in SHA256 mode then initiate a DMA transfer to feed the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfer is finished, HAL_HASHEx_SHA256_Finish() API must be called to retrieve the computed digest.

HAL_HASHEx_SHA256_Finish

Function name

HAL_StatusTypeDef HAL_HASHEx_SHA256_Finish (HASH_HandleTypeDef * hhash, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Return the computed digest in SHA256 mode.

Parameters

- **hhash:** HASH handle.
- **pOutBuffer:** pointer to the computed digest. Digest size is 32 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- The API waits for DCIS to be set then reads the computed digest.
- HAL_HASHEx_SHA256_Finish() can be used as well to retrieve the digest in HMAC SHA256 mode.

HAL_HMACEx_SHA224_Start

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA224_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in HMAC SHA224 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 28 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMACEx_SHA256_Start

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA256_Start (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer, uint32_t Timeout)

Function description

Initialize the HASH peripheral in HMAC SHA256 mode, next process pInBuffer then read the computed digest.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 32 bytes.
- **Timeout:** Timeout value.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMACEx_SHA224_Start_IT

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA224_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in HMAC SHA224 mode, next process pInBuffer then read the computed digest in interrupt mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 28 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMACEx_SHA256_Start_IT

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA256_Start_IT (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size, uint8_t * pOutBuffer)

Function description

Initialize the HASH peripheral in HMAC SHA256 mode, next process pInBuffer then read the computed digest in interrupt mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.
- **pOutBuffer:** pointer to the computed digest. Digest size is 32 bytes.

Return values

- **HAL:** status

Notes

- Digest is available in pOutBuffer.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.

HAL_HMACEx_SHA224_Start_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA224_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in HMAC SHA224 mode then initiate the required DMA transfers to feed the key and the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASHEx_SHA224_Finish() API must be called to retrieve the computed digest.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- If MDMAT bit is set before calling this function (multi-buffer HASH processing case), the input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. For the processing of the last buffer of the thread, MDMAT bit must be reset and the buffer length (in bytes) doesn't have to be a multiple of 4.

HAL_HMACEx_SHA256_Start_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA256_Start_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

Initialize the HASH peripheral in HMAC SHA224 mode then initiate the required DMA transfers to feed the key and the input buffer to the Peripheral.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (buffer to be hashed).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASHEx_SHA256_Finish() API must be called to retrieve the computed digest.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- If MDMAT bit is set before calling this function (multi-buffer HASH processing case), the input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted. For the processing of the last buffer of the thread, MDMAT bit must be reset and the buffer length (in bytes) doesn't have to be a multiple of 4.

HAL_HMACEx_MD5_Step1_2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_MD5_Step1_2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

MD5 HMAC step 1 completion and step 2 start in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 1 consists in writing the inner hash function key in the Peripheral, step 2 consists in writing the message text.
- The API carries out the HMAC step 1 then starts step 2 with the first buffer entered to the Peripheral. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_MD5_Step2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_MD5_Step2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

MD5 HMAC step 2 in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral.
- The API carries on the HMAC step 2, applied to the buffer entered as input parameter. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_MD5_Step2_3_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_MD5_Step2_3_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

MD5 HMAC step 2 wrap-up and step 3 completion in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral, step 3 consists in writing the outer hash function key.
- The API wraps up the HMAC step 2 in processing the buffer entered as input parameter (the input buffer must be the last one of the multi-buffer thread) then carries out HMAC step 3.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASHEx_SHA256_Finish() API must be called to retrieve the computed digest.

HAL_HMACEx_SHA1_Step1_2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA1_Step1_2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA1 HMAC step 1 completion and step 2 start in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 1 consists in writing the inner hash function key in the Peripheral, step 2 consists in writing the message text.
- The API carries out the HMAC step 1 then starts step 2 with the first buffer entered to the Peripheral. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_SHA1_Step2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA1_Step2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA1 HMAC step 2 in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral.
- The API carries on the HMAC step 2, applied to the buffer entered as input parameter. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_SHA1_Step2_3_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA1_Step2_3_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA1 HMAC step 2 wrap-up and step 3 completion in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral, step 3 consists in writing the outer hash function key.
- The API wraps up the HMAC step 2 in processing the buffer entered as input parameter (the input buffer must be the last one of the multi-buffer thread) then carries out HMAC step 3.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASHEx_SHA256_Finish() API must be called to retrieve the computed digest.

HAL_HMACEx_SHA224_Step1_2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA224_Step1_2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA224 HMAC step 1 completion and step 2 start in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 1 consists in writing the inner hash function key in the Peripheral, step 2 consists in writing the message text.
- The API carries out the HMAC step 1 then starts step 2 with the first buffer entered to the Peripheral. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_SHA224_Step2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA224_Step2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA224 HMAC step 2 in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral.
- The API carries on the HMAC step 2, applied to the buffer entered as input parameter. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_SHA224_Step2_3_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA224_Step2_3_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA224 HMAC step 2 wrap-up and step 3 completion in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral, step 3 consists in writing the outer hash function key.
- The API wraps up the HMAC step 2 in processing the buffer entered as input parameter (the input buffer must be the last one of the multi-buffer thread) then carries out HMAC step 3.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASHEx_SHA256_Finish() API must be called to retrieve the computed digest.

HAL_HMACEx_SHA256_Step1_2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA256_Step1_2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA256 HMAC step 1 completion and step 2 start in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 1 consists in writing the inner hash function key in the Peripheral, step 2 consists in writing the message text.
- The API carries out the HMAC step 1 then starts step 2 with the first buffer entered to the Peripheral. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_SHA256_Step2_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA256_Step2_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA256 HMAC step 2 in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral.
- The API carries on the HMAC step 2, applied to the buffer entered as input parameter. DCAL bit is not automatically set after the message buffer feeding, allowing other messages DMA transfers to occur.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- The input buffer size (in bytes) must be a multiple of 4 otherwise, the HASH digest computation is corrupted.

HAL_HMACEx_SHA256_Step2_3_DMA

Function name

HAL_StatusTypeDef HAL_HMACEx_SHA256_Step2_3_DMA (HASH_HandleTypeDef * hhash, uint8_t * pInBuffer, uint32_t Size)

Function description

SHA256 HMAC step 2 wrap-up and step 3 completion in multi-buffer DMA mode.

Parameters

- **hhash:** HASH handle.
- **pInBuffer:** pointer to the input buffer (message buffer).
- **Size:** length of the input buffer in bytes.

Return values

- **HAL:** status

Notes

- Step 2 consists in writing the message text in the Peripheral, step 3 consists in writing the outer hash function key.
- The API wraps up the HMAC step 2 in processing the buffer entered as input parameter (the input buffer must be the last one of the multi-buffer thread) then carries out HMAC step 3.
- Same key is used for the inner and the outer hash functions; pointer to key and key size are respectively stored in hhash->Init.pKey and hhash->Init.KeySize.
- Once the DMA transfers are finished (indicated by hhash->State set back to HAL_HASH_STATE_READY), HAL_HASHEx_SHA256_Finish() API must be called to retrieve the computed digest.

37.2 HCD Firmware driver API description

The following section lists the various functions of the HCD library.

37.2.1 How to use this driver

1. Declare a HCD_HandleTypeDef handle structure, for example: HCD_HandleTypeDef hhcd;
2. Fill parameters of Init structure in HCD handle
3. Call HAL_HCD_Init() API to initialize the HCD peripheral (Core, Host core, ...)
4. Initialize the HCD low level resources through the HAL_HCD_MspInit() API:
   a. Enable the HCD/USB Low Level interface clock using the following macros
      - __HAL_RCC_USB_OTG_FS_CLK_ENABLE();
      - __HAL_RCC_USB_OTG_HS_CLK_ENABLE(); (For High Speed Mode)
      - __HAL_RCC_USB_OTG_HS_ULPI_CLK_ENABLE(); (For High Speed Mode)
      - __HAL_RCC_USB_CLK_ENABLE();
   b. Initialize the related GPIO clocks
   c. Configure HCD pin-out
   d. Configure HCD NVIC interrupt
5. Associate the Upper USB Host stack to the HAL HCD Driver:
   a. hhcd.pData = phost;
6. Enable HCD transmission and reception:
   a. HAL_HCD_Start();

37.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

This section contains the following APIs:

- ***HAL_HCD_Init()***
- ***HAL_HCD_HC_Init()***
- ***HAL_HCD_HC_Halt()***
- ***HAL_HCD_DeInit()***
- ***HAL_HCD_MspInit()***
- ***HAL_HCD_MspDeInit()***
- ***HAL_HCD_RegisterCallback()***
- ***HAL_HCD_UnRegisterCallback()***
- ***HAL_HCD_RegisterHC_NotifyURBChangeCallback()***
- ***HAL_HCD_UnRegisterHC_NotifyURBChangeCallback()***

37.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the USB Host Data Transfer

This section contains the following APIs:

- ***HAL_HCD_HC_SubmitRequest()***
- ***HAL_HCD_IRQHandler()***
- ***HAL_HCD_SOF_Callback()***
- ***HAL_HCD_Connect_Callback()***
- ***HAL_HCD_Disconnect_Callback()***
- ***HAL_HCD_PortEnabled_Callback()***
- ***HAL_HCD_PortDisabled_Callback()***

- *HAL_HCD_HC_NotifyURBChange_Callback()*
- *HAL_HCD_RegisterCallback()*
- *HAL_HCD_UnRegisterCallback()*
- *HAL_HCD_RegisterHC_NotifyURBChangeCallback()*
- *HAL_HCD_UnRegisterHC_NotifyURBChangeCallback()*
- *HAL_HCD_HC_SetHubInfo()*
- *HAL_HCD_HC_ClearHubInfo()*

37.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the HCD data transfers.

This section contains the following APIs:

- *HAL_HCD_Start()*
- *HAL_HCD_Stop()*
- *HAL_HCD_ResetPort()*

37.2.5 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- *HAL_HCD_GetState()*
- *HAL_HCD_HC_GetURBState()*
- *HAL_HCD_HC_GetXferCount()*
- *HAL_HCD_HC_GetState()*
- *HAL_HCD_GetCurrentFrame()*
- *HAL_HCD_GetCurrentSpeed()*
- *HAL_HCD_HC_SetHubInfo()*
- *HAL_HCD_HC_ClearHubInfo()*

37.2.6 Detailed description of functions

HAL_HCD_Init

Function name

HAL_StatusTypeDef HAL_HCD_Init (HCD_HandleTypeDef * hhcd)

Function description

Initialize the host driver.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_DeInit

Function name

HAL_StatusTypeDef HAL_HCD_DeInit (HCD_HandleTypeDef * hhcd)

Function description

DeInitialize the host driver.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_HC_Init

Function name

HAL_StatusTypeDef HAL_HCD_HC_Init (HCD_HandleTypeDef * hhcd, uint8_t ch_num, uint8_t epnum, uint8_t dev_address, uint8_t speed, uint8_t ep_type, uint16_t mps)

Function description

Initialize a host channel.

Parameters

- **hhcd:** HCD handle
- **ch_num:** Channel number. This parameter can be a value from 1 to 15
- **epnum:** Endpoint number. This parameter can be a value from 1 to 15
- **dev_address:** Current device address This parameter can be a value from 0 to 255
- **speed:** Current device speed. This parameter can be one of these values: HCD_DEVICE_SPEED_HIGH: High speed mode, HCD_DEVICE_SPEED_FULL: Full speed mode, HCD_DEVICE_SPEED_LOW: Low speed mode
- **ep_type:** Endpoint Type. This parameter can be one of these values: EP_TYPE_CTRL: Control type, EP_TYPE_ISOC: Isochronous type, EP_TYPE_BULK: Bulk type, EP_TYPE_INTR: Interrupt type
- **mps:** Max Packet Size. This parameter can be a value from 0 to32K

Return values

- **HAL:** status

HAL_HCD_HC_Halt

Function name

HAL_StatusTypeDef HAL_HCD_HC_Halt (HCD_HandleTypeDef * hhcd, uint8_t ch_num)

Function description

Halt a host channel.

Parameters

- **hhcd:** HCD handle
- **ch_num:** Channel number. This parameter can be a value from 1 to 15

Return values

- **HAL:** status

HAL_HCD_MspInit

Function name

void HAL_HCD_MspInit (HCD_HandleTypeDef * hhcd)

Function description

Initialize the HCD MSP.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_MspDeInit

Function name

void HAL_HCD_MspDeInit (HCD_HandleTypeDef * hhcd)

Function description

DeInitialize the HCD MSP.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_RegisterCallback

Function name

HAL_StatusTypeDef HAL_HCD_RegisterCallback (HCD_HandleTypeDef * hhcd, HAL_HCD_CallbackIDTypeDef CallbackID, pHCD_CallbackTypeDef pCallback)

Function description

Register a User USB HCD Callback To be used instead of the weak predefined callback.

Parameters

- **hhcd:** USB HCD handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_HCD_SOF_CB_ID USB HCD SOF callback ID
  - HAL_HCD_CONNECT_CB_ID USB HCD Connect callback ID
  - HAL_HCD_DISCONNECT_CB_ID OTG HCD Disconnect callback ID
  - HAL_HCD_PORT_ENABLED_CB_ID USB HCD Port Enable callback ID
  - HAL_HCD_PORT_DISABLED_CB_ID USB HCD Port Disable callback ID
  - HAL_HCD_MSPINIT_CB_ID MspDeInit callback ID
  - HAL_HCD_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_HCD_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_HCD_UnRegisterCallback (HCD_HandleTypeDef * hhcd, HAL_HCD_CallbackIDTypeDef CallbackID)

Function description

Unregister an USB HCD Callback USB HCD callback is redirected to the weak predefined callback.

Parameters

- **hhcd:** USB HCD handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_HCD_SOF_CB_ID USB HCD SOF callback ID
  - HAL_HCD_CONNECT_CB_ID USB HCD Connect callback ID
  - HAL_HCD_DISCONNECT_CB_ID OTG HCD Disconnect callback ID
  - HAL_HCD_PORT_ENABLED_CB_ID USB HCD Port Enabled callback ID
  - HAL_HCD_PORT_DISABLED_CB_ID USB HCD Port Disabled callback ID
  - HAL_HCD_MSPINIT_CB_ID MspDeInit callback ID
  - HAL_HCD_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_HCD_RegisterHC_NotifyURBChangeCallback

Function name

HAL_StatusTypeDef HAL_HCD_RegisterHC_NotifyURBChangeCallback (HCD_HandleTypeDef * hhcd, pHCD_HC_NotifyURBChangeCallbackTypeDef pCallback)

Function description

Register USB HCD Host Channel Notify URB Change Callback To be used instead of the weak HAL_HCD_HC_NotifyURBChange_Callback() predefined callback.

Parameters

- **hhcd:** HCD handle
- **pCallback:** pointer to the USB HCD Host Channel Notify URB Change Callback function

Return values

- **HAL:** status

HAL_HCD_UnRegisterHC_NotifyURBChangeCallback

Function name

HAL_StatusTypeDef HAL_HCD_UnRegisterHC_NotifyURBChangeCallback (HCD_HandleTypeDef * hhcd)

Function description

Unregister the USB HCD Host Channel Notify URB Change Callback USB HCD Host Channel Notify URB Change Callback is redirected to the weak HAL_HCD_HC_NotifyURBChange_Callback() predefined callback.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_HC_SubmitRequest

Function name

HAL_StatusTypeDef HAL_HCD_HC_SubmitRequest (HCD_HandleTypeDef * hhcd, uint8_t ch_num, uint8_t direction, uint8_t ep_type, uint8_t token, uint8_t * pbuff, uint16_t length, uint8_t do_ping)

Function description

Submit a new URB for processing.

Parameters

- **hhcd:** HCD handle
- **ch_num:** Channel number. This parameter can be a value from 1 to 15
- **direction:** Channel number. This parameter can be one of these values: 0 : Output / 1 : Input
- **ep_type:** Endpoint Type. This parameter can be one of these values: EP_TYPE_CTRL: Control type/ EP_TYPE_ISOC: Isochronous type/ EP_TYPE_BULK: Bulk type/ EP_TYPE_INTR: Interrupt type/
- **token:** Endpoint Type. This parameter can be one of these values: 0: HC_PID_SETUP / 1: HC_PID_DATA1
- **pbuff:** pointer to URB data
- **length:** Length of URB data
- **do_ping:** activate do ping protocol (for high speed only). This parameter can be one of these values: 0 : do ping inactive / 1 : do ping active

Return values

- **HAL:** status

HAL_HCD_HC_SetHubInfo

Function name

HAL_StatusTypeDef HAL_HCD_HC_SetHubInfo (HCD_HandleTypeDef * hhcd, uint8_t ch_num, uint8_t addr, uint8_t PortNbr)

Function description

Set host channel Hub information.

Parameters

- **hhcd:** HCD handle
- **ch_num:** Channel number. This parameter can be a value from 1 to 15
- **addr:** Hub address
- **PortNbr:** Hub port number

Return values

- **HAL:** status

HAL_HCD_HC_ClearHubInfo

Function name

HAL_StatusTypeDef HAL_HCD_HC_ClearHubInfo (HCD_HandleTypeDef * hhcd, uint8_t ch_num)

Function description

Clear host channel hub information.

Parameters

- **hhcd:** HCD handle
- **ch_num:** Channel number. This parameter can be a value from 1 to 15

Return values

- **HAL:** status

HAL_HCD_IRQHandler

Function name

void HAL_HCD_IRQHandler (HCD_HandleTypeDef * hhcd)

Function description

Handle HCD interrupt request.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_SOF_Callback

Function name

void HAL_HCD_SOF_Callback (HCD_HandleTypeDef * hhcd)

Function description

SOF callback.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_Connect_Callback

Function name

void HAL_HCD_Connect_Callback (HCD_HandleTypeDef * hhcd)

Function description

Connection Event callback.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_Disconnect_Callback

Function name

void HAL_HCD_Disconnect_Callback (HCD_HandleTypeDef * hhcd)

Function description

Disconnection Event callback.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_PortEnabled_Callback

Function name

void HAL_HCD_PortEnabled_Callback (HCD_HandleTypeDef * hhcd)

Function description

Port Enabled Event callback.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_PortDisabled_Callback

Function name

void HAL_HCD_PortDisabled_Callback (HCD_HandleTypeDef * hhcd)

Function description

Port Disabled Event callback.

Parameters

- **hhcd:** HCD handle

Return values

- **None:**

HAL_HCD_HC_NotifyURBChange_Callback

Function name

void HAL_HCD_HC_NotifyURBChange_Callback (HCD_HandleTypeDef * hhcd, uint8_t chnum, HCD_URBStateTypeDef urb_state)

Function description

Notify URB state change callback.

Parameters

- **hhcd:** HCD handle
- **chnum:** Channel number. This parameter can be a value from 1 to 15
- **urb_state:** This parameter can be one of these values: URB_IDLE/ URB_DONE/ URB_NOTREADY/ URB_NYET/ URB_ERROR/ URB_STALL/

Return values

- **None:**

HAL_HCD_ResetPort

Function name

HAL_StatusTypeDef HAL_HCD_ResetPort (HCD_HandleTypeDef * hhcd)

Function description

Reset the host port.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_Start

Function name

HAL_StatusTypeDef HAL_HCD_Start (HCD_HandleTypeDef * hhcd)

Function description

Start the host driver.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_Stop

Function name

HAL_StatusTypeDef HAL_HCD_Stop (HCD_HandleTypeDef * hhcd)

Function description

Stop the host driver.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** status

HAL_HCD_GetState

Function name

HCD_StateTypeDef HAL_HCD_GetState (HCD_HandleTypeDef const * hhcd)

Function description

Return the HCD handle state.

Parameters

- **hhcd:** HCD handle

Return values

- **HAL:** state

HAL_HCD_HC_GetURBState

Function name

HCD_URBStateTypeDef HAL_HCD_HC_GetURBState (HCD_HandleTypeDef const * hhcd, uint8_t chnum)

Function description

Return URB state for a channel.

Parameters

- **hhcd:** HCD handle
- **chnum:** Channel number. This parameter can be a value from 1 to 15

Return values

- **URB:** state. This parameter can be one of these values: URB_IDLE/ URB_DONE/ URB_NOTREADY/ URB_NYET/ URB_ERROR/ URB_STALL

HAL_HCD_HC_GetState

Function name

HCD_HCStateTypeDef HAL_HCD_HC_GetState (HCD_HandleTypeDef const * hhcd, uint8_t chnum)

Function description

Return the Host Channel state.

Parameters

- **hhcd:** HCD handle
- **chnum:** Channel number. This parameter can be a value from 1 to 15

Return values

- **Host:** channel state This parameter can be one of these values: HC_IDLE/ HC_XFRC/ HC_HALTED/ HC_NYET/ HC_NAK/ HC_STALL/ HC_XACTERR/ HC_BBLERR/ HC_DATATGLERR

HAL_HCD_HC_GetXferCount

Function name

uint32_t HAL_HCD_HC_GetXferCount (HCD_HandleTypeDef const * hhcd, uint8_t chnum)

Function description

Return the last host transfer size.

Parameters

- **hhcd:** HCD handle
- **chnum:** Channel number. This parameter can be a value from 1 to 15

Return values

- **last:** transfer size in byte

HAL_HCD_GetCurrentFrame

Function name

uint32_t HAL_HCD_GetCurrentFrame (HCD_HandleTypeDef * hhcd)

Function description

Return the current Host frame number.

Parameters

- **hhcd:** HCD handle

Return values

- **Current:** Host frame number

HAL_HCD_GetCurrentSpeed

Function name

uint32_t HAL_HCD_GetCurrentSpeed (HCD_HandleTypeDef * hhcd)

Function description

Return the Host enumeration speed.

Parameters

- **hhcd:** HCD handle

Return values

- **Enumeration:** speed

37.3 HCD Firmware driver defines

The following section lists the various define and macros of the module.

37.3.1 HCD

HCD

HCD Device Speed

HCD_DEVICE_SPEED_HIGH

HCD_DEVICE_SPEED_FULL

HCD_DEVICE_SPEED_LOW

38 HAL I2C Generic Driver

38.1 I2C Firmware driver registers structures

38.1.1 I2C_InitTypeDef

I2C_InitTypeDef is defined in the stm32u5xx_hal_i2c.h

Data Fields

- ***uint32_t Timing***
- ***uint32_t OwnAddress1***
- ***uint32_t AddressingMode***
- ***uint32_t DualAddressMode***
- ***uint32_t OwnAddress2***
- ***uint32_t OwnAddress2Masks***
- ***uint32_t GeneralCallMode***
- ***uint32_t NoStretchMode***

Field Documentation

- ***uint32_t I2C_InitTypeDef::Timing***
  Specifies the I2C_TIMINGR_register value. This parameter calculated by referring to I2C initialization section in Reference manual
- ***uint32_t I2C_InitTypeDef::OwnAddress1***
  Specifies the first device own address. This parameter can be a 7-bit or 10-bit address.
- ***uint32_t I2C_InitTypeDef::AddressingMode***
  Specifies if 7-bit or 10-bit addressing mode is selected. This parameter can be a value of ***I2C_ADDRESSING_MODE***
- ***uint32_t I2C_InitTypeDef::DualAddressMode***
  Specifies if dual addressing mode is selected. This parameter can be a value of ***I2C_DUAL_ADDRESSING_MODE***
- ***uint32_t I2C_InitTypeDef::OwnAddress2***
  Specifies the second device own address if dual addressing mode is selected This parameter can be a 7-bit address.
- ***uint32_t I2C_InitTypeDef::OwnAddress2Masks***
  Specifies the acknowledge mask address second device own address if dual addressing mode is selected. This parameter can be a value of ***I2C_OWN_ADDRESS2_MASKS***
- ***uint32_t I2C_InitTypeDef::GeneralCallMode***
  Specifies if general call mode is selected. This parameter can be a value of ***I2C_GENERAL_CALL_ADDRESSING_MODE***
- ***uint32_t I2C_InitTypeDef::NoStretchMode***
  Specifies if nostretch mode is selected. This parameter can be a value of ***I2C_NOSTRETCH_MODE***

38.1.2 __I2C_HandleTypeDef

__I2C_HandleTypeDef is defined in the stm32u5xx_hal_i2c.h

Data Fields

38.2 I2C Firmware driver API description

The following section lists the various functions of the I2C library.

38.2.1 How to use this driver

The I2C HAL driver can be used as follows:

1. Declare a I2C_HandleTypeDef handle structure, for example: I2C_HandleTypeDef hi2c;
2. Initialize the I2C low level resources by implementing the HAL_I2C_MspInit() API:
   a. Enable the I2Cx interface clock
   b. I2C pins configuration
      - Enable the clock for the I2C GPIOs
      - Configure I2C pins as alternate function open-drain
   c. NVIC configuration if you need to use interrupt process
      - Configure the I2Cx interrupt priority
      - Enable the NVIC I2C IRQ Channel
   d. DMA Configuration if you need to use DMA process
      - Declare a DMA_HandleTypeDef handle structure for the transmit or receive channel
      - Enable the DMAx interface clock using
      - Configure the DMA handle parameters
      - Configure the DMA Tx or Rx channel
      - Associate the initialized DMA handle to the hi2c DMA Tx or Rx handle
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx or Rx channel

3. Configure the Communication Clock Timing, Own Address1, Master Addressing mode, Dual Addressing mode, Own Address2, Own Address2 Mask, General call and Nostretch mode in the hi2c Init structure.
4. Initialize the I2C registers by calling the HAL_I2C_Init(), configures also the low level Hardware (GPIO, CLOCK, NVIC...etc) by calling the customized HAL_I2C_MspInit(&hi2c) API.
5. To check if target device is ready for communication, use the function HAL_I2C_IsDeviceReady()
6. For I2C IO and IO MEM operations, three operation modes are available within this driver :

Polling mode IO operation

- Transmit in master mode an amount of data in blocking mode using HAL_I2C_Master_Transmit()
- Receive in master mode an amount of data in blocking mode using HAL_I2C_Master_Receive()
- Transmit in slave mode an amount of data in blocking mode using HAL_I2C_Slave_Transmit()
- Receive in slave mode an amount of data in blocking mode using HAL_I2C_Slave_Receive()

Polling mode IO MEM operation

- Write an amount of data in blocking mode to a specific memory address using HAL_I2C_Mem_Write()
- Read an amount of data in blocking mode from a specific memory address using HAL_I2C_Mem_Read()

Interrupt mode IO operation

- Transmit in master mode an amount of data in non-blocking mode using HAL_I2C_Master_Transmit_IT()
- At transmission end of transfer, HAL_I2C_MasterTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterTxCpltCallback()
- Receive in master mode an amount of data in non-blocking mode using HAL_I2C_Master_Receive_IT()
- At reception end of transfer, HAL_I2C_MasterRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterRxCpltCallback()
- Transmit in slave mode an amount of data in non-blocking mode using HAL_I2C_Slave_Transmit_IT()
- At transmission end of transfer, HAL_I2C_SlaveTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveTxCpltCallback()
- Receive in slave mode an amount of data in non-blocking mode using HAL_I2C_Slave_Receive_IT()
- At reception end of transfer, HAL_I2C_SlaveRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()
- Abort a master or memory I2C process communication with Interrupt using HAL_I2C_Master_Abort_IT()
- End of abort process, HAL_I2C_AbortCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_AbortCpltCallback()
- Discard a slave I2C process communication using __HAL_I2C_GENERATE_NACK() macro. This action will inform Master to generate a Stop condition to discard the communication.

Interrupt mode or DMA mode IO sequential operation

Note: *These interfaces allow to manage a sequential transfer with a repeated start condition when a direction change during transfer*

- A specific option field manage the different steps of a sequential transfer

- Option field values are defined through I2C_XFEROPTIONS and are listed below:
  - I2C_FIRST_AND_LAST_FRAME: No sequential usage, functional is same as associated interfaces in no sequential mode
  - I2C_FIRST_FRAME: Sequential usage, this option allow to manage a sequence with start condition, address and data to transfer without a final stop condition
  - I2C_FIRST_AND_NEXT_FRAME: Sequential usage (Master only), this option allow to manage a sequence with start condition, address and data to transfer without a final stop condition, an then permit a call the same master sequential interface several times (like HAL_I2C_Master_Seq_Transmit_IT() then HAL_I2C_Master_Seq_Transmit_IT() or HAL_I2C_Master_Seq_Transmit_DMA() then HAL_I2C_Master_Seq_Transmit_DMA())
  - I2C_NEXT_FRAME: Sequential usage, this option allow to manage a sequence with a restart condition, address and with new data to transfer if the direction change or manage only the new data to transfer if no direction change and without a final stop condition in both cases
  - I2C_LAST_FRAME: Sequential usage, this option allow to manage a sequance with a restart condition, address and with new data to transfer if the direction change or manage only the new data to transfer if no direction change and with a final stop condition in both cases
  - I2C_LAST_FRAME_NO_STOP: Sequential usage (Master only), this option allow to manage a restart condition after several call of the same master sequential interface several times (link with option I2C_FIRST_AND_NEXT_FRAME). Usage can, transfer several bytes one by one using HAL_I2C_Master_Seq_Transmit_IT or HAL_I2C_Master_Seq_Receive_IT or HAL_I2C_Master_Seq_Transmit_DMA or HAL_I2C_Master_Seq_Receive_DMA with option I2C_FIRST_AND_NEXT_FRAME then I2C_NEXT_FRAME. Then usage of this option I2C_LAST_FRAME_NO_STOP at the last Transmit or Receive sequence permit to call the opposite interface Receive or Transmit without stopping the communication and so generate a restart condition.
  - I2C_OTHER_FRAME: Sequential usage (Master only), this option allow to manage a restart condition after each call of the same master sequential interface. Usage can, transfer several bytes one by one with a restart with slave address between each bytes using HAL_I2C_Master_Seq_Transmit_IT or HAL_I2C_Master_Seq_Receive_IT or HAL_I2C_Master_Seq_Transmit_DMA or HAL_I2C_Master_Seq_Receive_DMA with option I2C_FIRST_FRAME then I2C_OTHER_FRAME. Then usage of this option I2C_OTHER_AND_LAST_FRAME at the last frame to help automatic generation of STOP condition.

- Different sequential I2C interfaces are listed below:
  - Sequential transmit in master I2C mode an amount of data in non-blocking mode using HAL_I2C_Master_Seq_Transmit_IT() or using HAL_I2C_Master_Seq_Transmit_DMA()
    - At transmission end of current frame transfer, HAL_I2C_MasterTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterTxCpltCallback()
  - Sequential receive in master I2C mode an amount of data in non-blocking mode using HAL_I2C_Master_Seq_Receive_IT() or using HAL_I2C_Master_Seq_Receive_DMA()
    - At reception end of current frame transfer, HAL_I2C_MasterRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterRxCpltCallback()
  - Abort a master or memory IT or DMA I2C process communication with Interrupt using HAL_I2C_Master_Abort_IT()
    - End of abort process, HAL_I2C_AbortCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_AbortCpltCallback()
  - Enable/disable the Address listen mode in slave I2C mode using HAL_I2C_EnableListen_IT() HAL_I2C_DisableListen_IT()
    - When address slave I2C match, HAL_I2C_AddrCallback() is executed and users can add their own code to check the Address Match Code and the transmission direction request by master (Write/Read).
    - At Listen mode end HAL_I2C_ListenCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_ListenCpltCallback()
  - Sequential transmit in slave I2C mode an amount of data in non-blocking mode using HAL_I2C_Slave_Seq_Transmit_IT() or using HAL_I2C_Slave_Seq_Transmit_DMA()
    - At transmission end of current frame transfer, HAL_I2C_SlaveTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveTxCpltCallback()
  - Sequential receive in slave I2C mode an amount of data in non-blocking mode using HAL_I2C_Slave_Seq_Receive_IT() or using HAL_I2C_Slave_Seq_Receive_DMA()
    - At reception end of current frame transfer, HAL_I2C_SlaveRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveRxCpltCallback()
  - In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()
  - Discard a slave I2C process communication using __HAL_I2C_GENERATE_NACK() macro. This action will inform Master to generate a Stop condition to discard the communication.

Interrupt mode IO MEM operation

- Write an amount of data in non-blocking mode with Interrupt to a specific memory address using HAL_I2C_Mem_Write_IT()
- At Memory end of write transfer, HAL_I2C_MemTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemTxCpltCallback()
- Read an amount of data in non-blocking mode with Interrupt from a specific memory address using HAL_I2C_Mem_Read_IT()
- At Memory end of read transfer, HAL_I2C_MemRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()

DMA mode IO operation

- Transmit in master mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Master_Transmit_DMA()
- At transmission end of transfer, HAL_I2C_MasterTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterTxCpltCallback()

- Receive in master mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Master_Receive_DMA()
- At reception end of transfer, HAL_I2C_MasterRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MasterRxCpltCallback()
- Transmit in slave mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Slave_Transmit_DMA()
- At transmission end of transfer, HAL_I2C_SlaveTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveTxCpltCallback()
- Receive in slave mode an amount of data in non-blocking mode (DMA) using HAL_I2C_Slave_Receive_DMA()
- At reception end of transfer, HAL_I2C_SlaveRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_SlaveRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()
- Abort a master or memory I2C process communication with Interrupt using HAL_I2C_Master_Abort_IT()
- End of abort process, HAL_I2C_AbortCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_AbortCpltCallback()
- Discard a slave I2C process communication using __HAL_I2C_GENERATE_NACK() macro. This action will inform Master to generate a Stop condition to discard the communication.

DMA mode IO MEM operation

- Write an amount of data in non-blocking mode with DMA to a specific memory address using HAL_I2C_Mem_Write_DMA()
- At Memory end of write transfer, HAL_I2C_MemTxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemTxCpltCallback()
- Read an amount of data in non-blocking mode with DMA from a specific memory address using HAL_I2C_Mem_Read_DMA()
- At Memory end of read transfer, HAL_I2C_MemRxCpltCallback() is executed and users can add their own code by customization of function pointer HAL_I2C_MemRxCpltCallback()
- In case of transfer Error, HAL_I2C_ErrorCallback() function is executed and users can add their own code by customization of function pointer HAL_I2C_ErrorCallback()

I2C HAL driver macros list

Below the list of most used macros in I2C HAL driver.

- __HAL_I2C_ENABLE: Enable the I2C peripheral
- __HAL_I2C_DISABLE: Disable the I2C peripheral
- __HAL_I2C_GENERATE_NACK: Generate a Non-Acknowledge I2C peripheral in Slave mode
- __HAL_I2C_GET_FLAG: Check whether the specified I2C flag is set or not
- __HAL_I2C_CLEAR_FLAG: Clear the specified I2C pending flag
- __HAL_I2C_ENABLE_IT: Enable the specified I2C interrupt
- __HAL_I2C_DISABLE_IT: Disable the specified I2C interrupt

Callback registration

The compilation flag USE_HAL_I2C_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_I2C_RegisterCallback() or HAL_I2C_RegisterAddrCallback() to register an interrupt callback.

Function HAL_I2C_RegisterCallback() allows to register following callbacks:

- MasterTxCpltCallback : callback for Master transmission end of transfer.
- MasterRxCpltCallback : callback for Master reception end of transfer.
- SlaveTxCpltCallback : callback for Slave transmission end of transfer.
- SlaveRxCpltCallback : callback for Slave reception end of transfer.
- ListenCpltCallback : callback for end of listen mode.
- MemTxCpltCallback : callback for Memory transmission end of transfer.

- MemRxCpltCallback : callback for Memory reception end of transfer.
- ErrorCallback : callback for error detection.
- AbortCpltCallback : callback for abort completion process.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

For specific callback AddrCallback use dedicated register callbacks : HAL_I2C_RegisterAddrCallback().

Use function HAL_I2C_UnRegisterCallback to reset a callback to the default weak function. HAL_I2C_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- MasterTxCpltCallback : callback for Master transmission end of transfer.
- MasterRxCpltCallback : callback for Master reception end of transfer.
- SlaveTxCpltCallback : callback for Slave transmission end of transfer.
- SlaveRxCpltCallback : callback for Slave reception end of transfer.
- ListenCpltCallback : callback for end of listen mode.
- MemTxCpltCallback : callback for Memory transmission end of transfer.
- MemRxCpltCallback : callback for Memory reception end of transfer.
- ErrorCallback : callback for error detection.
- AbortCpltCallback : callback for abort completion process.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit.

For callback AddrCallback use dedicated register callbacks : HAL_I2C_UnRegisterAddrCallback().

By default, after the HAL_I2C_Init() and when the state is HAL_I2C_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_I2C_MasterTxCpltCallback(), HAL_I2C_MasterRxCpltCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_I2C_Init()/ HAL_I2C_DeInit() only when these callbacks are null (not registered beforehand). If MspInit or MspDeInit are not null, the HAL_I2C_Init()/ HAL_I2C_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_I2C_STATE_READY state only. Exception done MspInit/ MspDeInit functions that can be registered/unregistered in HAL_I2C_STATE_READY or HAL_I2C_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_I2C_RegisterCallback() before calling HAL_I2C_DeInit() or HAL_I2C_Init() function.

When the compilation flag USE_HAL_I2C_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

Note: You can refer to the I2C HAL driver header file for more useful macros

38.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and deinitialize the I2Cx peripheral:

- User must Implement HAL_I2C_MspInit() function in which he configures all related peripherals resources (CLOCK, GPIO, DMA, IT and NVIC).
- Call the function HAL_I2C_Init() to configure the selected device with the selected configuration:
  - Clock Timing
  - Own Address 1
  - Addressing mode (Master, Slave)
  - Dual Addressing mode
  - Own Address 2
  - Own Address 2 Mask
  - General call mode
  - Nostretch mode
- Call the function HAL_I2C_DeInit() to restore the default configuration of the selected I2Cx peripheral.

This section contains the following APIs:

- *HAL_I2C_Init()*
- *HAL_I2C_DeInit()*
- *HAL_I2C_MspInit()*
- *HAL_I2C_MspDeInit()*
- *HAL_I2C_RegisterCallback()*
- *HAL_I2C_UnRegisterCallback()*
- *HAL_I2C_RegisterAddrCallback()*
- *HAL_I2C_UnRegisterAddrCallback()*

38.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the I2C data transfers.

1. There are two modes of transfer:
   – Blocking mode : The communication is performed in the polling mode. The status of all data processing is returned by the same function after finishing transfer.
   – No-Blocking mode : The communication is performed using Interrupts or DMA. These functions return the status of the transfer startup. The end of the data processing will be indicated through the dedicated I2C IRQ when using Interrupt mode or the DMA IRQ when using DMA mode.
2. Blocking mode functions are :
   – HAL_I2C_Master_Transmit()
   – HAL_I2C_Master_Receive()
   – HAL_I2C_Slave_Transmit()
   – HAL_I2C_Slave_Receive()
   – HAL_I2C_Mem_Write()
   – HAL_I2C_Mem_Read()
   – HAL_I2C_IsDeviceReady()
3. No-Blocking mode functions with Interrupt are :
   – HAL_I2C_Master_Transmit_IT()
   – HAL_I2C_Master_Receive_IT()
   – HAL_I2C_Slave_Transmit_IT()
   – HAL_I2C_Slave_Receive_IT()
   – HAL_I2C_Mem_Write_IT()
   – HAL_I2C_Mem_Read_IT()
   – HAL_I2C_Master_Seq_Transmit_IT()
   – HAL_I2C_Master_Seq_Receive_IT()
   – HAL_I2C_Slave_Seq_Transmit_IT()
   – HAL_I2C_Slave_Seq_Receive_IT()
   – HAL_I2C_EnableListen_IT()
   – HAL_I2C_DisableListen_IT()
   – HAL_I2C_Master_Abort_IT()
4. No-Blocking mode functions with DMA are :
   – HAL_I2C_Master_Transmit_DMA()
   – HAL_I2C_Master_Receive_DMA()
   – HAL_I2C_Slave_Transmit_DMA()
   – HAL_I2C_Slave_Receive_DMA()
   – HAL_I2C_Mem_Write_DMA()
   – HAL_I2C_Mem_Read_DMA()
   – HAL_I2C_Master_Seq_Transmit_DMA()
   – HAL_I2C_Master_Seq_Receive_DMA()
   – HAL_I2C_Slave_Seq_Transmit_DMA()
   – HAL_I2C_Slave_Seq_Receive_DMA()

5. A set of Transfer Complete Callbacks are provided in non Blocking mode:
   – HAL_I2C_MasterTxCpltCallback()
   – HAL_I2C_MasterRxCpltCallback()
   – HAL_I2C_SlaveTxCpltCallback()
   – HAL_I2C_SlaveRxCpltCallback()
   – HAL_I2C_MemTxCpltCallback()
   – HAL_I2C_MemRxCpltCallback()
   – HAL_I2C_AddrCallback()
   – HAL_I2C_ListenCpltCallback()
   – HAL_I2C_ErrorCallback()
   – HAL_I2C_AbortCpltCallback()

This section contains the following APIs:
- *HAL_I2C_Master_Transmit()*
- *HAL_I2C_Master_Receive()*
- *HAL_I2C_Slave_Transmit()*
- *HAL_I2C_Slave_Receive()*
- *HAL_I2C_Master_Transmit_IT()*
- *HAL_I2C_Master_Receive_IT()*
- *HAL_I2C_Slave_Transmit_IT()*
- *HAL_I2C_Slave_Receive_IT()*
- *HAL_I2C_Master_Transmit_DMA()*
- *HAL_I2C_Master_Receive_DMA()*
- *HAL_I2C_Slave_Transmit_DMA()*
- *HAL_I2C_Slave_Receive_DMA()*
- *HAL_I2C_Mem_Write()*
- *HAL_I2C_Mem_Read()*
- *HAL_I2C_Mem_Write_IT()*
- *HAL_I2C_Mem_Read_IT()*
- *HAL_I2C_Mem_Write_DMA()*
- *HAL_I2C_Mem_Read_DMA()*
- *HAL_I2C_IsDeviceReady()*
- *HAL_I2C_Master_Seq_Transmit_IT()*
- *HAL_I2C_Master_Seq_Transmit_DMA()*
- *HAL_I2C_Master_Seq_Receive_IT()*
- *HAL_I2C_Master_Seq_Receive_DMA()*
- *HAL_I2C_Slave_Seq_Transmit_IT()*
- *HAL_I2C_Slave_Seq_Transmit_DMA()*
- *HAL_I2C_Slave_Seq_Receive_IT()*
- *HAL_I2C_Slave_Seq_Receive_DMA()*
- *HAL_I2C_EnableListen_IT()*
- *HAL_I2C_DisableListen_IT()*
- *HAL_I2C_Master_Abort_IT()*

38.2.4 Peripheral State, Mode and Error functions

This subsection permit to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:
- *HAL_I2C_GetState()*
- *HAL_I2C_GetMode()*
- *HAL_I2C_GetError()*

38.2.5 Detailed description of functions

HAL_I2C_Init

Function name

HAL_StatusTypeDef HAL_I2C_Init (I2C_HandleTypeDef * hi2c)

Function description

Initializes the I2C according to the specified parameters in the I2C_InitTypeDef and initialize the associated handle.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **HAL:** status

HAL_I2C_DeInit

Function name

HAL_StatusTypeDef HAL_I2C_DeInit (I2C_HandleTypeDef * hi2c)

Function description

DeInitialize the I2C peripheral.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **HAL:** status

HAL_I2C_MspInit

Function name

void HAL_I2C_MspInit (I2C_HandleTypeDef * hi2c)

Function description

Initialize the I2C MSP.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_MspDeInit

Function name

void HAL_I2C_MspDeInit (I2C_HandleTypeDef * hi2c)

Function description

DeInitialize the I2C MSP.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_RegisterCallback

Function name

HAL_StatusTypeDef HAL_I2C_RegisterCallback (I2C_HandleTypeDef * hi2c, HAL_I2C_CallbackIDTypeDef CallbackID, pI2C_CallbackTypeDef pCallback)

Function description

Register a User I2C Callback To be used instead of the weak predefined callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  – HAL_I2C_MASTER_TX_COMPLETE_CB_ID Master Tx Transfer completed callback ID
  – HAL_I2C_MASTER_RX_COMPLETE_CB_ID Master Rx Transfer completed callback ID
  – HAL_I2C_SLAVE_TX_COMPLETE_CB_ID Slave Tx Transfer completed callback ID
  – HAL_I2C_SLAVE_RX_COMPLETE_CB_ID Slave Rx Transfer completed callback ID
  – HAL_I2C_LISTEN_COMPLETE_CB_ID Listen Complete callback ID
  – HAL_I2C_MEM_TX_COMPLETE_CB_ID Memory Tx Transfer callback ID
  – HAL_I2C_MEM_RX_COMPLETE_CB_ID Memory Rx Transfer completed callback ID
  – HAL_I2C_ERROR_CB_ID Error callback ID
  – HAL_I2C_ABORT_CB_ID Abort callback ID
  – HAL_I2C_MSPINIT_CB_ID MspInit callback ID
  – HAL_I2C_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

Notes

- The HAL_I2C_RegisterCallback() may be called before HAL_I2C_Init() in HAL_I2C_STATE_RESET to register callbacks for HAL_I2C_MSPINIT_CB_ID and HAL_I2C_MSPDEINIT_CB_ID.

HAL_I2C_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_I2C_UnRegisterCallback (I2C_HandleTypeDef * hi2c, HAL_I2C_CallbackIDTypeDef CallbackID)

Function description

Unregister an I2C Callback I2C callback is redirected to the weak predefined callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values: This parameter can be one of the following values:
  – HAL_I2C_MASTER_TX_COMPLETE_CB_ID Master Tx Transfer completed callback ID
  – HAL_I2C_MASTER_RX_COMPLETE_CB_ID Master Rx Transfer completed callback ID
  – HAL_I2C_SLAVE_TX_COMPLETE_CB_ID Slave Tx Transfer completed callback ID
  – HAL_I2C_SLAVE_RX_COMPLETE_CB_ID Slave Rx Transfer completed callback ID
  – HAL_I2C_LISTEN_COMPLETE_CB_ID Listen Complete callback ID
  – HAL_I2C_MEM_TX_COMPLETE_CB_ID Memory Tx Transfer callback ID
  – HAL_I2C_MEM_RX_COMPLETE_CB_ID Memory Rx Transfer completed callback ID
  – HAL_I2C_ERROR_CB_ID Error callback ID
  – HAL_I2C_ABORT_CB_ID Abort callback ID
  – HAL_I2C_MSPINIT_CB_ID MspInit callback ID
  – HAL_I2C_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

Notes

- The HAL_I2C_UnRegisterCallback() may be called before HAL_I2C_Init() in HAL_I2C_STATE_RESET to un-register callbacks for HAL_I2C_MSPINIT_CB_ID and HAL_I2C_MSPDEINIT_CB_ID.

HAL_I2C_RegisterAddrCallback

Function name

HAL_StatusTypeDef HAL_I2C_RegisterAddrCallback (I2C_HandleTypeDef * hi2c, pI2C_AddrCallbackTypeDef pCallback)

Function description

Register the Slave Address Match I2C Callback To be used instead of the weak HAL_I2C_AddrCallback() predefined callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pCallback:** pointer to the Address Match Callback function

Return values

- **HAL:** status

HAL_I2C_UnRegisterAddrCallback

Function name

HAL_StatusTypeDef HAL_I2C_UnRegisterAddrCallback (I2C_HandleTypeDef * hi2c)

Function description

UnRegister the Slave Address Match I2C Callback Info Ready I2C Callback is redirected to the weak HAL_I2C_AddrCallback() predefined callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **HAL:** status

HAL_I2C_Master_Transmit

Function name

HAL_StatusTypeDef HAL_I2C_Master_Transmit (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Transmits in master mode an amount of data in blocking mode.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_Master_Receive

Function name

HAL_StatusTypeDef HAL_I2C_Master_Receive (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Receives in master mode an amount of data in blocking mode.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_Slave_Transmit

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Transmit (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Transmits in slave mode an amount of data in blocking mode.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_Slave_Receive

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Receive (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Receive in slave mode an amount of data in blocking mode.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_Mem_Write

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Write (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Write an amount of data in blocking mode to a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_Mem_Read

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Read (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Read an amount of data in blocking mode from a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_I2C_IsDeviceReady

Function name

HAL_StatusTypeDef HAL_I2C_IsDeviceReady (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint32_t Trials, uint32_t Timeout)

Function description

Checks if target device is ready for communication.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **Trials:** Number of trials
- **Timeout:** Timeout duration

Return values

- **HAL:** status

Notes

- This function is used with Memory devices

HAL_I2C_Master_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I2C_Master_Transmit_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size)

Function description

Transmit in master mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Master_Receive_IT

Function name

HAL_StatusTypeDef HAL_I2C_Master_Receive_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size)

Function description

Receive in master mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Slave_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Transmit_IT (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size)

Function description

Transmit in slave mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Slave_Receive_IT

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Receive_IT (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size)

Function description

Receive in slave mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Mem_Write_IT

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Write_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size)

Function description

Write an amount of data in non-blocking mode with Interrupt to a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Mem_Read_IT

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Read_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size)

Function description

Read an amount of data in non-blocking mode with Interrupt from a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Master_Seq_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I2C_Master_Seq_Transmit_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential transmit in master I2C mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Master_Seq_Receive_IT

Function name

HAL_StatusTypeDef HAL_I2C_Master_Seq_Receive_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential receive in master I2C mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Slave_Seq_Transmit_IT

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Seq_Transmit_IT (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential transmit in slave/device I2C mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Slave_Seq_Receive_IT

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Seq_Receive_IT (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential receive in slave/device I2C mode an amount of data in non-blocking mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_EnableListen_IT

Function name

HAL_StatusTypeDef HAL_I2C_EnableListen_IT (I2C_HandleTypeDef * hi2c)

Function description

Enable the Address listen mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **HAL:** status

HAL_I2C_DisableListen_IT

Function name

HAL_StatusTypeDef HAL_I2C_DisableListen_IT (I2C_HandleTypeDef * hi2c)

Function description

Disable the Address listen mode with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C

Return values

- **HAL:** status

HAL_I2C_Master_Abort_IT

Function name

HAL_StatusTypeDef HAL_I2C_Master_Abort_IT (I2C_HandleTypeDef * hi2c, uint16_t DevAddress)

Function description

Abort a master or memory I2C IT or DMA process communication with Interrupt.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface

Return values

- **HAL:** status

HAL_I2C_Master_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Master_Transmit_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size)

Function description

Transmit in master mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Master_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Master_Receive_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size)

Function description

Receive in master mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Slave_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Transmit_DMA (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size)

Function description

Transmit in slave mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Slave_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Receive_DMA (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size)

Function description

Receive in slave mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Mem_Write_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Write_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size)

Function description

Write an amount of data in non-blocking mode with DMA to a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent

Return values

- **HAL:** status

HAL_I2C_Mem_Read_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Mem_Read_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint16_t MemAddress, uint16_t MemAddSize, uint8_t * pData, uint16_t Size)

Function description

Reads an amount of data in non-blocking mode with DMA from a specific memory address.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **MemAddress:** Internal memory address
- **MemAddSize:** Size of internal memory address
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be read

Return values

- **HAL:** status

HAL_I2C_Master_Seq_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Master_Seq_Transmit_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential transmit in master I2C mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Master_Seq_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Master_Seq_Receive_DMA (I2C_HandleTypeDef * hi2c, uint16_t DevAddress, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential receive in master I2C mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **DevAddress:** Target device address: The device 7 bits address value in datasheet must be shifted to the left before calling the interface
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Slave_Seq_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Seq_Transmit_DMA (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential transmit in slave/device I2C mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_Slave_Seq_Receive_DMA

Function name

HAL_StatusTypeDef HAL_I2C_Slave_Seq_Receive_DMA (I2C_HandleTypeDef * hi2c, uint8_t * pData, uint16_t Size, uint32_t XferOptions)

Function description

Sequential receive in slave/device I2C mode an amount of data in non-blocking mode with DMA.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent
- **XferOptions:** Options of Transfer, value of I2C Sequential Transfer Options

Return values

- **HAL:** status

Notes

- This interface allow to manage repeated start condition when a direction change during transfer

HAL_I2C_EV_IRQHandler

Function name

void HAL_I2C_EV_IRQHandler (I2C_HandleTypeDef * hi2c)

Function description

This function handles I2C event interrupt request.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_ER_IRQHandler

Function name

void HAL_I2C_ER_IRQHandler (I2C_HandleTypeDef * hi2c)

Function description

This function handles I2C error interrupt request.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_MasterTxCpltCallback

Function name

void HAL_I2C_MasterTxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Master Tx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_MasterRxCpltCallback

Function name

void HAL_I2C_MasterRxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Master Rx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_SlaveTxCpltCallback

Function name

void HAL_I2C_SlaveTxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Slave Tx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_SlaveRxCpltCallback

Function name

void HAL_I2C_SlaveRxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Slave Rx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_AddrCallback

Function name

void HAL_I2C_AddrCallback (I2C_HandleTypeDef * hi2c, uint8_t TransferDirection, uint16_t AddrMatchCode)

Function description

Slave Address Match callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.
- **TransferDirection:** Master request Transfer Direction (Write/Read), value of I2C Transfer Direction Master Point of View
- **AddrMatchCode:** Address Match Code

Return values

- **None:**

HAL_I2C_ListenCpltCallback

Function name

void HAL_I2C_ListenCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Listen Complete callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_MemTxCpltCallback

Function name

void HAL_I2C_MemTxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Memory Tx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_MemRxCpltCallback

Function name

void HAL_I2C_MemRxCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

Memory Rx Transfer completed callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_ErrorCallback

Function name

void HAL_I2C_ErrorCallback (I2C_HandleTypeDef * hi2c)

Function description

I2C error callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_AbortCpltCallback

Function name

void HAL_I2C_AbortCpltCallback (I2C_HandleTypeDef * hi2c)

Function description

I2C abort callback.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **None:**

HAL_I2C_GetState

Function name

HAL_I2C_StateTypeDef HAL_I2C_GetState (const I2C_HandleTypeDef * hi2c)

Function description

Return the I2C handle state.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **HAL:** state

HAL_I2C_GetMode

Function name

HAL_I2C_ModeTypeDef HAL_I2C_GetMode (const I2C_HandleTypeDef * hi2c)

Function description

Returns the I2C Master, Slave, Memory or no mode.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for I2C module

Return values

- **HAL:** mode

HAL_I2C_GetError

Function name

uint32_t HAL_I2C_GetError (const I2C_HandleTypeDef * hi2c)

Function description

Return the I2C error code.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2C.

Return values

- **I2C:** Error Code

38.3 I2C Firmware driver defines

The following section lists the various define and macros of the module.

38.3.1 I2C

I2C

I2C Addressing Mode

I2C_ADDRESSINGMODE_7BIT

I2C_ADDRESSINGMODE_10BIT

I2C Dual Addressing Mode

I2C_DUALADDRESS_DISABLE

I2C_DUALADDRESS_ENABLE

I2C Error Code definition

HAL_I2C_ERROR_NONE

No error

HAL_I2C_ERROR_BERR

BERR error

HAL_I2C_ERROR_ARLO

ARLO error

HAL_I2C_ERROR_AF

ACKF error

HAL_I2C_ERROR_OVR

OVR error

HAL_I2C_ERROR_DMA

DMA transfer error

HAL_I2C_ERROR_TIMEOUT

Timeout error

HAL_I2C_ERROR_SIZE

Size Management error

HAL_I2C_ERROR_DMA_PARAM

DMA Parameter Error

HAL_I2C_ERROR_INVALID_CALLBACK

Invalid Callback error

HAL_I2C_ERROR_INVALID_PARAM

Invalid Parameters error

I2C Exported Macros

__HAL_I2C_RESET_HANDLE_STATE

Description:

- Reset I2C handle state.

Parameters:

- __HANDLE__: specifies the I2C Handle.

Return value:

- None

__HAL_I2C_ENABLE_IT

Description:

- Enable the specified I2C interrupt.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __INTERRUPT__: specifies the interrupt source to enable. This parameter can be one of the following values:
  – I2C_IT_ERRI Errors interrupt enable
  – I2C_IT_TCI Transfer complete interrupt enable
  – I2C_IT_STOPI STOP detection interrupt enable
  – I2C_IT_NACKI NACK received interrupt enable
  – I2C_IT_ADDRI Address match interrupt enable
  – I2C_IT_RXI RX interrupt enable
  – I2C_IT_TXI TX interrupt enable

Return value:

- None

__HAL_I2C_DISABLE_IT

Description:

- Disable the specified I2C interrupt.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __INTERRUPT__: specifies the interrupt source to disable. This parameter can be one of the following values:
  – I2C_IT_ERRI Errors interrupt enable
  – I2C_IT_TCI Transfer complete interrupt enable
  – I2C_IT_STOPI STOP detection interrupt enable
  – I2C_IT_NACKI NACK received interrupt enable
  – I2C_IT_ADDRI Address match interrupt enable
  – I2C_IT_RXI RX interrupt enable
  – I2C_IT_TXI TX interrupt enable

Return value:

- None

__HAL_I2C_GET_IT_SOURCE

Description:

- Check whether the specified I2C interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __INTERRUPT__: specifies the I2C interrupt source to check. This parameter can be one of the following values:
  – I2C_IT_ERRI Errors interrupt enable
  – I2C_IT_TCI Transfer complete interrupt enable
  – I2C_IT_STOPI STOP detection interrupt enable
  – I2C_IT_NACKI NACK received interrupt enable
  – I2C_IT_ADDRI Address match interrupt enable
  – I2C_IT_RXI RX interrupt enable
  – I2C_IT_TXI TX interrupt enable

Return value:

- The: new state of __INTERRUPT__ (SET or RESET).

I2C_FLAG_MASK

Description:

- Check whether the specified I2C flag is set or not.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - I2C_FLAG_TXE Transmit data register empty
  - I2C_FLAG_TXIS Transmit interrupt status
  - I2C_FLAG_RXNE Receive data register not empty
  - I2C_FLAG_ADDR Address matched (slave mode)
  - I2C_FLAG_AF Acknowledge failure received flag
  - I2C_FLAG_STOPF STOP detection flag
  - I2C_FLAG_TC Transfer complete (master mode)
  - I2C_FLAG_TCR Transfer complete reload
  - I2C_FLAG_BERR Bus error
  - I2C_FLAG_ARLO Arbitration lost
  - I2C_FLAG_OVR Overrun/Underrun
  - I2C_FLAG_PECERR PEC error in reception
  - I2C_FLAG_TIMEOUT Timeout or Tlow detection flag
  - I2C_FLAG_ALERT SMBus alert
  - I2C_FLAG_BUSY Bus busy
  - I2C_FLAG_DIR Transfer direction (slave mode)

Return value:

- The: new state of __FLAG__ (SET or RESET).

__HAL_I2C_GET_FLAG

__HAL_I2C_CLEAR_FLAG

Description:

- Clear the I2C pending flags which are cleared by writing 1 in a specific bit.

Parameters:

- __HANDLE__: specifies the I2C Handle.
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - I2C_FLAG_TXE Transmit data register empty
  - I2C_FLAG_ADDR Address matched (slave mode)
  - I2C_FLAG_AF Acknowledge failure received flag
  - I2C_FLAG_STOPF STOP detection flag
  - I2C_FLAG_BERR Bus error
  - I2C_FLAG_ARLO Arbitration lost
  - I2C_FLAG_OVR Overrun/Underrun
  - I2C_FLAG_PECERR PEC error in reception
  - I2C_FLAG_TIMEOUT Timeout or Tlow detection flag
  - I2C_FLAG_ALERT SMBus alert

Return value:

- None

__HAL_I2C_ENABLE

Description:
- Enable the specified I2C peripheral.

Parameters:
- __HANDLE__: specifies the I2C Handle.

Return value:
- None

__HAL_I2C_DISABLE

Description:
- Disable the specified I2C peripheral.

Parameters:
- __HANDLE__: specifies the I2C Handle.

Return value:
- None

__HAL_I2C_GENERATE_NACK

Description:
- Generate a Non-Acknowledge I2C peripheral in Slave mode.

Parameters:
- __HANDLE__: specifies the I2C Handle.

Return value:
- None

39.1 I2CEx Firmware driver registers structures

39.1.1 I2C_AutonomousModeConfTypeDef

I2C_AutonomousModeConfTypeDef is defined in the stm32u5xx_hal_i2c_ex.h

Data Fields

- ***uint32_t TriggerState***
- ***uint32_t TriggerSelection***
- ***uint32_t TriggerPolarity***

Field Documentation

- ***uint32_t I2C_AutonomousModeConfTypeDef::TriggerState***
  Specifies the trigger state. This parameter can be a value of ***I2CEx_AutonomousMode_FunctionalState***
- ***uint32_t I2C_AutonomousModeConfTypeDef::TriggerSelection***
  Specifies the autonomous mode trigger signal selection. This parameter can be a value of ***I2CEx_AutonomousMode_TriggerSelection***
- ***uint32_t I2C_AutonomousModeConfTypeDef::TriggerPolarity***
  Specifies the autonomous mode trigger signal polarity sensitivity. This parameter can be a value of ***I2CEx_AutonomousMode_TriggerPolarity***

39.2 I2CEx Firmware driver API description

The following section lists the various functions of the I2CEx library.

39.2.1 I2C peripheral Extended features

Comparing to other previous devices, the I2C interface for STM32U5xx devices contains the following additional features

- Possibility to disable or enable Analog Noise Filter
- Use of a configured Digital Noise Filter
- Disable or enable wakeup from Stop mode(s)
- Disable or enable Fast Mode Plus
- Configure Autonomous mode

39.2.2 How to use this driver

This driver provides functions to configure Noise Filter and Wake Up Feature

1. Configure I2C Analog noise filter using the function HAL_I2CEx_ConfigAnalogFilter()
2. Configure I2C Digital noise filter using the function HAL_I2CEx_ConfigDigitalFilter()
3. Configure the enable or disable of I2C Wake Up Mode using the functions :
   – HAL_I2CEx_EnableWakeUp()
   – HAL_I2CEx_DisableWakeUp()
4. Configure the enable or disable of fast mode plus driving capability using the functions :
   – HAL_I2CEx_ConfigFastModePlus()
5. Set or get or clear the autonomous mode configuration using these functions :
   – HAL_I2CEx_SetConfigAutonomousMode()
   – HAL_I2CEx_GetConfigAutonomousMode()
   – HAL_I2CEx_ClearConfigAutonomousMode()

39.2.3 Filter Mode Functions

This section provides functions allowing to:

- Configure Noise Filters

This section contains the following APIs:
- *HAL_I2CEx_ConfigAnalogFilter()*
- *HAL_I2CEx_ConfigDigitalFilter()*

39.2.4 WakeUp Mode Functions

This section provides functions allowing to:
- Configure Wake Up Feature

This section contains the following APIs:
- *HAL_I2CEx_EnableWakeUp()*
- *HAL_I2CEx_DisableWakeUp()*

39.2.5 Fast Mode Plus Functions

This section provides functions allowing to:
- Configure Fast Mode Plus

This section contains the following APIs:
- *HAL_I2CEx_ConfigFastModePlus()*

39.2.6 Autonomous Mode functions

This section provides functions allowing to:
- Configure Autonomous Mode

This section contains the following APIs:
- *HAL_I2CEx_SetConfigAutonomousMode()*
- *HAL_I2CEx_GetConfigAutonomousMode()*
- *HAL_I2CEx_ClearConfigAutonomousMode()*

39.2.7 Detailed description of functions

HAL_I2CEx_ConfigAnalogFilter

Function name

HAL_StatusTypeDef HAL_I2CEx_ConfigAnalogFilter (I2C_HandleTypeDef * hi2c, uint32_t AnalogFilter)

Function description

Configure I2C Analog noise filter.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.
- **AnalogFilter:** New state of the Analog filter.

Return values

- **HAL:** status

HAL_I2CEx_ConfigDigitalFilter

Function name

HAL_StatusTypeDef HAL_I2CEx_ConfigDigitalFilter (I2C_HandleTypeDef * hi2c, uint32_t DigitalFilter)

Function description

Configure I2C Digital noise filter.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.
- **DigitalFilter:** Coefficient of digital noise filter between Min_Data=0x00 and Max_Data=0x0F.

Return values

- **HAL:** status

HAL_I2CEx_EnableWakeUp

Function name

HAL_StatusTypeDef HAL_I2CEx_EnableWakeUp (I2C_HandleTypeDef * hi2c)

Function description

Enable I2C wakeup from Stop mode(s).

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.

Return values

- **HAL:** status

HAL_I2CEx_DisableWakeUp

Function name

HAL_StatusTypeDef HAL_I2CEx_DisableWakeUp (I2C_HandleTypeDef * hi2c)

Function description

Disable I2C wakeup from Stop mode(s).

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.

Return values

- **HAL:** status

HAL_I2CEx_ConfigFastModePlus

Function name

HAL_StatusTypeDef HAL_I2CEx_ConfigFastModePlus (I2C_HandleTypeDef * hi2c, uint32_t FastModePlus)

Function description

Configure I2C Fast Mode Plus.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.
- **FastModePlus:** New state of the Fast Mode Plus.

Return values

- **HAL:** status

HAL_I2CEx_SetConfigAutonomousMode

Function name

HAL_StatusTypeDef HAL_I2CEx_SetConfigAutonomousMode (I2C_HandleTypeDef * hi2c, const I2C_AutonomousModeConfTypeDef * sConfig)

Function description

Set Autonomous Mode configuration.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.
- **sConfig:** Pointer to a I2C_AutonomousModeConfTypeDef structure that contains the configuration information of the autonomous mode for the specified I2Cx peripheral.

Return values

- **HAL:** status

HAL_I2CEx_GetConfigAutonomousMode

Function name

HAL_StatusTypeDef HAL_I2CEx_GetConfigAutonomousMode (const I2C_HandleTypeDef * hi2c, I2C_AutonomousModeConfTypeDef * sConfig)

Function description

Get Autonomous Mode configuration.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.
- **sConfig:** Pointer to a I2C_AutonomousModeConfTypeDef structure that contains the configuration information of the autonomous mode for the specified I2Cx peripheral.

Return values

- **HAL:** status

HAL_I2CEx_ClearConfigAutonomousMode

Function name

HAL_StatusTypeDef HAL_I2CEx_ClearConfigAutonomousMode (I2C_HandleTypeDef * hi2c)

Function description

Clear Autonomous Mode configuration.

Parameters

- **hi2c:** Pointer to a I2C_HandleTypeDef structure that contains the configuration information for the specified I2Cx peripheral.

Return values

- **HAL:** status

39.3 I2CEx Firmware driver defines

I2C_GRP1_RTC_WUT_TRG
HW Trigger signal is RTC_WUT_TRG

I2C_GRP2_LPDMA_CH0_TCF_TRG
HW Trigger signal is LPDMA_CH0_TRG

I2C_GRP2_LPDMA_CH1_TCF_TRG
HW Trigger signal is LPDMA_CH1_TRG

I2C_GRP2_LPDMA_CH2_TCF_TRG
HW Trigger signal is LPDMA_CH2_TRG

I2C_GRP2_LPDMA_CH3_TCF_TRG
HW Trigger signal is LPDMA_CH3_TRG

I2C_GRP2_EXTI5_TRG
HW Trigger signal is EXTI5_TRG

I2C_GRP2_EXTI8_TRG
HW Trigger signal is EXTI8_TRG

I2C_GRP2_LPTIM1_CH1_TRG
HW Trigger signal is LPTIM1_CH1_TRG

I2C_GRP2_LPTIM3_CH1_TRG
HW Trigger signal is LPTIM3_CH1_TRG

I2C_GRP2_COMP1_TRG
HW Trigger signal is COMP1_TRG

I2C_GRP2_COMP2_TRG
HW Trigger signal is COMP2_TRG

I2C_GRP2_RTC_ALRA_TRG
HW Trigger signal is RTC_ALRA_TRG

I2C_GRP2_RTC_WUT_TRG
HW Trigger signal is RTC_WUT_TRG

I2C Extended Fast Mode Plus

I2C_FASTMODEPLUS_ENABLE
Enable Fast Mode Plus

I2C_FASTMODEPLUS_DISABLE
Disable Fast Mode Plus

40 HAL ICACHE Generic Driver

40.1 ICACHE Firmware driver registers structures

40.1.1 ICACHE_RegionConfigTypeDef

ICACHE_RegionConfigTypeDef is defined in the stm32u5xx_hal_icache.h

Data Fields

- ***uint32_t BaseAddress***
- ***uint32_t RemapAddress***
- ***uint32_t Size***
- ***uint32_t TrafficRoute***
- ***uint32_t OutputBurstType***

Field Documentation

- ***uint32_t ICACHE_RegionConfigTypeDef::BaseAddress***
  Configures the Base address of Region i to be remapped
- ***uint32_t ICACHE_RegionConfigTypeDef::RemapAddress***
  Configures the Remap address of Region i to be remapped
- ***uint32_t ICACHE_RegionConfigTypeDef::Size***
  Configures the Region size. This parameter can be a value of ***ICACHE_Region_Size***
- ***uint32_t ICACHE_RegionConfigTypeDef::TrafficRoute***
  Selects the traffic route. This parameter can be a value of ***ICACHE_Traffic_Route***
- ***uint32_t ICACHE_RegionConfigTypeDef::OutputBurstType***
  Selects the output burst type. This parameter can be a value of ***ICACHE_Output_Burst_Type***

40.2 ICACHE Firmware driver API description

The following section lists the various functions of the ICACHE library.

40.2.1 ICACHE main features

The Instruction Cache (ICACHE) is introduced on C-AHB code bus of Cortex-M33 processor to improve performance when fetching instruction and data from both internal and external memories. It allows close to zero wait states performance.

- The ICACHE provides two performance counters (Hit and Miss), cache invalidate maintenance operation, error management and TrustZone security support.
- The ICACHE provides additionally the possibility to remap input address falling into up to four memory regions (used to remap aliased code in external memories to the internal Code region, for execution)
  ===

40.2.2 How to use this driver

The ICACHE HAL driver can be used as follows:

1. Optionally configure the Instruction Cache mode with HAL_ICACHE_ConfigAssociativityMode() if the default configuration does not suit the application requirements.
2. Enable and disable the Instruction Cache with respectively HAL_ICACHE_Enable() and HAL_ICACHE_Disable(). Use HAL_ICACHE_IsEnabled() to get the Instruction Cache status. To ensure a deterministic cache behavior after power on, system reset or after a call to @ref HAL_ICACHE_Disable(), the application must call @ref HAL_ICACHE_WaitForInvalidateComplete(). Indeed on power on, system reset or cache disable, an automatic cache invalidation procedure is launched and the cache is bypassed until the operation completes.

3. Initiate the cache maintenance invalidation procedure with either HAL_ICACHE_Invalidate() (blocking mode) or HAL_ICACHE_Invalidate_IT() (interrupt mode). When interrupt mode is used, the callback function HAL_ICACHE_InvalidateCompleteCallback() is called when the invalidate procedure is complete. The function HAL_ICACHE_WaitForInvalidateComplete() may be called to wait for the end of the invalidate procedure automatically initiated when disabling the Instruction Cache with HAL_ICACHE_Disable(). The cache operation is bypassed during the invalidation procedure.
4. Use the performance monitoring counters for Hit and Miss with the following functions: HAL_ICACHE_Monitor_Start(), HAL_ICACHE_Monitor_Stop(), HAL_ICACHE_Monitor_Reset(), HAL_ICACHE_Monitor_GetHitValue() and HAL_ICACHE_Monitor_GetMissValue()
5. Enable and disable up to four regions to remap input address from external memories to the internal Code region for execution with HAL_ICACHE_EnableRemapRegion() and HAL_ICACHE_DisableRemapRegion()

40.2.3 Initialization and control functions

This section provides functions allowing to initialize and control the Instruction Cache (mode, invalidate procedure, performance counters).

This section contains the following APIs:

- *HAL_ICACHE_ConfigAssociativityMode()*
- *HAL_ICACHE_DeInit()*
- *HAL_ICACHE_Enable()*
- *HAL_ICACHE_Disable()*
- *HAL_ICACHE_IsEnabled()*
- *HAL_ICACHE_Invalidate()*
- *HAL_ICACHE_Invalidate_IT()*
- *HAL_ICACHE_WaitForInvalidateComplete()*
- *HAL_ICACHE_Monitor_Start()*
- *HAL_ICACHE_Monitor_Stop()*
- *HAL_ICACHE_Monitor_Reset()*
- *HAL_ICACHE_Monitor_GetHitValue()*
- *HAL_ICACHE_Monitor_GetMissValue()*

40.2.4 IRQ and callback functions

This section provides functions allowing to handle ICACHE global interrupt and the associated callback functions.

This section contains the following APIs:

- *HAL_ICACHE_IRQHandler()*
- *HAL_ICACHE_InvalidateCompleteCallback()*
- *HAL_ICACHE_ErrorCallback()*

40.2.5 Memory remapped regions functions

This section provides functions allowing to manage the remapping of external memories to internal Code for execution.

This section contains the following APIs:

- *HAL_ICACHE_EnableRemapRegion()*
- *HAL_ICACHE_DisableRemapRegion()*

40.2.6 Detailed description of functions

HAL_ICACHE_Enable

Function name

HAL_StatusTypeDef HAL_ICACHE_Enable (void)

Function description

Enable the Instruction Cache.

Return values

- **HAL:** status (HAL_OK)

Notes

- This function always returns HAL_OK even if there is any ongoing cache operation. The Instruction Cache is bypassed until the cache operation completes.

HAL_ICACHE_Disable

Function name

HAL_StatusTypeDef HAL_ICACHE_Disable (void)

Function description

Disable the Instruction Cache.

Return values

- **HAL:** status (HAL_OK/HAL_TIMEOUT)

Notes

- This function waits for the cache being disabled but not for the end of the automatic cache invalidation procedure.

HAL_ICACHE_IsEnabled

Function name

uint32_t HAL_ICACHE_IsEnabled (void)

Function description

Check whether the Instruction Cache is enabled or not.

Return values

- **Status:** (0: disabled, 1: enabled)

HAL_ICACHE_ConfigAssociativityMode

Function name

HAL_StatusTypeDef HAL_ICACHE_ConfigAssociativityMode (uint32_t AssociativityMode)

Function description

Configure the Instruction Cache cache associativity mode selection.

Parameters

- **AssociativityMode:** Associativity mode selection This parameter can be one of the following values:
  – ICACHE_1WAY 1-way cache (direct mapped cache)
  – ICACHE_2WAYS 2-ways set associative cache (default)

Return values

- **HAL:** status (HAL_OK/HAL_ERROR)

HAL_ICACHE_DeInit

Function name

HAL_StatusTypeDef HAL_ICACHE_DeInit (void)

Function description

DeInitialize the Instruction Cache.

Return values

- **HAL:** status (HAL_OK)

HAL_ICACHE_Invalidate

Function name

HAL_StatusTypeDef HAL_ICACHE_Invalidate (void)

Function description

Invalidate the Instruction Cache.

Return values

- **HAL:** status (HAL_OK/HAL_ERROR/HAL_TIMEOUT)

Notes

- This function waits for the end of cache invalidation procedure and clears the associated BSYENDF flag.

HAL_ICACHE_Invalidate_IT

Function name

HAL_StatusTypeDef HAL_ICACHE_Invalidate_IT (void)

Function description

Invalidate the Instruction Cache with interrupt.

Return values

- **HAL:** status (HAL_OK/HAL_ERROR)

Notes

- This function launches cache invalidation and returns. User application shall resort to interrupt generation to check the end of the cache invalidation with the BSYENDF flag and the HAL_ICACHE_InvalidateCompleteCallback() callback.

HAL_ICACHE_WaitForInvalidateComplete

Function name

HAL_StatusTypeDef HAL_ICACHE_WaitForInvalidateComplete (void)

Function description

Wait for the end of the Instruction Cache invalidate procedure.

Return values

- **HAL:** status (HAL_OK/HAL_TIMEOUT)

Notes

- This function checks and clears the BSYENDF flag when set.

HAL_ICACHE_Monitor_Start

Function name

HAL_StatusTypeDef HAL_ICACHE_Monitor_Start (uint32_t MonitorType)

Function description

Start the Instruction Cache performance monitoring.

Parameters

- **MonitorType:** Monitoring type This parameter can be one of the following values:
  – ICACHE_MONITOR_HIT_MISS Hit & Miss monitoring
  – ICACHE_MONITOR_HIT Hit monitoring
  – ICACHE_MONITOR_MISS Miss monitoring

Return values

- **HAL:** status (HAL_OK)

HAL_ICACHE_Monitor_Stop

Function name

HAL_StatusTypeDef HAL_ICACHE_Monitor_Stop (uint32_t MonitorType)

Function description

Stop the Instruction Cache performance monitoring.

Parameters

- **MonitorType:** Monitoring type This parameter can be one of the following values:
  – ICACHE_MONITOR_HIT_MISS Hit & Miss monitoring
  – ICACHE_MONITOR_HIT Hit monitoring
  – ICACHE_MONITOR_MISS Miss monitoring

Return values

- **HAL:** status (HAL_OK)

Notes

- Stopping the monitoring does not reset the values.

HAL_ICACHE_Monitor_Reset

Function name

HAL_StatusTypeDef HAL_ICACHE_Monitor_Reset (uint32_t MonitorType)

Function description

Reset the Instruction Cache performance monitoring values.

Parameters

- **MonitorType:** Monitoring type This parameter can be one of the following values:
  – ICACHE_MONITOR_HIT_MISS Hit & Miss monitoring
  – ICACHE_MONITOR_HIT Hit monitoring
  – ICACHE_MONITOR_MISS Miss monitoring

Return values

- **HAL:** status (HAL_OK)

HAL_ICACHE_Monitor_GetHitValue

Function name

uint32_t HAL_ICACHE_Monitor_GetHitValue (void)

Function description

Get the Instruction Cache performance Hit monitoring value.

Return values

- **Hit:** monitoring value

Notes

- Upon reaching the 32-bit maximum value, monitor does not wrap.

HAL_ICACHE_Monitor_GetMissValue

Function name

uint32_t HAL_ICACHE_Monitor_GetMissValue (void)

Function description

Get the Instruction Cache performance Miss monitoring value.

Return values

- **Miss:** monitoring value

Notes

- Upon reaching the 32-bit maximum value, monitor does not wrap.

HAL_ICACHE_IRQHandler

Function name

void HAL_ICACHE_IRQHandler (void)

Function description

Handle the Instruction Cache interrupt request.

Return values

- **None:**

Notes

- This function should be called under the ICACHE_IRQHandler().
- This function respectively disables the interrupt and clears the flag of any pending flag before calling the associated user callback.

HAL_ICACHE_InvalidateCompleteCallback

Function name

void HAL_ICACHE_InvalidateCompleteCallback (void)

Function description

Cache invalidation complete callback.

HAL_ICACHE_ErrorCallback

Function name

void HAL_ICACHE_ErrorCallback (void)

Function description

Error callback.

HAL_ICACHE_EnableRemapRegion

Function name

HAL_StatusTypeDef HAL_ICACHE_EnableRemapRegion (uint32_t Region, const ICACHE_RegionConfigTypeDef *const pRegionConfig)

Function description

Configure and enable a region for memory remapping.

Parameters

- **Region:** Region number This parameter can be a value of
  - Remapped Region number
- **pRegionConfig:** Pointer to structure of ICACHE region configuration parameters

Return values

- **HAL:** status (HAL_OK/HAL_ERROR)

Notes

- The Instruction Cache and the region must be disabled.

HAL_ICACHE_DisableRemapRegion

Function name

HAL_StatusTypeDef HAL_ICACHE_DisableRemapRegion (uint32_t Region)

Function description

Disable the memory remapping for a predefined region.

Parameters

- **Region:** Region number This parameter can be a value of
  - Remapped Region number

Return values

- **HAL:** status (HAL_OK/HAL_ERROR)

40.3 ICACHE Firmware driver defines

The following section lists the various define and macros of the module.

40.3.1 ICACHE

ICACHE

Flags

ICACHE_FLAG_BUSY

Busy flag

ICACHE_FLAG_BUSYEND

Busy end flag

ICACHE_FLAG_ERROR

Cache error flag

Flags and Interrupts Management

__HAL_ICACHE_ENABLE_IT

Description:

- Enable ICACHE interrupts.

Parameters:

- __INTERRUPT__: specifies the ICACHE interrupt sources to be enabled. This parameter can be any combination of the following values:
  - ICACHE_IT_BUSYEND Busy end interrupt
  - ICACHE_IT_ERROR Cache error interrupt

__HAL_ICACHE_DISABLE_IT

Description:
- Disable ICACHE interrupts.

Parameters:
- __INTERRUPT__: specifies the ICACHE interrupt sources to be disabled. This parameter can be any combination of the following values:
  - ICACHE_IT_BUSYEND Busy end interrupt
  - ICACHE_IT_ERROR Cache error interrupt

__HAL_ICACHE_GET_IT_SOURCE

Description:
- Check whether the specified ICACHE interrupt source is enabled or not.

Parameters:
- __INTERRUPT__: specifies the ICACHE interrupt source to check. This parameter can be any combination of the following values:
  - ICACHE_IT_BUSYEND Busy end interrupt
  - ICACHE_IT_ERROR Cache error interrupt

Return value:
- The: state of __INTERRUPT__ (0 or 1).

__HAL_ICACHE_GET_FLAG

Description:
- Check whether the selected ICACHE flag is set or not.

Parameters:
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - ICACHE_FLAG_BUSY Busy flag
  - ICACHE_FLAG_BUSYEND Busy end flag
  - ICACHE_FLAG_ERROR Cache error flag

Return value:
- The: state of __FLAG__ (0 or 1).

__HAL_ICACHE_CLEAR_FLAG

Description:
- Clear the selected ICACHE flags.

Parameters:
- __FLAG__: specifies the ICACHE flags to clear. This parameter can be any combination of the following values:
  - ICACHE_FLAG_BUSYEND Busy end flag
  - ICACHE_FLAG_ERROR Cache error flag

Interrupts

ICACHE_IT_BUSYEND

Busy end interrupt

ICACHE_IT_ERROR

Cache error interrupt

Monitor type

ICACHE_MONITOR_HIT_MISS

Hit & Miss monitoring

ICACHE_MONITOR_HIT

Hit monitoring

ICACHE_MONITOR_MISS

Miss monitoring

Remapped Output burst type

ICACHE_OUTPUT_BURST_WRAP

WRAP

ICACHE_OUTPUT_BURST_INCR

INCR

Remapped Region number

ICACHE_REGION_0

Region 0

ICACHE_REGION_1

Region 1

ICACHE_REGION_2

Region 2

ICACHE_REGION_3

Region 3

Remapped Region size

ICACHE_REGIONSIZE_2MB

Region size 2MB

ICACHE_REGIONSIZE_4MB

Region size 4MB

ICACHE_REGIONSIZE_8MB

Region size 8MB

ICACHE_REGIONSIZE_16MB

Region size 16MB

ICACHE_REGIONSIZE_32MB

Region size 32MB

ICACHE_REGIONSIZE_64MB

Region size 64MB

ICACHE_REGIONSIZE_128MB

Region size 128MB

Remapped Traffic route

ICACHE_MASTER1_PORT

Master1 port

ICACHE_MASTER2_PORT

Master2 port

Ways selection

ICACHE_1WAY

1-way cache (direct mapped cache)

ICACHE_2WAYS

2-ways set associative cache (default)

41 HAL IRDA Generic Driver

41.1 IRDA Firmware driver registers structures

41.1.1 IRDA_InitTypeDef

IRDA_InitTypeDef is defined in the stm32u5xx_hal_irda.h

Data Fields

- ***uint32_t BaudRate***
- ***uint32_t WordLength***
- ***uint32_t Parity***
- ***uint32_t Mode***
- ***uint8_t Prescaler***
- ***uint16_t PowerMode***
- ***uint32_t ClockPrescaler***

Field Documentation

- ***uint32_t IRDA_InitTypeDef::BaudRate***
  This member configures the IRDA communication baud rate. The baud rate register is computed using the following formula: Baud Rate Register = ((usart_ker_ckpres) / ((hirda->Init.BaudRate))) where usart_ker_ckpres is the IRDA input clock divided by a prescaler
- ***uint32_t IRDA_InitTypeDef::WordLength***
  Specifies the number of data bits transmitted or received in a frame. This parameter can be a value of ***IRDAEx_Word_Length***
- ***uint32_t IRDA_InitTypeDef::Parity***
  Specifies the parity mode. This parameter can be a value of ***IRDA_Parity***
  Note:
  – When parity is enabled, the computed parity is inserted at the MSB position of the transmitted data (9th bit when the word length is set to 9 data bits; 8th bit when the word length is set to 8 data bits).
- ***uint32_t IRDA_InitTypeDef::Mode***
  Specifies whether the Receive or Transmit mode is enabled or disabled. This parameter can be a value of ***IRDA_Transfer_Mode***
- ***uint8_t IRDA_InitTypeDef::Prescaler***
  Specifies the Prescaler value for dividing the UART/USART source clock to achieve low-power frequency.
  Note:
  – Prescaler value 0 is forbidden
- ***uint16_t IRDA_InitTypeDef::PowerMode***
  Specifies the IRDA power mode. This parameter can be a value of ***IRDA_Low_Power***
- ***uint32_t IRDA_InitTypeDef::ClockPrescaler***
  Specifies the prescaler value used to divide the IRDA clock source. This parameter can be a value of ***IRDA_ClockPrescaler***.

41.1.2 __IRDA_HandleTypeDef

__IRDA_HandleTypeDef is defined in the stm32u5xx_hal_irda.h

Data Fields

- ***USART_TypeDef * Instance***
- ***IRDA_InitTypeDef Init***
- ***const uint8_t * pTxBuffPtr***
- ***uint16_t TxXferSize***
- ***__IO uint16_t TxXferCount***
- ***uint8_t * pRxBuffPtr***
- ***uint16_t RxXferSize***
- ***__IO uint16_t RxXferCount***

- ***uint16_t Mask***
- ***DMA_HandleTypeDef * hdmatx***
- ***DMA_HandleTypeDef * hdmarx***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_IRDA_StateTypeDef gState***
- ***__IO HAL_IRDA_StateTypeDef RxState***
- ***__IO uint32_t ErrorCode***
- ***void(* TxHalfCpltCallback***
- ***void(* TxCpltCallback***
- ***void(* RxHalfCpltCallback***
- ***void(* RxCpltCallback***
- ***void(* ErrorCallback***
- ***void(* AbortCpltCallback***
- ***void(* AbortTransmitCpltCallback***
- ***void(* AbortReceiveCpltCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***USART_TypeDef* __IRDA_HandleTypeDef::Instance***
  USART registers base address
- ***IRDA_InitTypeDef __IRDA_HandleTypeDef::Init***
  IRDA communication parameters
- ***const uint8_t* __IRDA_HandleTypeDef::pTxBuffPtr***
  Pointer to IRDA Tx transfer Buffer
- ***uint16_t __IRDA_HandleTypeDef::TxXferSize***
  IRDA Tx Transfer size
- ***__IO uint16_t __IRDA_HandleTypeDef::TxXferCount***
  IRDA Tx Transfer Counter
- ***uint8_t* __IRDA_HandleTypeDef::pRxBuffPtr***
  Pointer to IRDA Rx transfer Buffer
- ***uint16_t __IRDA_HandleTypeDef::RxXferSize***
  IRDA Rx Transfer size
- ***__IO uint16_t __IRDA_HandleTypeDef::RxXferCount***
  IRDA Rx Transfer Counter
- ***uint16_t __IRDA_HandleTypeDef::Mask***
  USART RX RDR register mask
- ***DMA_HandleTypeDef* __IRDA_HandleTypeDef::hdmatx***
  IRDA Tx DMA Handle parameters
- ***DMA_HandleTypeDef* __IRDA_HandleTypeDef::hdmarx***
  IRDA Rx DMA Handle parameters
- ***HAL_LockTypeDef __IRDA_HandleTypeDef::Lock***
  Locking object
- ***__IO HAL_IRDA_StateTypeDef __IRDA_HandleTypeDef::gState***
  IRDA state information related to global Handle management and also related to Tx operations. This parameter can be a value of **HAL_IRDA_StateTypeDef**
- ***__IO HAL_IRDA_StateTypeDef __IRDA_HandleTypeDef::RxState***
  IRDA state information related to Rx operations. This parameter can be a value of **HAL_IRDA_StateTypeDef**
- ***__IO uint32_t __IRDA_HandleTypeDef::ErrorCode***
  IRDA Error code
- ***void(* __IRDA_HandleTypeDef::TxHalfCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Tx Half Complete Callback
- ***void(* __IRDA_HandleTypeDef::TxCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Tx Complete Callback

- ***void(* __IRDA_HandleTypeDef::RxHalfCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Rx Half Complete Callback
- ***void(* __IRDA_HandleTypeDef::RxCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Rx Complete Callback
- ***void(* __IRDA_HandleTypeDef::ErrorCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Error Callback
- ***void(* __IRDA_HandleTypeDef::AbortCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Abort Complete Callback
- ***void(* __IRDA_HandleTypeDef::AbortTransmitCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Abort Transmit Complete Callback
- ***void(* __IRDA_HandleTypeDef::AbortReceiveCpltCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Abort Receive Complete Callback
- ***void(* __IRDA_HandleTypeDef::MspInitCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Msp Init callback
- ***void(* __IRDA_HandleTypeDef::MspDeInitCallback)(struct __IRDA_HandleTypeDef *hirda)***
  IRDA Msp DeInit callback

41.2 IRDA Firmware driver API description

The following section lists the various functions of the IRDA library.

41.2.1 How to use this driver

The IRDA HAL driver can be used as follows:

1. Declare a IRDA_HandleTypeDef handle structure (eg. IRDA_HandleTypeDef hirda).
2. Initialize the IRDA low level resources by implementing the HAL_IRDA_MspInit() API in setting the associated USART or UART in IRDA mode:
   – Enable the USARTx/UARTx interface clock.
   – USARTx/UARTx pins configuration:
     ◦ Enable the clock for the USARTx/UARTx GPIOs.
     ◦ Configure these USARTx/UARTx pins (TX as alternate function pull-up, RX as alternate function Input).
   – NVIC configuration if you need to use interrupt process (HAL_IRDA_Transmit_IT() and HAL_IRDA_Receive_IT() APIs):
     ◦ Configure the USARTx/UARTx interrupt priority.
     ◦ Enable the NVIC USARTx/UARTx IRQ handle.
     ◦ The specific IRDA interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros __HAL_IRDA_ENABLE_IT() and __HAL_IRDA_DISABLE_IT() inside the transmit and receive process.
   – DMA Configuration if you need to use DMA process (HAL_IRDA_Transmit_DMA() and HAL_IRDA_Receive_DMA() APIs):
     ◦ Declare a DMA handle structure for the Tx/Rx channel.
     ◦ Enable the DMAx interface clock.
     ◦ Configure the declared DMA handle structure with the required Tx/Rx parameters.
     ◦ Configure the DMA Tx/Rx channel.
     ◦ Associate the initialized DMA handle to the IRDA DMA Tx/Rx handle.
     ◦ Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx/Rx channel.
3. Program the Baud Rate, Word Length and Parity and Mode(Receiver/Transmitter), the normal or low power mode and the clock prescaler in the hirda handle Init structure.

4. Initialize the IRDA registers by calling the HAL_IRDA_Init() API:
   – This API configures also the low level Hardware GPIO, CLOCK, CORTEX...etc) by calling the customized HAL_IRDA_MspInit() API.

Note: The specific IRDA interrupts (Transmission complete interrupt, RXNE interrupt and Error Interrupts) will be managed using the macros __HAL_IRDA_ENABLE_IT() and __HAL_IRDA_DISABLE_IT() inside the transmit and receive process.

5. Three operation modes are available within this driver :

Polling mode IO operation

- Send an amount of data in blocking mode using HAL_IRDA_Transmit()
- Receive an amount of data in blocking mode using HAL_IRDA_Receive()

Interrupt mode IO operation

- Send an amount of data in non-blocking mode using HAL_IRDA_Transmit_IT()
- At transmission end of transfer HAL_IRDA_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_TxCpltCallback()
- Receive an amount of data in non-blocking mode using HAL_IRDA_Receive_IT()
- At reception end of transfer HAL_IRDA_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_RxCpltCallback()
- In case of transfer Error, HAL_IRDA_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_IRDA_ErrorCallback()

DMA mode IO operation

- Send an amount of data in non-blocking mode (DMA) using HAL_IRDA_Transmit_DMA()
- At transmission half of transfer HAL_IRDA_TxHalfCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_TxHalfCpltCallback()
- At transmission end of transfer HAL_IRDA_TxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_TxCpltCallback()
- Receive an amount of data in non-blocking mode (DMA) using HAL_IRDA_Receive_DMA()
- At reception half of transfer HAL_IRDA_RxHalfCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_RxHalfCpltCallback()
- At reception end of transfer HAL_IRDA_RxCpltCallback() is executed and user can add his own code by customization of function pointer HAL_IRDA_RxCpltCallback()
- In case of transfer Error, HAL_IRDA_ErrorCallback() function is executed and user can add his own code by customization of function pointer HAL_IRDA_ErrorCallback()

IRDA HAL driver macros list

Below the list of most used macros in IRDA HAL driver.

- __HAL_IRDA_ENABLE: Enable the IRDA peripheral
- __HAL_IRDA_DISABLE: Disable the IRDA peripheral
- __HAL_IRDA_GET_FLAG : Check whether the specified IRDA flag is set or not
- __HAL_IRDA_CLEAR_FLAG : Clear the specified IRDA pending flag
- __HAL_IRDA_ENABLE_IT: Enable the specified IRDA interrupt
- __HAL_IRDA_DISABLE_IT: Disable the specified IRDA interrupt
- __HAL_IRDA_GET_IT_SOURCE: Check whether or not the specified IRDA interrupt is enabled

Note: You can refer to the IRDA HAL driver header file for more useful macros

41.2.2 Callback registration

The compilation define USE_HAL_IRDA_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use Function HAL_IRDA_RegisterCallback() to register a user callback. Function HAL_IRDA_RegisterCallback() allows to register following callbacks:

- TxHalfCpltCallback : Tx Half Complete Callback.
- TxCpltCallback : Tx Complete Callback.
- RxHalfCpltCallback : Rx Half Complete Callback.
- RxCpltCallback : Rx Complete Callback.
- ErrorCallback : Error Callback.
- AbortCpltCallback : Abort Complete Callback.
- AbortTransmitCpltCallback : Abort Transmit Complete Callback.
- AbortReceiveCpltCallback : Abort Receive Complete Callback.
- MspInitCallback : IRDA MspInit.
- MspDeInitCallback : IRDA MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_IRDA_UnRegisterCallback() to reset a callback to the default weak function. HAL_IRDA_UnRegisterCallback() takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- TxHalfCpltCallback : Tx Half Complete Callback.
- TxCpltCallback : Tx Complete Callback.
- RxHalfCpltCallback : Rx Half Complete Callback.
- RxCpltCallback : Rx Complete Callback.
- ErrorCallback : Error Callback.
- AbortCpltCallback : Abort Complete Callback.
- AbortTransmitCpltCallback : Abort Transmit Complete Callback.
- AbortReceiveCpltCallback : Abort Receive Complete Callback.
- MspInitCallback : IRDA MspInit.
- MspDeInitCallback : IRDA MspDeInit.

By default, after the HAL_IRDA_Init() and when the state is HAL_IRDA_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_IRDA_TxCpltCallback(), HAL_IRDA_RxHalfCpltCallback(). Exception done for MspInit and MspDeInit functions that are respectively reset to the legacy weak functions in the HAL_IRDA_Init() and HAL_IRDA_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_IRDA_Init() and HAL_IRDA_DeInit() keep and use the user MspInit/ MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in HAL_IRDA_STATE_READY state only. Exception done MspInit/ MspDeInit that can be registered/unregistered in HAL_IRDA_STATE_READY or HAL_IRDA_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_IRDA_RegisterCallback() before calling HAL_IRDA_DeInit() or HAL_IRDA_Init() function.

When The compilation define USE_HAL_IRDA_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and weak callbacks are used.

41.2.3 Initialization and Configuration functions

This subsection provides a set of functions allowing to initialize the USARTx in asynchronous IRDA mode.

- For the asynchronous mode only these parameters can be configured:
  - Baud Rate
  - Word Length
  - Parity: If the parity is enabled, then the MSB bit of the data written in the data register is transmitted but is changed by the parity bit.
  - Power mode
  - Prescaler setting
  - Receiver/transmitter modes

The HAL_IRDA_Init() API follows the USART asynchronous configuration procedures (details for the procedures are available in reference manual).

This section contains the following APIs:

- *HAL_IRDA_Init()*

- *HAL_IRDA_DeInit()*
- *HAL_IRDA_MspInit()*
- *HAL_IRDA_MspDeInit()*
- *HAL_IRDA_RegisterCallback()*
- *HAL_IRDA_UnRegisterCallback()*

41.2.4 IO operation functions

This subsection provides a set of functions allowing to manage the IRDA data transfers.

IrDA is a half duplex communication protocol. If the Transmitter is busy, any data on the IrDA receive line will be ignored by the IrDA decoder and if the Receiver is busy, data on the TX from the USART to IrDA will not be encoded by IrDA. While receiving data, transmission should be avoided as the data to be transmitted could be corrupted.

1. There are two modes of transfer:
   – Blocking mode: the communication is performed in polling mode. The HAL status of all data processing is returned by the same function after finishing transfer.
   – Non-Blocking mode: the communication is performed using Interrupts or DMA, these API's return the HAL status. The end of the data processing will be indicated through the dedicated IRDA IRQ when using Interrupt mode or the DMA IRQ when using DMA mode. The HAL_IRDA_TxCpltCallback(), HAL_IRDA_RxCpltCallback() user callbacks will be executed respectively at the end of the Transmit or Receive process The HAL_IRDA_ErrorCallback() user callback will be executed when a communication error is detected
2. Blocking mode APIs are :
   – HAL_IRDA_Transmit()
   – HAL_IRDA_Receive()
3. Non Blocking mode APIs with Interrupt are :
   – HAL_IRDA_Transmit_IT()
   – HAL_IRDA_Receive_IT()
   – HAL_IRDA_IRQHandler()
4. Non Blocking mode functions with DMA are :
   – HAL_IRDA_Transmit_DMA()
   – HAL_IRDA_Receive_DMA()
   – HAL_IRDA_DMAPause()
   – HAL_IRDA_DMAResume()
   – HAL_IRDA_DMAStop()
5. A set of Transfer Complete Callbacks are provided in Non Blocking mode:
   – HAL_IRDA_TxHalfCpltCallback()
   – HAL_IRDA_TxCpltCallback()
   – HAL_IRDA_RxHalfCpltCallback()
   – HAL_IRDA_RxCpltCallback()
   – HAL_IRDA_ErrorCallback()
6. Non-Blocking mode transfers could be aborted using Abort API's :
   – HAL_IRDA_Abort()
   – HAL_IRDA_AbortTransmit()
   – HAL_IRDA_AbortReceive()
   – HAL_IRDA_Abort_IT()
   – HAL_IRDA_AbortTransmit_IT()
   – HAL_IRDA_AbortReceive_IT()
7. For Abort services based on interrupts (HAL_IRDA_Abortxxx_IT), a set of Abort Complete Callbacks are provided:
   – HAL_IRDA_AbortCpltCallback()
   – HAL_IRDA_AbortTransmitCpltCallback()
   – HAL_IRDA_AbortReceiveCpltCallback()

8. In Non-Blocking mode transfers, possible errors are split into 2 categories. Errors are handled as follows :
   – Error is considered as Recoverable and non blocking : Transfer could go till end, but error severity is to be evaluated by user : this concerns Frame Error, Parity Error or Noise Error in Interrupt mode reception . Received character is then retrieved and stored in Rx buffer, Error code is set to allow user to identify error type, and HAL_IRDA_ErrorCallback() user callback is executed. Transfer is kept ongoing on IRDA side. If user wants to abort it, Abort services should be called by user.
   – Error is considered as Blocking : Transfer could not be completed properly and is aborted. This concerns Overrun Error In Interrupt mode reception and all errors in DMA mode. Error code is set to allow user to identify error type, and HAL_IRDA_ErrorCallback() user callback is executed.

This section contains the following APIs:
- *HAL_IRDA_Transmit()*
- *HAL_IRDA_Receive()*
- *HAL_IRDA_Transmit_IT()*
- *HAL_IRDA_Receive_IT()*
- *HAL_IRDA_Transmit_DMA()*
- *HAL_IRDA_Receive_DMA()*
- *HAL_IRDA_DMAPause()*
- *HAL_IRDA_DMAResume()*
- *HAL_IRDA_DMAStop()*
- *HAL_IRDA_Abort()*
- *HAL_IRDA_AbortTransmit()*
- *HAL_IRDA_AbortReceive()*
- *HAL_IRDA_Abort_IT()*
- *HAL_IRDA_AbortTransmit_IT()*
- *HAL_IRDA_AbortReceive_IT()*
- *HAL_IRDA_IRQHandler()*
- *HAL_IRDA_TxCpltCallback()*
- *HAL_IRDA_TxHalfCpltCallback()*
- *HAL_IRDA_RxCpltCallback()*
- *HAL_IRDA_RxHalfCpltCallback()*
- *HAL_IRDA_ErrorCallback()*
- *HAL_IRDA_AbortCpltCallback()*
- *HAL_IRDA_AbortTransmitCpltCallback()*
- *HAL_IRDA_AbortReceiveCpltCallback()*

41.2.5 Peripheral State and Error functions

This subsection provides a set of functions allowing to return the State of IrDA communication process and also return Peripheral Errors occurred during communication process
- HAL_IRDA_GetState() API can be helpful to check in run-time the state of the IRDA peripheral handle.
- HAL_IRDA_GetError() checks in run-time errors that could occur during communication.

This section contains the following APIs:
- *HAL_IRDA_GetState()*
- *HAL_IRDA_GetError()*

41.2.6 Detailed description of functions

HAL_IRDA_Init

Function name

HAL_StatusTypeDef HAL_IRDA_Init (IRDA_HandleTypeDef * hirda)

Function description

Initialize the IRDA mode according to the specified parameters in the IRDA_InitTypeDef and initialize the associated handle.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **HAL:** status

HAL_IRDA_DeInit

Function name

HAL_StatusTypeDef HAL_IRDA_DeInit (IRDA_HandleTypeDef * hirda)

Function description

DeInitialize the IRDA peripheral.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **HAL:** status

HAL_IRDA_MspInit

Function name

void HAL_IRDA_MspInit (IRDA_HandleTypeDef * hirda)

Function description

Initialize the IRDA MSP.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_MspDeInit

Function name

void HAL_IRDA_MspDeInit (IRDA_HandleTypeDef * hirda)

Function description

DeInitialize the IRDA MSP.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_RegisterCallback

Function name

HAL_StatusTypeDef HAL_IRDA_RegisterCallback (IRDA_HandleTypeDef * hirda, HAL_IRDA_CallbackIDTypeDef CallbackID, pIRDA_CallbackTypeDef pCallback)

Function description

Register a User IRDA Callback To be used to override the weak predefined callback.

Parameters

- **hirda:** irda handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  – HAL_IRDA_TX_HALFCOMPLETE_CB_ID Tx Half Complete Callback ID
  – HAL_IRDA_TX_COMPLETE_CB_ID Tx Complete Callback ID
  – HAL_IRDA_RX_HALFCOMPLETE_CB_ID Rx Half Complete Callback ID
  – HAL_IRDA_RX_COMPLETE_CB_ID Rx Complete Callback ID
  – HAL_IRDA_ERROR_CB_ID Error Callback ID
  – HAL_IRDA_ABORT_COMPLETE_CB_ID Abort Complete Callback ID
  – HAL_IRDA_ABORT_TRANSMIT_COMPLETE_CB_ID Abort Transmit Complete Callback ID
  – HAL_IRDA_ABORT_RECEIVE_COMPLETE_CB_ID Abort Receive Complete Callback ID
  – HAL_IRDA_MSPINIT_CB_ID MspInit Callback ID
  – HAL_IRDA_MSPDEINIT_CB_ID MspDeInit Callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

Notes

- The HAL_IRDA_RegisterCallback() may be called before HAL_IRDA_Init() in HAL_IRDA_STATE_RESET to register callbacks for HAL_IRDA_MSPINIT_CB_ID and HAL_IRDA_MSPDEINIT_CB_ID

HAL_IRDA_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_IRDA_UnRegisterCallback (IRDA_HandleTypeDef * hirda, HAL_IRDA_CallbackIDTypeDef CallbackID)

Function description

Unregister an IRDA callback IRDA callback is redirected to the weak predefined callback.

Parameters

- **hirda:** irda handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  – HAL_IRDA_TX_HALFCOMPLETE_CB_ID Tx Half Complete Callback ID
  – HAL_IRDA_TX_COMPLETE_CB_ID Tx Complete Callback ID
  – HAL_IRDA_RX_HALFCOMPLETE_CB_ID Rx Half Complete Callback ID
  – HAL_IRDA_RX_COMPLETE_CB_ID Rx Complete Callback ID
  – HAL_IRDA_ERROR_CB_ID Error Callback ID
  – HAL_IRDA_ABORT_COMPLETE_CB_ID Abort Complete Callback ID
  – HAL_IRDA_ABORT_TRANSMIT_COMPLETE_CB_ID Abort Transmit Complete Callback ID
  – HAL_IRDA_ABORT_RECEIVE_COMPLETE_CB_ID Abort Receive Complete Callback ID
  – HAL_IRDA_MSPINIT_CB_ID MspInit Callback ID
  – HAL_IRDA_MSPDEINIT_CB_ID MspDeInit Callback ID

Return values

- **HAL:** status

Notes

- The HAL_IRDA_UnRegisterCallback() may be called before HAL_IRDA_Init() in HAL_IRDA_STATE_RESET to un-register callbacks for HAL_IRDA_MSPINIT_CB_ID and HAL_IRDA_MSPDEINIT_CB_ID

HAL_IRDA_Transmit

Function name

HAL_StatusTypeDef HAL_IRDA_Transmit (IRDA_HandleTypeDef * hirda, const uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Send an amount of data in blocking mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** Pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be sent.
- **Timeout:** Specify timeout value.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the sent data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.

HAL_IRDA_Receive

Function name

HAL_StatusTypeDef HAL_IRDA_Receive (IRDA_HandleTypeDef * hirda, uint8_t * pData, uint16_t Size, uint32_t Timeout)

Function description

Receive an amount of data in blocking mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** Pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be received.
- **Timeout:** Specify timeout value.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the received data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.

HAL_IRDA_Transmit_IT

Function name

HAL_StatusTypeDef HAL_IRDA_Transmit_IT (IRDA_HandleTypeDef * hirda, const uint8_t * pData, uint16_t Size)

Function description

Send an amount of data in interrupt mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** Pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be sent.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the sent data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.

HAL_IRDA_Receive_IT

Function name

HAL_StatusTypeDef HAL_IRDA_Receive_IT (IRDA_HandleTypeDef * hirda, uint8_t * pData, uint16_t Size)

Function description

Receive an amount of data in interrupt mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** Pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be received.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the received data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.

HAL_IRDA_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_IRDA_Transmit_DMA (IRDA_HandleTypeDef * hirda, const uint8_t * pData, uint16_t Size)

Function description

Send an amount of data in DMA mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be sent.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the sent data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.

HAL_IRDA_Receive_DMA

Function name

HAL_StatusTypeDef HAL_IRDA_Receive_DMA (IRDA_HandleTypeDef * hirda, uint8_t * pData, uint16_t Size)

Function description

Receive an amount of data in DMA mode.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.
- **pData:** Pointer to data buffer (u8 or u16 data elements).
- **Size:** Amount of data elements (u8 or u16) to be received.

Return values

- **HAL:** status

Notes

- When UART parity is not enabled (PCE = 0), and Word Length is configured to 9 bits (M1-M0 = 01), the received data is handled as a set of u16. In this case, Size must reflect the number of u16 available through pData.
- When the IRDA parity is enabled (PCE = 1), the received data contains the parity bit (MSB position).

HAL_IRDA_DMAPause

Function name

HAL_StatusTypeDef HAL_IRDA_DMAPause (IRDA_HandleTypeDef * hirda)

Function description

Pause the DMA Transfer.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **HAL:** status

HAL_IRDA_DMAResume

Function name

HAL_StatusTypeDef HAL_IRDA_DMAResume (IRDA_HandleTypeDef * hirda)

Function description

Resume the DMA Transfer.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

HAL_IRDA_DMAStop

Function name

HAL_StatusTypeDef HAL_IRDA_DMAStop (IRDA_HandleTypeDef * hirda)

Function description

Stop the DMA Transfer.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

HAL_IRDA_Abort

Function name

HAL_StatusTypeDef HAL_IRDA_Abort (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing transfers (blocking mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Tx and Rx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort (in case of transfer in DMA mode)Set handle State to READY
- This procedure is executed in blocking mode : when exiting function, Abort is considered as completed.

HAL_IRDA_AbortTransmit

Function name

HAL_StatusTypeDef HAL_IRDA_AbortTransmit (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing Transmit transfer (blocking mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing Tx transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Tx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort (in case of transfer in DMA mode)Set handle State to READY
- This procedure is executed in blocking mode : when exiting function, Abort is considered as completed.

HAL_IRDA_AbortReceive

Function name

HAL_StatusTypeDef HAL_IRDA_AbortReceive (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing Receive transfer (blocking mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing Rx transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Rx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort (in case of transfer in DMA mode)Set handle State to READY
- This procedure is executed in blocking mode : when exiting function, Abort is considered as completed.

HAL_IRDA_Abort_IT

Function name

HAL_StatusTypeDef HAL_IRDA_Abort_IT (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing transfers (Interrupt mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Tx and Rx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort_IT (in case of transfer in DMA mode)Set handle State to READYAt abort completion, call user abort complete callback
- This procedure is executed in Interrupt mode, meaning that abort procedure could be considered as completed only when user abort complete callback is executed (not when exiting function).

HAL_IRDA_AbortTransmit_IT

Function name

HAL_StatusTypeDef HAL_IRDA_AbortTransmit_IT (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing Transmit transfer (Interrupt mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing Tx transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Tx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort_IT (in case of transfer in DMA mode)Set handle State to READYAt abort completion, call user abort complete callback
- This procedure is executed in Interrupt mode, meaning that abort procedure could be considered as completed only when user abort complete callback is executed (not when exiting function).

HAL_IRDA_AbortReceive_IT

Function name

HAL_StatusTypeDef HAL_IRDA_AbortReceive_IT (IRDA_HandleTypeDef * hirda)

Function description

Abort ongoing Receive transfer (Interrupt mode).

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified UART module.

Return values

- **HAL:** status

Notes

- This procedure could be used for aborting any ongoing Rx transfer started in Interrupt or DMA mode. This procedure performs following operations : Disable IRDA Interrupts (Rx)Disable the DMA transfer in the peripheral register (if enabled)Abort DMA transfer by calling HAL_DMA_Abort_IT (in case of transfer in DMA mode)Set handle State to READYAt abort completion, call user abort complete callback
- This procedure is executed in Interrupt mode, meaning that abort procedure could be considered as completed only when user abort complete callback is executed (not when exiting function).

HAL_IRDA_IRQHandler

Function name

void HAL_IRDA_IRQHandler (IRDA_HandleTypeDef * hirda)

Function description

Handle IRDA interrupt request.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_TxCpltCallback

Function name

void HAL_IRDA_TxCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

Tx Transfer completed callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_RxCpltCallback

Function name

void HAL_IRDA_RxCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

Rx Transfer completed callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_TxHalfCpltCallback

Function name

void HAL_IRDA_TxHalfCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

Tx Half Transfer completed callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified USART module.

Return values

- **None:**

HAL_IRDA_RxHalfCpltCallback

Function name

void HAL_IRDA_RxHalfCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

Rx Half Transfer complete callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_ErrorCallback

Function name

void HAL_IRDA_ErrorCallback (IRDA_HandleTypeDef * hirda)

Function description

IRDA error callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_AbortCpltCallback

Function name

void HAL_IRDA_AbortCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

IRDA Abort Complete callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_AbortTransmitCpltCallback

Function name

void HAL_IRDA_AbortTransmitCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

IRDA Abort Complete callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_AbortReceiveCpltCallback

Function name

void HAL_IRDA_AbortReceiveCpltCallback (IRDA_HandleTypeDef * hirda)

Function description

IRDA Abort Receive Complete callback.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **None:**

HAL_IRDA_GetState

Function name

HAL_IRDA_StateTypeDef HAL_IRDA_GetState (const IRDA_HandleTypeDef * hirda)

Function description

Return the IRDA handle state.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **HAL:** state

HAL_IRDA_GetError

Function name

uint32_t HAL_IRDA_GetError (const IRDA_HandleTypeDef * hirda)

Function description

Return the IRDA handle error code.

Parameters

- **hirda:** Pointer to a IRDA_HandleTypeDef structure that contains the configuration information for the specified IRDA module.

Return values

- **IRDA:** Error Code

41.3 IRDA Firmware driver defines

The following section lists the various define and macros of the module.

41.3.1 IRDA

IRDA

IRDA Clock Prescaler

IRDA_PRESCALER_DIV1

fclk_pres = fclk

IRDA_PRESCALER_DIV2

fclk_pres = fclk/2

HAL_IRDA_ERROR_PE
Parity error

HAL_IRDA_ERROR_NE
Noise error

HAL_IRDA_ERROR_FE
frame error

HAL_IRDA_ERROR_ORE

Overrun error

HAL_IRDA_ERROR_DMA

DMA transfer error

HAL_IRDA_ERROR_BUSY

Busy Error

HAL_IRDA_ERROR_INVALID_CALLBACK

Invalid Callback error

IRDA Exported Macros

__HAL_IRDA_RESET_HANDLE_STATE

Description:

- Reset IRDA handle state.

Parameters:

- __HANDLE__: IRDA handle.

Return value:

- None

__HAL_IRDA_FLUSH_DRREGISTER

Description:

- Flush the IRDA DR register.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_FLAG

Description:

- Clear the specified IRDA pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __FLAG__: specifies the flag to check. This parameter can be any combination of the following values:
  - IRDA_CLEAR_PEF
  - IRDA_CLEAR_FEF
  - IRDA_CLEAR_NEF
  - IRDA_CLEAR_OREF
  - IRDA_CLEAR_TCF
  - IRDA_CLEAR_IDLEF

Return value:

- None

__HAL_IRDA_CLEAR_PEFLAG

Description:

- Clear the IRDA PE pending flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_CLEAR_FEFLAG

Description:
- Clear the IRDA FE pending flag.

Parameters:
- __HANDLE__: specifies the IRDA Handle.

Return value:
- None

__HAL_IRDA_CLEAR_NEFLAG

Description:
- Clear the IRDA NE pending flag.

Parameters:
- __HANDLE__: specifies the IRDA Handle.

Return value:
- None

__HAL_IRDA_CLEAR_OREFLAG

Description:
- Clear the IRDA ORE pending flag.

Parameters:
- __HANDLE__: specifies the IRDA Handle.

Return value:
- None

__HAL_IRDA_CLEAR_IDLEFLAG

Description:
- Clear the IRDA IDLE pending flag.

Parameters:
- __HANDLE__: specifies the IRDA Handle.

Return value:
- None

__HAL_IRDA_GET_FLAG

Description:
- Check whether the specified IRDA flag is set or not.

Parameters:
- __HANDLE__: specifies the IRDA Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - IRDA_FLAG_REACK Receive enable acknowledge flag
  - IRDA_FLAG_TEACK Transmit enable acknowledge flag
  - IRDA_FLAG_BUSY Busy flag
  - IRDA_FLAG_ABRF Auto Baud rate detection flag
  - IRDA_FLAG_ABRE Auto Baud rate detection error flag
  - IRDA_FLAG_TXE Transmit data register empty flag
  - IRDA_FLAG_TC Transmission Complete flag
  - IRDA_FLAG_RXNE Receive data register not empty flag
  - IRDA_FLAG_ORE OverRun Error flag
  - IRDA_FLAG_NE Noise Error flag
  - IRDA_FLAG_FE Framing Error flag
  - IRDA_FLAG_PE Parity Error flag

Return value:
- The: new state of __FLAG__ (TRUE or FALSE).

__HAL_IRDA_ENABLE_IT

Description:
- Enable the specified IRDA interrupt.

Parameters:
- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to enable. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_PE Parity Error interrupt
  - IRDA_IT_ERR Error interrupt(Frame error, noise error, overrun error)

Return value:
- None

__HAL_IRDA_DISABLE_IT

Description:
- Disable the specified IRDA interrupt.

Parameters:
- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to disable. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_PE Parity Error interrupt
  - IRDA_IT_ERR Error interrupt(Frame error, noise error, overrun error)

Return value:
- None

__HAL_IRDA_GET_IT

Description:
- Check whether the specified IRDA interrupt has occurred or not.

Parameters:
- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to check. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_ORE OverRun Error interrupt
  - IRDA_IT_NE Noise Error interrupt
  - IRDA_IT_FE Framing Error interrupt
  - IRDA_IT_PE Parity Error interrupt

Return value:
- The: new state of __IT__ (SET or RESET).

__HAL_IRDA_GET_IT_SOURCE

Description:
- Check whether the specified IRDA interrupt source is enabled or not.

Parameters:
- __HANDLE__: specifies the IRDA Handle.
- __INTERRUPT__: specifies the IRDA interrupt source to check. This parameter can be one of the following values:
  - IRDA_IT_TXE Transmit Data Register empty interrupt
  - IRDA_IT_TC Transmission complete interrupt
  - IRDA_IT_RXNE Receive Data register not empty interrupt
  - IRDA_IT_IDLE Idle line detection interrupt
  - IRDA_IT_ERR Framing, overrun or noise error interrupt
  - IRDA_IT_PE Parity Error interrupt

Return value:
- The: new state of __IT__ (SET or RESET).

__HAL_IRDA_CLEAR_IT

Description:

- Clear the specified IRDA ISR flag, in setting the proper ICR register flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __IT_CLEAR__: specifies the interrupt clear register flag that needs to be set to clear the corresponding interrupt This parameter can be one of the following values:
  – IRDA_CLEAR_PEF Parity Error Clear Flag
  – IRDA_CLEAR_FEF Framing Error Clear Flag
  – IRDA_CLEAR_NEF Noise detected Clear Flag
  – IRDA_CLEAR_OREF OverRun Error Clear Flag
  – IRDA_CLEAR_TCF Transmission Complete Clear Flag

Return value:

- None

__HAL_IRDA_SEND_REQ

Description:

- Set a specific IRDA request flag.

Parameters:

- __HANDLE__: specifies the IRDA Handle.
- __REQ__: specifies the request flag to set This parameter can be one of the following values:
  – IRDA_AUTOBAUD_REQUEST Auto-Baud Rate Request
  – IRDA_RXDATA_FLUSH_REQUEST Receive Data flush Request
  – IRDA_TXDATA_FLUSH_REQUEST Transmit data flush Request

Return value:

- None

__HAL_IRDA_ONE_BIT_SAMPLE_ENABLE

Description:

- Enable the IRDA one bit sample method.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_ONE_BIT_SAMPLE_DISABLE

Description:

- Disable the IRDA one bit sample method.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_ENABLE

Description:

- Enable UART/USART associated to IRDA Handle.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

__HAL_IRDA_DISABLE

Description:

- Disable UART/USART associated to IRDA Handle.

Parameters:

- __HANDLE__: specifies the IRDA Handle.

Return value:

- None

43 HAL IWDG Generic Driver

43.1 IWDG Firmware driver registers structures

43.1.1 IWDG_InitTypeDef

IWDG_InitTypeDef is defined in the stm32u5xx_hal_iwdg.h

Data Fields

- ***uint32_t Prescaler***
- ***uint32_t Reload***
- ***uint32_t Window***
- ***uint32_t EWI***

Field Documentation

- ***uint32_t IWDG_InitTypeDef::Prescaler***
  Select the prescaler of the IWDG. This parameter can be a value of ***IWDG_Prescaler***
- ***uint32_t IWDG_InitTypeDef::Reload***
  Specifies the IWDG down-counter reload value. This parameter must be a number between Min_Data = 0 and Max_Data = 0x0FFF
- ***uint32_t IWDG_InitTypeDef::Window***
  Specifies the window value to be compared to the down-counter. This parameter must be a number between Min_Data = 0 and Max_Data = 0x0FFF
- ***uint32_t IWDG_InitTypeDef::EWI***
  Specifies if IWDG Early Wakeup Interrupt is enable or not and the comparator value. This parameter must be a number between Min_Data = 0 and Max_Data = 0x0FFF value 0 means that EWI is disabled

43.1.2 __IWDG_HandleTypeDef

__IWDG_HandleTypeDef is defined in the stm32u5xx_hal_iwdg.h

Data Fields

- ***IWDG_TypeDef * Instance***
- ***IWDG_InitTypeDef Init***
- ***void(* EwiCallback***
- ***void(* MspInitCallback***

Field Documentation

- ***IWDG_TypeDef* __IWDG_HandleTypeDef::Instance***
  Register base address
- ***IWDG_InitTypeDef __IWDG_HandleTypeDef::Init***
  IWDG required parameters
- ***void(* __IWDG_HandleTypeDef::EwiCallback)(struct __IWDG_HandleTypeDef *hiwdg)***
  IWDG Early WakeUp Interrupt callback
- ***void(* __IWDG_HandleTypeDef::MspInitCallback)(struct __IWDG_HandleTypeDef *hiwdg)***
  IWDG Msp Init callback

43.2 IWDG Firmware driver API description

The following section lists the various functions of the IWDG library.

43.2.1 IWDG Generic features

- The IWDG can be started by either software or hardware (configurable through option byte).
- The IWDG is clocked by the Low-Speed Internal clock (LSI) and thus stays active even if the main clock fails.

- Once the IWDG is started, the LSI is forced ON and both cannot be disabled. The counter starts counting down from the reset value (0xFFF). When it reaches the end of count value (0x000) a reset signal is generated (IWDG reset).
- Whenever the key value 0x0000 AAAA is written in the IWDG_KR register, the IWDG_RLR value is reloaded into the counter and the watchdog reset is prevented.
- The IWDG is implemented in the VDD voltage domain that is still functional in STOP and STANDBY mode (IWDG reset can wake up the CPU from STANDBY). IWDGRST flag in RCC_CSR register can be used to inform when an IWDG reset occurs.
- Debug mode: When the microcontroller enters debug mode (core halted), the IWDG counter either continues to work normally or stops, depending on DBG_IWDG_STOP configuration bit in DBG module, accessible through __HAL_DBGMCU_FREEZE_IWDG() and __HAL_DBGMCU_UNFREEZE_IWDG() macros.

Min-max timeout value @32KHz (LSI): ~125us / ~131.04s The IWDG timeout may vary due to LSI clock frequency dispersion. STM32U5xx devices provide the capability to measure the LSI clock frequency (LSI clock is internally connected to TIM16 CH1 input capture). The measured value can be used to have an IWDG timeout with an acceptable accuracy.

Default timeout value (necessary for IWDG_SR status register update): Constant LSI_VALUE is defined based on the nominal LSI clock frequency. This frequency being subject to variations as mentioned above, the default timeout value (defined through constant HAL_IWDG_DEFAULT_TIMEOUT below) may become too short or too long. In such cases, this default timeout value can be tuned by redefining the constant LSI_VALUE at user-application level (based, for instance, on the measured LSI clock frequency as explained above).

43.2.2 How to use this driver

1. Register callback to treat Iwdg interrupt and MspInit using HAL_IWDG_RegisterCallback().
   - Provide exiting handle as first parameter.
   - Provide which callback will be registered using one value from HAL_IWDG_CallbackIDTypeDef.
   - Provide callback function pointer.
2. Use IWDG using HAL_IWDG_Init() function to :
   - Enable instance by writing Start keyword in IWDG_KEY register. LSI clock is forced ON and IWDG counter starts counting down.
   - Enable write access to configuration registers: IWDG_PR, IWDG_RLR, IWDG_WINR, IWDG_EWCR.
   - Configure the IWDG prescaler and counter reload value. This reload value will be loaded in the IWDG counter each time the watchdog is reloaded, then the IWDG will start counting down from this value.
   - Depending on window parameter:
     - If Window Init parameter is same as Window register value, nothing more is done but reload counter value in order to exit function with exact time base.
     - Else modify Window register. This will automatically reload watchdog counter.
   - Depending on Early Wakeup Interrupt parameter:
     - If EWI is set to disable, comparator is set to 0, interrupt is disable & flag is clear.
     - Else modify EWCR register, setting comparator value, enable interrupt & clear flag.
   - Wait for status flags to be reset.
3. Then the application program must refresh the IWDG counter at regular intervals during normal operation to prevent an MCU reset, using HAL_IWDG_Refresh() function.

IWDG HAL driver macros list

Below the list of most used macros in IWDG HAL driver:
- __HAL_IWDG_START: Enable the IWDG peripheral
- __HAL_IWDG_RELOAD_COUNTER: Reloads IWDG counter with value defined in the reload register

43.2.3 Initialization and Start functions

This section provides functions allowing to:
- Initialize the IWDG according to the specified parameters in the IWDG_InitTypeDef of associated handle.
- Manage Window option.

- Once initialization is performed in HAL_IWDG_Init function, Watchdog is reloaded in order to exit function with correct time base.

This section contains the following APIs:
- *HAL_IWDG_Init()*
- *HAL_IWDG_MspInit()*
- *HAL_IWDG_RegisterCallback()*
- *HAL_IWDG_UnRegisterCallback()*

43.2.4 IO operation functions

This section provides functions allowing to:
- Refresh the IWDG.

This section contains the following APIs:
- *HAL_IWDG_Refresh()*
- *HAL_IWDG_IRQHandler()*
- *HAL_IWDG_EarlyWakeupCallback()*

43.2.5 Detailed description of functions

HAL_IWDG_Init

Function name

HAL_StatusTypeDef HAL_IWDG_Init (IWDG_HandleTypeDef * hiwdg)

Function description

Initialize the IWDG according to the specified parameters in the IWDG_InitTypeDef and start watchdog.

Parameters

- **hiwdg:** pointer to a IWDG_HandleTypeDef structure that contains the configuration information for the specified IWDG module.

Return values

- **HAL:** status

HAL_IWDG_MspInit

Function name

void HAL_IWDG_MspInit (IWDG_HandleTypeDef * hiwdg)

Function description

Initialize the IWDG MSP.

Parameters

- **hiwdg:** pointer to a IWDG_HandleTypeDef structure that contains the configuration information for the specified IWDG module.

Return values

- **None:**

Notes

- When rewriting this function in user file, mechanism may be added to avoid multiple initialize when HAL_IWDG_Init function is called again to change parameters.

HAL_IWDG_RegisterCallback

Function name

HAL_StatusTypeDef HAL_IWDG_RegisterCallback (IWDG_HandleTypeDef * hiwdg, HAL_IWDG_CallbackIDTypeDef CallbackID, pIWDG_CallbackTypeDef pCallback)

Function description

Register a User IWDG Callback To be used instead of the weak (surcharged) predefined callback.

Parameters

- **hiwdg:** IWDG handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_IWDG_EWI_CB_ID Early WakeUp Interrupt Callback ID
  - HAL_IWDG_MSPINIT_CB_ID MspInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_IWDG_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_IWDG_UnRegisterCallback (IWDG_HandleTypeDef * hiwdg, HAL_IWDG_CallbackIDTypeDef CallbackID)

Function description

Unregister a IWDG Callback IWDG Callback is redirected to the weak (surcharged) predefined callback.

Parameters

- **hiwdg:** IWDG handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_IWDG_EWI_CB_ID Early WakeUp Interrupt Callback ID
  - HAL_IWDG_MSPINIT_CB_ID MspInit callback ID

Return values

- **status:**

HAL_IWDG_Refresh

Function name

HAL_StatusTypeDef HAL_IWDG_Refresh (IWDG_HandleTypeDef * hiwdg)

Function description

Refresh the IWDG.

Parameters

- **hiwdg:** pointer to a IWDG_HandleTypeDef structure that contains the configuration information for the specified IWDG module.

Return values

- **HAL:** status

HAL_IWDG_IRQHandler

Function name

void HAL_IWDG_IRQHandler (IWDG_HandleTypeDef * hiwdg)

Function description

Handle IWDG interrupt request.

Parameters

- **hiwdg:** pointer to a IWDG_HandleTypeDef structure that contains the configuration information for the specified IWDG module.

Return values

- **None:**

Notes

- The Early Wakeup Interrupt (EWI) can be used if specific safety operations or data logging must be performed before the actual reset is generated. The EWI interrupt is enabled by calling HAL_IWDG_Init function with EWIMode set to IWDG_EWI_ENABLE. When the downcounter reaches the value 0x40, and EWI interrupt is generated and the corresponding Interrupt Service Routine (ISR) can be used to trigger specific actions (such as communications or data logging), before resetting the device.

HAL_IWDG_EarlyWakeupCallback

Function name

void HAL_IWDG_EarlyWakeupCallback (IWDG_HandleTypeDef * hiwdg)

Function description

IWDG Early Wakeup callback.

Parameters

- **hiwdg:** pointer to a IWDG_HandleTypeDef structure that contains the configuration information for the specified IWDG module.

Return values

- **None:**

43.3 IWDG Firmware driver defines

The following section lists the various define and macros of the module.

43.3.1 IWDG

IWDG

IWDG Early Wakeup Interrupt Mode

IWDG_EWI_DISABLE

EWI Disable

IWDG Exported Macros

__HAL_IWDG_START

Description:

- Enable the IWDG peripheral.

Parameters:

- __HANDLE__: IWDG handle

Return value:

- None

__HAL_IWDG_RELOAD_COUNTER

Description:

- Reload IWDG counter with value defined in the reload register (write access to IWDG_PR, IWDG_RLR, IWDG_WINR, IWDG_EWCR registers disabled).

Parameters:

- __HANDLE__: IWDG handle

Return value:

- None

IWDG Prescaler

IWDG_PRESCALER_4

IWDG prescaler set to 4

IWDG_PRESCALER_8

IWDG prescaler set to 8

IWDG_PRESCALER_16

IWDG prescaler set to 16

IWDG_PRESCALER_32

IWDG prescaler set to 32

IWDG_PRESCALER_64

IWDG prescaler set to 64

IWDG_PRESCALER_128

IWDG prescaler set to 128

IWDG_PRESCALER_256

IWDG prescaler set to 256

IWDG_PRESCALER_512

IWDG prescaler set to 512

IWDG_PRESCALER_1024

IWDG prescaler set to 1024

IWDG Window option

IWDG_WINDOW_DISABLE

44 HAL JPEG Generic Driver

44.1 JPEG Firmware driver registers structures

44.1.1 JPEG_ConfTypeDef

JPEG_ConfTypeDef is defined in the stm32u5xx_hal_jpeg.h

Data Fields

- ***uint32_t ColorSpace***
- ***uint32_t ChromaSubsampling***
- ***uint32_t ImageHeight***
- ***uint32_t ImageWidth***
- ***uint32_t ImageQuality***

Field Documentation

- ***uint32_t JPEG_ConfTypeDef::ColorSpace***
  Image Color space : gray-scale, YCBCR, RGB or CMYK This parameter can be a value of ***JPEG_ColorSpace***
- ***uint32_t JPEG_ConfTypeDef::ChromaSubsampling***
  Chroma Subsampling in case of YCBCR or CMYK color space, 0-> 4:4:4 , 1-> 4:2:2, 2 -> 4:1:1, 3 -> 4:2:0 This parameter can be a value of ***JPEG_ChromaSubsampling***
- ***uint32_t JPEG_ConfTypeDef::ImageHeight***
  Image height : number of lines
- ***uint32_t JPEG_ConfTypeDef::ImageWidth***
  Image width : number of pixels per line
- ***uint32_t JPEG_ConfTypeDef::ImageQuality***
  Quality of the JPEG encoding : from 1 to 100

44.1.2 __JPEG_HandleTypeDef

__JPEG_HandleTypeDef is defined in the stm32u5xx_hal_jpeg.h

Data Fields

- ***JPEG_TypeDef * Instance***
- ***JPEG_ConfTypeDef Conf***
- ***uint8_t * pJpegInBuffPtr***
- ***uint8_t * pJpegOutBuffPtr***
- ***__IO uint32_t JpegInCount***
- ***__IO uint32_t JpegOutCount***
- ***uint32_t InDataLength***
- ***uint32_t OutDataLength***
- ***DMA_HandleTypeDef * hdmain***
- ***DMA_HandleTypeDef * hdmaout***
- ***uint8_t CustomQuanTable***
- ***uint8_t * QuantTable0***
- ***uint8_t * QuantTable1***
- ***uint8_t * QuantTable2***
- ***uint8_t * QuantTable3***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_JPEG_STATETypeDef State***
- ***__IO uint32_t ErrorCode***
- ***__IO uint32_t Context***
- ***void(* InfoReadyCallback***
- ***void(* EncodeCpltCallback***

- *void(* DecodeCpltCallback*
- *void(* ErrorCallback*
- *void(* GetDataCallback*
- *void(* DataReadyCallback*
- *void(* MspInitCallback*
- *void(* MspDeInitCallback*

Field Documentation

- ***JPEG_TypeDef* __JPEG_HandleTypeDef::Instance***
  JPEG peripheral register base address
- ***JPEG_ConfTypeDef __JPEG_HandleTypeDef::Conf***
  Current JPEG encoding/decoding parameters
- ***uint8_t* __JPEG_HandleTypeDef::pJpegInBuffPtr***
  Pointer to JPEG processing (encoding, decoding,...) input buffer
- ***uint8_t* __JPEG_HandleTypeDef::pJpegOutBuffPtr***
  Pointer to JPEG processing (encoding, decoding,...) output buffer
- ***__IO uint32_t __JPEG_HandleTypeDef::JpegInCount***
  Internal Counter of input data
- ***__IO uint32_t __JPEG_HandleTypeDef::JpegOutCount***
  Internal Counter of output data
- ***uint32_t __JPEG_HandleTypeDef::InDataLength***
  Input Buffer Length in Bytes
- ***uint32_t __JPEG_HandleTypeDef::OutDataLength***
  Output Buffer Length in Bytes
- ***DMA_HandleTypeDef* __JPEG_HandleTypeDef::hdmain***
  JPEG In DMA handle parameters
- ***DMA_HandleTypeDef* __JPEG_HandleTypeDef::hdmaout***
  JPEG Out DMA handle parameters
- ***uint8_t __JPEG_HandleTypeDef::CustomQuanTable***
  If set to 1 specify that user customized quantization tables are used
- ***uint8_t* __JPEG_HandleTypeDef::QuantTable0***
  Basic Quantization Table for component 0
- ***uint8_t* __JPEG_HandleTypeDef::QuantTable1***
  Basic Quantization Table for component 1
- ***uint8_t* __JPEG_HandleTypeDef::QuantTable2***
  Basic Quantization Table for component 2
- ***uint8_t* __JPEG_HandleTypeDef::QuantTable3***
  Basic Quantization Table for component 3
- ***HAL_LockTypeDef __JPEG_HandleTypeDef::Lock***
  JPEG locking object
- ***__IO HAL_JPEG_STATETypeDef __JPEG_HandleTypeDef::State***
  JPEG peripheral state
- ***__IO uint32_t __JPEG_HandleTypeDef::ErrorCode***
  JPEG Error code
- ***__IO uint32_t __JPEG_HandleTypeDef::Context***
  JPEG Internal context
- ***void(* __JPEG_HandleTypeDef::InfoReadyCallback)(struct __JPEG_HandleTypeDef *hjpeg, JPEG_ConfTypeDef *pInfo)***
  JPEG Info ready callback
- ***void(* __JPEG_HandleTypeDef::EncodeCpltCallback)(struct __JPEG_HandleTypeDef *hjpeg)***
  JPEG Encode complete callback
- ***void(* __JPEG_HandleTypeDef::DecodeCpltCallback)(struct __JPEG_HandleTypeDef *hjpeg)***
  JPEG Decode complete callback
- ***void(* __JPEG_HandleTypeDef::ErrorCallback)(struct __JPEG_HandleTypeDef *hjpeg)***
  JPEG Error callback

- ***void(* __JPEG_HandleTypeDef::GetDataCallback)(struct __JPEG_HandleTypeDef *hjpeg, uint32_t NbDecodedData)***
  JPEG Get Data callback
- ***void(* __JPEG_HandleTypeDef::DataReadyCallback)(struct __JPEG_HandleTypeDef *hjpeg, uint8_t *pDataOut, uint32_t OutDataLength)***
  JPEG Data ready callback
- ***void(* __JPEG_HandleTypeDef::MspInitCallback)(struct __JPEG_HandleTypeDef *hjpeg)***
  JPEG Msp Init callback
- ***void(* __JPEG_HandleTypeDef::MspDeInitCallback)(struct __JPEG_HandleTypeDef *hjpeg)***
  JPEG Msp DeInit callback

44.2 JPEG Firmware driver API description

The following section lists the various functions of the JPEG library.

44.2.1 How to use this driver

1. Initialize the JPEG peripheral using HAL_JPEG_Init : No initialization parameters are required. Only the call to HAL_JPEG_Init is necessary to initialize the JPEG peripheral.
2. If operation is JPEG encoding use function HAL_JPEG_ConfigEncoding to set the encoding parameters (mandatory before calling the encoding function). the application can change the encoding parameter ImageQuality from 1 to 100 to obtain a more or less quality (visual quality vs the original row image), and inversely more or less jpg file size.
3. Note that for decoding operation the JPEG peripheral output data are organized in YCbCr blocks called MCU (Minimum Coded Unit) as defioned in the JPEG specification ISO/IEC 10918-1 standard. It is up to the application to transform these YCbCr blocks to RGB data that can be display. Respectively, for Encoding operation the JPEG peripheral input should be organized in YCbCr MCU blocks. It is up to the application to perform the necessary RGB to YCbCr MCU blocks transformation before feeding the JPEG peripheral with data.
4. Use functions HAL_JPEG_Encode and HAL_JPEG_Decode to start respectively a JPEG encoding/decoding operation in polling method (blocking).
5. Use functions HAL_JPEG_Encode_IT and HAL_JPEG_Decode_IT to start respectively a JPEG encoding/decoding operation with Interrupt method (not blocking).
6. Use functions HAL_JPEG_Encode_DMA and HAL_JPEG_Decode_DMA to start respectively a JPEG encoding/decoding operation with DMA method (not blocking).
7. Callback HAL_JPEG_InfoReadyCallback is asserted if the current operation is a JPEG decoding to provide the application with JPEG image parameters. This callback is asserted when the JPEG peripheral successfully parse the JPEG header.

8. Callback HAL_JPEG_GetDataCallback is asserted for both encoding and decoding operations to inform the application that the input buffer has been consumed by the peripheral and to ask for a new data chunk if the operation (encoding/decoding) has not been complete yet.
   – This CallBack should be implemented in the application side. It should call the function HAL_JPEG_ConfigInputBuffer if new input data are available, or call HAL_JPEG_Pause with parameter XferSelection set to JPEG_PAUSE_RESUME_INPUT to inform the JPEG HAL driver that the ongoing operation shall pause waiting for the application to provide a new input data chunk. Once the application succeed getting new data and if the input has been paused, the application can call the function HAL_JPEG_ConfigInputBuffer to set the new input buffer and size, then resume the JPEG HAL input by calling new function HAL_JPEG_Resume. If the application has ended feeding the HAL JPEG with input data (no more input data), the application Should call the function HAL_JPEG_ConfigInputBuffer (within the callback HAL_JPEG_GetDataCallback) with the parameter InDataLength set to zero.
   – The mechanism of HAL_JPEG_ConfigInputBuffer/HAL_JPEG_Pause/HAL_JPEG_Resume allows to the application to provide the input data (for encoding or decoding) by chunks. If the new input data chunk is not available (because data should be read from an input file for example) the application can pause the JPEG input (using function HAL_JPEG_Pause) Once the new input data chunk is available (read from a file for example), the application can call the function HAL_JPEG_ConfigInputBuffer to provide the HAL with the new chunk then resume the JPEG HAL input by calling function HAL_JPEG_Resume.
   – The application can call functions HAL_JPEG_ConfigInputBuffer then HAL_JPEG_Resume. any time (outside the HAL_JPEG_GetDataCallback) Once the new input chunk data available. However, to keep data coherency, the function HAL_JPEG_Pause must be imperatively called (if necessary) within the callback HAL_JPEG_GetDataCallback, i.e when the HAL JPEG has ended Transferring the previous chunk buffer to the JPEG peripheral.
9. Callback HAL_JPEG_DataReadyCallback is asserted when the HAL JPEG driver has filled the given output buffer with the given size.
   – This CallBack should be implemented in the application side. It should call the function HAL_JPEG_ConfigOutputBuffer to provide the HAL JPEG driver with the new output buffer location and size to be used to store next data chunk. if the application is not ready to provide the output chunk location then it can call the function HAL_JPEG_Pause with parameter XferSelection set to JPEG_PAUSE_RESUME_OUTPUT to inform the JPEG HAL driver that it shall pause output data. Once the application is ready to receive the new data chunk (output buffer location free or available) it should call the function HAL_JPEG_ConfigOutputBuffer to provide the HAL JPEG driver with the new output chunk buffer location and size, then call HAL_JPEG_Resume to inform the HAL that it shall resume outputting data in the given output buffer.
   – The mechanism of HAL_JPEG_ConfigOutputBuffer/HAL_JPEG_Pause/HAL_JPEG_Resume allows the application to receive data from the JPEG peripheral by chunks. when a chunk is received, the application can pause the HAL JPEG output data to be able to process these received data (YCbCr to RGB conversion in case of decoding or data storage in case of encoding).
   – The application can call functions HAL_JPEG_ ConfigOutputBuffer then HAL_JPEG_Resume. any time (outside the HAL_JPEG_DataReadyCallback) Once the output data buffer is free to use. However, to keep data coherency, the function HAL_JPEG_Pause must be imperatively called (if necessary) within the callback HAL_JPEG_ DataReadyCallback, i.e when the HAL JPEG has ended Transferring the previous chunk buffer from the JPEG peripheral to the application.
10. Callback HAL_JPEG_EncodeCpltCallback is asserted when the HAL JPEG driver has ended the current JPEG encoding operation, and all output data has been transmitted to the application.
11. Callback HAL_JPEG_DecodeCpltCallback is asserted when the HAL JPEG driver has ended the current JPEG decoding operation. and all output data has been transmitted to the application.
12. Callback HAL_JPEG_ErrorCallback is asserted when an error occurred during the current operation. the application can call the function HAL_JPEG_GetError() to retrieve the error codes.
13. By default the HAL JPEG driver uses the default quantization tables as provide in the JPEG specification (ISO/IEC 10918-1 standard) for encoding. User can change these default tables if necessary using the function HAL_JPEG_SetUserQuantTables Note that for decoding the quantization tables are automatically extracted from the JPEG header.
14. To control JPEG state you can use the following function: HAL_JPEG_GetState()

JPEG HAL driver macros list

Below the list of most used macros in JPEG HAL driver.

- __HAL_JPEG_RESET_HANDLE_STATE : Reset JPEG handle state.
- __HAL_JPEG_ENABLE : Enable the JPEG peripheral.
- __HAL_JPEG_DISABLE : Disable the JPEG peripheral.
- __HAL_JPEG_GET_FLAG : Check the specified JPEG status flag.
- __HAL_JPEG_CLEAR_FLAG : Clear the specified JPEG status flag.
- __HAL_JPEG_ENABLE_IT : Enable the specified JPEG Interrupt.
- __HAL_JPEG_DISABLE_IT : Disable the specified JPEG Interrupt.
- __HAL_JPEG_GET_IT_SOURCE : returns the state of the specified JPEG Interrupt (Enabled or disabled).

Callback registration

44.2.2 Initialization and de-initialization functions

This section provides functions allowing to:
- Initialize the JPEG peripheral and creates the associated handle
- DeInitialize the JPEG peripheral

This section contains the following APIs:
- ***HAL_JPEG_Init()***
- ***HAL_JPEG_DeInit()***
- ***HAL_JPEG_MspInit()***
- ***HAL_JPEG_MspDeInit()***
- ***HAL_JPEG_RegisterCallback()***
- ***HAL_JPEG_UnRegisterCallback()***
- ***HAL_JPEG_RegisterInfoReadyCallback()***
- ***HAL_JPEG_UnRegisterInfoReadyCallback()***
- ***HAL_JPEG_RegisterGetDataCallback()***
- ***HAL_JPEG_UnRegisterGetDataCallback()***
- ***HAL_JPEG_RegisterDataReadyCallback()***
- ***HAL_JPEG_UnRegisterDataReadyCallback()***

44.2.3 Configuration functions

This section provides functions allowing to:
- HAL_JPEG_ConfigEncoding() : JPEG encoding configuration
- HAL_JPEG_GetInfo() : Extract the image configuration from the JPEG header during the decoding
- HAL_JPEG_EnableHeaderParsing() : Enable JPEG Header parsing for decoding
- HAL_JPEG_DisableHeaderParsing() : Disable JPEG Header parsing for decoding
- HAL_JPEG_SetUserQuantTables : Modify the default Quantization tables used for JPEG encoding.

This section contains the following APIs:
- ***HAL_JPEG_ConfigEncoding()***
- ***HAL_JPEG_GetInfo()***
- ***HAL_JPEG_EnableHeaderParsing()***
- ***HAL_JPEG_DisableHeaderParsing()***
- ***HAL_JPEG_SetUserQuantTables()***

44.2.4 JPEG processing functions

This section provides functions allowing to:
- HAL_JPEG_Encode() : JPEG encoding with polling process
- HAL_JPEG_Decode() : JPEG decoding with polling process
- HAL_JPEG_Encode_IT() : JPEG encoding with interrupt process
- HAL_JPEG_Decode_IT() : JPEG decoding with interrupt process
- HAL_JPEG_Encode_DMA() : JPEG encoding with DMA process

- HAL_JPEG_Decode_DMA() : JPEG decoding with DMA process
- HAL_JPEG_Pause() : Pause the Input/Output processing
- HAL_JPEG_Resume() : Resume the JPEG Input/Output processing
- HAL_JPEG_ConfigInputBuffer() : Config Encoding/Decoding Input Buffer
- HAL_JPEG_ConfigOutputBuffer() : Config Encoding/Decoding Output Buffer
- HAL_JPEG_Abort() : Aborts the JPEG Encoding/Decoding

This section contains the following APIs:

- *HAL_JPEG_Encode()*
- *HAL_JPEG_Decode()*
- *HAL_JPEG_Encode_IT()*
- *HAL_JPEG_Decode_IT()*
- *HAL_JPEG_Encode_DMA()*
- *HAL_JPEG_Decode_DMA()*
- *HAL_JPEG_Pause()*
- *HAL_JPEG_Resume()*
- *HAL_JPEG_ConfigInputBuffer()*
- *HAL_JPEG_ConfigOutputBuffer()*
- *HAL_JPEG_Abort()*

44.2.5 JPEG Decode and Encode callback functions

This section provides callback functions:

- HAL_JPEG_InfoReadyCallback() : Decoding JPEG Info ready callback
- HAL_JPEG_EncodeCpltCallback() : Encoding complete callback.
- HAL_JPEG_DecodeCpltCallback() : Decoding complete callback.
- HAL_JPEG_ErrorCallback() : JPEG error callback.
- HAL_JPEG_GetDataCallback() : Get New Data chunk callback.
- HAL_JPEG_DataReadyCallback() : Decoded/Encoded Data ready callback.

This section contains the following APIs:

- *HAL_JPEG_InfoReadyCallback()*
- *HAL_JPEG_EncodeCpltCallback()*
- *HAL_JPEG_DecodeCpltCallback()*
- *HAL_JPEG_ErrorCallback()*
- *HAL_JPEG_GetDataCallback()*
- *HAL_JPEG_DataReadyCallback()*

44.2.6 JPEG IRQ handler management

This section provides JPEG IRQ handler function.

- HAL_JPEG_IRQHandler() : handles JPEG interrupt request

This section contains the following APIs:

- *HAL_JPEG_IRQHandler()*

44.2.7 Peripheral State and Error functions

This section provides JPEG State and Errors function.

- HAL_JPEG_GetState() : permits to get in run-time the JPEG state.
- HAL_JPEG_GetError() : Returns the JPEG error code if any.

This section contains the following APIs:

- *HAL_JPEG_GetState()*
- *HAL_JPEG_GetError()*

44.2.8 Detailed description of functions

HAL_JPEG_Init

Function name

HAL_StatusTypeDef HAL_JPEG_Init (JPEG_HandleTypeDef * hjpeg)

Function description

Initializes the JPEG according to the specified parameters in the JPEG_InitTypeDef and creates the associated handle.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **HAL:** status

HAL_JPEG_DeInit

Function name

HAL_StatusTypeDef HAL_JPEG_DeInit (JPEG_HandleTypeDef * hjpeg)

Function description

DeInitializes the JPEG peripheral.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **HAL:** status

HAL_JPEG_MspInit

Function name

void HAL_JPEG_MspInit (JPEG_HandleTypeDef * hjpeg)

Function description

Initializes the JPEG MSP.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **None:**

HAL_JPEG_MspDeInit

Function name

void HAL_JPEG_MspDeInit (JPEG_HandleTypeDef * hjpeg)

Function description

DeInitializes JPEG MSP.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **None:**

HAL_JPEG_RegisterCallback

Function name

HAL_StatusTypeDef HAL_JPEG_RegisterCallback (JPEG_HandleTypeDef * hjpeg, HAL_JPEG_CallbackIDTypeDef CallbackID, pJPEG_CallbackTypeDef pCallback)

Function description

Register a User JPEG Callback To be used to override the weak predefined callback.

Parameters

- **hjpeg:** JPEG handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  – HAL_JPEG_ENCODE_CPLT_CB_ID Encode Complete callback ID
  – HAL_JPEG_DECODE_CPLT_CB_ID Decode Complete callback ID
  – HAL_JPEG_ERROR_CB_ID Error callback ID
  – HAL_JPEG_MSPINIT_CB_ID MspInit callback ID
  – HAL_JPEG_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_JPEG_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_JPEG_UnRegisterCallback (JPEG_HandleTypeDef * hjpeg, HAL_JPEG_CallbackIDTypeDef CallbackID)

Function description

Unregister a JPEG Callback JPEG callback is redirected to the weak predefined callback.

Parameters

- **hjpeg:** JPEG handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  – HAL_JPEG_ENCODE_CPLT_CB_ID Encode Complete callback ID
  – HAL_JPEG_DECODE_CPLT_CB_ID Decode Complete callback ID
  – HAL_JPEG_ERROR_CB_ID Error callback ID
  – HAL_JPEG_MSPINIT_CB_ID MspInit callback ID
  – HAL_JPEG_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_JPEG_RegisterInfoReadyCallback

Function name

HAL_StatusTypeDef HAL_JPEG_RegisterInfoReadyCallback (JPEG_HandleTypeDef * hjpeg, pJPEG_InfoReadyCallbackTypeDef pCallback)

Function description

Register Info Ready JPEG Callback To be used instead of the weak HAL_JPEG_InfoReadyCallback() predefined callback.

Parameters

- **hjpeg:** JPEG handle
- **pCallback:** pointer to the Info Ready Callback function

Return values

- **HAL:** status

HAL_JPEG_UnRegisterInfoReadyCallback

Function name

HAL_StatusTypeDef HAL_JPEG_UnRegisterInfoReadyCallback (JPEG_HandleTypeDef * hjpeg)

Function description

UnRegister the Info Ready JPEG Callback Info Ready JPEG Callback is redirected to the weak HAL_JPEG_InfoReadyCallback() predefined callback.

Parameters

- **hjpeg:** JPEG handle

Return values

- **HAL:** status

HAL_JPEG_RegisterGetDataCallback

Function name

HAL_StatusTypeDef HAL_JPEG_RegisterGetDataCallback (JPEG_HandleTypeDef * hjpeg, pJPEG_GetDataCallbackTypeDef pCallback)

Function description

Register Get Data JPEG Callback To be used instead of the weak HAL_JPEG_GetDataCallback() predefined callback.

Parameters

- **hjpeg:** JPEG handle
- **pCallback:** pointer to the Get Data Callback function

Return values

- **HAL:** status

HAL_JPEG_UnRegisterGetDataCallback

Function name

HAL_StatusTypeDef HAL_JPEG_UnRegisterGetDataCallback (JPEG_HandleTypeDef * hjpeg)

Function description

UnRegister the Get Data JPEG Callback Get Data JPEG Callback is redirected to the weak HAL_JPEG_GetDataCallback() predefined callback.

Parameters

- **hjpeg:** JPEG handle

Return values

- **HAL:** status

HAL_JPEG_RegisterDataReadyCallback

Function name

HAL_StatusTypeDef HAL_JPEG_RegisterDataReadyCallback (JPEG_HandleTypeDef * hjpeg, pJPEG_DataReadyCallbackTypeDef pCallback)

Function description

Register Data Ready JPEG Callback To be used instead of the weak HAL_JPEG_DataReadyCallback() predefined callback.

Parameters

- **hjpeg:** JPEG handle
- **pCallback:** pointer to the Get Data Callback function

Return values

- **HAL:** status

HAL_JPEG_UnRegisterDataReadyCallback

Function name

HAL_StatusTypeDef HAL_JPEG_UnRegisterDataReadyCallback (JPEG_HandleTypeDef * hjpeg)

Function description

UnRegister the Data Ready JPEG Callback Get Data Ready Callback is redirected to the weak HAL_JPEG_DataReadyCallback() predefined callback.

Parameters

- **hjpeg:** JPEG handle

Return values

- **HAL:** status

HAL_JPEG_ConfigEncoding

Function name

HAL_StatusTypeDef HAL_JPEG_ConfigEncoding (JPEG_HandleTypeDef * hjpeg, const JPEG_ConfTypeDef * pConf)

Function description

Set the JPEG encoding configuration.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pConf:** pointer to a JPEG_ConfTypeDef structure that contains the encoding configuration

Return values

- **HAL:** status

HAL_JPEG_GetInfo

Function name

HAL_StatusTypeDef HAL_JPEG_GetInfo (JPEG_HandleTypeDef * hjpeg, JPEG_ConfTypeDef * pInfo)

Function description

Extract the image configuration from the JPEG header during the decoding.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pInfo:** pointer to a JPEG_ConfTypeDef structure that contains The JPEG decoded header information

Return values

- **HAL:** status

HAL_JPEG_EnableHeaderParsing

Function name

HAL_StatusTypeDef HAL_JPEG_EnableHeaderParsing (JPEG_HandleTypeDef * hjpeg)

Function description

Enable JPEG Header parsing for decoding.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for the JPEG.

Return values

- **HAL:** status

HAL_JPEG_DisableHeaderParsing

Function name

HAL_StatusTypeDef HAL_JPEG_DisableHeaderParsing (JPEG_HandleTypeDef * hjpeg)

Function description

Disable JPEG Header parsing for decoding.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for the JPEG.

Return values

- **HAL:** status

HAL_JPEG_SetUserQuantTables

Function name

HAL_StatusTypeDef HAL_JPEG_SetUserQuantTables (JPEG_HandleTypeDef * hjpeg, uint8_t * QTable0, uint8_t * QTable1, uint8_t * QTable2, uint8_t * QTable3)

Function description

Modify the default Quantization tables used for JPEG encoding.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **QTable0:** pointer to uint8_t , define the user quantification table for color component 1. If NULL assume no need to update the table and no error return
- **QTable1:** pointer to uint8_t , define the user quantification table for color component 2. If NULL assume no need to update the table and no error return.
- **QTable2:** pointer to uint8_t , define the user quantification table for color component 3, If NULL assume no need to update the table and no error return.
- **QTable3:** pointer to uint8_t , define the user quantification table for color component 4. If NULL assume no need to update the table and no error return.

Return values

- **HAL:** status

HAL_JPEG_Encode

Function name

HAL_StatusTypeDef HAL_JPEG_Encode (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataInMCU, uint32_t InDataLength, uint8_t * pDataOut, uint32_t OutDataLength, uint32_t Timeout)

Function description

Starts JPEG encoding with polling processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pDataInMCU:** Pointer to the Input buffer
- **InDataLength:** size in bytes Input buffer
- **pDataOut:** Pointer to the jpeg output data buffer
- **OutDataLength:** size in bytes of the Output buffer
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_JPEG_Decode

Function name

HAL_StatusTypeDef HAL_JPEG_Decode (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataIn, uint32_t InDataLength, uint8_t * pDataOutMCU, uint32_t OutDataLength, uint32_t Timeout)

Function description

Starts JPEG decoding with polling processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pDataIn:** Pointer to the input data buffer
- **InDataLength:** size in bytes Input buffer
- **pDataOutMCU:** Pointer to the Output data buffer
- **OutDataLength:** size in bytes of the Output buffer
- **Timeout:** Specify Timeout value

Return values

- **HAL:** status

HAL_JPEG_Encode_IT

Function name

HAL_StatusTypeDef HAL_JPEG_Encode_IT (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataInMCU, uint32_t InDataLength, uint8_t * pDataOut, uint32_t OutDataLength)

Function description

Starts JPEG encoding with interrupt processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pDataInMCU:** Pointer to the Input buffer
- **InDataLength:** size in bytes Input buffer
- **pDataOut:** Pointer to the jpeg output data buffer
- **OutDataLength:** size in bytes of the Output buffer

Return values

- **HAL:** status

HAL_JPEG_Decode_IT

Function name

HAL_StatusTypeDef HAL_JPEG_Decode_IT (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataIn, uint32_t InDataLength, uint8_t * pDataOutMCU, uint32_t OutDataLength)

Function description

Starts JPEG decoding with interrupt processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pDataIn:** Pointer to the input data buffer
- **InDataLength:** size in bytes Input buffer
- **pDataOutMCU:** Pointer to the Output data buffer
- **OutDataLength:** size in bytes of the Output buffer

Return values

- **HAL:** status

HAL_JPEG_Encode_DMA

Function name

HAL_StatusTypeDef HAL_JPEG_Encode_DMA (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataInMCU, uint32_t InDataLength, uint8_t * pDataOut, uint32_t OutDataLength)

Function description

Starts JPEG encoding with DMA processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pDataInMCU:** Pointer to the Input buffer
- **InDataLength:** size in bytes Input buffer
- **pDataOut:** Pointer to the jpeg output data buffer
- **OutDataLength:** size in bytes of the Output buffer

Return values

- **HAL:** status

HAL_JPEG_Decode_DMA

Function name

HAL_StatusTypeDef HAL_JPEG_Decode_DMA (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataIn, uint32_t InDataLength, uint8_t * pDataOutMCU, uint32_t OutDataLength)

Function description

Starts JPEG decoding with DMA processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pDataIn:** Pointer to the input data buffer
- **InDataLength:** size in bytes Input buffer
- **pDataOutMCU:** Pointer to the Output data buffer
- **OutDataLength:** size in bytes of the Output buffer

Return values

- **HAL:** status

HAL_JPEG_Pause

Function name

HAL_StatusTypeDef HAL_JPEG_Pause (JPEG_HandleTypeDef * hjpeg, uint32_t XferSelection)

Function description

Pause the JPEG Input/Output processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **XferSelection:** This parameter can be one of the following values : JPEG_PAUSE_RESUME_INPUT : Pause Input processing JPEG_PAUSE_RESUME_OUTPUT: Pause Output processing JPEG_PAUSE_RESUME_INPUT_OUTPUT: Pause Input and Output processing

Return values

- **HAL:** status

HAL_JPEG_Resume

Function name

HAL_StatusTypeDef HAL_JPEG_Resume (JPEG_HandleTypeDef * hjpeg, uint32_t XferSelection)

Function description

Resume the JPEG Input/Output processing.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **XferSelection:** This parameter can be one of the following values : JPEG_PAUSE_RESUME_INPUT : Resume Input processing JPEG_PAUSE_RESUME_OUTPUT: Resume Output processing JPEG_PAUSE_RESUME_INPUT_OUTPUT: Resume Input and Output processing

Return values

- **HAL:** status

HAL_JPEG_ConfigInputBuffer

Function name

void HAL_JPEG_ConfigInputBuffer (JPEG_HandleTypeDef * hjpeg, uint8_t * pNewInputBuffer, uint32_t InDataLength)

Function description

Config Encoding/Decoding Input Buffer.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module.
- **pNewInputBuffer:** Pointer to the new input data buffer
- **InDataLength:** Size in bytes of the new Input data buffer

Return values

- **HAL:** status

HAL_JPEG_ConfigOutputBuffer

Function name

void HAL_JPEG_ConfigOutputBuffer (JPEG_HandleTypeDef * hjpeg, uint8_t * pNewOutputBuffer, uint32_t OutDataLength)

Function description

Config Encoding/Decoding Output Buffer.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module.
- **pNewOutputBuffer:** Pointer to the new output data buffer
- **OutDataLength:** Size in bytes of the new Output data buffer

Return values

- **HAL:** status

HAL_JPEG_Abort

Function name

HAL_StatusTypeDef HAL_JPEG_Abort (JPEG_HandleTypeDef * hjpeg)

Function description

Aborts the JPEG Encoding/Decoding.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **HAL:** status

HAL_JPEG_InfoReadyCallback

Function name

void HAL_JPEG_InfoReadyCallback (JPEG_HandleTypeDef * hjpeg, JPEG_ConfTypeDef * pInfo)

Function description

Decoding JPEG Info ready callback.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pInfo:** pointer to a JPEG_ConfTypeDef structure that contains The JPEG decoded header information

Return values

- **None:**

HAL_JPEG_EncodeCpltCallback

Function name

void HAL_JPEG_EncodeCpltCallback (JPEG_HandleTypeDef * hjpeg)

Function description

Encoding complete callback.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **None:**

HAL_JPEG_DecodeCpltCallback

Function name

void HAL_JPEG_DecodeCpltCallback (JPEG_HandleTypeDef * hjpeg)

Function description

Decoding complete callback.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **None:**

HAL_JPEG_ErrorCallback

Function name

void HAL_JPEG_ErrorCallback (JPEG_HandleTypeDef * hjpeg)

Function description

JPEG error callback.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **None:**

HAL_JPEG_GetDataCallback

Function name

void HAL_JPEG_GetDataCallback (JPEG_HandleTypeDef * hjpeg, uint32_t NbDecodedData)

Function description

Get New Data chunk callback.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **NbDecodedData:** Number of consumed data in the previous chunk in bytes

Return values

- **None:**

HAL_JPEG_DataReadyCallback

Function name

void HAL_JPEG_DataReadyCallback (JPEG_HandleTypeDef * hjpeg, uint8_t * pDataOut, uint32_t OutDataLength)

Function description

Decoded/Encoded Data ready callback.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module
- **pDataOut:** pointer to the output data buffer
- **OutDataLength:** number in bytes of data available in the specified output buffer

Return values

- **None:**

HAL_JPEG_IRQHandler

Function name

void HAL_JPEG_IRQHandler (JPEG_HandleTypeDef * hjpeg)

Function description

This function handles JPEG interrupt request.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **None:**

HAL_JPEG_GetState

Function name

HAL_JPEG_STATETypeDef HAL_JPEG_GetState (const JPEG_HandleTypeDef * hjpeg)

Function description

Returns the JPEG state.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for JPEG module

Return values

- **JPEG:** state

HAL_JPEG_GetError

Function name

uint32_t HAL_JPEG_GetError (const JPEG_HandleTypeDef * hjpeg)

Function description

Return the JPEG error code.

Parameters

- **hjpeg:** pointer to a JPEG_HandleTypeDef structure that contains the configuration information for the specified JPEG.

Return values

- **JPEG:** Error Code

44.3 JPEG Firmware driver defines

The following section lists the various define and macros of the module.

44.3.1 JPEG

JPEG

JPEG Chrominance Sampling

JPEG_444_SUBSAMPLING

Chroma Subsampling 4:4:4

JPEG_420_SUBSAMPLING

Chroma Subsampling 4:2:0

JPEG_422_SUBSAMPLING

Chroma Subsampling 4:2:2

JPEG ColorSpace

JPEG_GRAYSCALE_COLORSPACE

JPEG_YCBCR_COLORSPACE

JPEG_CMYK_COLORSPACE

JPEG Error Code definition

HAL_JPEG_ERROR_NONE

No error

HAL_JPEG_ERROR_HUFF_TABLE

HUffman Table programming error

HAL_JPEG_ERROR_QUANT_TABLE

Quantization Table programming error

HAL_JPEG_ERROR_DMA

DMA transfer error

HAL_JPEG_ERROR_TIMEOUT

Timeout error

HAL_JPEG_ERROR_INVALID_CALLBACK

Invalid Callback error

JPEG Exported Macros

__HAL_JPEG_RESET_HANDLE_STATE

Description:
- Reset JPEG handle state.

Parameters:
- __HANDLE__: specifies the JPEG handle.

Return value:
- None

__HAL_JPEG_ENABLE

Description:
- Enable the JPEG peripheral.

Parameters:
- __HANDLE__: specifies the JPEG handle.

Return value:
- None

__HAL_JPEG_DISABLE

Description:
- Disable the JPEG peripheral.

Parameters:
- __HANDLE__: specifies the JPEG handle.

Return value:
- None

__HAL_JPEG_GET_FLAG

Description:
- Check the specified JPEG status flag.

Parameters:
- __HANDLE__: specifies the JPEG handle.
- __FLAG__: specifies the flag to check This parameter can be one of the following values:
  – JPEG_FLAG_IFTF : The input FIFO is not full and is below its threshold flag
  – JPEG_FLAG_IFNFF : The input FIFO Not Full Flag, a data can be written
  – JPEG_FLAG_OFTF : The output FIFO is not empty and has reach its threshold
  – JPEG_FLAG_OFNEF : The output FIFO is not empty, a data is available
  – JPEG_FLAG_EOCF : JPEG Codec core has finished the encoding or the decoding process and than last data has been sent to the output FIFO
  – JPEG_FLAG_HPDF : JPEG Codec has finished the parsing of the headers and the internal registers have been updated
  – JPEG_FLAG_COF : JPEG Codec operation on going flag

Return value:
- __HAL_JPEG_GET_FLAG: : returns The new state of __FLAG__ (TRUE or FALSE)

__HAL_JPEG_CLEAR_FLAG

Description:

- Clear the specified JPEG status flag.

Parameters:

- __HANDLE__: specifies the JPEG handle.
- __FLAG__: specifies the flag to clear This parameter can be one of the following values:
  – JPEG_FLAG_EOCF : JPEG Codec core has finished the encoding or the decoding process and than last data has been sent to the output FIFO
  – JPEG_FLAG_HPDF : JPEG Codec has finished the parsing of the headers

Return value:

- None

__HAL_JPEG_ENABLE_IT

Description:

- Enable Interrupt.

Parameters:

- __HANDLE__: specifies the JPEG handle.
- __INTERRUPT__: specifies the interrupt to enable This parameter can be one of the following values:
  – JPEG_IT_IFT : Input FIFO Threshold Interrupt
  – JPEG_IT_IFNF : Input FIFO Not Full Interrupt
  – JPEG_IT_OFT : Output FIFO Threshold Interrupt
  – JPEG_IT_OFNE : Output FIFO Not empty Interrupt
  – JPEG_IT_EOC : End of Conversion Interrupt
  – JPEG_IT_HPD : Header Parsing Done Interrupt

Return value:

- No: return

__HAL_JPEG_DISABLE_IT

Description:

- Disable Interrupt.

Parameters:

- __HANDLE__: specifies the JPEG handle.
- __INTERRUPT__: specifies the interrupt to disable This parameter can be one of the following values:
  – JPEG_IT_IFT : Input FIFO Threshold Interrupt
  – JPEG_IT_IFNF : Input FIFO Not Full Interrupt
  – JPEG_IT_OFT : Output FIFO Threshold Interrupt
  – JPEG_IT_OFNE : Output FIFO Not empty Interrupt
  – JPEG_IT_EOC : End of Conversion Interrupt
  – JPEG_IT_HPD : Header Parsing Done Interrupt

Return value:

- No: return

Notes:

- To disable an IT we must use MODIFY_REG macro to avoid writing "1" to the FIFO flush bits located in the same IT enable register (CR register).

__HAL_JPEG_GET_IT_SOURCE

Description:

- Get Interrupt state.

Parameters:

- __HANDLE__: specifies the JPEG handle.
- __INTERRUPT__: specifies the interrupt to check This parameter can be one of the following values:
  – JPEG_IT_IFT : Input FIFO Threshold Interrupt
  – JPEG_IT_IFNF : Input FIFO Not Full Interrupt
  – JPEG_IT_OFT : Output FIFO Threshold Interrupt
  – JPEG_IT_OFNE : Output FIFO Not empty Interrupt
  – JPEG_IT_EOC : End of Conversion Interrupt
  – JPEG_IT_HPD : Header Parsing Done Interrupt

Return value:

- returns: The new state of __INTERRUPT__ (Enabled or disabled)

JPEG Flag definition

JPEG_FLAG_IFTF

Input FIFO is not full and is below its threshold flag

JPEG_FLAG_IFNFF

Input FIFO Not Full Flag, a data can be written

JPEG_FLAG_OFTF

Output FIFO is not empty and has reach its threshold

JPEG_FLAG_OFNEF

Output FIFO is not empty, a data is available

JPEG_FLAG_EOCF

JPEG Codec core has finished the encoding or the decoding process and than last data has been sent to the output FIFO

JPEG_FLAG_HPDF

JPEG Codec has finished the parsing of the headers and the internal registers have been updated

JPEG_FLAG_COF

JPEG Codec operation on going flag

JPEG_FLAG_ALL

JPEG Codec All previous flag

JPEG Image Quality

JPEG_IMAGE_QUALITY_MIN

Minimum JPEG quality

JPEG_IMAGE_QUALITY_MAX

Maximum JPEG quality

JPEG Interrupt configuration definition

JPEG_IT_IFT

Input FIFO Threshold Interrupt

JPEG_IT_IFNF

Input FIFO Not Full Interrupt

JPEG_IT_OFT

Output FIFO Threshold Interrupt

JPEG_IT_OFNE

Output FIFO Not Empty Interrupt

JPEG_IT_EOC

End of Conversion Interrupt

JPEG_IT_HPD

Header Parsing Done Interrupt

JPEG Process Pause Resume definition

JPEG_PAUSE_RESUME_INPUT

Pause/Resume Input FIFO Xfer

JPEG_PAUSE_RESUME_OUTPUT

Pause/Resume Output FIFO Xfer

JPEG_PAUSE_RESUME_INPUT_OUTPUT

Pause/Resume Input and Output FIFO Xfer

JPEG Quantization Table Size

JPEG_QUANT_TABLE_SIZE

JPEG Quantization Table Size in bytes

45 HAL LPTIM Generic Driver

45.1 LPTIM Firmware driver registers structures

45.1.1 LPTIM_ClockConfigTypeDef

LPTIM_ClockConfigTypeDef is defined in the stm32u5xx_hal_lptim.h

Data Fields

- ***uint32_t Source***
- ***uint32_t Prescaler***

Field Documentation

- ***uint32_t LPTIM_ClockConfigTypeDef::Source***
  Selects the clock source. This parameter can be a value of ***LPTIM_Clock_Source***
- ***uint32_t LPTIM_ClockConfigTypeDef::Prescaler***
  Specifies the counter clock Prescaler. This parameter can be a value of ***LPTIM_Clock_Prescaler***

45.1.2 LPTIM_ULPClockConfigTypeDef

LPTIM_ULPClockConfigTypeDef is defined in the stm32u5xx_hal_lptim.h

Data Fields

- ***uint32_t Polarity***
- ***uint32_t SampleTime***

Field Documentation

- ***uint32_t LPTIM_ULPClockConfigTypeDef::Polarity***
  Selects the polarity of the active edge for the counter unit if the ULPTIM input is selected. Note: This parameter is used only when Ultra low power clock source is used. Note: If the polarity is configured on 'both edges', an auxiliary clock (one of the Low power oscillator) must be active. This parameter can be a value of ***LPTIM_Clock_Polarity***
- ***uint32_t LPTIM_ULPClockConfigTypeDef::SampleTime***
  Selects the clock sampling time to configure the clock glitch filter. Note: This parameter is used only when Ultra low power clock source is used. This parameter can be a value of ***LPTIM_Clock_Sample_Time***

45.1.3 LPTIM_TriggerConfigTypeDef

LPTIM_TriggerConfigTypeDef is defined in the stm32u5xx_hal_lptim.h

Data Fields

- ***uint32_t Source***
- ***uint32_t ActiveEdge***
- ***uint32_t SampleTime***

Field Documentation

- ***uint32_t LPTIM_TriggerConfigTypeDef::Source***
  Selects the Trigger source. This parameter can be a value of ***LPTIM_Trigger_Source***
- ***uint32_t LPTIM_TriggerConfigTypeDef::ActiveEdge***
  Selects the Trigger active edge. Note: This parameter is used only when an external trigger is used. This parameter can be a value of ***LPTIM_External_Trigger_Polarity***
- ***uint32_t LPTIM_TriggerConfigTypeDef::SampleTime***
  Selects the trigger sampling time to configure the clock glitch filter. Note: This parameter is used only when an external trigger is used. This parameter can be a value of ***LPTIM_Trigger_Sample_Time***

45.1.4 LPTIM_InitTypeDef

LPTIM_InitTypeDef is defined in the stm32u5xx_hal_lptim.h

Data Fields

- ***LPTIM_ClockConfigTypeDef Clock***
- ***LPTIM_ULPClockConfigTypeDef UltraLowPowerClock***

- ***LPTIM_TriggerConfigTypeDef Trigger***
- ***uint32_t Period***
- ***uint32_t UpdateMode***
- ***uint32_t CounterSource***
- ***uint32_t Input1Source***
- ***uint32_t Input2Source***
- ***uint32_t RepetitionCounter***

Field Documentation

- ***LPTIM_ClockConfigTypeDef LPTIM_InitTypeDef::Clock***
  Specifies the clock parameters
- ***LPTIM_ULPClockConfigTypeDef LPTIM_InitTypeDef::UltraLowPowerClock***
  Specifies the Ultra Low Power clock parameters
- ***LPTIM_TriggerConfigTypeDef LPTIM_InitTypeDef::Trigger***
  Specifies the Trigger parameters
- ***uint32_t LPTIM_InitTypeDef::Period***
  Specifies the period value to be loaded into the active Auto-Reload Register at the next update event. This parameter can be a number between Min_Data = 0x0001 and Max_Data = 0xFFFF.
- ***uint32_t LPTIM_InitTypeDef::UpdateMode***
  Specifies whether the update of the autoreload and the compare values is done immediately or after the end of current period. This parameter can be a value of ***LPTIM_Updating_Mode***
- ***uint32_t LPTIM_InitTypeDef::CounterSource***
  Specifies whether the counter is incremented each internal event or each external event. This parameter can be a value of ***LPTIM_Counter_Source***
- ***uint32_t LPTIM_InitTypeDef::Input1Source***
  Specifies source selected for input1 (GPIO or comparator output). This parameter can be a value of ***LPTIM_Input1_Source***
- ***uint32_t LPTIM_InitTypeDef::Input2Source***
  Specifies source selected for input2 (GPIO or comparator output). Note: This parameter is used only for encoder feature so is used only for LPTIM1 instance. This parameter can be a value of ***LPTIM_Input2_Source***
- ***uint32_t LPTIM_InitTypeDef::RepetitionCounter***
  Specifies the repetition counter value. Each time the RCR downcounter reaches zero, an update event is generated and counting restarts from the RCR value (N). Note: When using repetition counter the UpdateMode field must be set to LPTIM_UPDATE_ENDOFPERIOD otherwise unpredictable behavior may occur. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.

45.1.5 LPTIM_OC_ConfigTypeDef

LPTIM_OC_ConfigTypeDef is defined in the stm32u5xx_hal_lptim.h

Data Fields

- ***uint32_t Pulse***
- ***uint32_t OCPolarity***

Field Documentation

- ***uint32_t LPTIM_OC_ConfigTypeDef::Pulse***
  Specifies the pulse value to be loaded into the Capture Compare Register. This parameter can be a number between Min_Data = 0x0000 and Max_Data = 0xFFFF
- ***uint32_t LPTIM_OC_ConfigTypeDef::OCPolarity***
  Specifies the output polarity. This parameter can be a value of ***LPTIM_Output_Compare_Polarity***

45.1.6 LPTIM_IC_ConfigTypeDef

LPTIM_IC_ConfigTypeDef is defined in the stm32u5xx_hal_lptim.h

Data Fields

- ***uint32_t ICInputSource***
- ***uint32_t ICPrescaler***
- ***uint32_t ICPolarity***

- *uint32_t ICFilter*

Field Documentation

- ***uint32_t LPTIM_IC_ConfigTypeDef::ICInputSource***
  Specifies source selected for IC channel. This parameter can be a value of *LPTIM_Input_Capture_Source*
- ***uint32_t LPTIM_IC_ConfigTypeDef::ICPrescaler***
  Specifies the Input Capture Prescaler. This parameter can be a value of *LPTIM_Input_Capture_Prescaler*
- ***uint32_t LPTIM_IC_ConfigTypeDef::ICPolarity***
  Specifies the active edge of the input signal. This parameter can be a value of *LPTIM_Input_Capture_Polarity*
- ***uint32_t LPTIM_IC_ConfigTypeDef::ICFilter***
  Specifies the input capture filter. This parameter can be a value of *LPTIM_Input_Capture_Filter*

45.1.7 __LPTIM_HandleTypeDef

__LPTIM_HandleTypeDef is defined in the stm32u5xx_hal_lptim.h

Data Fields

- ***LPTIM_TypeDef * Instance***
- ***LPTIM_InitTypeDef Init***
- ***HAL_LPTIM_ActiveChannel Channel***
- ***DMA_HandleTypeDef * hdma***
- ***HAL_StatusTypeDef Status***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_LPTIM_StateTypeDef State***
- ***__IO HAL_LPTIM_ChannelStateTypeDef ChannelState***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***
- ***void(* CompareMatchCallback***
- ***void(* AutoReloadMatchCallback***
- ***void(* TriggerCallback***
- ***void(* CompareWriteCallback***
- ***void(* AutoReloadWriteCallback***
- ***void(* DirectionUpCallback***
- ***void(* DirectionDownCallback***
- ***void(* UpdateEventCallback***
- ***void(* RepCounterWriteCallback***
- ***void(* UpdateEventHalfCpltCallback***
- ***void(* ErrorCallback***
- ***void(* IC_CaptureCallback***
- ***void(* IC_CaptureHalfCpltCallback***
- ***void(* IC_OverCaptureCallback***

Field Documentation

- ***LPTIM_TypeDef* __LPTIM_HandleTypeDef::Instance***
  Register base address
- ***LPTIM_InitTypeDef __LPTIM_HandleTypeDef::Init***
  LPTIM required parameters
- ***HAL_LPTIM_ActiveChannel __LPTIM_HandleTypeDef::Channel***
  Active channel
- ***DMA_HandleTypeDef* __LPTIM_HandleTypeDef::hdma[3]***
  DMA Handlers array, This array is accessed by a *LPTIM_DMA_Handle_index*
- ***HAL_StatusTypeDef __LPTIM_HandleTypeDef::Status***
  LPTIM peripheral status

- ***HAL_LockTypeDef __LPTIM_HandleTypeDef::Lock***
  LPTIM locking object
- ***__IO HAL_LPTIM_StateTypeDef __LPTIM_HandleTypeDef::State***
  LPTIM peripheral state
- ***__IO HAL_LPTIM_ChannelStateTypeDef __LPTIM_HandleTypeDef::ChannelState[2]***
  LPTIM channel operation state
- ***void(* __LPTIM_HandleTypeDef::MspInitCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  LPTIM Base Msp Init Callback
- ***void(* __LPTIM_HandleTypeDef::MspDeInitCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  LPTIM Base Msp DeInit Callback
- ***void(* __LPTIM_HandleTypeDef::CompareMatchCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Compare match Callback
- ***void(* __LPTIM_HandleTypeDef::AutoReloadMatchCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Auto-reload match Callback
- ***void(* __LPTIM_HandleTypeDef::TriggerCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  External trigger event detection Callback
- ***void(* __LPTIM_HandleTypeDef::CompareWriteCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Compare register write complete Callback
- ***void(* __LPTIM_HandleTypeDef::AutoReloadWriteCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Auto-reload register write complete Callback
- ***void(* __LPTIM_HandleTypeDef::DirectionUpCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Up-counting direction change Callback
- ***void(* __LPTIM_HandleTypeDef::DirectionDownCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Down-counting direction change Callback
- ***void(* __LPTIM_HandleTypeDef::UpdateEventCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Update event detection Callback
- ***void(* __LPTIM_HandleTypeDef::RepCounterWriteCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Repetition counter register write complete Callback
- ***void(* __LPTIM_HandleTypeDef::UpdateEventHalfCpltCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Update event half complete detection Callback
- ***void(* __LPTIM_HandleTypeDef::ErrorCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  LPTIM Error Callback
- ***void(* __LPTIM_HandleTypeDef::IC_CaptureCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Input capture Callback
- ***void(* __LPTIM_HandleTypeDef::IC_CaptureHalfCpltCallback)(struct __LPTIM_HandleTypeDef *htim)***
  Input Capture half complete Callback
- ***void(* __LPTIM_HandleTypeDef::IC_OverCaptureCallback)(struct __LPTIM_HandleTypeDef *hlptim)***
  Over capture Callback

45.2 LPTIM Firmware driver API description

The following section lists the various functions of the LPTIM library.

45.2.1 How to use this driver

The LPTIM HAL driver can be used as follows:

1. Initialize the LPTIM low level resources by implementing the HAL_LPTIM_MspInit():
   - Enable the LPTIM interface clock using __HAL_RCC_LPTIMx_CLK_ENABLE().
   - In case of using interrupts (e.g. HAL_LPTIM_PWM_Start_IT()):
     - Configure the LPTIM interrupt priority using HAL_NVIC_SetPriority().
     - Enable the LPTIM IRQ handler using HAL_NVIC_EnableIRQ().
     - In LPTIM IRQ handler, call HAL_LPTIM_IRQHandler().
2. Initialize the LPTIM HAL using HAL_LPTIM_Init(). This function configures mainly:
   - The instance: LPTIM1, LPTIM2, LPTIM3 or LPTIM4.
   - Clock: the counter clock.
     - Source : it can be either the ULPTIM input (IN1) or one of the internal clock; (APB, LSE, LSI or MSI).
     - Prescaler: select the clock divider.
   - UltraLowPowerClock : To be used only if the ULPTIM is selected as counter clock source.
     - Polarity: polarity of the active edge for the counter unit if the ULPTIM input is selected.
     - SampleTime: clock sampling time to configure the clock glitch filter.
   - Trigger: How the counter start.
     - Source: trigger can be software or one of the hardware triggers.
     - ActiveEdge : only for hardware trigger.
     - SampleTime : trigger sampling time to configure the trigger glitch filter.
   - OutputPolarity : 2 opposite polarities are possible.
   - UpdateMode: specifies whether the update of the autoreload and the compare values is done immediately or after the end of current period.
   - Input1Source: Source selected for input1 (GPIO or comparator output).
   - Input2Source: Source selected for input2 (GPIO or comparator output). Input2 is used only for encoder feature so is used only for LPTIM1 instance.
3. Six modes are available:
   - PWM Mode: To generate a PWM signal with specified period and pulse, call HAL_LPTIM_PWM_Start() or HAL_LPTIM_PWM_Start_IT() for interruption mode.
   - One Pulse Mode: To generate pulse with specified width in response to a stimulus, call HAL_LPTIM_OnePulse_Start() or HAL_LPTIM_OnePulse_Start_IT() for interruption mode.
   - Set once Mode: In this mode, the output changes the level (from low level to high level if the output polarity is configured high, else the opposite) when a compare match occurs. To start this mode, call HAL_LPTIM_SetOnce_Start() or HAL_LPTIM_SetOnce_Start_IT() for interruption mode.
   - Encoder Mode: To use the encoder interface call HAL_LPTIM_Encoder_Start() or HAL_LPTIM_Encoder_Start_IT() for interruption mode. Only available for LPTIM1 instance.
   - Time out Mode: an active edge on one selected trigger input rests the counter. The first trigger event will start the timer, any successive trigger event will reset the counter and the timer will restart. To start this mode call HAL_LPTIM_TimeOut_Start_IT() or HAL_LPTIM_TimeOut_Start_IT() for interruption mode.
   - Counter Mode: counter can be used to count external events on the LPTIM Input1 or it can be used to count internal clock cycles. To start this mode, call HAL_LPTIM_Counter_Start() or HAL_LPTIM_Counter_Start_IT() for interruption mode.
4. User can stop any process by calling the corresponding API: HAL_LPTIM_Xxx_Stop() or HAL_LPTIM_Xxx_Stop_IT() if the process is already started in interruption mode.
5. De-initialize the LPTIM peripheral using HAL_LPTIM_DeInit().

Callback registration

The compilation define USE_HAL_LPTIM_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use Function HAL_LPTIM_RegisterCallback() to register a callback. HAL_LPTIM_RegisterCallback() takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_LPTIM_UnRegisterCallback() to reset a callback to the default weak function. HAL_LPTIM_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID.

These functions allow to register/unregister following callbacks:

- MspInitCallback : LPTIM Base Msp Init Callback.
- MspDeInitCallback : LPTIM Base Msp DeInit Callback.
- CompareMatchCallback : Compare match Callback.
- AutoReloadMatchCallback : Auto-reload match Callback.
- TriggerCallback : External trigger event detection Callback.
- CompareWriteCallback : Compare register write complete Callback.
- AutoReloadWriteCallback : Auto-reload register write complete Callback.
- DirectionUpCallback : Up-counting direction change Callback.
- DirectionDownCallback : Down-counting direction change Callback.
- UpdateEventCallback : Update event detection Callback.
- RepCounterWriteCallback : Repetition counter register write complete Callback.

By default, after the Init and when the state is HAL_LPTIM_STATE_RESET all interrupt callbacks are set to the corresponding weak functions: examples HAL_LPTIM_TriggerCallback(), HAL_LPTIM_CompareMatchCallback().

Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functionalities in the Init/DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the Init/DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand)

Callbacks can be registered/unregistered in HAL_LPTIM_STATE_READY state only. Exception done MspInit/MspDeInit that can be registered/unregistered in HAL_LPTIM_STATE_READY or HAL_LPTIM_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_LPTIM_RegisterCallback() before calling DeInit or Init function.

When The compilation define USE_HAL_LPTIM_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

45.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

- Initialize the LPTIM according to the specified parameters in the LPTIM_InitTypeDef and initialize the associated handle.
- DeInitialize the LPTIM peripheral.
- Initialize the LPTIM MSP.
- DeInitialize the LPTIM MSP.

This section contains the following APIs:

- ***HAL_LPTIM_Init()***
- ***HAL_LPTIM_DeInit()***
- ***HAL_LPTIM_MspInit()***
- ***HAL_LPTIM_MspDeInit()***

45.2.3 LPTIM Start Stop operation functions

This section provides functions allowing to:

- Start the PWM mode.
- Stop the PWM mode.
- Start the One pulse mode.
- Stop the One pulse mode.
- Start the Set once mode.
- Stop the Set once mode.
- Start the Encoder mode.
- Stop the Encoder mode.
- Start the Timeout mode.
- Stop the Timeout mode.
- Start the Counter mode.
- Stop the Counter mode.

This section contains the following APIs:

- *HAL_LPTIM_PWM_Start()*
- *HAL_LPTIM_PWM_Stop()*
- *HAL_LPTIM_PWM_Start_IT()*
- *HAL_LPTIM_PWM_Stop_IT()*
- *HAL_LPTIM_PWM_Start_DMA()*
- *HAL_LPTIM_PWM_Stop_DMA()*
- *HAL_LPTIM_OnePulse_Start()*
- *HAL_LPTIM_OnePulse_Stop()*
- *HAL_LPTIM_OnePulse_Start_IT()*
- *HAL_LPTIM_OnePulse_Stop_IT()*
- *HAL_LPTIM_SetOnce_Start()*
- *HAL_LPTIM_SetOnce_Stop()*
- *HAL_LPTIM_SetOnce_Start_IT()*
- *HAL_LPTIM_SetOnce_Stop_IT()*
- *HAL_LPTIM_Encoder_Start()*
- *HAL_LPTIM_Encoder_Stop()*
- *HAL_LPTIM_Encoder_Start_IT()*
- *HAL_LPTIM_Encoder_Stop_IT()*
- *HAL_LPTIM_TimeOut_Start()*
- *HAL_LPTIM_TimeOut_Stop()*
- *HAL_LPTIM_TimeOut_Start_IT()*
- *HAL_LPTIM_TimeOut_Stop_IT()*
- *HAL_LPTIM_Counter_Start()*
- *HAL_LPTIM_Counter_Stop()*
- *HAL_LPTIM_Counter_Start_IT()*
- *HAL_LPTIM_Counter_Stop_IT()*
- *HAL_LPTIM_IC_Start()*
- *HAL_LPTIM_IC_Stop()*
- *HAL_LPTIM_IC_Start_IT()*
- *HAL_LPTIM_IC_Stop_IT()*
- *HAL_LPTIM_IC_Start_DMA()*
- *HAL_LPTIM_IC_Stop_DMA()*
- *HAL_LPTIM_OC_ConfigChannel()*
- *HAL_LPTIM_IC_ConfigChannel()*

45.2.4 LPTIM Read operation functions

This section provides LPTIM Reading functions.

- Read the counter value.
- Read the period (Auto-reload) value.
- Read the pulse (Compare)value.

This section contains the following APIs:

- *HAL_LPTIM_ReadCounter()*
- *HAL_LPTIM_ReadAutoReload()*
- *HAL_LPTIM_ReadCapturedValue()*
- *HAL_LPTIM_IC_GetOffset()*

45.2.5 LPTIM Config function

This section provides LPTIM Config function.

- Configure channel: Output Compare mode, Period, Polarity.

This section contains the following APIs:

- *HAL_LPTIM_OC_ConfigChannel()*
- *HAL_LPTIM_IC_ConfigChannel()*

45.2.6 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_LPTIM_GetState()*

45.2.7 Detailed description of functions

HAL_LPTIM_Init

Function name

HAL_StatusTypeDef HAL_LPTIM_Init (LPTIM_HandleTypeDef * hlptim)

Function description

Initialize the LPTIM according to the specified parameters in the LPTIM_InitTypeDef and initialize the associated handle.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_DeInit

Function name

HAL_StatusTypeDef HAL_LPTIM_DeInit (LPTIM_HandleTypeDef * hlptim)

Function description

DeInitialize the LPTIM peripheral.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_MspInit

Function name

void HAL_LPTIM_MspInit (LPTIM_HandleTypeDef * hlptim)

Function description

Initialize the LPTIM MSP.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_MspDeInit

Function name

void HAL_LPTIM_MspDeInit (LPTIM_HandleTypeDef * hlptim)

Function description

DeInitialize LPTIM MSP.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_OC_ConfigChannel

Function name

HAL_StatusTypeDef HAL_LPTIM_OC_ConfigChannel (LPTIM_HandleTypeDef * hlptim, const LPTIM_OC_ConfigTypeDef * sConfig, uint32_t Channel)

Function description

Parameters

- **hlptim:** LPTIM handle
- **sConfig:** The output configuration structure
- **Channel:** LPTIM Channel to be configured This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  – LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

Notes

- Successive calls to HAL_LPTIM_OC_ConfigChannel can only be performed after a delay that must be greater or equal than the value of (PRESC x 3) kernel clock cycles, PRESC[2:0] being the clock decimal division factor (1, 2, 4, ..., 128). Any successive call violating this delay, leads to unpredictable results.

HAL_LPTIM_PWM_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Start the LPTIM PWM generation.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be enabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  – LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_PWM_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Stop (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stop the LPTIM PWM generation.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be disabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  – LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_PWM_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Start the LPTIM PWM generation in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be enabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  – LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_PWM_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Stop_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stop the LPTIM PWM generation in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be disabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  – LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_PWM_Start_DMA

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Start_DMA (LPTIM_HandleTypeDef * hlptim, uint32_t Channel, const uint32_t * pData, uint32_t Length)

Function description

Start the LPTIM PWM generation in DMA mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be enabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  – LPTIM_CHANNEL_2: LPTIM Channel 2 selected
- **pData:** The destination Buffer address
- **Length:** The length of data to be transferred from LPTIM peripheral to memory

Return values

- **HAL:** status

HAL_LPTIM_PWM_Stop_DMA

Function name

HAL_StatusTypeDef HAL_LPTIM_PWM_Stop_DMA (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stop the LPTIM PWM generation in DMA mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be disabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  – LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_OnePulse_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Start the LPTIM One pulse generation.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be enabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  – LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_OnePulse_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Stop (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stop the LPTIM One pulse generation.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be disabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  – LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_OnePulse_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Start the LPTIM One pulse generation in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be enabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  – LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_OnePulse_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_OnePulse_Stop_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stop the LPTIM One pulse generation in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be disabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  – LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_SetOnce_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Start the LPTIM in Set once mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be enabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  – LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_SetOnce_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Stop (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stop the LPTIM Set once mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be disabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  – LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_SetOnce_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Start the LPTIM Set once mode in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be enabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  – LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_SetOnce_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_SetOnce_Stop_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stop the LPTIM Set once mode in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be disabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  – LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_Encoder_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Start (LPTIM_HandleTypeDef * hlptim)

Function description

Start the Encoder interface.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Encoder_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Stop (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Encoder interface.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Encoder_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Start_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Start the Encoder interface in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Encoder_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Encoder_Stop_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Encoder interface in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_TimeOut_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Timeout)

Function description

Start the Timeout function.

Parameters

- **hlptim:** LPTIM handle
- **Timeout:** Specifies the TimeOut value to reset the counter. This parameter must be a value between 0x0000 and 0xFFFF.

Return values

- **HAL:** status

Notes

- The first trigger event will start the timer, any successive trigger event will reset the counter and the timer restarts.

HAL_LPTIM_TimeOut_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Stop (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Timeout function.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_TimeOut_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Timeout)

Function description

Start the Timeout function in interrupt mode.

Parameters

- **hlptim:** LPTIM handle
- **Timeout:** Specifies the TimeOut value to reset the counter. This parameter must be a value between 0x0000 and 0xFFFF.

Return values

- **HAL:** status

Notes

- The first trigger event will start the timer, any successive trigger event will reset the counter and the timer restarts.

HAL_LPTIM_TimeOut_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_TimeOut_Stop_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Timeout function in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Counter_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Start (LPTIM_HandleTypeDef * hlptim)

Function description

Start the Counter mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Counter_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Stop (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Counter mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Counter_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Start_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Start the Counter mode in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_Counter_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_Counter_Stop_IT (LPTIM_HandleTypeDef * hlptim)

Function description

Stop the Counter mode in interrupt mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** status

HAL_LPTIM_IC_ConfigChannel

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_ConfigChannel (LPTIM_HandleTypeDef * hlptim, const LPTIM_IC_ConfigTypeDef * sConfig, uint32_t Channel)

Function description

Parameters

- **hlptim:** LPTIM handle
- **sConfig:** The input configuration structure
- **Channel:** LPTIM Channel to be configured This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **HAL:** status

Notes

- Successive calls to HAL_LPTIM_IC_ConfigChannel can only be performed after a delay that must be greater or equal than the value of (PRESC x 3) kernel clock cycles, PRESC[2:0] being the clock decimal division factor (1, 2, 4, ..., 128). Any successive call violating this delay, leads to unpredictable results.

HAL_LPTIM_IC_Start

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Start (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Starts the LPTIM Input Capture measurement.

Parameters

- **hlptim:** LPTIM Input Capture handle
- **Channel:** LPTIM Channels to be enabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: TIM Channel 1 selected
  - LPTIM_CHANNEL_2: TIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_IC_Stop

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Stop (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stops the LPTIM Input Capture measurement.

Parameters

- **hlptim:** LPTIM Input Capture handle
- **Channel:** LPTIM Channels to be disabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: TIM Channel 1 selected
  – LPTIM_CHANNEL_2: TIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_IC_Start_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Start_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Starts the LPTIM Input Capture measurement in interrupt mode.

Parameters

- **hlptim:** LPTIM Input Capture handle
- **Channel:** LPTIM Channels to be enabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: TIM Channel 1 selected
  – LPTIM_CHANNEL_2: TIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_IC_Stop_IT

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Stop_IT (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stops the LPTIM Input Capture measurement in interrupt mode.

Parameters

- **hlptim:** LPTIM Input Capture handle
- **Channel:** LPTIM Channels to be disabled This parameter can be one of the following values:
  – LPTIM_CHANNEL_1: TIM Channel 1 selected
  – LPTIM_CHANNEL_2: TIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_IC_Start_DMA

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Start_DMA (LPTIM_HandleTypeDef * hlptim, uint32_t Channel, uint32_t * pData, uint32_t Length)

Function description

Starts the LPTIM Input Capture measurement in DMA mode.

Parameters

- **hlptim:** LPTIM Input Capture handle
- **Channel:** LPTIM Channels to be enabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: TIM Channel 1 selected
  - LPTIM_CHANNEL_2: TIM Channel 2 selected
- **pData:** The destination Buffer address
- **Length:** The length of data to be transferred from LPTIM peripheral to memory

Return values

- **HAL:** status

HAL_LPTIM_IC_Stop_DMA

Function name

HAL_StatusTypeDef HAL_LPTIM_IC_Stop_DMA (LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Stops the LPTIM Input Capture measurement in DMA mode.

Parameters

- **hlptim:** LPTIM Input Capture handle
- **Channel:** LPTIM Channels to be disabled This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: TIM Channel 1 selected
  - LPTIM_CHANNEL_2: TIM Channel 2 selected

Return values

- **HAL:** status

HAL_LPTIM_ReadCounter

Function name

uint32_t HAL_LPTIM_ReadCounter (const LPTIM_HandleTypeDef * hlptim)

Function description

Return the current counter value.

Parameters

- **hlptim:** LPTIM handle

Return values

- **Counter:** value.

HAL_LPTIM_ReadAutoReload

Function name

uint32_t HAL_LPTIM_ReadAutoReload (const LPTIM_HandleTypeDef * hlptim)

Function description

Return the current Autoreload (Period) value.

Parameters

- **hlptim:** LPTIM handle

Return values

- **Autoreload:** value.

HAL_LPTIM_ReadCapturedValue

Function name

uint32_t HAL_LPTIM_ReadCapturedValue (const LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

Return the current Compare (Pulse) value.

Parameters

- **hlptim:** LPTIM handle
- **Channel:** LPTIM Channel to be selected This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **Compare:** value.

HAL_LPTIM_IC_GetOffset

Function name

uint8_t HAL_LPTIM_IC_GetOffset (const LPTIM_HandleTypeDef * hlptim, uint32_t Channel)

Function description

LPTimer Input Capture Get Offset(in counter step unit)

Parameters

- **hlptim:** pointer to a LPTIM_HandleTypeDef structure that contains the configuration information for LPTIM module.
- **Channel:** This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return values

- **The:** offset value

Notes

- The real capture value corresponding to the input capture trigger can be calculated using the formula hereafter : Real capture value = captured(LPTIM_CCRx) - offset The Offset value is depending on the glitch filter value for the channel and the value of the prescaler for the kernel clock. Please check Errata Sheet V1_8 for more details under "variable latency on input capture channel" section.

HAL_LPTIM_IRQHandler

Function name

void HAL_LPTIM_IRQHandler (LPTIM_HandleTypeDef * hlptim)

Function description

Handle LPTIM interrupt request.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_CompareMatchCallback

Function name

void HAL_LPTIM_CompareMatchCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Compare match callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_AutoReloadMatchCallback

Function name

void HAL_LPTIM_AutoReloadMatchCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Autoreload match callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_TriggerCallback

Function name

void HAL_LPTIM_TriggerCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Trigger detected callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_CompareWriteCallback

Function name

void HAL_LPTIM_CompareWriteCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Compare write callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_AutoReloadWriteCallback

Function name

void HAL_LPTIM_AutoReloadWriteCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Autoreload write callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_DirectionUpCallback

Function name

void HAL_LPTIM_DirectionUpCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Direction counter changed from Down to Up callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_DirectionDownCallback

Function name

void HAL_LPTIM_DirectionDownCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Direction counter changed from Up to Down callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_ErrorCallback

Function name

void HAL_LPTIM_ErrorCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Error callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_UpdateEventCallback

Function name

void HAL_LPTIM_UpdateEventCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Repetition counter underflowed (or contains zero) and LPTIM counter overflowed callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_UpdateEventHalfCpltCallback

Function name

void HAL_LPTIM_UpdateEventHalfCpltCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Update event half complete callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_RepCounterWriteCallback

Function name

void HAL_LPTIM_RepCounterWriteCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Successful APB bus write to repetition counter register callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_IC_CaptureCallback

Function name

void HAL_LPTIM_IC_CaptureCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Input Capture callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_IC_CaptureHalfCpltCallback

Function name

void HAL_LPTIM_IC_CaptureHalfCpltCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Input Capture half complete callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM IC handle

Return values

- **None:**

HAL_LPTIM_IC_OverCaptureCallback

Function name

void HAL_LPTIM_IC_OverCaptureCallback (LPTIM_HandleTypeDef * hlptim)

Function description

Over Capture callback in non-blocking mode.

Parameters

- **hlptim:** LPTIM handle

Return values

- **None:**

HAL_LPTIM_RegisterCallback

Function name

HAL_StatusTypeDef HAL_LPTIM_RegisterCallback (LPTIM_HandleTypeDef * hlptim, HAL_LPTIM_CallbackIDTypeDef CallbackID, pLPTIM_CallbackTypeDef pCallback)

Function description

Register a User LPTIM callback to be used instead of the weak predefined callback.

Parameters

- **hlptim:** LPTIM handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_LPTIM_MSPINIT_CB_ID LPTIM Base Msp Init Callback ID
  - HAL_LPTIM_MSPDEINIT_CB_ID LPTIM Base Msp DeInit Callback ID
  - HAL_LPTIM_COMPARE_MATCH_CB_ID Compare match Callback ID
  - HAL_LPTIM_AUTORELOAD_MATCH_CB_ID Auto-reload match Callback ID
  - HAL_LPTIM_TRIGGER_CB_ID External trigger event detection Callback ID
  - HAL_LPTIM_COMPARE_WRITE_CB_ID Compare register write complete Callback ID
  - HAL_LPTIM_AUTORELOAD_WRITE_CB_ID Auto-reload register write complete Callback ID
  - HAL_LPTIM_DIRECTION_UP_CB_ID Up-counting direction change Callback ID
  - HAL_LPTIM_DIRECTION_DOWN_CB_ID Down-counting direction change Callback ID
  - HAL_LPTIM_UPDATE_EVENT_CB_ID Update event detection Callback ID
  - HAL_LPTIM_REP_COUNTER_WRITE_CB_ID Repetition counter register write complete Callback ID
  - HAL_LPTIM_UPDATE_EVENT_HALF_CB_ID Update event Half detection Callback ID
  - HAL_LPTIM_ERROR_CB_ID Error Callback ID
  - HAL_LPTIM_IC_CAPTURE_CB_ID Input Capture Callback ID
  - HAL_LPTIM_IC_CAPTURE_HALF_CB_ID Input Capture half complete Callback ID
  - HAL_LPTIM_OVER_CAPTURE_CB_ID Over Capture Callback ID
- **pCallback:** pointer to the callback function

Return values

- **status:**

HAL_LPTIM_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_LPTIM_UnRegisterCallback (LPTIM_HandleTypeDef * hlptim, HAL_LPTIM_CallbackIDTypeDef CallbackID)

Function description

Unregister a LPTIM callback LLPTIM callback is redirected to the weak predefined callback.

Parameters

- **hlptim:** LPTIM handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_LPTIM_MSPINIT_CB_ID LPTIM Base Msp Init Callback ID
  - HAL_LPTIM_MSPDEINIT_CB_ID LPTIM Base Msp DeInit Callback ID
  - HAL_LPTIM_COMPARE_MATCH_CB_ID Compare match Callback ID
  - HAL_LPTIM_AUTORELOAD_MATCH_CB_ID Auto-reload match Callback ID
  - HAL_LPTIM_TRIGGER_CB_ID External trigger event detection Callback ID
  - HAL_LPTIM_COMPARE_WRITE_CB_ID Compare register write complete Callback ID
  - HAL_LPTIM_AUTORELOAD_WRITE_CB_ID Auto-reload register write complete Callback ID
  - HAL_LPTIM_DIRECTION_UP_CB_ID Up-counting direction change Callback ID
  - HAL_LPTIM_DIRECTION_DOWN_CB_ID Down-counting direction change Callback ID
  - HAL_LPTIM_UPDATE_EVENT_CB_ID Update event detection Callback ID
  - HAL_LPTIM_REP_COUNTER_WRITE_CB_ID Repetition counter register write complete Callback ID
  - HAL_LPTIM_UPDATE_EVENT_HALF_CB_ID Update event Half detection Callback ID
  - HAL_LPTIM_ERROR_CB_ID Error Callback ID
  - HAL_LPTIM_IC_CAPTURE_CB_ID Input Capture Callback ID
  - HAL_LPTIM_IC_CAPTURE_HALF_CB_ID Input Capture half complete Callback ID
  - HAL_LPTIM_OVER_CAPTURE_CB_ID Over Capture Callback ID

Return values

- **status:**

HAL_LPTIM_GetState

Function name

HAL_LPTIM_StateTypeDef HAL_LPTIM_GetState (const LPTIM_HandleTypeDef * hlptim)

Function description

Return the LPTIM handle state.

Parameters

- **hlptim:** LPTIM handle

Return values

- **HAL:** state

45.3 LPTIM Firmware driver defines

The following section lists the various define and macros of the module.

45.3.1 LPTIM

LPTIM

LPTIM Channel

LPTIM_CHANNEL_1

Capture/compare channel 1 identifier

LPTIM_CHANNEL_2

Capture/compare channel 2 identifier

LPTIM Clock Polarity

LPTIM_CLOCKPOLARITY_RISING

LPTIM_CLOCKPOLARITY_FALLING

LPTIM_CLOCKPOLARITY_RISING_FALLING

LPTIM Clock Prescaler

LPTIM_PRESCALER_DIV1

LPTIM_PRESCALER_DIV2

LPTIM_PRESCALER_DIV4

LPTIM_PRESCALER_DIV8

LPTIM_PRESCALER_DIV16

LPTIM_PRESCALER_DIV32

LPTIM_PRESCALER_DIV64

LPTIM_PRESCALER_DIV128

LPTIM Clock Sample Time

LPTIM_CLOCKSAMPLETIME_DIRECTTRANSITION

LPTIM_CLOCKSAMPLETIME_2TRANSITIONS

LPTIM_CLOCKSAMPLETIME_4TRANSITIONS

LPTIM_CLOCKSAMPLETIME_8TRANSITIONS

LPTIM Clock Source

LPTIM_CLOCKSOURCE_APBCLOCK_LPOSC

LPTIM_CLOCKSOURCE_ULPTIM

LPTIM Counter Source

LPTIM_COUNTERSOURCE_INTERNAL

LPTIM_COUNTERSOURCE_EXTERNAL

LPTIM DMA Handle Index

LPTIM_DMA_ID_UPDATE

Index of the DMA handle used for Update DMA requests

LPTIM_DMA_ID_CC1

Index of the DMA handle used for Capture/Update event 1 DMA request

LPTIM_DMA_ID_CC2

Index of the DMA handle used for Capture/Update event 2 DMA request

LPTIM DMA Sources

LPTIM_DMA_UPDATE

DMA request is triggered by the update event

LPTIM_DMA_CC1

DMA request is triggered by the capture 1 event

LPTIM_DMA_CC2

DMA request is triggered by the capture 2 event

LPTIM Exported Macros

__HAL_LPTIM_RESET_HANDLE_STATE

Description:
- Reset LPTIM handle state.

Parameters:
- __HANDLE__: LPTIM handle

Return value:
- None

__HAL_LPTIM_ENABLE

Description:
- Enable the LPTIM peripheral.

Parameters:
- __HANDLE__: LPTIM handle

Return value:
- None

__HAL_LPTIM_DISABLE

Description:
- Disable the LPTIM peripheral.

Parameters:
- __HANDLE__: LPTIM handle

Return value:
- None

__HAL_LPTIM_START_CONTINUOUS

Description:
- Start the LPTIM peripheral in Continuous mode.

Parameters:
- __HANDLE__: LPTIM handle

Return value:
- None

__HAL_LPTIM_START_SINGLE

Description:
- Start the LPTIM peripheral in single mode.

Parameters:
- __HANDLE__: LPTIM handle

Return value:
- None

__HAL_LPTIM_RESET_COUNTER

Description:
- Reset the LPTIM Counter register in synchronous mode.

Parameters:
- __HANDLE__: LPTIM handle

Return value:
- None

__HAL_LPTIM_RESET_COUNTER_AFTERREAD

Description:
- Reset after read of the LPTIM Counter register in asynchronous mode.

Parameters:
- __HANDLE__: LPTIM handle

Return value:
- None

__HAL_LPTIM_AUTORELOAD_SET

Description:
- Write the passed parameter in the Autoreload register.

Parameters:
- __HANDLE__: LPTIM handle
- __VALUE__: Autoreload value

Return value:
- None

Notes:
- The ARR register can only be modified when the LPTIM instance is enabled.

__HAL_LPTIM_COMPARE_SET

Description:
- Write the passed parameter in the Compare register.

Parameters:
- __HANDLE__: LPTIM handle
- __VALUE__: Compare value
- __CHANNEL__: TIM Channel to be configured

Return value:
- None

Notes:
- The CCRx registers can only be modified when the LPTIM instance is enabled.

__HAL_LPTIM_REPETITIONCOUNTER_SET

Description:
- Write the passed parameter in the Repetition register.

Parameters:
- __HANDLE__: LPTIM handle
- __VALUE__: Repetition value

Return value:
- None

__HAL_LPTIM_REPETITIONCOUNTER_GET

Description:

- Return the current Repetition value.

Parameters:

- __HANDLE__: LPTIM handle

Return value:

- Repetition: register value

Notes:

- The RCR register can only be modified when the LPTIM instance is enabled.

__HAL_LPTIM_CAPTURE_COMPARE_ENABLE

Description:

- Enable the LPTIM signal input/output on the corresponding pin.

Parameters:

- __HANDLE__: LPTIM handle
- __CHANNEL__: LPTIM Channels to be enabled. This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return value:

- None

__HAL_LPTIM_CAPTURE_COMPARE_DISABLE

Description:

- Disable the LPTIM signal input/output on the corresponding pin.

Parameters:

- __HANDLE__: LPTIM handle
- __CHANNEL__: LPTIM Channels to be disabled. This parameter can be one of the following values:
  - LPTIM_CHANNEL_1: LPTIM Channel 1 selected
  - LPTIM_CHANNEL_2: LPTIM Channel 2 selected

Return value:

- None

__HAL_LPTIM_GET_FLAG

Description:

- Check whether the specified LPTIM flag is set or not.

Parameters:

- __HANDLE__: LPTIM handle
- __FLAG__: LPTIM flag to check This parameter can be a value of:
  - LPTIM_FLAG_REPOK : Repetition register update OK Flag.
  - LPTIM_FLAG_UPDATE : Update event Flag.
  - LPTIM_FLAG_DOWN : Counter direction change up Flag.
  - LPTIM_FLAG_UP : Counter direction change down to up Flag.
  - LPTIM_FLAG_ARROK : Autoreload register update OK Flag.
  - LPTIM_FLAG_CMP1OK : Compare register 1 update OK Flag.
  - LPTIM_FLAG_CMP2OK : Compare register 2 update OK Flag.
  - LPTIM_FLAG_EXTTRIG : External trigger edge event Flag.
  - LPTIM_FLAG_ARRM : Autoreload match Flag.
  - LPTIM_FLAG_CC1 : Capture/Compare 1 interrupt flag.
  - LPTIM_FLAG_CC2 : Capture/Compare 2 interrupt flag.
  - LPTIM_FLAG_CC1O : Capture/Compare 1 over-capture flag.
  - LPTIM_FLAG_CC2O : Capture/Compare 2 over-capture flag.
  - LPTIM_FLAG_DIEROK : DMA & interrupt enable update OK flag.

Return value:

- The: state of the specified flag (SET or RESET).

__HAL_LPTIM_CLEAR_FLAG

Description:

- Clear the specified LPTIM flag.

Parameters:

- __HANDLE__: LPTIM handle.
- __FLAG__: LPTIM flag to clear. This parameter can be a value of:
  - LPTIM_FLAG_REPOK : Repetition register update OK Flag.
  - LPTIM_FLAG_UPDATE : Update event Flag.
  - LPTIM_FLAG_DOWN : Counter direction change up Flag.
  - LPTIM_FLAG_UP : Counter direction change down to up Flag.
  - LPTIM_FLAG_ARROK : Autoreload register update OK Flag.
  - LPTIM_FLAG_CMP1OK : Compare register 1 update OK Flag.
  - LPTIM_FLAG_CMP2OK : Compare register 2 update OK Flag.
  - LPTIM_FLAG_EXTTRIG : External trigger edge event Flag.
  - LPTIM_FLAG_ARRM : Autoreload match Flag.
  - LPTIM_FLAG_CC1 : Capture/Compare 1 interrupt flag.
  - LPTIM_FLAG_CC2 : Capture/Compare 2 interrupt flag.
  - LPTIM_FLAG_CC1O : Capture/Compare 1 over-capture flag.
  - LPTIM_FLAG_CC2O : Capture/Compare 2 over-capture flag.
  - LPTIM_FLAG_DIEROK : DMA & interrupt enable update OK flag.

Return value:

- None.

__HAL_LPTIM_ENABLE_IT

Description:
- Enable the specified LPTIM interrupt.

Parameters:
- __HANDLE__: LPTIM handle.
- __INTERRUPT__: LPTIM interrupt to set. This parameter can be a value of:
  - LPTIM_IT_REPOK : Repetition register update OK Interrupt.
  - LPTIM_IT_UPDATE : Update event register Interrupt.
  - LPTIM_IT_DOWN : Counter direction change up Interrupt.
  - LPTIM_IT_UP : Counter direction change down to up Interrupt.
  - LPTIM_IT_ARROK : Autoreload register update OK Interrupt.
  - LPTIM_IT_CMP1OK : Compare register 1 update OK Interrupt.
  - LPTIM_IT_CMP2OK : Compare register 2 update OK Interrupt.
  - LPTIM_IT_EXTTRIG : External trigger edge event Interrupt.
  - LPTIM_IT_ARRM : Autoreload match Interrupt.
  - LPTIM_IT_CC1 : Capture/Compare 1 interrupt Interrupt.
  - LPTIM_IT_CC2 : Capture/Compare 2 interrupt Interrupt.
  - LPTIM_IT_CC1O : Capture/Compare 1 over-capture Interrupt.
  - LPTIM_IT_CC2O : Capture/Compare 2 over-capture Interrupt.

Return value:
- None.

Notes:
- The LPTIM interrupts can only be enabled when the LPTIM instance is enabled.

__HAL_LPTIM_DISABLE_IT

Description:
- Disable the specified LPTIM interrupt.

Parameters:
- __HANDLE__: LPTIM handle.
- __INTERRUPT__: LPTIM interrupt to set. This parameter can be a value of:
  - LPTIM_IT_REPOK : Repetition register update OK Interrupt.
  - LPTIM_IT_UPDATE : Update event register Interrupt.
  - LPTIM_IT_DOWN : Counter direction change up Interrupt.
  - LPTIM_IT_UP : Counter direction change down to up Interrupt.
  - LPTIM_IT_ARROK : Autoreload register update OK Interrupt.
  - LPTIM_IT_CMP1OK : Compare register 1 update OK Interrupt.
  - LPTIM_IT_CMP2OK : Compare register 2 update OK Interrupt.
  - LPTIM_IT_EXTTRIG : External trigger edge event Interrupt.
  - LPTIM_IT_ARRM : Autoreload match Interrupt.
  - LPTIM_IT_CC1 : Capture/Compare 1 interrupt Interrupt.
  - LPTIM_IT_CC2 : Capture/Compare 2 interrupt Interrupt.
  - LPTIM_IT_CC1O : Capture/Compare 1 over-capture Interrupt.
  - LPTIM_IT_CC2O : Capture/Compare 2 over-capture Interrupt.

Return value:
- None.

Notes:
- The LPTIM interrupts can only be disabled when the LPTIM instance is enabled.

__HAL_LPTIM_ENABLE_DMA

Description:

- Enable the specified DMA request.

Parameters:

- __HANDLE__: specifies the TIM Handle.
- __DMA__: specifies the LPTIM DMA request to enable. This parameter can be one of the following values:
  - LPTIM_DMA_UPDATE: Update DMA request
  - LPTIM_DMA_CC1: Capture/Compare 1 DMA request
  - LPTIM_DMA_CC2: Capture/Compare 2 DMA request

Return value:

- None

__HAL_LPTIM_DISABLE_DMA

Description:

- Disable the specified DMA request.

Parameters:

- __HANDLE__: specifies the LPTIM Handle.
- __DMA__: specifies the LPTIM DMA request to disable. This parameter can be one of the following values:
  - LPTIM_DMA_UPDATE: Update DMA request
  - LPTIM_DMA_CC1: Capture/Compare 1 DMA request
  - LPTIM_DMA_CC2: Capture/Compare 2 DMA request

Return value:

- None

__HAL_LPTIM_GET_IT_SOURCE

Description:

- Check whether the specified LPTIM interrupt source is enabled or not.

Parameters:

- __HANDLE__: LPTIM handle.
- __INTERRUPT__: LPTIM interrupt to check. This parameter can be a value of:
  - LPTIM_IT_REPOK : Repetition register update OK Interrupt.
  - LPTIM_IT_UPDATE : Update event register Interrupt.
  - LPTIM_IT_DOWN : Counter direction change up Interrupt.
  - LPTIM_IT_UP : Counter direction change down to up Interrupt.
  - LPTIM_IT_ARROK : Autoreload register update OK Interrupt.
  - LPTIM_IT_CMP1OK : Compare register 1 update OK Interrupt.
  - LPTIM_IT_CMP2OK : Compare register 2 update OK Interrupt.
  - LPTIM_IT_EXTTRIG : External trigger edge event Interrupt.
  - LPTIM_IT_ARRM : Autoreload match Interrupt.
  - LPTIM_IT_CC1 : Capture/Compare 1 interrupt Interrupt.
  - LPTIM_IT_CC2 : Capture/Compare 2 interrupt Interrupt.
  - LPTIM_IT_CC1O : Capture/Compare 1 over-capture Interrupt.
  - LPTIM_IT_CC2O : Capture/Compare 2 over-capture Interrupt.

Return value:

- Interrupt: status.

46 HAL LTDC Generic Driver

46.1 LTDC Firmware driver registers structures

46.1.1 LTDC_ColorTypeDef

LTDC_ColorTypeDef is defined in the stm32u5xx_hal_ltdc.h

Data Fields

- ***uint8_t Blue***
- ***uint8_t Green***
- ***uint8_t Red***
- ***uint8_t Reserved***

Field Documentation

- ***uint8_t LTDC_ColorTypeDef::Blue***
  Configures the blue value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint8_t LTDC_ColorTypeDef::Green***
  Configures the green value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint8_t LTDC_ColorTypeDef::Red***
  Configures the red value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint8_t LTDC_ColorTypeDef::Reserved***
  Reserved 0xFF

46.1.2 LTDC_InitTypeDef

LTDC_InitTypeDef is defined in the stm32u5xx_hal_ltdc.h

Data Fields

- ***uint32_t HSPolarity***
- ***uint32_t VSPolarity***
- ***uint32_t DEPolarity***
- ***uint32_t PCPolarity***
- ***uint32_t HorizontalSync***
- ***uint32_t VerticalSync***
- ***uint32_t AccumulatedHBP***
- ***uint32_t AccumulatedVBP***
- ***uint32_t AccumulatedActiveW***
- ***uint32_t AccumulatedActiveH***
- ***uint32_t TotalWidth***
- ***uint32_t TotalHeigh***
- ***LTDC_ColorTypeDef Backcolor***

Field Documentation

- ***uint32_t LTDC_InitTypeDef::HSPolarity***
  configures the horizontal synchronization polarity. This parameter can be one value of *LTDC_HS_POLARITY*
- ***uint32_t LTDC_InitTypeDef::VSPolarity***
  configures the vertical synchronization polarity. This parameter can be one value of *LTDC_VS_POLARITY*
- ***uint32_t LTDC_InitTypeDef::DEPolarity***
  configures the data enable polarity. This parameter can be one of value of *LTDC_DE_POLARITY*
- ***uint32_t LTDC_InitTypeDef::PCPolarity***
  configures the pixel clock polarity. This parameter can be one of value of *LTDC_PC_POLARITY*

- ***uint32_t LTDC_InitTypeDef::HorizontalSync***
  configures the number of Horizontal synchronization width. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF.
- ***uint32_t LTDC_InitTypeDef::VerticalSync***
  configures the number of Vertical synchronization height. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0x7FF.
- ***uint32_t LTDC_InitTypeDef::AccumulatedHBP***
  configures the accumulated horizontal back porch width. This parameter must be a number between Min_Data = LTDC_HorizontalSync and Max_Data = 0xFFF.
- ***uint32_t LTDC_InitTypeDef::AccumulatedVBP***
  configures the accumulated vertical back porch height. This parameter must be a number between Min_Data = LTDC_VerticalSync and Max_Data = 0x7FF.
- ***uint32_t LTDC_InitTypeDef::AccumulatedActiveW***
  configures the accumulated active width. This parameter must be a number between Min_Data = LTDC_AccumulatedHBP and Max_Data = 0xFFF.
- ***uint32_t LTDC_InitTypeDef::AccumulatedActiveH***
  configures the accumulated active height. This parameter must be a number between Min_Data = LTDC_AccumulatedVBP and Max_Data = 0x7FF.
- ***uint32_t LTDC_InitTypeDef::TotalWidth***
  configures the total width. This parameter must be a number between Min_Data = LTDC_AccumulatedActiveW and Max_Data = 0xFFF.
- ***uint32_t LTDC_InitTypeDef::TotalHeigh***
  configures the total height. This parameter must be a number between Min_Data = LTDC_AccumulatedActiveH and Max_Data = 0x7FF.
- ***LTDC_ColorTypeDef LTDC_InitTypeDef::Backcolor***
  Configures the background color.

46.1.3 LTDC_LayerCfgTypeDef

LTDC_LayerCfgTypeDef is defined in the stm32u5xx_hal_ltdc.h

Data Fields

- ***uint32_t WindowX0***
- ***uint32_t WindowX1***
- ***uint32_t WindowY0***
- ***uint32_t WindowY1***
- ***uint32_t PixelFormat***
- ***uint32_t Alpha***
- ***uint32_t Alpha0***
- ***uint32_t BlendingFactor1***
- ***uint32_t BlendingFactor2***
- ***uint32_t FBStartAdress***
- ***uint32_t ImageWidth***
- ***uint32_t ImageHeight***
- ***LTDC_ColorTypeDef Backcolor***

Field Documentation

- ***uint32_t LTDC_LayerCfgTypeDef::WindowX0***
  Configures the Window Horizontal Start Position. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF.
- ***uint32_t LTDC_LayerCfgTypeDef::WindowX1***
  Configures the Window Horizontal Stop Position. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0xFFF.
- ***uint32_t LTDC_LayerCfgTypeDef::WindowY0***
  Configures the Window vertical Start Position. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0x7FF.

- ***uint32_t LTDC_LayerCfgTypeDef::WindowY1***
  Configures the Window vertical Stop Position. This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x7FF.
- ***uint32_t LTDC_LayerCfgTypeDef::PixelFormat***
  Specifies the pixel format. This parameter can be one of value of ***LTDC_Pixelformat***
- ***uint32_t LTDC_LayerCfgTypeDef::Alpha***
  Specifies the constant alpha used for blending. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint32_t LTDC_LayerCfgTypeDef::Alpha0***
  Configures the default alpha value. This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF.
- ***uint32_t LTDC_LayerCfgTypeDef::BlendingFactor1***
  Select the blending factor 1. This parameter can be one of value of ***LTDC_BlendingFactor1***
- ***uint32_t LTDC_LayerCfgTypeDef::BlendingFactor2***
  Select the blending factor 2. This parameter can be one of value of ***LTDC_BlendingFactor2***
- ***uint32_t LTDC_LayerCfgTypeDef::FBStartAdress***
  Configures the color frame buffer address
- ***uint32_t LTDC_LayerCfgTypeDef::ImageWidth***
  Configures the color frame buffer line length. This parameter must be a number between Min_Data = 0x0000 and Max_Data = 0x1FFF.
- ***uint32_t LTDC_LayerCfgTypeDef::ImageHeight***
  Specifies the number of line in frame buffer. This parameter must be a number between Min_Data = 0x000 and Max_Data = 0x7FF.
- ***LTDC_ColorTypeDef LTDC_LayerCfgTypeDef::Backcolor***
  Configures the layer background color.

46.1.4 __LTDC_HandleTypeDef

__LTDC_HandleTypeDef is defined in the stm32u5xx_hal_ltdc.h

Data Fields

- ***LTDC_TypeDef * Instance***
- ***LTDC_InitTypeDef Init***
- ***LTDC_LayerCfgTypeDef LayerCfg***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_LTDC_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***void(* LineEventCallback***
- ***void(* ReloadEventCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***LTDC_TypeDef* __LTDC_HandleTypeDef::Instance***
  LTDC Register base address
- ***LTDC_InitTypeDef __LTDC_HandleTypeDef::Init***
  LTDC parameters
- ***LTDC_LayerCfgTypeDef __LTDC_HandleTypeDef::LayerCfg[MAX_LAYER]***
  LTDC Layers parameters
- ***HAL_LockTypeDef __LTDC_HandleTypeDef::Lock***
  LTDC Lock
- ***__IO HAL_LTDC_StateTypeDef __LTDC_HandleTypeDef::State***
  LTDC state
- ***__IO uint32_t __LTDC_HandleTypeDef::ErrorCode***
  LTDC Error code

- ***void(* __LTDC_HandleTypeDef::LineEventCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Line Event Callback
- ***void(* __LTDC_HandleTypeDef::ReloadEventCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Reload Event Callback
- ***void(* __LTDC_HandleTypeDef::ErrorCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Error Callback
- ***void(* __LTDC_HandleTypeDef::MspInitCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Msp Init callback
- ***void(* __LTDC_HandleTypeDef::MspDeInitCallback)(struct __LTDC_HandleTypeDef *hltdc)***
  LTDC Msp DeInit callback

46.2 LTDC Firmware driver API description

The following section lists the various functions of the LTDC library.

46.2.1 How to use this driver

The LTDC HAL driver can be used as follows:

1. Declare a LTDC_HandleTypeDef handle structure, for example: LTDC_HandleTypeDef hltdc;
2. Initialize the LTDC low level resources by implementing the HAL_LTDC_MspInit() API:
   a. Enable the LTDC interface clock
   b. NVIC configuration if you need to use interrupt process
      - Configure the LTDC interrupt priority
      - Enable the NVIC LTDC IRQ Channel
3. Initialize the required configuration through the following parameters: the LTDC timing, the horizontal and vertical polarity, the pixel clock polarity, Data Enable polarity and the LTDC background color value using HAL_LTDC_Init() function

Configuration

1. Program the required configuration through the following parameters: the pixel format, the blending factors, input alpha value, the window size and the image size using HAL_LTDC_ConfigLayer() function for foreground or/and background layer.
2. Optionally, configure and enable the CLUT using HAL_LTDC_ConfigCLUT() and HAL_LTDC_EnableCLUT functions.
3. Optionally, enable the Dither using HAL_LTDC_EnableDither().
4. Optionally, configure and enable the Color keying using HAL_LTDC_ConfigColorKeying() and HAL_LTDC_EnableColorKeying functions.
5. Optionally, configure LineInterrupt using HAL_LTDC_ProgramLineEvent() function
6. If needed, reconfigure and change the pixel format value, the alpha value value, the window size, the window position and the layer start address for foreground or/and background layer using respectively the following functions: HAL_LTDC_SetPixelFormat(), HAL_LTDC_SetAlpha(), HAL_LTDC_SetWindowSize(), HAL_LTDC_SetWindowPosition() and HAL_LTDC_SetAddress().
7. Variant functions with _NoReload suffix allows to set the LTDC configuration/settings without immediate reload. This is useful in case when the program requires to modify serval LTDC settings (on one or both layers) then applying(reload) these settings in one shot by calling the function HAL_LTDC_Reload(). After calling the _NoReload functions to set different color/format/layer settings, the program shall call the function HAL_LTDC_Reload() to apply(reload) these settings. Function HAL_LTDC_Reload() can be called with the parameter ReloadType set to LTDC_RELOAD_IMMEDIATE if an immediate reload is required. Function HAL_LTDC_Reload() can be called with the parameter ReloadType set to LTDC_RELOAD_VERTICAL_BLANKING if the reload should be done in the next vertical blanking period, this option allows to avoid display flicker by applying the new settings during the vertical blanking period.
8. To control LTDC state you can use the following function: HAL_LTDC_GetState()

LTDC HAL driver macros list

Below the list of most used macros in LTDC HAL driver.

- __HAL_LTDC_ENABLE: Enable the LTDC.

- __HAL_LTDC_DISABLE: Disable the LTDC.
- __HAL_LTDC_LAYER_ENABLE: Enable an LTDC Layer.
- __HAL_LTDC_LAYER_DISABLE: Disable an LTDC Layer.
- __HAL_LTDC_RELOAD_IMMEDIATE_CONFIG: Reload Layer Configuration.
- __HAL_LTDC_GET_FLAG: Get the LTDC pending flags.
- __HAL_LTDC_CLEAR_FLAG: Clear the LTDC pending flags.
- __HAL_LTDC_ENABLE_IT: Enable the specified LTDC interrupts.
- __HAL_LTDC_DISABLE_IT: Disable the specified LTDC interrupts.
- __HAL_LTDC_GET_IT_SOURCE: Check whether the specified LTDC interrupt has occurred or not.

Note: You can refer to the LTDC HAL driver header file for more useful macros

Callback registration

The compilation define USE_HAL_LTDC_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use function HAL_LTDC_RegisterCallback() to register a callback.

Function HAL_LTDC_RegisterCallback() allows to register following callbacks:

- LineEventCallback : LTDC Line Event Callback.
- ReloadEventCallback : LTDC Reload Event Callback.
- ErrorCallback : LTDC Error Callback
- MspInitCallback : LTDC MspInit.
- MspDeInitCallback : LTDC MspDeInit.

This function takes as parameters the HAL peripheral handle, the callback ID and a pointer to the user callback function.

Use function HAL_LTDC_UnRegisterCallback() to reset a callback to the default weak function. HAL_LTDC_UnRegisterCallback() takes as parameters the HAL peripheral handle and the callback ID.

This function allows to reset following callbacks:

- LineEventCallback : LTDC Line Event Callback
- ReloadEventCallback : LTDC Reload Event Callback
- ErrorCallback : LTDC Error Callback
- MspInitCallback : LTDC MspInit
- MspDeInitCallback : LTDC MspDeInit.

By default, after the HAL_LTDC_Init and when the state is HAL_LTDC_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_LTDC_LineEventCallback(), HAL_LTDC_ErrorCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak (surcharged) functions in the HAL_LTDC_Init() and HAL_LTDC_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_LTDC_Init() and HAL_LTDC_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in HAL_LTDC_STATE_READY state only. Exception done MspInit/MspDeInit that can be registered/unregistered in HAL_LTDC_STATE_READY or HAL_LTDC_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_LTDC_RegisterCallback() before calling HAL_LTDC_DeInit() or HAL_LTDC_Init() function.

When the compilation define USE_HAL_LTDC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

46.2.2 Initialization and Configuration functions

This section provides functions allowing to:

- Initialize and configure the LTDC
- De-initialize the LTDC

This section contains the following APIs:

- ***HAL_LTDC_Init()***
- ***HAL_LTDC_DeInit()***
- ***HAL_LTDC_MspInit()***

- *HAL_LTDC_MspDeInit()*
- *HAL_LTDC_RegisterCallback()*
- *HAL_LTDC_UnRegisterCallback()*
- *HAL_LTDC_ErrorCallback()*
- *HAL_LTDC_LineEventCallback()*
- *HAL_LTDC_ReloadEventCallback()*

46.2.3 IO operation functions

This section provides function allowing to:

- Handle LTDC interrupt request

This section contains the following APIs:

- *HAL_LTDC_IRQHandler()*
- *HAL_LTDC_ErrorCallback()*
- *HAL_LTDC_LineEventCallback()*
- *HAL_LTDC_ReloadEventCallback()*

46.2.4 Peripheral Control functions

This section provides functions allowing to:

- Configure the LTDC foreground or/and background parameters.
- Set the active layer.
- Configure the color keying.
- Configure the C-LUT.
- Enable / Disable the color keying.
- Enable / Disable the C-LUT.
- Update the layer position.
- Update the layer size.
- Update pixel format on the fly.
- Update transparency on the fly.
- Update address on the fly.

This section contains the following APIs:

- *HAL_LTDC_ConfigLayer()*
- *HAL_LTDC_ConfigColorKeying()*
- *HAL_LTDC_ConfigCLUT()*
- *HAL_LTDC_EnableColorKeying()*
- *HAL_LTDC_DisableColorKeying()*
- *HAL_LTDC_EnableCLUT()*
- *HAL_LTDC_DisableCLUT()*
- *HAL_LTDC_EnableDither()*
- *HAL_LTDC_DisableDither()*
- *HAL_LTDC_SetWindowSize()*
- *HAL_LTDC_SetWindowPosition()*
- *HAL_LTDC_SetPixelFormat()*
- *HAL_LTDC_SetAlpha()*
- *HAL_LTDC_SetAddress()*
- *HAL_LTDC_SetPitch()*
- *HAL_LTDC_ProgramLineEvent()*
- *HAL_LTDC_Reload()*
- *HAL_LTDC_ConfigLayer_NoReload()*
- *HAL_LTDC_SetWindowSize_NoReload()*

- *HAL_LTDC_SetWindowPosition_NoReload()*
- *HAL_LTDC_SetPixelFormat_NoReload()*
- *HAL_LTDC_SetAlpha_NoReload()*
- *HAL_LTDC_SetAddress_NoReload()*
- *HAL_LTDC_SetPitch_NoReload()*
- *HAL_LTDC_ConfigColorKeying_NoReload()*
- *HAL_LTDC_EnableColorKeying_NoReload()*
- *HAL_LTDC_DisableColorKeying_NoReload()*
- *HAL_LTDC_EnableCLUT_NoReload()*
- *HAL_LTDC_DisableCLUT_NoReload()*

46.2.5 Peripheral State and Errors functions

This subsection provides functions allowing to

- Check the LTDC handle state.
- Get the LTDC handle error code.

This section contains the following APIs:

- *HAL_LTDC_GetState()*
- *HAL_LTDC_GetError()*

46.2.6 Detailed description of functions

HAL_LTDC_Init

Function name

HAL_StatusTypeDef HAL_LTDC_Init (LTDC_HandleTypeDef * hltdc)

Function description

Initialize the LTDC according to the specified parameters in the LTDC_InitTypeDef.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **HAL:** status

HAL_LTDC_DeInit

Function name

HAL_StatusTypeDef HAL_LTDC_DeInit (LTDC_HandleTypeDef * hltdc)

Function description

De-initialize the LTDC peripheral.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **None:**

HAL_LTDC_MspInit

Function name

void HAL_LTDC_MspInit (LTDC_HandleTypeDef * hltdc)

Function description

Initialize the LTDC MSP.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **None:**

HAL_LTDC_MspDeInit

Function name

void HAL_LTDC_MspDeInit (LTDC_HandleTypeDef * hltdc)

Function description

De-initialize the LTDC MSP.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **None:**

HAL_LTDC_ErrorCallback

Function name

void HAL_LTDC_ErrorCallback (LTDC_HandleTypeDef * hltdc)

Function description

Error LTDC callback.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **None:**

HAL_LTDC_LineEventCallback

Function name

void HAL_LTDC_LineEventCallback (LTDC_HandleTypeDef * hltdc)

Function description

Line Event callback.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **None:**

HAL_LTDC_ReloadEventCallback

Function name

void HAL_LTDC_ReloadEventCallback (LTDC_HandleTypeDef * hltdc)

Function description

Reload Event callback.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **None:**

HAL_LTDC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_LTDC_RegisterCallback (LTDC_HandleTypeDef * hltdc, HAL_LTDC_CallbackIDTypeDef CallbackID, pLTDC_CallbackTypeDef pCallback)

Function description

Register a User LTDC Callback To be used instead of the weak predefined callback.

Parameters

- **hltdc:** ltdc handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_LTDC_LINE_EVENT_CB_ID Line Event Callback ID
  - HAL_LTDC_RELOAD_EVENT_CB_ID Reload Event Callback ID
  - HAL_LTDC_ERROR_CB_ID Error Callback ID
  - HAL_LTDC_MSPINIT_CB_ID MspInit callback ID
  - HAL_LTDC_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **status:**

HAL_LTDC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_LTDC_UnRegisterCallback (LTDC_HandleTypeDef * hltdc, HAL_LTDC_CallbackIDTypeDef CallbackID)

Function description

Unregister an LTDC Callback LTDC callback is redirected to the weak predefined callback.

Parameters

- **hltdc:** ltdc handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_LTDC_LINE_EVENT_CB_ID Line Event Callback ID
  - HAL_LTDC_RELOAD_EVENT_CB_ID Reload Event Callback ID
  - HAL_LTDC_ERROR_CB_ID Error Callback ID
  - HAL_LTDC_MSPINIT_CB_ID MspInit callback ID
  - HAL_LTDC_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **status:**

HAL_LTDC_IRQHandler

Function name

void HAL_LTDC_IRQHandler (LTDC_HandleTypeDef * hltdc)

Function description

Handle LTDC interrupt request.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **HAL:** status

HAL_LTDC_ConfigLayer

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigLayer (LTDC_HandleTypeDef * hltdc, LTDC_LayerCfgTypeDef * pLayerCfg, uint32_t LayerIdx)

Function description

Configure the LTDC Layer according to the specified parameters in the LTDC_InitTypeDef and create the associated handle.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **pLayerCfg:** pointer to a LTDC_LayerCfgTypeDef structure that contains the configuration information for the Layer.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetWindowSize

Function name

HAL_StatusTypeDef HAL_LTDC_SetWindowSize (LTDC_HandleTypeDef * hltdc, uint32_t XSize, uint32_t YSize, uint32_t LayerIdx)

Function description

Set the LTDC window size.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **XSize:** LTDC Pixel per line
- **YSize:** LTDC Line number
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetWindowPosition

Function name

HAL_StatusTypeDef HAL_LTDC_SetWindowPosition (LTDC_HandleTypeDef * hltdc, uint32_t X0, uint32_t Y0, uint32_t LayerIdx)

Function description

Set the LTDC window position.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **X0:** LTDC window X offset
- **Y0:** LTDC window Y offset
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetPixelFormat

Function name

HAL_StatusTypeDef HAL_LTDC_SetPixelFormat (LTDC_HandleTypeDef * hltdc, uint32_t Pixelformat, uint32_t LayerIdx)

Function description

Reconfigure the pixel format.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **Pixelformat:** new pixel format value.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1).

Return values

- **HAL:** status

HAL_LTDC_SetAlpha

Function name

HAL_StatusTypeDef HAL_LTDC_SetAlpha (LTDC_HandleTypeDef * hltdc, uint32_t Alpha, uint32_t LayerIdx)

Function description

Reconfigure the layer alpha value.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **Alpha:** new alpha value.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetAddress

Function name

HAL_StatusTypeDef HAL_LTDC_SetAddress (LTDC_HandleTypeDef * hltdc, uint32_t Address, uint32_t LayerIdx)

Function description

Reconfigure the frame buffer Address.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **Address:** new address value.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1).

Return values

- **HAL:** status

HAL_LTDC_SetPitch

Function name

HAL_StatusTypeDef HAL_LTDC_SetPitch (LTDC_HandleTypeDef * hltdc, uint32_t LinePitchInPixels, uint32_t LayerIdx)

Function description

Function used to reconfigure the pitch for specific cases where the attached LayerIdx buffer have a width that is larger than the one intended to be displayed on screen.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LinePitchInPixels:** New line pitch in pixels to configure for LTDC layer 'LayerIdx'.
- **LayerIdx:** LTDC layer index concerned by the modification of line pitch.

Return values

- **HAL:** status

Notes

- This function should be called only after a previous call to HAL_LTDC_ConfigLayer() to modify the default pitch configured by HAL_LTDC_ConfigLayer() when required (refer to example described just above).

HAL_LTDC_ConfigColorKeying

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigColorKeying (LTDC_HandleTypeDef * hltdc, uint32_t RGBValue, uint32_t LayerIdx)

Function description

Configure the color keying.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **RGBValue:** the color key value
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_ConfigCLUT

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigCLUT (LTDC_HandleTypeDef * hltdc, const uint32_t * pCLUT, uint32_t CLUTSize, uint32_t LayerIdx)

Function description

Load the color lookup table.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **pCLUT:** pointer to the color lookup table address.
- **CLUTSize:** the color lookup table size.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_EnableColorKeying

Function name

HAL_StatusTypeDef HAL_LTDC_EnableColorKeying (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Enable the color keying.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_DisableColorKeying

Function name

HAL_StatusTypeDef HAL_LTDC_DisableColorKeying (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Disable the color keying.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_EnableCLUT

Function name

HAL_StatusTypeDef HAL_LTDC_EnableCLUT (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Enable the color lookup table.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_DisableCLUT

Function name

HAL_StatusTypeDef HAL_LTDC_DisableCLUT (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Disable the color lookup table.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_ProgramLineEvent

Function name

HAL_StatusTypeDef HAL_LTDC_ProgramLineEvent (LTDC_HandleTypeDef * hltdc, uint32_t Line)

Function description

Define the position of the line interrupt.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **Line:** Line Interrupt Position.

Return values

- **HAL:** status

Notes

- User application may resort to HAL_LTDC_LineEventCallback() at line interrupt generation.

HAL_LTDC_EnableDither

Function name

HAL_StatusTypeDef HAL_LTDC_EnableDither (LTDC_HandleTypeDef * hltdc)

Function description

Enable Dither.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **HAL:** status

HAL_LTDC_DisableDither

Function name

HAL_StatusTypeDef HAL_LTDC_DisableDither (LTDC_HandleTypeDef * hltdc)

Function description

Disable Dither.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **HAL:** status

HAL_LTDC_Reload

Function name

HAL_StatusTypeDef HAL_LTDC_Reload (LTDC_HandleTypeDef * hltdc, uint32_t ReloadType)

Function description

Reload LTDC Layers configuration.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **ReloadType:** This parameter can be one of the following values : LTDC_RELOAD_IMMEDIATE : Immediate Reload LTDC_RELOAD_VERTICAL_BLANKING : Reload in the next Vertical Blanking

Return values

- **HAL:** status

Notes

- User application may resort to HAL_LTDC_ReloadEventCallback() at reload interrupt generation.

HAL_LTDC_ConfigLayer_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigLayer_NoReload (LTDC_HandleTypeDef * hltdc, LTDC_LayerCfgTypeDef * pLayerCfg, uint32_t LayerIdx)

Function description

Configure the LTDC Layer according to the specified without reloading parameters in the LTDC_InitTypeDef and create the associated handle.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **pLayerCfg:** pointer to a LTDC_LayerCfgTypeDef structure that contains the configuration information for the Layer.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetWindowSize_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetWindowSize_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t XSize, uint32_t YSize, uint32_t LayerIdx)

Function description

Set the LTDC window size without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **XSize:** LTDC Pixel per line
- **YSize:** LTDC Line number
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetWindowPosition_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetWindowPosition_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t X0, uint32_t Y0, uint32_t LayerIdx)

Function description

Set the LTDC window position without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **X0:** LTDC window X offset
- **Y0:** LTDC window Y offset
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetPixelFormat_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetPixelFormat_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t Pixelformat, uint32_t LayerIdx)

Function description

Reconfigure the pixel format without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDfef structure that contains the configuration information for the LTDC.
- **Pixelformat:** new pixel format value.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1).

Return values

- **HAL:** status

HAL_LTDC_SetAlpha_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetAlpha_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t Alpha, uint32_t LayerIdx)

Function description

Reconfigure the layer alpha value without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **Alpha:** new alpha value.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_SetAddress_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetAddress_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t Address, uint32_t LayerIdx)

Function description

Reconfigure the frame buffer Address without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **Address:** new address value.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1).

Return values

- **HAL:** status

HAL_LTDC_SetPitch_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_SetPitch_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t LinePitchInPixels, uint32_t LayerIdx)

Function description

Function used to reconfigure the pitch for specific cases where the attached LayerIdx buffer have a width that is larger than the one intended to be displayed on screen.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LinePitchInPixels:** New line pitch in pixels to configure for LTDC layer 'LayerIdx'.
- **LayerIdx:** LTDC layer index concerned by the modification of line pitch.

Return values

- **HAL:** status

Notes

- This function should be called only after a previous call to HAL_LTDC_ConfigLayer() to modify the default pitch configured by HAL_LTDC_ConfigLayer() when required (refer to example described just above). Variant of the function HAL_LTDC_SetPitch without immediate reload.

HAL_LTDC_ConfigColorKeying_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_ConfigColorKeying_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t RGBValue, uint32_t LayerIdx)

Function description

Configure the color keying without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **RGBValue:** the color key value
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_EnableColorKeying_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_EnableColorKeying_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Enable the color keying without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_DisableColorKeying_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_DisableColorKeying_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Disable the color keying without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_EnableCLUT_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_EnableCLUT_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Enable the color lookup table without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_DisableCLUT_NoReload

Function name

HAL_StatusTypeDef HAL_LTDC_DisableCLUT_NoReload (LTDC_HandleTypeDef * hltdc, uint32_t LayerIdx)

Function description

Disable the color lookup table without reloading.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **LayerIdx:** LTDC Layer index. This parameter can be one of the following values: LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1)

Return values

- **HAL:** status

HAL_LTDC_GetState

Function name

HAL_LTDC_StateTypeDef HAL_LTDC_GetState (const LTDC_HandleTypeDef * hltdc)

Function description

Return the LTDC handle state.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **HAL:** state

HAL_LTDC_GetError

Function name

uint32_t HAL_LTDC_GetError (const LTDC_HandleTypeDef * hltdc)

Function description

Return the LTDC handle error code.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.

Return values

- **LTDC:** Error Code

46.3 LTDC Firmware driver defines

The following section lists the various define and macros of the module.

46.3.1 LTDC

LTDC

LTDC Alpha

LTDC_ALPHA

LTDC Constant Alpha mask

LTDC BACK COLOR

LTDC_COLOR

Color mask

LTDC Blending Factor1

LTDC_BLENDING_FACTOR1_CA

Blending factor : Cte Alpha

LTDC_BLENDING_FACTOR1_PAxCA

Blending factor : Cte Alpha x Pixel Alpha

LTDC Blending Factor2

LTDC_BLENDING_FACTOR2_CA

Blending factor : Cte Alpha

LTDC_BLENDING_FACTOR2_PAxCA

Blending factor : Cte Alpha x Pixel Alpha

LTDC DE POLARITY

LTDC_DEPOLARITY_AL

Data Enable, is active low.

LTDC_DEPOLARITY_AH

Data Enable, is active high.

LTDC Error Code

HAL_LTDC_ERROR_NONE

LTDC No error

HAL_LTDC_ERROR_TE

LTDC Transfer error

HAL_LTDC_ERROR_FU

LTDC FIFO Underrun

HAL_LTDC_ERROR_TIMEOUT

LTDC Timeout error

HAL_LTDC_ERROR_INVALID_CALLBACK

LTDC Invalid Callback error

LTDC Exported Macros

__HAL_LTDC_RESET_HANDLE_STATE

Description:

- Reset LTDC handle state.

Parameters:

- __HANDLE__: LTDC handle

Return value:

- None

__HAL_LTDC_ENABLE

Description:

- Enable the LTDC.

Parameters:

- __HANDLE__: LTDC handle

Return value:

- None.

__HAL_LTDC_DISABLE

Description:
- Disable the LTDC.

Parameters:
- __HANDLE__: LTDC handle

Return value:
- None.

__HAL_LTDC_LAYER_ENABLE

Description:
- Enable the LTDC Layer.

Parameters:
- __HANDLE__: LTDC handle
- __LAYER__: Specify the layer to be enabled. This parameter can be LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1).

Return value:
- None.

__HAL_LTDC_LAYER_DISABLE

Description:
- Disable the LTDC Layer.

Parameters:
- __HANDLE__: LTDC handle
- __LAYER__: Specify the layer to be disabled. This parameter can be LTDC_LAYER_1 (0) or LTDC_LAYER_2 (1).

Return value:
- None.

__HAL_LTDC_RELOAD_IMMEDIATE_CONFIG

Description:
- Reload immediately all LTDC Layers.

Parameters:
- __HANDLE__: LTDC handle

Return value:
- None.

__HAL_LTDC_VERTICAL_BLANKING_RELOAD_CONFIG

Description:
- Reload during vertical blanking period all LTDC Layers.

Parameters:
- __HANDLE__: LTDC handle

Return value:
- None.

__HAL_LTDC_GET_FLAG

Description:

- Get the LTDC pending flags.

Parameters:

- __HANDLE__: LTDC handle
- __FLAG__: Get the specified flag. This parameter can be any combination of the following values:
  – LTDC_FLAG_LI: Line Interrupt flag
  – LTDC_FLAG_FU: FIFO Underrun Interrupt flag
  – LTDC_FLAG_TE: Transfer Error interrupt flag
  – LTDC_FLAG_RR: Register Reload Interrupt Flag

Return value:

- The: state of FLAG (SET or RESET).

__HAL_LTDC_CLEAR_FLAG

Description:

- Clears the LTDC pending flags.

Parameters:

- __HANDLE__: LTDC handle
- __FLAG__: Specify the flag to clear. This parameter can be any combination of the following values:
  – LTDC_FLAG_LI: Line Interrupt flag
  – LTDC_FLAG_FU: FIFO Underrun Interrupt flag
  – LTDC_FLAG_TE: Transfer Error interrupt flag
  – LTDC_FLAG_RR: Register Reload Interrupt Flag

Return value:

- None

__HAL_LTDC_ENABLE_IT

Description:

- Enables the specified LTDC interrupts.

Parameters:

- __HANDLE__: LTDC handle
- __INTERRUPT__: Specify the LTDC interrupt sources to be enabled. This parameter can be any combination of the following values:
  – LTDC_IT_LI: Line Interrupt flag
  – LTDC_IT_FU: FIFO Underrun Interrupt flag
  – LTDC_IT_TE: Transfer Error interrupt flag
  – LTDC_IT_RR: Register Reload Interrupt Flag

Return value:

- None

__HAL_LTDC_DISABLE_IT

Description:

- Disables the specified LTDC interrupts.

Parameters:

- __HANDLE__: LTDC handle
- __INTERRUPT__: Specify the LTDC interrupt sources to be disabled. This parameter can be any combination of the following values:
  - LTDC_IT_LI: Line Interrupt flag
  - LTDC_IT_FU: FIFO Underrun Interrupt flag
  - LTDC_IT_TE: Transfer Error interrupt flag
  - LTDC_IT_RR: Register Reload Interrupt Flag

Return value:

- None

__HAL_LTDC_GET_IT_SOURCE

Description:

- Check whether the specified LTDC interrupt has occurred or not.

Parameters:

- __HANDLE__: LTDC handle
- __INTERRUPT__: Specify the LTDC interrupt source to check. This parameter can be one of the following values:
  - LTDC_IT_LI: Line Interrupt flag
  - LTDC_IT_FU: FIFO Underrun Interrupt flag
  - LTDC_IT_TE: Transfer Error interrupt flag
  - LTDC_IT_RR: Register Reload Interrupt Flag

Return value:

- The: state of INTERRUPT (SET or RESET).

LTDC Exported Types

MAX_LAYER

LTDC Flags

LTDC_FLAG_LI

LTDC Line Interrupt Flag

LTDC_FLAG_FU

LTDC FIFO Underrun interrupt Flag

LTDC_FLAG_TE

LTDC Transfer Error interrupt Flag

LTDC_FLAG_RR

LTDC Register Reload interrupt Flag

LTDC HS POLARITY

LTDC_HSPOLARITY_AL

Horizontal Synchronization is active low.

LTDC_HSPOLARITY_AH

Horizontal Synchronization is active high.

LTDC Interrupts

LTDC_IT_LI

LTDC Line Interrupt

LTDC_IT_FU

LTDC FIFO Underrun Interrupt

LTDC_IT_TE

LTDC Transfer Error Interrupt

LTDC_IT_RR

LTDC_LINE_NUMBER

LTDC Layer Line number

LTDC PC POLARITY

LTDC_PCPOLARITY_IPC

input pixel clock.

LTDC_PCPOLARITY_IIPC

inverted input pixel clock.

LTDC Pixel format

LTDC_PIXEL_FORMAT_ARGB8888

ARGB8888 LTDC pixel format

LTDC_PIXEL_FORMAT_RGB888

RGB888 LTDC pixel format

LTDC_PIXEL_FORMAT_RGB565

RGB565 LTDC pixel format

LTDC_PIXEL_FORMAT_ARGB1555

ARGB1555 LTDC pixel format

LTDC_PIXEL_FORMAT_ARGB4444

ARGB4444 LTDC pixel format

LTDC_PIXEL_FORMAT_L8

L8 LTDC pixel format

LTDC_PIXEL_FORMAT_AL44

AL44 LTDC pixel format

LTDC_PIXEL_FORMAT_AL88

AL88 LTDC pixel format

LTDC Reload Type

LTDC_RELOAD_IMMEDIATE

Immediate Reload

LTDC_RELOAD_VERTICAL_BLANKING

Vertical Blanking Reload

LTDC SYNC

LTDC_HORIZONTALSYNC

Horizontal synchronization width.

LTDC_VERTICALSYNC

Vertical synchronization height.

LTDC VS POLARITY

LTDC_VSPOLARITY_AL

Vertical Synchronization is active low.

LTDC_VSPOLARITY_AH

Vertical Synchronization is active high.

47 HAL LTDC Extension Driver

47.1 LTDCEx Firmware driver API description

The following section lists the various functions of the LTDCEx library.

47.1.1 Initialization and Configuration functions

This section provides functions allowing to:

- Initialize and configure the LTDC

This section contains the following APIs:

- *HAL_LTDCEx_StructInitFromVideoConfig()*
- *HAL_LTDCEx_StructInitFromAdaptedCommandConfig()*

47.1.2 Detailed description of functions

HAL_LTDCEx_StructInitFromVideoConfig

Function name

HAL_StatusTypeDef HAL_LTDCEx_StructInitFromVideoConfig (LTDC_HandleTypeDef * hltdc, DSI_VidCfgTypeDef * VidCfg)

Function description

Retrieve common parameters from DSI Video mode configuration structure.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **VidCfg:** pointer to a DSI_VidCfgTypeDef structure that contains the DSI video mode configuration parameters

Return values

- **HAL:** status

Notes

- The implementation of this function is taking into account the LTDC polarities inversion as described in the current LTDC specification

HAL_LTDCEx_StructInitFromAdaptedCommandConfig

Function name

HAL_StatusTypeDef HAL_LTDCEx_StructInitFromAdaptedCommandConfig (LTDC_HandleTypeDef * hltdc, DSI_CmdCfgTypeDef * CmdCfg)

Function description

Retrieve common parameters from DSI Adapted command mode configuration structure.

Parameters

- **hltdc:** pointer to a LTDC_HandleTypeDef structure that contains the configuration information for the LTDC.
- **CmdCfg:** pointer to a DSI_CmdCfgTypeDef structure that contains the DSI command mode configuration parameters

Return values

- **HAL:** status

Notes

- The implementation of this function is taking into account the LTDC polarities inversion as described in the current LTDC specification

48 HAL MDF Generic Driver

48.1 MDF Firmware driver registers structures

48.1.1 MDF_ClockTriggerTypeDef

MDF_ClockTriggerTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t Source***
- ***uint32_t Edge***

Field Documentation

- ***FunctionalState MDF_ClockTriggerTypeDef::Activation***
  Output clock trigger enable/disable
- ***uint32_t MDF_ClockTriggerTypeDef::Source***
  Output clock trigger source. This parameter can be a value of ***MDF_ClockTriggerSource***
- ***uint32_t MDF_ClockTriggerTypeDef::Edge***
  Output clock trigger edge. This parameter can be a value of ***MDF_ClockTriggerEdge***

48.1.2 MDF_OutputClockTypeDef

MDF_OutputClockTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t Pins***
- ***uint32_t Divider***
- ***MDF_ClockTriggerTypeDef Trigger***

Field Documentation

- ***FunctionalState MDF_OutputClockTypeDef::Activation***
  Output clock enable/disable
- ***uint32_t MDF_OutputClockTypeDef::Pins***
  Output clock pins. This parameter can be a value of ***MDF_OuputClockPins***
- ***uint32_t MDF_OutputClockTypeDef::Divider***
  Output clock divider. This parameter must be a number between Min_Data = 1 and Max_Data = 16
- ***MDF_ClockTriggerTypeDef MDF_OutputClockTypeDef::Trigger***
  Output clock trigger parameters

48.1.3 MDF_CommonParamTypeDef

MDF_CommonParamTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***uint32_t InterleavedFilters***
- ***uint32_t ProcClockDivider***
- ***MDF_OutputClockTypeDef OutputClock***

Field Documentation

- ***uint32_t MDF_CommonParamTypeDef::InterleavedFilters***
  Number of filters in interleaved mode with filter 0. This parameter must be a number between Min_Data = 0 and Max_Data = 1 for STM32U535xx/STM32U545xx devices. This parameter must be a number between Min_Data = 0 and Max_Data = 5 for other devices.
  Note:
  – This parameter is not used for ADF instance
- ***uint32_t MDF_CommonParamTypeDef::ProcClockDivider***
  Processing clock divider. This parameter must be a number between Min_Data = 1 and Max_Data = 128

- ***MDF_OutputClockTypeDef MDF_CommonParamTypeDef::OutputClock***
  Output clock parameters

48.1.4 MDF_SerialInterfaceTypeDef

MDF_SerialInterfaceTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t Mode***
- ***uint32_t ClockSource***
- ***uint32_t Threshold***

Field Documentation

- ***FunctionalState MDF_SerialInterfaceTypeDef::Activation***
  Serial interface enable/disable
- ***uint32_t MDF_SerialInterfaceTypeDef::Mode***
  Serial interface mode. This parameter can be a value of ***MDF_SitfMode***
- ***uint32_t MDF_SerialInterfaceTypeDef::ClockSource***
  Serial interface clock source. This parameter can be a value of ***MDF_SitfClockSource***
- ***uint32_t MDF_SerialInterfaceTypeDef::Threshold***
  SPI threshold for clock absence detection or Manchester symbol threshold. This parameter must be a number between Min_Data = 4 and Max_Data = 31

48.1.5 MDF_InitTypeDef

MDF_InitTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***MDF_CommonParamTypeDef CommonParam***
- ***MDF_SerialInterfaceTypeDef SerialInterface***
- ***uint32_t FilterBistream***

Field Documentation

- ***MDF_CommonParamTypeDef MDF_InitTypeDef::CommonParam***
  MDF common parameters
- ***MDF_SerialInterfaceTypeDef MDF_InitTypeDef::SerialInterface***
  MDF serial interface parameters
- ***uint32_t MDF_InitTypeDef::FilterBistream***
  MDF filter bitstream selection. This parameter can be a value of ***MDF_FilterBitstream***

48.1.6 __MDF_HandleTypeDef

__MDF_HandleTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***MDF_Filter_TypeDef * Instance***
- ***MDF_InitTypeDef Init***
- ***DMA_HandleTypeDef * hdma***
- ***__IO HAL_MDF_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***void(* OldCallback***
- ***void(* AcqCpltCallback***
- ***void(* AcqHalfCpltCallback***
- ***void(* SndLvCallback***
- ***void(* SadCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***MDF_Filter_TypeDef* __MDF_HandleTypeDef::Instance***
  MDF instance
- ***MDF_InitTypeDef __MDF_HandleTypeDef::Init***
  MDF init parameters
- ***DMA_HandleTypeDef* __MDF_HandleTypeDef::hdma***
  Pointer on DMA handler for acquisitions
- ***__IO HAL_MDF_StateTypeDef __MDF_HandleTypeDef::State***
  MDF state
- ***__IO uint32_t __MDF_HandleTypeDef::ErrorCode***
  MDF error code
- ***void(* __MDF_HandleTypeDef::OldCallback)(struct __MDF_HandleTypeDef *hmdf, uint32_t Threshold)***
  MDF out-off limit detector callback.
  Note:
  – Not used for ADF instance
- ***void(* __MDF_HandleTypeDef::AcqCpltCallback)(struct __MDF_HandleTypeDef *hmdf)***
  MDF acquisition complete callback
- ***void(* __MDF_HandleTypeDef::AcqHalfCpltCallback)(struct __MDF_HandleTypeDef *hmdf)***
  MDF acquisition half complete callback
- ***void(* __MDF_HandleTypeDef::SndLvCallback)(struct __MDF_HandleTypeDef *hmdf, uint32_t SoundLevel, uint32_t AmbientNoise)***
  MDF sound level callback.
  Note:
  – Not used for MDF instance
- ***void(* __MDF_HandleTypeDef::SadCallback)(struct __MDF_HandleTypeDef *hmdf)***
  MDF sound activity detector callback.
  Note:
  – Not used for MDF instance
- ***void(* __MDF_HandleTypeDef::ErrorCallback)(struct __MDF_HandleTypeDef *hmdf)***
  MDF error callback
- ***void(* __MDF_HandleTypeDef::MspInitCallback)(struct __MDF_HandleTypeDef *hmdf)***
  MDF MSP init callback
- ***void(* __MDF_HandleTypeDef::MspDeInitCallback)(struct __MDF_HandleTypeDef *hmdf)***
  MDF MSP de-init callback

48.1.7 MDF_ReshapeFilterTypeDef

MDF_ReshapeFilterTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t DecimationRatio***

Field Documentation

- ***FunctionalState MDF_ReshapeFilterTypeDef::Activation***
  Reshape filter enable/disable
- ***uint32_t MDF_ReshapeFilterTypeDef::DecimationRatio***
  Reshape filter decimation ratio. This parameter can be a value of ***MDF_ReshapeDecimationRatio***

48.1.8 MDF_HighPassFilterTypeDef

MDF_HighPassFilterTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t CutOffFrequency***

Field Documentation

- ***FunctionalState MDF_HighPassFilterTypeDef::Activation***
  High pass filter enable/disable

- ***uint32_t MDF_HighPassFilterTypeDef::CutOffFrequency***
  High pass filter cut-off frequency. This parameter can be a value of ***MDF_HighPassCutOffFreq***

48.1.9 MDF_IntegratorTypeDef

MDF_IntegratorTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t Value***
- ***uint32_t OutputDivision***

Field Documentation

- ***FunctionalState MDF_IntegratorTypeDef::Activation***
  Integrator enable/disable
- ***uint32_t MDF_IntegratorTypeDef::Value***
  Integrator value. This parameter must be a number between Min_Data = 2 and Max_Data = 128
- ***uint32_t MDF_IntegratorTypeDef::OutputDivision***
  Integrator output division. This parameter can be a value of ***MDF_IntegratorOutputDiv***

48.1.10 MDF_SoundActivityTypeDef

MDF_SoundActivityTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***FunctionalState Activation***
- ***uint32_t Mode***
- ***uint32_t FrameSize***
- ***FunctionalState Hysteresis***
- ***uint32_t SoundTriggerEvent***
- ***uint32_t DataMemoryTransfer***
- ***uint32_t MinNoiseLevel***
- ***uint32_t HangoverWindow***
- ***uint32_t LearningFrames***
- ***uint32_t AmbientNoiseSlope***
- ***uint32_t SignalNoiseThreshold***
- ***FunctionalState SoundLevelInterrupt***

Field Documentation

- ***FunctionalState MDF_SoundActivityTypeDef::Activation***
  Sound activity detector enable/disable
- ***uint32_t MDF_SoundActivityTypeDef::Mode***
  Sound activity detector mode. This parameter can be a value of ***MDF_SadMode***
- ***uint32_t MDF_SoundActivityTypeDef::FrameSize***
  Size of one frame to compute short-term signal level. This parameter can be a value of ***MDF_SadFrameSize***
- ***FunctionalState MDF_SoundActivityTypeDef::Hysteresis***
  Hysteresis enable/disable.
  Note:
  – This parameter is not used if Mode is set to MDF_SAD_AMBIENT_NOISE_ESTIMATOR
- ***uint32_t MDF_SoundActivityTypeDef::SoundTriggerEvent***
  Sound trigger event configuration. This parameter can be a value of ***MDF_SadSoundTriggerEvent***
- ***uint32_t MDF_SoundActivityTypeDef::DataMemoryTransfer***
  Data memory transfer mode. This parameter can be a value of ***MDF_SadDataMemoryTransfer***
- ***uint32_t MDF_SoundActivityTypeDef::MinNoiseLevel***
  Minimum noise level. This parameter must be a number between Min_Data = 0 and Max_Data = 8191
- ***uint32_t MDF_SoundActivityTypeDef::HangoverWindow***
  Hangover time window in frames. This parameter can be a value of ***MDF_SadHangoverWindow***

- ***uint32_t MDF_SoundActivityTypeDef::LearningFrames***
  Number of learning frames for the first estimation of noise level. This parameter can be a value of ***MDF_SadLearningFrames***
- ***uint32_t MDF_SoundActivityTypeDef::AmbientNoiseSlope***
  Ambient noise slope control. This parameter must be a number between Min_Data = 0 and Max_Data = 7.
  Note:
  – This parameter is not used if Mode is set to MDF_SAD_SOUND_DETECTOR
- ***uint32_t MDF_SoundActivityTypeDef::SignalNoiseThreshold***
  Signal to noise threshold. This parameter can be a value of ***MDF_SadSignalNoiseThreshold***
- ***FunctionalState MDF_SoundActivityTypeDef::SoundLevelInterrupt***
  Sound level interrupt enable/disable.
  Note:
  – This interrupt is mainly used for debug purpose

48.1.11 MDF_FilterTriggerTypeDef

MDF_FilterTriggerTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***uint32_t Source***
- ***uint32_t Edge***

Field Documentation

- ***uint32_t MDF_FilterTriggerTypeDef::Source***
  Filter trigger source. This parameter can be a value of ***MDF_FilterTriggerSource***
- ***uint32_t MDF_FilterTriggerTypeDef::Edge***
  Filter trigger edge. This parameter can be a value of ***MDF_FilterTriggerEdge***

48.1.12 MDF_FilterConfigTypeDef

MDF_FilterConfigTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***uint32_t DataSource***
- ***uint32_t Delay***
- ***uint32_t CicMode***
- ***uint32_t DecimationRatio***
- ***int32_t Offset***
- ***int32_t Gain***
- ***MDF_ReshapeFilterTypeDef ReshapeFilter***
- ***MDF_HighPassFilterTypeDef HighPassFilter***
- ***MDF_IntegratorTypeDef Integrator***
- ***MDF_SoundActivityTypeDef SoundActivity***
- ***uint32_t AcquisitionMode***
- ***uint32_t FifoThreshold***
- ***uint32_t DiscardSamples***
- ***MDF_FilterTriggerTypeDef Trigger***
- ***uint32_t SnapshotFormat***

Field Documentation

- ***uint32_t MDF_FilterConfigTypeDef::DataSource***
  Filter data source. This parameter can be a value of ***MDF_DataSource***
- ***uint32_t MDF_FilterConfigTypeDef::Delay***
  Delay to apply on data source in number of samples. This parameter must be a number between Min_Data = 0 and Max_Data = 127
- ***uint32_t MDF_FilterConfigTypeDef::CicMode***
  CIC filter mode. This parameter can be a value of ***MDF_CicMode***

- ***uint32_t MDF_FilterConfigTypeDef::DecimationRatio***
  Filter decimation ratio. This parameter must be a number between Min_Data = 2 and Max_Data = 512
- ***int32_t MDF_FilterConfigTypeDef::Offset***
  Filter offset error compensation. This parameter must be a number between Min_Data = -33554432 and Max_Data = 33554431.
  Note:
  – This parameter is not used for ADF instance
- ***int32_t MDF_FilterConfigTypeDef::Gain***
  Filter gain in step of around 3db (from -48db to 72dB). This parameter must be a number between Min_Data = -16 and Max_Data = 24
- ***MDF_ReshapeFilterTypeDef MDF_FilterConfigTypeDef::ReshapeFilter***
  Reshape filter configuration
- ***MDF_HighPassFilterTypeDef MDF_FilterConfigTypeDef::HighPassFilter***
  High pass filter configuration
- ***MDF_IntegratorTypeDef MDF_FilterConfigTypeDef::Integrator***
  Integrator configuration.
  Note:
  – This parameter is not used for ADF instance
- ***MDF_SoundActivityTypeDef MDF_FilterConfigTypeDef::SoundActivity***
  Sound activity detector configuration.
  Note:
  – This parameter is not used for MDF instance
- ***uint32_t MDF_FilterConfigTypeDef::AcquisitionMode***
  Filter acquisition mode. This parameter can be a value of ***MDF_AcquisitionMode***
- ***uint32_t MDF_FilterConfigTypeDef::FifoThreshold***
  Filter RXFIFO threshold. This parameter can be a value of ***MDF_FifoThreshold***
- ***uint32_t MDF_FilterConfigTypeDef::DiscardSamples***
  Number of samples to discard after filter enable. This parameter must be a number between Min_Data = 0 and Max_Data = 255
- ***MDF_FilterTriggerTypeDef MDF_FilterConfigTypeDef::Trigger***
  Filter trigger configuration.
  Note:
  – This parameter is not used if AcquisitionMode is set to MDF_MODE_ASYNC_CONT or MDF_MODE_ASYNC_SINGLE
- ***uint32_t MDF_FilterConfigTypeDef::SnapshotFormat***
  Snapshot format. This parameter can be a value of ***MDF_SnapshotFormat***.
  Note:
  – This parameter is used only if AcquisitionMode is set to MDF_MODE_SYNC_SNAPSHOT and for MDF instance

48.1.13 MDF_SnapshotParamTypeDef

MDF_SnapshotParamTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***int32_t Value***
- ***uint32_t DecimationCounter***
- ***uint32_t IntegratorCounter***

Field Documentation

- ***int32_t MDF_SnapshotParamTypeDef::Value***
  Snapshot acquisition value on 16 or 23 MSB depending on snapshot format
- ***uint32_t MDF_SnapshotParamTypeDef::DecimationCounter***
  Decimation counter value when snapshot trigger occurs
- ***uint32_t MDF_SnapshotParamTypeDef::IntegratorCounter***
  Integrator counter value when snapshot trigger occurs. This value is available only if snapshot format is 16 bits resolution

48.1.14 MDF_DmaConfigTypeDef

MDF_DmaConfigTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***uint32_t Address***
- ***uint32_t DataLength***
- ***FunctionalState MsbOnly***

Field Documentation

- ***uint32_t MDF_DmaConfigTypeDef::Address***
  DMA destination address
- ***uint32_t MDF_DmaConfigTypeDef::DataLength***
  Length of data to transfer in bytes
- ***FunctionalState MDF_DmaConfigTypeDef::MsbOnly***
  Transfer only the 16MSB of the acquistion data

48.1.15 MDF_ScdConfigTypeDef

MDF_ScdConfigTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***uint32_t Threshold***
- ***uint32_t BreakSignal***

Field Documentation

- ***uint32_t MDF_ScdConfigTypeDef::Threshold***
  Short-circuit detector threshold. This parameter must be a number between Min_Data = 2 and Max_Data = 256
- ***uint32_t MDF_ScdConfigTypeDef::BreakSignal***
  Break signal assignment for short-circuit detector. This parameter can be a values combination of ***MDF_BreakSignals***

48.1.16 MDF_OldConfigTypeDef

MDF_OldConfigTypeDef is defined in the stm32u5xx_hal_mdf.h

Data Fields

- ***uint32_t OldCicMode***
- ***uint32_t OldDecimationRatio***
- ***int32_t HighThreshold***
- ***int32_t LowThreshold***
- ***uint32_t OldEventConfig***
- ***uint32_t BreakSignal***

Field Documentation

- ***uint32_t MDF_OldConfigTypeDef::OldCicMode***
  Out-off limit detector CIC filter mode. This parameter can be a value of ***MDF_OldCicMode***
- ***uint32_t MDF_OldConfigTypeDef::OldDecimationRatio***
  Out-off limit detector decimation ratio. This parameter must be a number between Min_Data = 1 and Max_Data = 32
- ***int32_t MDF_OldConfigTypeDef::HighThreshold***
  Out-off limit detector high threshold. This parameter must be a number between Min_Data = -33554432 and Max_Data = 33554431
- ***int32_t MDF_OldConfigTypeDef::LowThreshold***
  Out-off limit detector low threshold. This parameter must be a number between Min_Data = -33554432 and Max_Data = 33554431
- ***uint32_t MDF_OldConfigTypeDef::OldEventConfig***
  Out-off limit event configuration. This parameter can be a value of ***MDF_OldEventConfig***
- ***uint32_t MDF_OldConfigTypeDef::BreakSignal***
  Break signal assignment for out-off limit detector. This parameter can be a values combination of ***MDF_BreakSignals***

48.2 MDF Firmware driver API description

The following section lists the various functions of the MDF library.

48.2.1 How to use this driver

Initialization and de-initialization

1. User has first to initialize MDF or ADF instance.
2. As prerequisite, fill in the HAL_MDF_MspInit() :
   - Enable MDFz or ADFz clock interface with __HAL_RCC_MDFz_CLK_ENABLE() or __HAL_RCC_ADFz_CLK_ENABLE().
   - Enable the clocks for the used GPIOS with __HAL_RCC_GPIOx_CLK_ENABLE().
   - Configure these pins in alternate mode using HAL_GPIO_Init().
   - If interrupt mode is used, enable and configure MDFz_FLTx or ADFz interrupt with HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().
   - If DMA mode is used, initialize and configure DMA.
3. Configure the common parameters (only for first MDF or ADF instance init), serial interface parameters and filter bitstream selection by calling HAL_MDF_Init() function.

1. User can de-initialize MDF or ADF instance with HAL_MDF_DeInit() function.

Acquisition

1. Configure filter parameters and start acquisition using HAL_MDF_AcqStart(), HAL_MDF_AcqStart_IT() or HAL_MDF_AcqStart_DMA().
2. In polling mode :
   - Use HAL_MDF_PollForAcq() to detect the end of acquisition. Use HAL_MDF_GetAcqValue to get acquisition value.
   - Only for MDF instance, use HAL_MDF_PollForSnapshotAcq() to detect the end of snapshot acquisition. Use HAL_MDF_GetSnapshotAcqValue to get snapshot acquisition value.
   - Only for ADF instance, use HAL_MDF_PollForSndLvl() to detect and get new sound level value and ambient noise value.
   - Only for ADF instance, use HAL_MDF_PollForSad() to detect sound activity.
3. In interrupt mode :
   - HAL_MDF_AcqCpltCallback() will be called at the end of acquisition. Use HAL_MDF_GetAcqValue to get acquisition value or use HAL_MDF_GetSnapshotAcqValue to get snapshot acquisition value.
   - Only for ADF instance, HAL_MDF_SndLvlCallback() will be called when new sound level and ambient noise values are available.
   - Only for ADF instance, HAL_MDF_SadCallback() will be called when sound activity detection occurs.
   - HAL_MDF_ErrorCallback() will be called if overflow, filter overrun or saturation occurs. Use HAL_MDF_GetErrorCode() to get the corresponding error.
4. In DMA mode :
   - HAL_MDF_AcqHalfCpltCallback() and HAL_MDF_AcqCpltCallback() will be called respectively at the half acquisition and at the acquisition complete.
   - Only for ADF instance, HAL_MDF_SndLvlCallback() will be called when new sound level and ambient noise values are available.
   - Only for ADF instance, HAL_MDF_SadCallback() will be called when sound activity detection occurs.
   - HAL_MDF_ErrorCallback() will be called if overflow, filter overrun, saturation or DMA error occurs. Use HAL_MDF_GetErrorCode() to get the corresponding error.
5. Use HAL_MDF_GenerateTrgo() to generate pulse on TRGO signal.
6. During acquisition, use HAL_MDF_SetDelay() and HAL_MDF_GetDelay() to respectively set and get the delay on data source.
7. During acquisition, use HAL_MDF_SetGain() and HAL_MDF_GetGain() to respectively set and get the filter gain.

8. During acquisition, use HAL_MDF_SetOffset() and HAL_MDF_GetOffset() to respectively set and get the filter offset error compensation.
9. During acquisition, only for MDF instance, use HAL_MDF_SetOffset() and HAL_MDF_GetOffset() to respectively set and get the filter offset error compensation.
10. Stop acquisition using HAL_MDF_AcqStop(), HAL_MDF_AcqStop_IT() or HAL_MDF_AcqStop_DMA().

Clock absence detection

1. Clock absence detection is always enabled so no need to start clock absence detection in polling mode. Use HAL_MDF_CkabStart_IT() to start clock absence detection in interrupt mode.
2. In polling mode, use HAL_MDF_PollForCkab() to detect the clock absence.
3. In interrupt mode, HAL_MDF_ErrorCallback() will be called if clock absence detection occurs. Use HAL_MDF_GetErrorCode() to get the corresponding error.
4. Stop clock absence detection in interrupt mode using HAL_MDF_CkabStop_IT().

Short circuit detection

1. Only for MDF instance, start short circuit detection using HAL_MDF_ScdStart() or HAL_MDF_ScdStart_IT().
2. In polling mode, use HAL_MDF_PollForScd() to detect short circuit.
3. In interrupt mode, HAL_MDF_ErrorCallback() will be called if short circuit detection occurs. Use HAL_MDF_GetErrorCode() to get the corresponding error.
4. Stop short circuit detection using HAL_MDF_ScdStop() or HAL_MDF_ScdStop_IT().

Out-off limit detection

1. Only for MDF instance, start out-off limit detection using HAL_MDF_OldStart() or HAL_MDF_OldStart_IT().
2. In polling mode, use HAL_MDF_PollForOld() to detect out-off limit and to get threshold information.
3. In interrupt mode, HAL_MDF_OldCallback() will be called if out-off limit detection occurs.
4. Stop out-off limit detection using HAL_MDF_OldStop() or HAL_MDF_OldStop_IT().

generic functions

1. HAL_MDF_IRQHandler will be called when MDF or ADF interrupt occurs.
2. HAL_MDF_ErrorCallback will be called when MDF or ADF error occurs.
3. Use HAL_MDF_GetState() to get the current MDF or ADF instance state.
4. Use HAL_MDF_GetErrorCode() to get the current MDF or ADF instance error code.

Callback registration

The compilation define USE_HAL_MDF_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use functions HAL_MDF_RegisterCallback(), HAL_MDF_RegisterOldCallback() or HAL_MDF_RegisterSndLvlCallback() to register a user callback.

Function HAL_MDF_RegisterCallback() allows to register following callbacks :

- AcqCpltCallback : Acquisition complete callback.
- AcqHalfCpltCallback : Acquisition half complete callback.
- SadCallback : Sound activity detection callback (only for ADF instance).
- ErrorCallback : Error callback.
- MspInitCallback : MSP init callback.
- MspDeInitCallback : MSP de-init callback.

This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

For MDF instance and for specific out-off limit detection callback use dedicated register callback : HAL_MDF_RegisterOldCallback().

For ADF instance and for specific sound level callback use dedicated register callback : HAL_MDF_RegisterSndLvlCallback().

Use function HAL_MDF_UnRegisterCallback() to reset a callback to the default weak function.

HAL_MDF_UnRegisterCallback() takes as parameters the HAL peripheral handle and the Callback ID.

This function allows to reset following callbacks :

- AcqCpltCallback : Acquisition complete callback.
- AcqHalfCpltCallback : Acquisition half complete callback.
- SadCallback : Sound activity detection callback (only for ADF instance).
- ErrorCallback : Error callback.
- MspInitCallback : MSP init callback.
- MspDeInitCallback : MSP de-init callback.

For MDF instance and for specific out-off limit detection callback use dedicated unregister callback : HAL_MDF_UnRegisterOldCallback().

For ADF instance and for specific sound level callback use dedicated unregister callback : HAL_MDF_UnRegisterSndLvlCallback().

By default, after the call of init function and if the state is RESET all callbacks are reset to the corresponding legacy weak functions : examples HAL_MDF_AcqCpltCallback(), HAL_MDF_ErrorCallback(). Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak functions in the init and de-init only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the init and de-init keep and use the user MspInit/MspDeInit callbacks (registered beforehand).

Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the init/de-init. In that case first register the MspInit/MspDeInit user callbacks using HAL_MDF_RegisterCallback() before calling init or de-init function.

When the compilation define USE_HAL_MDF_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak callbacks are used.

48.2.2 Initialization and de-initialization functions

This section provides functions allowing to :

- Initialize the MDF or ADF instance.
- De-initialize the MDF or ADF instance.
- Register and unregister callbacks.

This section contains the following APIs:

- *HAL_MDF_Init()*
- *HAL_MDF_DeInit()*
- *HAL_MDF_MspInit()*
- *HAL_MDF_MspDeInit()*
- *HAL_MDF_RegisterCallback()*
- *HAL_MDF_UnRegisterCallback()*
- *HAL_MDF_RegisterOldCallback()*
- *HAL_MDF_UnRegisterOldCallback()*
- *HAL_MDF_RegisterSndLvlCallback()*
- *HAL_MDF_UnRegisterSndLvlCallback()*

48.2.3 Acquisition functions

This section provides functions allowing to :

- Start and stop acquisition in polling, interrupt or DMA mode.
- Wait and get acquisition values.
- Generate pulse on TRGO signal.
- Modify and get some filter parameters during acquisition.
- Wait and get sound level values for ADF instance.
- Detect sound activity for ADF instance.

This section contains the following APIs:

- *HAL_MDF_AcqStart()*
- *HAL_MDF_PollForAcq()*

- *HAL_MDF_PollForSnapshotAcq()*
- *HAL_MDF_GetAcqValue()*
- *HAL_MDF_GetSnapshotAcqValue()*
- *HAL_MDF_AcqStop()*
- *HAL_MDF_AcqStart_IT()*
- *HAL_MDF_AcqStop_IT()*
- *HAL_MDF_AcqStart_DMA()*
- *HAL_MDF_AcqStop_DMA()*
- *HAL_MDF_GenerateTrgo()*
- *HAL_MDF_SetDelay()*
- *HAL_MDF_GetDelay()*
- *HAL_MDF_SetGain()*
- *HAL_MDF_GetGain()*
- *HAL_MDF_SetOffset()*
- *HAL_MDF_GetOffset()*
- *HAL_MDF_PollForSndLvl()*
- *HAL_MDF_PollForSad()*
- *HAL_MDF_AcqCpltCallback()*
- *HAL_MDF_AcqHalfCpltCallback()*
- *HAL_MDF_SndLvlCallback()*
- *HAL_MDF_SadCallback()*

48.2.4 Clock absence detection functions

This section provides functions allowing to :

- Start and stop clock absence detection in interrupt mode.
- Detect clock absence.

This section contains the following APIs:

- *HAL_MDF_PollForCkab()*
- *HAL_MDF_CkabStart_IT()*
- *HAL_MDF_CkabStop_IT()*

48.2.5 Short circuit detection functions

This section provides functions available only for MDF instance allowing to :

- Start and stop short circuit detection in polling and interrupt mode.
- Detect short circuit.

This section contains the following APIs:

- *HAL_MDF_ScdStart()*
- *HAL_MDF_PollForScd()*
- *HAL_MDF_ScdStop()*
- *HAL_MDF_ScdStart_IT()*
- *HAL_MDF_ScdStop_IT()*

48.2.6 Out-off limit detection functions

This section provides functions available only for MDF instance allowing to :

- Start and stop out-off limit detection in polling and interrupt mode.
- Detect short circuit and get threshold information.

This section contains the following APIs:

- *HAL_MDF_OldStart()*
- *HAL_MDF_PollForOld()*

- *HAL_MDF_OldStop()*
- *HAL_MDF_OldStart_IT()*
- *HAL_MDF_OldStop_IT()*
- *HAL_MDF_OldCallback()*

48.2.7 Generic functions

This section provides functions allowing to :

- Handle MDF interrupt.
- Inform user that error occurs.
- Get the current MDF instance state.
- Get the current MDF instance error code.

This section contains the following APIs:

- *HAL_MDF_IRQHandler()*
- *HAL_MDF_ErrorCallback()*
- *HAL_MDF_GetState()*
- *HAL_MDF_GetError()*

48.2.8 Detailed description of functions

HAL_MDF_Init

Function name

HAL_StatusTypeDef HAL_MDF_Init (MDF_HandleTypeDef * hmdf)

Function description

Initialize the MDF instance according to the specified parameters in the MDF_InitTypeDef structure and initialize the associated handle.

Parameters

- **hmdf:** MDF handle.

Return values

- **HAL:** status.

HAL_MDF_DeInit

Function name

HAL_StatusTypeDef HAL_MDF_DeInit (MDF_HandleTypeDef * hmdf)

Function description

De-initialize the MDF instance.

Parameters

- **hmdf:** MDF handle.

Return values

- **HAL:** status.

HAL_MDF_MspInit

Function name

void HAL_MDF_MspInit (MDF_HandleTypeDef * hmdf)

Function description

Initialize the MDF instance MSP.

Parameters

- **hmdf:** MDF handle.

Return values

- **None.:**

HAL_MDF_MspDeInit

Function name

void HAL_MDF_MspDeInit (MDF_HandleTypeDef * hmdf)

Function description

De-initialize the MDF instance MSP.

Parameters

- **hmdf:** MDF handle.

Return values

- **None.:**

HAL_MDF_RegisterCallback

Function name

HAL_StatusTypeDef HAL_MDF_RegisterCallback (MDF_HandleTypeDef * hmdf, HAL_MDF_CallbackIDTypeDef CallbackID, pMDF_CallbackTypeDef pCallback)

Function description

Register a user MDF callback to be used instead of the weak predefined callback.

Parameters

- **hmdf:** MDF handle.
- **CallbackID:** ID of the callback to be registered. This parameter can be one of the following values:
  - HAL_MDF_ACQ_COMPLETE_CB_ID acquisition complete callback ID.
  - HAL_MDF_ACQ_HALFCOMPLETE_CB_ID acquisition half complete callback ID.
  - HAL_MDF_SAD_CB_ID sound activity detector callback ID (only for ADF instance).
  - HAL_MDF_ERROR_CB_ID error callback ID.
  - HAL_MDF_MSPINIT_CB_ID MSP init callback ID.
  - HAL_MDF_MSPDEINIT_CB_ID MSP de-init callback ID.
- **pCallback:** pointer to the callback function.

Return values

- **HAL:** status.

HAL_MDF_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_MDF_UnRegisterCallback (MDF_HandleTypeDef * hmdf, HAL_MDF_CallbackIDTypeDef CallbackID)

Function description

Unregister a user MDF callback.

Parameters

- **hmdf:** MDF handle.
- **CallbackID:** ID of the callback to be unregistered. This parameter can be one of the following values:
  - HAL_MDF_ACQ_COMPLETE_CB_ID acquisition complete callback ID.
  - HAL_MDF_ACQ_HALFCOMPLETE_CB_ID acquisition half complete callback ID.
  - HAL_MDF_SAD_CB_ID sound activity detector callback ID (only for ADF instance).
  - HAL_MDF_ERROR_CB_ID error callback ID.
  - HAL_MDF_MSPINIT_CB_ID MSP init callback ID.
  - HAL_MDF_MSPDEINIT_CB_ID MSP de-init callback ID.

Return values

- **HAL:** status.

HAL_MDF_RegisterOldCallback

Function name

HAL_StatusTypeDef HAL_MDF_RegisterOldCallback (MDF_HandleTypeDef * hmdf, pMDF_OldCallbackTypeDef pCallback)

Function description

Register specific MDF out-off limit detector callback to be used instead of the weak predefined callback.

Parameters

- **hmdf:** MDF handle.
- **pCallback:** pointer to the out-off limit detector callback function.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_UnRegisterOldCallback

Function name

HAL_StatusTypeDef HAL_MDF_UnRegisterOldCallback (MDF_HandleTypeDef * hmdf)

Function description

Unregister the specific MDF out-off limit detector callback.

Parameters

- **hmdf:** MDF handle.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_RegisterSndLvlCallback

Function name

HAL_StatusTypeDef HAL_MDF_RegisterSndLvlCallback (MDF_HandleTypeDef * hmdf, pMDF_SndLvlCallbackTypeDef pCallback)

Function description

Register specific MDF sound level callback to be used instead of the weak predefined callback.

Parameters

- **hmdf:** MDF handle.
- **pCallback:** pointer to the sound level callback function.

Return values

- **HAL:** status.

Notes

- This function must not be used with MDF instance.

HAL_MDF_UnRegisterSndLvlCallback

Function name

HAL_StatusTypeDef HAL_MDF_UnRegisterSndLvlCallback (MDF_HandleTypeDef * hmdf)

Function description

Unregister the specific MDF sound level callback.

Parameters

- **hmdf:** MDF handle.

Return values

- **HAL:** status.

Notes

- This function must not be used with MDF instance.

HAL_MDF_AcqStart

Function name

HAL_StatusTypeDef HAL_MDF_AcqStart (MDF_HandleTypeDef * hmdf, const MDF_FilterConfigTypeDef * pFilterConfig)

Function description

This function allows to start acquisition in polling mode.

Parameters

- **hmdf:** MDF handle.
- **pFilterConfig:** Filter configuration parameters.

Return values

- **HAL:** status.

HAL_MDF_PollForAcq

Function name

HAL_StatusTypeDef HAL_MDF_PollForAcq (MDF_HandleTypeDef * hmdf, uint32_t Timeout)

Function description

This function allows to poll for available acquisition value.

Parameters

- **hmdf:** MDF handle.
- **Timeout:** Timeout value in milliseconds.

Return values

- **HAL:** status.

HAL_MDF_PollForSnapshotAcq

Function name

HAL_StatusTypeDef HAL_MDF_PollForSnapshotAcq (MDF_HandleTypeDef * hmdf, uint32_t Timeout)

Function description

This function allows to poll for available snapshot acquisition value.

Parameters

- **hmdf:** MDF handle.
- **Timeout:** Timeout value in milliseconds.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_GetAcqValue

Function name

HAL_StatusTypeDef HAL_MDF_GetAcqValue (const MDF_HandleTypeDef * hmdf, int32_t * pValue)

Function description

This function allows to get acquisition value.

Parameters

- **hmdf:** MDF handle.
- **pValue:** Acquisition value on 24 MSB.

Return values

- **HAL:** status.

HAL_MDF_GetSnapshotAcqValue

Function name

HAL_StatusTypeDef HAL_MDF_GetSnapshotAcqValue (MDF_HandleTypeDef * hmdf, MDF_SnapshotParamTypeDef * pSnapshotParam)

Function description

This function allows to get snapshot acquisition value.

Parameters

- **hmdf:** MDF handle.
- **pSnapshotParam:** Snapshot parameters.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_AcqStop

Function name

HAL_StatusTypeDef HAL_MDF_AcqStop (MDF_HandleTypeDef * hmdf)

Function description

This function allows to stop acquisition in polling mode.

Parameters

- **hmdf:** MDF handle.

Return values

- **HAL:** status.

HAL_MDF_AcqStart_IT

Function name

HAL_StatusTypeDef HAL_MDF_AcqStart_IT (MDF_HandleTypeDef * hmdf, const MDF_FilterConfigTypeDef * pFilterConfig)

Function description

This function allows to start acquisition in interrupt mode.

Parameters

- **hmdf:** MDF handle.
- **pFilterConfig:** Filter configuration parameters.

Return values

- **HAL:** status.

HAL_MDF_AcqStop_IT

Function name

HAL_StatusTypeDef HAL_MDF_AcqStop_IT (MDF_HandleTypeDef * hmdf)

Function description

This function allows to stop acquisition in interrupt mode.

Parameters

- **hmdf:** MDF handle.

Return values

- **HAL:** status.

HAL_MDF_AcqStart_DMA

Function name

HAL_StatusTypeDef HAL_MDF_AcqStart_DMA (MDF_HandleTypeDef * hmdf, const MDF_FilterConfigTypeDef * pFilterConfig, const MDF_DmaConfigTypeDef * pDmaConfig)

Function description

This function allows to start acquisition in DMA mode.

Parameters

- **hmdf:** MDF handle.
- **pFilterConfig:** Filter configuration parameters.
- **pDmaConfig:** DMA configuration parameters.

Return values

- **HAL:** status.

HAL_MDF_AcqStop_DMA

Function name

HAL_StatusTypeDef HAL_MDF_AcqStop_DMA (MDF_HandleTypeDef * hmdf)

Function description

This function allows to stop acquisition in DMA mode.

Parameters

- **hmdf:** MDF handle.

Return values

- **HAL:** status.

HAL_MDF_GenerateTrgo

Function name

HAL_StatusTypeDef HAL_MDF_GenerateTrgo (const MDF_HandleTypeDef * hmdf)

Function description

This function allows to generate pulse on TRGO signal.

Parameters

- **hmdf:** MDF handle.

Return values

- **HAL:** status.

HAL_MDF_SetDelay

Function name

HAL_StatusTypeDef HAL_MDF_SetDelay (MDF_HandleTypeDef * hmdf, uint32_t Delay)

Function description

This function allows to set delay to apply on data source in number of samples.

Parameters

- **hmdf:** MDF handle.
- **Delay:** Delay to apply on data source in number of samples. This parameter must be a number between Min_Data = 0 and Max_Data = 127.

Return values

- **HAL:** status.

HAL_MDF_GetDelay

Function name

HAL_StatusTypeDef HAL_MDF_GetDelay (const MDF_HandleTypeDef * hmdf, uint32_t * pDelay)

Function description

This function allows to get current delay applied on data source in number of samples.

Parameters

- **hmdf:** MDF handle.
- **pDelay:** Current delay applied on data source in number of samples. This value is between Min_Data = 0 and Max_Data = 127.

Return values

- **HAL:** status.

HAL_MDF_SetGain

Function name

HAL_StatusTypeDef HAL_MDF_SetGain (MDF_HandleTypeDef * hmdf, int32_t Gain)

Function description

This function allows to set filter gain.

Parameters

- **hmdf:** MDF handle.
- **Gain:** Filter gain in step of around 3db (from -48db to 72dB). This parameter must be a number between Min_Data = -16 and Max_Data = 24.

Return values

- **HAL:** status.

HAL_MDF_GetGain

Function name

HAL_StatusTypeDef HAL_MDF_GetGain (const MDF_HandleTypeDef * hmdf, int32_t * pGain)

Function description

This function allows to get filter gain.

Parameters

- **hmdf:** MDF handle.
- **pGain:** Filter gain in step of around 3db (from -48db to 72dB). This parameter is between Min_Data = -16 and Max_Data = 24.

Return values

- **HAL:** status.

HAL_MDF_SetOffset

Function name

HAL_StatusTypeDef HAL_MDF_SetOffset (MDF_HandleTypeDef * hmdf, int32_t Offset)

Function description

This function allows to set filter offset error compensation.

Parameters

- **hmdf:** MDF handle.
- **Offset:** Filter offset error compensation. This parameter must be a number between Min_Data = -33554432 and Max_Data = 33554431.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_GetOffset

Function name

HAL_StatusTypeDef HAL_MDF_GetOffset (const MDF_HandleTypeDef * hmdf, int32_t * pOffset)

Function description

This function allows to get filter offset error compensation.

Parameters

- **hmdf:** MDF handle.
- **pOffset:** Filter offset error compensation. This value is between Min_Data = -33554432 and Max_Data = 33554431.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_PollForSndLvl

Function name

HAL_StatusTypeDef HAL_MDF_PollForSndLvl (MDF_HandleTypeDef * hmdf, uint32_t Timeout, uint32_t * pSoundLevel, uint32_t * pAmbientNoise)

Function description

This function allows to poll for sound level data.

Parameters

- **hmdf:** MDF handle.
- **Timeout:** Timeout value in milliseconds.
- **pSoundLevel:** Sound level. This parameter can be a value between Min_Data = 0 and Max_Data = 32767.
- **pAmbientNoise:** Ambient noise. This parameter can be a value between Min_Data = 0 and Max_Data = 32767.

Return values

- **HAL:** status.

Notes

- This function must not be used with MDF instance.

HAL_MDF_PollForSad

Function name

HAL_StatusTypeDef HAL_MDF_PollForSad (MDF_HandleTypeDef * hmdf, uint32_t Timeout)

Function description

This function allows to poll for sound activity detection.

Parameters

- **hmdf:** MDF handle.
- **Timeout:** Timeout value in milliseconds.

Return values

- **HAL:** status.

Notes

- This function must not be used with MDF instance.

HAL_MDF_AcqCpltCallback

Function name

void HAL_MDF_AcqCpltCallback (MDF_HandleTypeDef * hmdf)

Function description

MDF acquisition complete callback.

Parameters

- **hmdf:** MDF handle.

Return values

- **None.:**

HAL_MDF_AcqHalfCpltCallback

Function name

void HAL_MDF_AcqHalfCpltCallback (MDF_HandleTypeDef * hmdf)

Function description

MDF acquisition half complete callback.

Parameters

- **hmdf:** MDF handle.

Return values

- **None.:**

HAL_MDF_SndLvlCallback

Function name

void HAL_MDF_SndLvlCallback (MDF_HandleTypeDef * hmdf, uint32_t SoundLevel, uint32_t AmbientNoise)

Function description

MDF sound level callback.

Parameters

- **hmdf:** MDF handle.
- **SoundLevel:** Sound level value computed by sound activity detector. This parameter can be a value between Min_Data = 0 and Max_Data = 32767.
- **AmbientNoise:** Ambient noise value computed by sound activity detector. This parameter can be a value between Min_Data = 0 and Max_Data = 32767.

Return values

- **None.:**

HAL_MDF_SadCallback

Function name

void HAL_MDF_SadCallback (MDF_HandleTypeDef * hmdf)

Function description

MDF sound activity detector callback.

Parameters

- **hmdf:** MDF handle.

Return values

- **None.:**

HAL_MDF_PollForCkab

Function name

HAL_StatusTypeDef HAL_MDF_PollForCkab (MDF_HandleTypeDef * hmdf, uint32_t Timeout)

Function description

This function allows to poll for the clock absence detection.

Parameters

- **hmdf:** MDF handle.
- **Timeout:** Timeout value in milliseconds.

Return values

- **HAL:** status.

HAL_MDF_CkabStart_IT

Function name

HAL_StatusTypeDef HAL_MDF_CkabStart_IT (MDF_HandleTypeDef * hmdf)

Function description

This function allows to start clock absence detection in interrupt mode.

Parameters

- **hmdf:** MDF handle.

Return values

- **HAL:** status.

HAL_MDF_CkabStop_IT

Function name

HAL_StatusTypeDef HAL_MDF_CkabStop_IT (MDF_HandleTypeDef * hmdf)

Function description

This function allows to stop clock absence detection in interrupt mode.

Parameters

- **hmdf:** MDF handle.

Return values

- **HAL:** status.

HAL_MDF_ScdStart

Function name

HAL_StatusTypeDef HAL_MDF_ScdStart (MDF_HandleTypeDef * hmdf, const MDF_ScdConfigTypeDef * pScdConfig)

Function description

This function allows to start short-circuit detection in polling mode.

Parameters

- **hmdf:** MDF handle.
- **pScdConfig:** Short-circuit detector configuration parameters.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_PollForScd

Function name

HAL_StatusTypeDef HAL_MDF_PollForScd (MDF_HandleTypeDef * hmdf, uint32_t Timeout)

Function description

This function allows to poll for the short-circuit detection.

Parameters

- **hmdf:** MDF handle.
- **Timeout:** Timeout value in milliseconds.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_ScdStop

Function name

HAL_StatusTypeDef HAL_MDF_ScdStop (MDF_HandleTypeDef * hmdf)

Function description

This function allows to stop short-circuit detection in polling mode.

Parameters

- **hmdf:** MDF handle.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_ScdStart_IT

Function name

HAL_StatusTypeDef HAL_MDF_ScdStart_IT (MDF_HandleTypeDef * hmdf, const MDF_ScdConfigTypeDef * pScdConfig)

Function description

This function allows to start short-circuit detection in interrupt mode.

Parameters

- **hmdf:** MDF handle.
- **pScdConfig:** Short-circuit detector configuration parameters.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_ScdStop_IT

Function name

HAL_StatusTypeDef HAL_MDF_ScdStop_IT (MDF_HandleTypeDef * hmdf)

Function description

This function allows to stop short-circuit detection in interrupt mode.

Parameters

- **hmdf:** MDF handle.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_OldStart

Function name

HAL_StatusTypeDef HAL_MDF_OldStart (MDF_HandleTypeDef * hmdf, const MDF_OldConfigTypeDef * pOldConfig)

Function description

This function allows to start out-off limit detection in polling mode.

Parameters

- **hmdf:** MDF handle.
- **pOldConfig:** Out-off limit detector configuration parameters.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_PollForOld

Function name

HAL_StatusTypeDef HAL_MDF_PollForOld (MDF_HandleTypeDef * hmdf, uint32_t Timeout, uint32_t * pThresholdInfo)

Function description

This function allows to poll for the out-off limit detection.

Parameters

- **hmdf:** MDF handle.
- **Timeout:** Timeout value in milliseconds.
- **pThresholdInfo:** Threshold information of out-off limit detection. This parameter can be a value of MDF out-off limit detector threshold information.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_OldStop

Function name

HAL_StatusTypeDef HAL_MDF_OldStop (MDF_HandleTypeDef * hmdf)

Function description

This function allows to stop out-off limit detection in polling mode.

Parameters

- **hmdf:** MDF handle.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_OldStart_IT

Function name

HAL_StatusTypeDef HAL_MDF_OldStart_IT (MDF_HandleTypeDef * hmdf, const MDF_OldConfigTypeDef * pOldConfig)

Function description

This function allows to start out-off limit detection in interrupt mode.

Parameters

- **hmdf:** MDF handle.
- **pOldConfig:** Out-off limit detector configuration parameters.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_OldStop_IT

Function name

HAL_StatusTypeDef HAL_MDF_OldStop_IT (MDF_HandleTypeDef * hmdf)

Function description

This function allows to stop out-off limit detection in interrupt mode.

Parameters

- **hmdf:** MDF handle.

Return values

- **HAL:** status.

Notes

- This function must not be used with ADF instance.

HAL_MDF_OldCallback

Function name

void HAL_MDF_OldCallback (MDF_HandleTypeDef * hmdf, uint32_t ThresholdInfo)

Function description

MDF out-off limit detector callback.

Parameters

- **hmdf:** MDF handle.
- **ThresholdInfo:** Threshold information of out-off limit detection. This parameter can be a value of MDF out-off limit detector threshold information.

Return values

- **None.:**

HAL_MDF_IRQHandler

Function name

void HAL_MDF_IRQHandler (MDF_HandleTypeDef * hmdf)

Function description

This function handles the MDF interrupts.

Parameters

- **hmdf:** MDF handle.

Return values

- **None.:**

HAL_MDF_ErrorCallback

Function name

void HAL_MDF_ErrorCallback (MDF_HandleTypeDef * hmdf)

Function description

MDF error callback.

Parameters

- **hmdf:** MDF handle.

Return values

- **None.:**

HAL_MDF_GetState

Function name

HAL_MDF_StateTypeDef HAL_MDF_GetState (const MDF_HandleTypeDef * hmdf)

Function description

This function allows to get the current MDF state.

Parameters

- **hmdf:** MDF handle.

Return values

- **MDF:** state.

HAL_MDF_GetError

Function name

uint32_t HAL_MDF_GetError (const MDF_HandleTypeDef * hmdf)

Function description

This function allows to get the current MDF error.

Parameters

- **hmdf:** MDF handle.

Return values

- **MDF:** error code.

48.3 MDF Firmware driver defines

The following section lists the various define and macros of the module.

48.3.1 MDF

MDF

MDF acquisition mode

MDF_MODE_ASYNC_CONT

Asynchronous, continuous acquisition mode

MDF_MODE_ASYNC_SINGLE

Notes:

- Not available for ADF instance with SAD usage

Asynchronous, single-shot acquisition mode.

MDF_MODE_SYNC_CONT

Synchronous, continuous acquisition mode

MDF_MODE_SYNC_SINGLE

Notes:

- Not available for ADF instance with SAD usage

Synchronous, single-shot acquisition mode.

MDF_MODE_WINDOW_CONT

Notes:

- Not available for ADF instance with SAD usage

Window, continuous acquisition mode.

MDF_MODE_SYNC_SNAPSHOT

Notes:

- Not available for ADF instance

Synchronous, snapshot acquisition mode.

MDF break signals

MDF_NO_BREAK_SIGNAL

No break signal

MDF_TIM1_BREAK_SIGNAL

TIM1_BREAK signal

MDF_TIM1_BREAK2_SIGNAL

TIM1_BREAK2 signal

MDF_TIM8_BREAK_SIGNAL

TIM8_BREAK signal

MDF_TIM8_BREAK2_SIGNAL

TIM8_BREAK2 signal

MDF CIC mode

MDF_TWO_FILTERS_MCIC_FASTSINC

Notes:

- Not available for ADF instance

Two filters, main filter in FastSinc order.

MDF_TWO_FILTERS_MCIC_SINC1

Notes:

- Not available for ADF instance

Two filters, main filter in Sinc1 order.

MDF_TWO_FILTERS_MCIC_SINC2

Notes:

- Not available for ADF instance

Two filters, main filter in Sinc2 order.

MDF_TWO_FILTERS_MCIC_SINC3

Notes:

- Not available for ADF instance

Two filters, main filter in Sinc3 order.

MDF_ONE_FILTER_SINC4

One filter in Sinc4 order

MDF_ONE_FILTER_SINC5

One filter in Sinc5 order

MDF output clock trigger edge

MDF_CLOCK_TRIG_RISING_EDGE

Rising edge

MDF_CLOCK_TRIG_FALLING_EDGE

Falling edge

MDF output clock trigger source

MDF_CLOCK_TRIG_TRGO

MDF_CLOCK_TRIG_TIM1_TRGO

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM1_TRGO2

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM8_TRGO

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM8_TRGO2

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM3_TRGO

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM4_TRGO

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM16_OC1

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM6_TRGO

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_TIM7_TRGO

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_SAD_DET

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_EXTI11

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_EXTI15

MDF_CLOCK_TRIG_LPTIM1_OUT

Notes:

- Not available for ADF instance

MDF_CLOCK_TRIG_SAD_TRGO

Notes:

- Not available for ADF instance

MDF data source

MDF_DATA_SOURCE_BSMX

Data from bitstream matrix

MDF_DATA_SOURCE_ADCITF1

Notes:

- Not available for ADF instance

Data from ADC interface 1.

MDF_DATA_SOURCE_ADCITF2

Notes:

- Not available for ADF instance

Data from ADC interface 2.

MDF error code

MDF_ERROR_NONE

No error

MDF_ERROR_ACQUISITION_OVERFLOW

Overflow occurs during acquisition

MDF_ERROR_RSF_OVERRUN

Overrun occurs on reshape filter

MDF_ERROR_CLOCK_ABSENCE

Clock absence detection occurs

MDF_ERROR_SHORT_CIRCUIT

Notes:

- Not used for ADF instance

Short circuit detection occurs.

MDF_ERROR_SATURATION

Saturation detection occurs

MDF_ERROR_OUT_OFF_LIMIT

Notes:

- Not used for ADF instance

Out-off limit detection occurs.

MDF_ERROR_DMA

DMA error occurs

MDF_ERROR_INVALID_CALLBACK

Invalid callback error occurs

MDF Exported Macros

__HAL_MDF_RESET_HANDLE_STATE

Description:

- Reset MDF handle state.

Parameters:

- __HANDLE__: MDF handle.

Return value:

- None

MDF RXFIFO threshold

MDF_FIFO_THRESHOLD_NOT_EMPTY

Event generated when RXFIFO is not empty

MDF_FIFO_THRESHOLD_HALF_FULL

Event generated when RXFIFO is half_full

MDF filter bitstream

MDF_BITSTREAM0_RISING

MDF_BITSTREAM0_FALLING

MDF_BITSTREAM1_RISING

Notes:

- Not available for ADF instance

MDF_BITSTREAM1_FALLING

Notes:

- Not available for ADF instance

MDF_BITSTREAM2_RISING

Notes:

- Not available for ADF instance

MDF_BITSTREAM2_FALLING

Notes:

- Not available for ADF instance

MDF_BITSTREAM3_RISING

Notes:

- Not available for ADF instance

MDF_BITSTREAM3_FALLING

Notes:

- Not available for ADF instance

MDF_BITSTREAM4_RISING

Notes:

- Not available for ADF instance

MDF_BITSTREAM4_FALLING

Notes:

- Not available for ADF instance

MDF_BITSTREAM5_RISING

Notes:

- Not available for ADF instance

MDF_BITSTREAM5_FALLING

Notes:

- Not available for ADF instance

MDF filter trigger edge

MDF_FILTER_TRIG_RISING_EDGE

Rising edge

MDF_FILTER_TRIG_FALLING_EDGE

Falling edge

MDF filter trigger source

MDF_FILTER_TRIG_TRGO

MDF_FILTER_TRIG_OLD_EVENT

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM1_TRGO

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM1_TRGO2

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM8_TRGO

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM8_TRGO2

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM3_TRGO

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM4_TRGO

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM16_OC1

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM6_TRGO

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_TIM7_TRGO

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_ADF_SAD_DET

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_EXTI11

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_EXTI15

MDF_FILTER_TRIG_LPTIM1_OUT

Notes:

- Not available for ADF instance

MDF_FILTER_TRIG_ADF_TRGO

Notes:

- Not available for ADF instance

MDF high pass filter cut-off frequency

MDF_HPF_CUTOFF_0_000625FPCM

Cut-off frequency of 0.000625xFpcm

MDF_HPF_CUTOFF_0_00125FPCM

Cut-off frequency of 0.00125xFpcm

MDF_HPF_CUTOFF_0_0025FPCM

Cut-off frequency of 0.0025xFpcm

MDF_HPF_CUTOFF_0_0095FPCM

Cut-off frequency of 0.0095xFpcm

MDF integrator output division

MDF_INTEGRATOR_OUTPUT_DIV_128

Integrator data outputs divided by 128

MDF_INTEGRATOR_OUTPUT_DIV_32

Integrator data outputs divided by 32

MDF_INTEGRATOR_OUTPUT_DIV_4

Integrator data outputs divided by 4

MDF_INTEGRATOR_OUTPUT_NO_DIV

Integrator data outputs not divided

MDF out-off limit detector CIC mode

MDF_OLD_FILTER_FASTSINC

Out-off limit detector filter in FastSinc order

MDF_OLD_FILTER_SINC1

Out-off limit detector filter in Sinc1 order

MDF_OLD_FILTER_SINC2

Out-off limit detector filter in Sinc2 order

MDF_OLD_FILTER_SINC3

Out-off limit detector filter in Sinc3 order

MDF out-off limit detector event configuration

MDF_OLD_SIGNAL_OUTSIDE_THRESHOLDS

Out-off limit detector event is generated if signal is outside thresholds

MDF_OLD_SIGNAL_IN_THRESHOLDS

Out-off limit detector event is generated if signal is in thresholds

MDF out-off limit detector threshold information

MDF_OLD_IN_THRESHOLDS

The signal was in thresholds when out-off limit detection occurs

MDF_OLD_HIGH_THRESHOLD

The signal was higher than high threshold when out-off limit detection occurs

MDF_OLD_LOW_THRESHOLD

The signal was lower than low threshold when out-off limit detection occurs

MDF output clock pins

MDF_OUTPUT_CLOCK_0

MDF_CCK0 is used as output clock

MDF_OUTPUT_CLOCK_1

MDF_CCK1 is used as output clock

MDF_OUTPUT_CLOCK_ALL

MDF_CCK0 and MDF_CCK1 are used as output clock

MDF reshape filter decimation ratio

MDF_RSF_DECIMATION_RATIO_4

Reshape filter decimation ratio is 4

MDF_RSF_DECIMATION_RATIO_1

Reshape filter decimation ratio is 1

MDF sound activity detector data memory transfer mode

MDF_SAD_NO_MEMORY_TRANSFER

No memory transfer

MDF_SAD_MEMORY_TRANSFER_IN_DETECT

Memory transfer only in detect state

MDF_SAD_MEMORY_TRANSFER_ALWAYS

Memory transfer always

MDF sound activity detector frame size

MDF_SAD_8_PCM_SAMPLES

Frame size of 8 PCM samples

MDF_SAD_16_PCM_SAMPLES

Frame size of 16 PCM samples

MDF_SAD_32_PCM_SAMPLES

Frame size of 32 PCM samples

MDF_SAD_64_PCM_SAMPLES

Frame size of 64 PCM samples

MDF_SAD_128_PCM_SAMPLES

Frame size of 128 PCM samples

MDF_SAD_256_PCM_SAMPLES

Frame size of 256 PCM samples

MDF_SAD_512_PCM_SAMPLES

Frame size of 512 PCM samples

MDF sound activity detector data hangover time window

MDF_SAD_HANGOVER_4_FRAMES

Hangover window of 4 frames

MDF_SAD_HANGOVER_8_FRAMES

Hangover window of 8 frames

MDF_SAD_HANGOVER_16_FRAMES

Hangover window of 16 frames

MDF_SAD_HANGOVER_32_FRAMES

Hangover window of 32 frames

MDF_SAD_HANGOVER_64_FRAMES

Hangover window of 64 frames

MDF_SAD_HANGOVER_128_FRAMES

Hangover window of 128 frames

MDF_SAD_HANGOVER_256_FRAMES

Hangover window of 256 frames

MDF_SAD_HANGOVER_512_FRAMES

Hangover window of 512 frames

MDF sound activity detector data learning frames

MDF_SAD_LEARNING_2_FRAMES

2 learning frames

MDF_SAD_LEARNING_4_FRAMES

4 learning frames

MDF_SAD_LEARNING_8_FRAMES

8 learning frames

MDF_SAD_LEARNING_16_FRAMES

16 learning frames

MDF_SAD_LEARNING_32_FRAMES
32 learning frames

MDF sound activity detector mode

MDF_SAD_VOICE_ACTIVITY_DETECTOR
Voice activity detector

MDF_SAD_SOUND_DETECTOR
Sound detector

MDF_SAD_AMBIENT_NOISE_DETECTOR
Ambient noise detector

MDF sound activity detector data signal to noise threshold

MDF_SAD_SIGNAL_NOISE_3_5DB
Signal to noise threshold is 3.5dB

MDF_SAD_SIGNAL_NOISE_6DB
Signal to noise threshold is 6dB

MDF_SAD_SIGNAL_NOISE_9_5DB
Signal to noise threshold is 9.5dB

MDF_SAD_SIGNAL_NOISE_12DB
Signal to noise threshold is 12dB

MDF_SAD_SIGNAL_NOISE_15_6DB
Signal to noise threshold is 15.6dB

MDF_SAD_SIGNAL_NOISE_18DB
Signal to noise threshold is 18dB

MDF_SAD_SIGNAL_NOISE_21_6DB
Signal to noise threshold is 21.6dB

MDF_SAD_SIGNAL_NOISE_24_1DB
Signal to noise threshold is 24.1dB

MDF_SAD_SIGNAL_NOISE_27_6DB
Signal to noise threshold is 27.6dB

MDF_SAD_SIGNAL_NOISE_30_1DB
Signal to noise threshold is 30.1dB

MDF sound activity detector trigger event

MDF_SAD_ENTER_DETECT
Event when SAD enters in detect state

MDF_SAD_ENTER_EXIT_DETECT
Event when SAD enters or exits from detect state

MDF serial interface clock source

MDF_SITF_CCK0_SOURCE
Common clock 0 source

MDF_SITF_CCK1_SOURCE

Common clock 1 source

MDF_SITF_CKI_SOURCE

Notes:

- Not available for ADF instance

Dedicated input clock source.

MDF serial interface mode

MDF_SITF_LF_MASTER_SPI_MODE

Low frequency master SPI mode

MDF_SITF_NORMAL_SPI_MODE

Normal SPI mode

MDF_SITF_MANCHESTER_FALLING_MODE

Manchester mode rising edge logic 0 and falling edge logic 1

MDF_SITF_MANCHESTER_RISING_MODE

Manchester mode rising edge logic 1 and falling edge logic 0

MDF snapshot format

MDF_SNAPSHOT_23BITS

Snapshot data resolution of 23 bits

MDF_SNAPSHOT_16BITS

Snapshot data resolution of 16 bits

49 HAL MMC Generic Driver

49.1 MMC Firmware driver registers structures

49.1.1 HAL_MMC_CardInfoTypeDef

HAL_MMC_CardInfoTypeDef is defined in the stm32u5xx_hal_mmc.h

Data Fields

- ***uint32_t CardType***
- ***uint32_t Class***
- ***uint32_t RelCardAdd***
- ***uint32_t BlockNbr***
- ***uint32_t BlockSize***
- ***uint32_t LogBlockNbr***
- ***uint32_t LogBlockSize***

Field Documentation

- ***uint32_t HAL_MMC_CardInfoTypeDef::CardType***
  Specifies the card Type
- ***uint32_t HAL_MMC_CardInfoTypeDef::Class***
  Specifies the class of the card class
- ***uint32_t HAL_MMC_CardInfoTypeDef::RelCardAdd***
  Specifies the Relative Card Address
- ***uint32_t HAL_MMC_CardInfoTypeDef::BlockNbr***
  Specifies the Card Capacity in blocks
- ***uint32_t HAL_MMC_CardInfoTypeDef::BlockSize***
  Specifies one block size in bytes
- ***uint32_t HAL_MMC_CardInfoTypeDef::LogBlockNbr***
  Specifies the Card logical Capacity in blocks
- ***uint32_t HAL_MMC_CardInfoTypeDef::LogBlockSize***
  Specifies logical block size in bytes

49.1.2 __MMC_HandleTypeDef

__MMC_HandleTypeDef is defined in the stm32u5xx_hal_mmc.h

Data Fields

- ***MMC_TypeDef * Instance***
- ***MMC_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***const uint8_t * pTxBuffPtr***
- ***uint32_t TxXferSize***
- ***uint8_t * pRxBuffPtr***
- ***uint32_t RxXferSize***
- ***__IO uint32_t Context***
- ***__IO HAL_MMC_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***__IO uint16_t RPMBErrorCode***
- ***HAL_MMC_CardInfoTypeDef MmcCard***
- ***uint32_t CSD***
- ***uint32_t CID***
- ***uint32_t Ext_CSD***
- ***void(* TxCpltCallback***
- ***void(* RxCpltCallback***

- *void(* ErrorCallback*
- *void(* AbortCpltCallback*
- *void(* Read_DMALnkLstBufCpltCallback*
- *void(* Write_DMALnkLstBufCpltCallback*
- *void(* MspInitCallback*
- *void(* MspDeInitCallback*

Field Documentation

- ***MMC_TypeDef* __MMC_HandleTypeDef::Instance***
  MMC registers base address
- ***MMC_InitTypeDef __MMC_HandleTypeDef::Init***
  MMC required parameters
- ***HAL_LockTypeDef __MMC_HandleTypeDef::Lock***
  MMC locking object
- ***const uint8_t* __MMC_HandleTypeDef::pTxBuffPtr***
  Pointer to MMC Tx transfer Buffer
- ***uint32_t __MMC_HandleTypeDef::TxXferSize***
  MMC Tx Transfer size
- ***uint8_t* __MMC_HandleTypeDef::pRxBuffPtr***
  Pointer to MMC Rx transfer Buffer
- ***uint32_t __MMC_HandleTypeDef::RxXferSize***
  MMC Rx Transfer size
- ***__IO uint32_t __MMC_HandleTypeDef::Context***
  MMC transfer context
- ***__IO HAL_MMC_StateTypeDef __MMC_HandleTypeDef::State***
  MMC card State
- ***__IO uint32_t __MMC_HandleTypeDef::ErrorCode***
  MMC Card Error codes
- ***__IO uint16_t __MMC_HandleTypeDef::RPMBErrorCode***
  MMC RPMB Area Error codes
- ***HAL_MMC_CardInfoTypeDef __MMC_HandleTypeDef::MmcCard***
  MMC Card information
- ***uint32_t __MMC_HandleTypeDef::CSD[4U]***
  MMC card specific data table
- ***uint32_t __MMC_HandleTypeDef::CID[4U]***
  MMC card identification number table
- ***uint32_t __MMC_HandleTypeDef::Ext_CSD[128]***
- ***void(* __MMC_HandleTypeDef::TxCpltCallback)(struct __MMC_HandleTypeDef *hmmc)***
- ***void(* __MMC_HandleTypeDef::RxCpltCallback)(struct __MMC_HandleTypeDef *hmmc)***
- ***void(* __MMC_HandleTypeDef::ErrorCallback)(struct __MMC_HandleTypeDef *hmmc)***
- ***void(* __MMC_HandleTypeDef::AbortCpltCallback)(struct __MMC_HandleTypeDef *hmmc)***
- ***void(* __MMC_HandleTypeDef::Read_DMALnkLstBufCpltCallback)(struct __MMC_HandleTypeDef *hmmc)***
- ***void(* __MMC_HandleTypeDef::Write_DMALnkLstBufCpltCallback)(struct __MMC_HandleTypeDef *hmmc)***
- ***void(* __MMC_HandleTypeDef::MspInitCallback)(struct __MMC_HandleTypeDef *hmmc)***
- ***void(* __MMC_HandleTypeDef::MspDeInitCallback)(struct __MMC_HandleTypeDef *hmmc)***

49.1.3 HAL_MMC_CardCSDTypeDef

HAL_MMC_CardCSDTypeDef is defined in the stm32u5xx_hal_mmc.h

Data Fields

- ***__IO uint8_t CSDStruct***
- ***__IO uint8_t SysSpecVersion***
- ***__IO uint8_t Reserved1***

- ***__IO uint8_t TAAC***
- ***__IO uint8_t NSAC***

49.2 MMC Firmware driver API description

The following section lists the various functions of the MMC library.

49.2.1 How to use this driver

This driver implements a high level communication layer for read and write from/to this memory. The needed STM32 hardware resources (SDMMC and GPIO) are performed by the user in HAL_MMC_MspInit() function (MSP layer). Basically, the MSP layer configuration should be the same as we provide in the examples. You can easily tailor this configuration according to hardware resources.

This driver is a generic layered driver for SDMMC memories which uses the HAL SDMMC driver functions to interface with MMC and eMMC cards devices. It is used as follows:

1. Initialize the SDMMC low level resources by implement the HAL_MMC_MspInit() API:
   a. Enable the SDMMC interface clock using __HAL_RCC_SDMMC_CLK_ENABLE();
   b. SDMMC pins configuration for MMC card
      - Enable the clock for the SDMMC GPIOs using the functions __HAL_RCC_GPIOx_CLK_ENABLE();
      - Configure these SDMMC pins as alternate function pull-up using HAL_GPIO_Init() and according to your pin assignment;
   c. NVIC configuration if you need to use interrupt process (HAL_MMC_ReadBlocks_IT() and HAL_MMC_WriteBlocks_IT() APIs).
      - Configure the SDMMC interrupt priorities using function HAL_NVIC_SetPriority();
      - Enable the NVIC SDMMC IRQs using function HAL_NVIC_EnableIRQ()
      - SDMMC interrupts are managed using the macros __HAL_MMC_ENABLE_IT() and __HAL_MMC_DISABLE_IT() inside the communication process.
      - SDMMC interrupts pending bits are managed using the macros __HAL_MMC_GET_IT() and __HAL_MMC_CLEAR_IT()
   d. No general propose DMA Configuration is needed, an Internal DMA for SDMMC Peripheral are used.
2. At this stage, you can perform MMC read/write/erase operations after MMC card initialization

MMC Card Initialization and configuration

To initialize the MMC Card, use the HAL_MMC_Init() function. It Initializes SDMMC Peripheral (STM32 side) and the MMC Card, and put it into StandBy State (Ready for data transfer). This function provide the following operations:

1. Initialize the SDMMC peripheral interface with default configuration. The initialization process is done at 400KHz. You can change or adapt this frequency by adjusting the "ClockDiv" field. The MMC Card frequency (SDMMC_CK) is computed as follows: SDMMC_CK = SDMMCCLK / (2 * ClockDiv) In initialization mode and according to the MMC Card standard, make sure that the SDMMC_CK frequency doesn't exceed 400KHz. This phase of initialization is done through SDMMC_Init() and SDMMC_PowerState_ON() SDMMC low level APIs.
2. Initialize the MMC card. The API used is HAL_MMC_InitCard(). This phase allows the card initialization and identification and check the MMC Card type (Standard Capacity or High Capacity) The initialization flow is compatible with MMC standard. This API (HAL_MMC_InitCard()) could be used also to reinitialize the card in case of plug-off plug-in.
3. Configure the MMC Card Data transfer frequency. By Default, the card transfer frequency by adjusting the "ClockDiv" field. In transfer mode and according to the MMC Card standard, make sure that the SDMMC_CK frequency doesn't exceed 25MHz and 100MHz in High-speed mode switch.
4. Select the corresponding MMC Card according to the address read with the step 2.
5. Configure the MMC Card in wide bus mode: 4-bits data.
6. Select the MMC Card partition using HAL_MMC_SwitchPartition()

MMC Card Read operation

- You can read from MMC card in polling mode by using function HAL_MMC_ReadBlocks(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state.
- You can read from MMC card in DMA mode by using function HAL_MMC_ReadBlocks_DMA(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the DMA transfer process through the MMC Rx interrupt event.
- You can read from MMC card in Interrupt mode by using function HAL_MMC_ReadBlocks_IT(). This function allows the read of 512 bytes blocks. You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the IT transfer process through the MMC Rx interrupt event.

MMC Card Write operation

- You can write to MMC card in polling mode by using function HAL_MMC_WriteBlocks(). This function support only 512-bytes block length (the block size should be chosen as 512 bytes). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state.
- You can write to MMC card in DMA mode by using function HAL_MMC_WriteBlocks_DMA(). This function support only 512-bytes block length (the block size should be chosen as 512 byte). You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the DMA transfer process through the MMC Tx interrupt event.
- You can write to MMC card in Interrupt mode by using function HAL_MMC_WriteBlocks_IT(). This function allows the read of 512 bytes blocks. You can choose either one block read operation or multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetCardState() function for MMC card state. You could also check the IT transfer process through the MMC Tx interrupt event.

MMC card information

- To get MMC card information, you can use the function HAL_MMC_GetCardInfo(). It returns useful information about the MMC card such as block size, card type, block number ...

MMC card CSD register

- The HAL_MMC_GetCardCSD() API allows to get the parameters of the CSD register. Some of the CSD parameters are useful for card initialization and identification.

MMC card CID register

- The HAL_MMC_GetCardCID() API allows to get the parameters of the CID register. Some of the CID parameters are useful for card initialization and identification.

MMC Card Reply Protected Memory Block (RPMB) Key Programming operation

- You can program the authentication key of RPMB area in polling mode by using function HAL_MMC_RPMB_ProgramAuthenticationKey(). This function is only used once during the life of an MMC card. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetRPMBError() function for operation state.
- You can program the authentication key of RPMB area in Interrupt mode by using function HAL_MMC_RPMB_ProgramAuthenticationKey_IT(). This function is only used once during the life of an MMC card. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetRPMBError() function for operation state.

MMC Card Reply Protected Memory Block (RPMB) write counter operation

- You can get the write counter value of RPMB area in polling mode by using function HAL_MMC_RPMB_GetWriteCounter().
- You can get the write counter value of RPMB area in Interrupt mode by using function HAL_MMC_RPMB_GetWriteCounter_IT().

MMC Card Reply Protected Memory Block (RPMB) write operation

- You can write to the RPMB area of MMC card in polling mode by using function HAL_MMC_WriteBlocks(). This function supports the one, two, or thirty two blocks write operation (with 512-bytes block length). You can choose the number of blocks at the multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetRPMBError() function for operation state.

- You can write to the RPMB area of MMC card in Interrupt mode by using function HAL_MMC_WriteBlocks_IT(). This function supports the one, two, or thirty two blocks write operation (with 512-bytes block length). You can choose the number of blocks at the multiple block read operation by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetRPMBError() function for operation state.

MMC Card Reply Protected Memory Block (RPMB) read operation

- You can read from the RPMB area of MMC card in polling mode by using function HAL_MMC_RPMB_ReadBlocks(). The block size should be chosen as multiple of 512 bytes. You can choose the number of blocks by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetRPMBError() function for MMC card state.
- You can read from the RPMB area of MMC card in Interrupt mode by using function HAL_MMC_RPMB_ReadBlocks_IT(). The block size should be chosen as multiple of 512 bytes. You can choose the number of blocks by adjusting the "NumberOfBlocks" parameter. After this, you have to ensure that the transfer is done correctly. The check is done through HAL_MMC_GetRPMBError() function for MMC card state.

MMC HAL driver macros list

Below the list of most used macros in MMC HAL driver.

- __HAL_MMC_ENABLE_IT: Enable the MMC device interrupt
- __HAL_MMC_DISABLE_IT: Disable the MMC device interrupt
- __HAL_MMC_GET_FLAG:Check whether the specified MMC flag is set or not
- __HAL_MMC_CLEAR_FLAG: Clear the MMC's pending flags

Note: You can refer to the MMC HAL driver header file for more useful macros

Callback registration

The compilation define USE_HAL_MMC_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_MMC_RegisterCallback() to register a user callback, it allows to register following callbacks:

- TxCpltCallback : callback when a transmission transfer is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- ErrorCallback : callback when error occurs.
- AbortCpltCallback : callback when abort is completed.
- Read_DMALnkLstBufCpltCallback : callback when the DMA reception of linked list node buffer is completed.
- Write_DMALnkLstBufCpltCallback : callback when the DMA transmission of linked list node buffer is completed.
- MspInitCallback : MMC MspInit.
- MspDeInitCallback : MMC MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_MMC_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:
- TxCpltCallback : callback when a transmission transfer is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- ErrorCallback : callback when error occurs.
- AbortCpltCallback : callback when abort is completed.
- Read_DMADblBuf0CpltCallback : callback when the DMA reception of first buffer is completed.
- Read_DMADblBuf1CpltCallback : callback when the DMA reception of second buffer is completed.
- Write_DMADblBuf0CpltCallback : callback when the DMA transmission of first buffer is completed.
- Write_DMADblBuf1CpltCallback : callback when the DMA transmission of second buffer is completed.
- MspInitCallback : MMC MspInit.

- MspDeInitCallback : MMC MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_MMC_Init and if the state is HAL_MMC_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_MMC_Init and HAL_MMC_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_MMC_Init and HAL_MMC_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_MMC_RegisterCallback before calling HAL_MMC_DeInit or HAL_MMC_Init function. When The compilation define USE_HAL_MMC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

49.2.2 Initialization and de-initialization functions

This section provides functions allowing to initialize/de-initialize the MMC card device to be ready for use.

This section contains the following APIs:

- *HAL_MMC_Init()*
- *HAL_MMC_InitCard()*
- *HAL_MMC_DeInit()*
- *HAL_MMC_MspInit()*
- *HAL_MMC_MspDeInit()*

49.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the data transfer from/to MMC card.

This section contains the following APIs:

- *HAL_MMC_ReadBlocks()*
- *HAL_MMC_WriteBlocks()*
- *HAL_MMC_ReadBlocks_IT()*
- *HAL_MMC_WriteBlocks_IT()*
- *HAL_MMC_ReadBlocks_DMA()*
- *HAL_MMC_WriteBlocks_DMA()*
- *HAL_MMC_Erase()*
- *HAL_MMC_IRQHandler()*
- *HAL_MMC_GetState()*
- *HAL_MMC_GetError()*
- *HAL_MMC_TxCpltCallback()*
- *HAL_MMC_RxCpltCallback()*
- *HAL_MMC_ErrorCallback()*
- *HAL_MMC_AbortCallback()*
- *HAL_MMC_RegisterCallback()*
- *HAL_MMC_UnRegisterCallback()*

49.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the MMC card operations and get the related information

This section contains the following APIs:

- *HAL_MMC_GetCardCID()*
- *HAL_MMC_GetCardCSD()*
- *HAL_MMC_GetCardInfo()*
- *HAL_MMC_GetCardExtCSD()*
- *HAL_MMC_ConfigWideBusOperation()*

- *HAL_MMC_ConfigSpeedBusOperation()*
- *HAL_MMC_GetCardState()*
- *HAL_MMC_Abort()*
- *HAL_MMC_Abort_IT()*
- *HAL_MMC_EraseSequence()*
- *HAL_MMC_Sanitize()*
- *HAL_MMC_ConfigSecRemovalType()*
- *HAL_MMC_GetSupportedSecRemovalType()*
- *HAL_MMC_SleepDevice()*
- *HAL_MMC_AwakeDevice()*
- *HAL_MMC_SwitchPartition()*

49.2.5 Detailed description of functions

HAL_MMC_Init

Function name

HAL_StatusTypeDef HAL_MMC_Init (MMC_HandleTypeDef * hmmc)

Function description

Initializes the MMC according to the specified parameters in the MMC_HandleTypeDef and create the associated handle.

Parameters

- **hmmc:** Pointer to the MMC handle

Return values

- **HAL:** status

HAL_MMC_InitCard

Function name

HAL_StatusTypeDef HAL_MMC_InitCard (MMC_HandleTypeDef * hmmc)

Function description

Initializes the MMC Card.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **HAL:** status

Notes

- This function initializes the MMC card. It could be used when a card re-initialization is needed.

HAL_MMC_DeInit

Function name

HAL_StatusTypeDef HAL_MMC_DeInit (MMC_HandleTypeDef * hmmc)

Function description

De-Initializes the MMC card.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **HAL:** status

HAL_MMC_MspInit

Function name

void HAL_MMC_MspInit (MMC_HandleTypeDef * hmmc)

Function description

Initializes the MMC MSP.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **None:**

HAL_MMC_MspDeInit

Function name

void HAL_MMC_MspDeInit (MMC_HandleTypeDef * hmmc)

Function description

De-Initialize MMC MSP.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **None:**

HAL_MMC_ReadBlocks

Function name

HAL_StatusTypeDef HAL_MMC_ReadBlocks (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks, uint32_t Timeout)

Function description

Reads block(s) from a specified address in a card.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** pointer to the buffer that will contain the received data
- **BlockAdd:** Block Address from where data is to be read
- **NumberOfBlocks:** Number of MMC blocks to read
- **Timeout:** Specify timeout value

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_WriteBlocks

Function name

HAL_StatusTypeDef HAL_MMC_WriteBlocks (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks, uint32_t Timeout)

Function description

Allows to write block(s) to a specified address in a card.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** pointer to the buffer that will contain the data to transmit
- **BlockAdd:** Block Address where data will be written
- **NumberOfBlocks:** Number of MMC blocks to write
- **Timeout:** Specify timeout value

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_Erase

Function name

HAL_StatusTypeDef HAL_MMC_Erase (MMC_HandleTypeDef * hmmc, uint32_t BlockStartAdd, uint32_t BlockEndAdd)

Function description

Erases the specified memory area of the given MMC card.

Parameters

- **hmmc:** Pointer to MMC handle
- **BlockStartAdd:** Start Block address
- **BlockEndAdd:** End Block address

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_ReadBlocks_IT

Function name

HAL_StatusTypeDef HAL_MMC_ReadBlocks_IT (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

Reads block(s) from a specified address in a card.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** Pointer to the buffer that will contain the received data
- **BlockAdd:** Block Address from where data is to be read
- **NumberOfBlocks:** Number of blocks to read.

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().
- You could also check the IT transfer process through the MMC Rx interrupt event.

HAL_MMC_WriteBlocks_IT

Function name

HAL_StatusTypeDef HAL_MMC_WriteBlocks_IT (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

Writes block(s) to a specified address in a card.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** Pointer to the buffer that will contain the data to transmit
- **BlockAdd:** Block Address where data will be written
- **NumberOfBlocks:** Number of blocks to write

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().
- You could also check the IT transfer process through the MMC Tx interrupt event.

HAL_MMC_ReadBlocks_DMA

Function name

HAL_StatusTypeDef HAL_MMC_ReadBlocks_DMA (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

Reads block(s) from a specified address in a card.

Parameters

- **hmmc:** Pointer MMC handle
- **pData:** Pointer to the buffer that will contain the received data
- **BlockAdd:** Block Address from where data is to be read
- **NumberOfBlocks:** Number of blocks to read.

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().
- You could also check the DMA transfer process through the MMC Rx interrupt event.

HAL_MMC_WriteBlocks_DMA

Function name

HAL_StatusTypeDef HAL_MMC_WriteBlocks_DMA (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

Writes block(s) to a specified address in a card.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** Pointer to the buffer that will contain the data to transmit
- **BlockAdd:** Block Address where data will be written
- **NumberOfBlocks:** Number of blocks to write

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().
- You could also check the DMA transfer process through the MMC Tx interrupt event.

HAL_MMC_IRQHandler

Function name

void HAL_MMC_IRQHandler (MMC_HandleTypeDef * hmmc)

Function description

This function handles MMC card interrupt request.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **None:**

HAL_MMC_TxCpltCallback

Function name

void HAL_MMC_TxCpltCallback (MMC_HandleTypeDef * hmmc)

Function description

Tx Transfer completed callbacks.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **None:**

HAL_MMC_RxCpltCallback

Function name

void HAL_MMC_RxCpltCallback (MMC_HandleTypeDef * hmmc)

Function description

Rx Transfer completed callbacks.

Parameters

- **hmmc:** Pointer MMC handle

Return values

- **None:**

HAL_MMC_ErrorCallback

Function name

void HAL_MMC_ErrorCallback (MMC_HandleTypeDef * hmmc)

Function description

MMC error callbacks.

Parameters

- **hmmc:** Pointer MMC handle

Return values

- **None:**

HAL_MMC_AbortCallback

Function name

void HAL_MMC_AbortCallback (MMC_HandleTypeDef * hmmc)

Function description

MMC Abort callbacks.

Parameters

- **hmmc:** Pointer MMC handle

Return values

- **None:**

HAL_MMC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_MMC_RegisterCallback (MMC_HandleTypeDef * hmmc, HAL_MMC_CallbackIDTypeDef CallbackId, pMMC_CallbackTypeDef pCallback)

Function description

Register a User MMC Callback To be used instead of the weak (overridden) predefined callback.

Parameters

- **hmmc:** : MMC handle
- **CallbackId:** : ID of the callback to be registered This parameter can be one of the following values:
  - HAL_MMC_TX_CPLT_CB_ID MMC Tx Complete Callback ID
  - HAL_MMC_RX_CPLT_CB_ID MMC Rx Complete Callback ID
  - HAL_MMC_ERROR_CB_ID MMC Error Callback ID
  - HAL_MMC_ABORT_CB_ID MMC Abort Callback ID
  - HAL_MMC_READ_DMA_LNKLST_BUF_CPLT_CB_ID MMC DMA Rx Linked List Node buffer Callback ID
  - HAL_MMC_WRITE_DMA_LNKLST_BUF_CPLT_CB_ID MMC DMA Tx Linked List Node buffer Callback ID
  - HAL_MMC_MSP_INIT_CB_ID MMC MspInit Callback ID
  - HAL_MMC_MSP_DEINIT_CB_ID MMC MspDeInit Callback ID
- **pCallback:** : pointer to the Callback function

Return values

- **status:**

Notes

- The HAL_MMC_RegisterCallback() may be called before HAL_MMC_Init() in HAL_MMC_STATE_RESET to register callbacks for HAL_MMC_MSP_INIT_CB_ID and HAL_MMC_MSP_DEINIT_CB_ID.

HAL_MMC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_MMC_UnRegisterCallback (MMC_HandleTypeDef * hmmc, HAL_MMC_CallbackIDTypeDef CallbackId)

Function description

Unregister a User MMC Callback MMC Callback is redirected to the weak (overridden) predefined callback.

Parameters

- **hmmc:** : MMC handle
- **CallbackId:** : ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_MMC_TX_CPLT_CB_ID MMC Tx Complete Callback ID
  - HAL_MMC_RX_CPLT_CB_ID MMC Rx Complete Callback ID
  - HAL_MMC_ERROR_CB_ID MMC Error Callback ID
  - HAL_MMC_ABORT_CB_ID MMC Abort Callback ID
  - HAL_MMC_READ_DMA_LNKLST_BUF_CPLT_CB_ID MMC DMA Rx Linked List Node buffer Callback ID
  - HAL_MMC_WRITE_DMA_LNKLST_BUF_CPLT_CB_ID MMC DMA Tx Linked List Node buffer Callback ID
  - HAL_MMC_MSP_INIT_CB_ID MMC MspInit Callback ID
  - HAL_MMC_MSP_DEINIT_CB_ID MMC MspDeInit Callback ID

Return values

- **status:**

Notes

- The HAL_MMC_UnRegisterCallback() may be called before HAL_MMC_Init() in HAL_MMC_STATE_RESET to register callbacks for HAL_MMC_MSP_INIT_CB_ID and HAL_MMC_MSP_DEINIT_CB_ID.

HAL_MMC_ConfigWideBusOperation

Function name

HAL_StatusTypeDef HAL_MMC_ConfigWideBusOperation (MMC_HandleTypeDef * hmmc, uint32_t WideMode)

Function description

Enables wide bus operation for the requested card if supported by card.

Parameters

- **hmmc:** Pointer to MMC handle
- **WideMode:** Specifies the MMC card wide bus mode This parameter can be one of the following values:
  - SDMMC_BUS_WIDE_8B: 8-bit data transfer
  - SDMMC_BUS_WIDE_4B: 4-bit data transfer
  - SDMMC_BUS_WIDE_1B: 1-bit data transfer

Return values

- **HAL:** status

HAL_MMC_ConfigSpeedBusOperation

Function name

HAL_StatusTypeDef HAL_MMC_ConfigSpeedBusOperation (MMC_HandleTypeDef * hmmc, uint32_t SpeedMode)

Function description

Configure the speed bus mode.

Parameters

- **hmmc:** Pointer to the MMC handle
- **SpeedMode:** Specifies the MMC card speed bus mode This parameter can be one of the following values:
  - SDMMC_SPEED_MODE_AUTO: Max speed mode supported by the card
  - SDMMC_SPEED_MODE_DEFAULT: Default Speed (MMC @ 26MHz)
  - SDMMC_SPEED_MODE_HIGH: High Speed (MMC @ 52 MHz)
  - SDMMC_SPEED_MODE_DDR: High Speed DDR (MMC DDR @ 52 MHz)

Return values

- **HAL:** status

HAL_MMC_SwitchPartition

Function name

HAL_StatusTypeDef HAL_MMC_SwitchPartition (MMC_HandleTypeDef * hmmc, HAL_MMC_PartitionTypeDef Partition)

Function description

Used to select the partition.

Parameters

- **hmmc:** Pointer to MMC handle
- **Partition:** Partition type
- **Timeout:** Specify timeout value

Return values

- **HAL:** status

HAL_MMC_GetCardState

Function name

HAL_MMC_CardStateTypeDef HAL_MMC_GetCardState (MMC_HandleTypeDef * hmmc)

Function description

Gets the current mmc card data state.

Parameters

- **hmmc:** pointer to MMC handle

Return values

- **Card:** state

HAL_MMC_GetCardCID

Function name

HAL_StatusTypeDef HAL_MMC_GetCardCID (MMC_HandleTypeDef * hmmc, HAL_MMC_CardCIDTypeDef * pCID)

Function description

Returns information the information of the card which are stored on the CID register.

Parameters

- **hmmc:** Pointer to MMC handle
- **pCID:** Pointer to a HAL_MMC_CIDTypedef structure that contains all CID register parameters

Return values

- **HAL:** status

HAL_MMC_GetCardCSD

Function name

HAL_StatusTypeDef HAL_MMC_GetCardCSD (MMC_HandleTypeDef * hmmc, HAL_MMC_CardCSDTypeDef * pCSD)

Function description

Returns information the information of the card which are stored on the CSD register.

Parameters

- **hmmc:** Pointer to MMC handle
- **pCSD:** Pointer to a HAL_MMC_CardCSDTypeDef structure that contains all CSD register parameters

Return values

- **HAL:** status

HAL_MMC_GetCardInfo

Function name

HAL_StatusTypeDef HAL_MMC_GetCardInfo (MMC_HandleTypeDef * hmmc, HAL_MMC_CardInfoTypeDef * pCardInfo)

Function description

Gets the MMC card info.

Parameters

- **hmmc:** Pointer to MMC handle
- **pCardInfo:** Pointer to the HAL_MMC_CardInfoTypeDef structure that will contain the MMC card status information

Return values

- **HAL:** status

HAL_MMC_GetCardExtCSD

Function name

HAL_StatusTypeDef HAL_MMC_GetCardExtCSD (MMC_HandleTypeDef * hmmc, uint32_t * pExtCSD, uint32_t Timeout)

Function description

Returns information the information of the card which are stored on the Extended CSD register.

Parameters

- **hmmc:** Pointer to MMC handle
- **pExtCSD:** Pointer to a memory area (512 bytes) that contains all Extended CSD register parameters
- **Timeout:** Specify timeout value

Return values

- **HAL:** status

HAL_MMC_GetState

Function name

HAL_MMC_StateTypeDef HAL_MMC_GetState (const MMC_HandleTypeDef * hmmc)

Function description

return the MMC state

Parameters

- **hmmc:** Pointer to mmc handle

Return values

- **HAL:** state

HAL_MMC_GetError

Function name

uint32_t HAL_MMC_GetError (const MMC_HandleTypeDef * hmmc)

Function description

Return the MMC error code.

Parameters

- **hmmc:** : Pointer to a MMC_HandleTypeDef structure that contains the configuration information.

Return values

- **MMC:** Error Code

HAL_MMC_GetRPMBError

Function name

uint32_t HAL_MMC_GetRPMBError (const MMC_HandleTypeDef * hmmc)

Function description

HAL_MMC_Abort

Function name

HAL_StatusTypeDef HAL_MMC_Abort (MMC_HandleTypeDef * hmmc)

Function description

Abort the current transfer and disable the MMC.

Parameters

- **hmmc:** pointer to a MMC_HandleTypeDef structure that contains the configuration information for MMC module.

Return values

- **HAL:** status

HAL_MMC_Abort_IT

Function name

HAL_StatusTypeDef HAL_MMC_Abort_IT (MMC_HandleTypeDef * hmmc)

Function description

Abort the current transfer and disable the MMC (IT mode).

Parameters

- **hmmc:** pointer to a MMC_HandleTypeDef structure that contains the configuration information for MMC module.

Return values

- **HAL:** status

HAL_MMC_EraseSequence

Function name

HAL_StatusTypeDef HAL_MMC_EraseSequence (MMC_HandleTypeDef * hmmc, uint32_t EraseType, uint32_t BlockStartAdd, uint32_t BlockEndAdd)

Function description

Perform specific commands sequence for the different type of erase.

Parameters

- **hmmc:** Pointer to MMC handle
- **EraseType:** Specifies the type of erase to be performed This parameter can be one of the following values:
  – HAL_MMC_TRIM Erase the write blocks identified by CMD35 & 36
  – HAL_MMC_ERASE Erase the erase groups identified by CMD35 & 36
  – HAL_MMC_DISCARD Discard the write blocks identified by CMD35 & 36
  – HAL_MMC_SECURE_ERASE Perform a secure purge according SRT on the erase groups identified by CMD35 & 36
  – HAL_MMC_SECURE_TRIM_STEP1 Mark the write blocks identified by CMD35 & 36 for secure erase
  – HAL_MMC_SECURE_TRIM_STEP2 Perform a secure purge according SRT on the write blocks previously identified
- **BlockStartAdd:** Start Block address
- **BlockEndAdd:** End Block address

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_Sanitize

Function name

HAL_StatusTypeDef HAL_MMC_Sanitize (MMC_HandleTypeDef * hmmc)

Function description

Perform sanitize operation on the device.

Parameters

- **hmmc:** Pointer to MMC handle

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_ConfigSecRemovalType

Function name

HAL_StatusTypeDef HAL_MMC_ConfigSecRemovalType (MMC_HandleTypeDef * hmmc, uint32_t SRTMode)

Function description

Configure the Secure Removal Type (SRT) in the Extended CSD register.

Parameters

- **hmmc:** Pointer to MMC handle
- **SRTMode:** Specifies the type of erase to be performed This parameter can be one of the following values:
  – HAL_MMC_SRT_ERASE Information removed by an erase
  – HAL_MMC_SRT_WRITE_CHAR_ERASE Information removed by an overwriting with a character followed by an erase
  – HAL_MMC_SRT_WRITE_CHAR_COMPL_RANDOM Information removed by an overwriting with a character, its complement then a random character
  – HAL_MMC_SRT_VENDOR_DEFINED Information removed using a vendor defined

Return values

- **HAL:** status

Notes

- This API should be followed by a check on the card state through HAL_MMC_GetCardState().

HAL_MMC_GetSupportedSecRemovalType

Function name

HAL_StatusTypeDef HAL_MMC_GetSupportedSecRemovalType (MMC_HandleTypeDef * hmmc, uint32_t * SupportedSRT)

Function description

Gets the supported values of the the Secure Removal Type (SRT).

Parameters

- **hmmc:** pointer to MMC handle
- **SupportedSRT:** pointer for supported SRT value This parameter is a bit field of the following values:
  – HAL_MMC_SRT_ERASE Information removed by an erase
  – HAL_MMC_SRT_WRITE_CHAR_ERASE Information removed by an overwriting with a character followed by an erase
  – HAL_MMC_SRT_WRITE_CHAR_COMPL_RANDOM Information removed by an overwriting with a character, its complement then a random character
  – HAL_MMC_SRT_VENDOR_DEFINED Information removed using a vendor defined

Return values

- **HAL:** status

HAL_MMC_SleepDevice

Function name

HAL_StatusTypeDef HAL_MMC_SleepDevice (MMC_HandleTypeDef * hmmc)

Function description

Switch the device from Standby State to Sleep State.

Parameters

- **hmmc:** pointer to MMC handle

Return values

- **HAL:** status

HAL_MMC_AwakeDevice

Function name

HAL_StatusTypeDef HAL_MMC_AwakeDevice (MMC_HandleTypeDef * hmmc)

Function description

Switch the device from Sleep State to Standby State.

Parameters

- **hmmc:** pointer to MMC handle

Return values

- **HAL:** status

HAL_MMC_RPMB_ProgramAuthenticationKey

Function name

HAL_StatusTypeDef HAL_MMC_RPMB_ProgramAuthenticationKey (MMC_HandleTypeDef * hmmc, const uint8_t * pKey, uint32_t Timeout)

Function description

Allows to program the authentication key within the RPMB partition.

Parameters

- **hmmc:** Pointer to MMC handle
- **pKey:** pointer to the authentication key (32 bytes)
- **Timeout:** Specify timeout value

Return values

- **HAL:** status

HAL_MMC_RPMB_ProgramAuthenticationKey_IT

Function name

HAL_StatusTypeDef HAL_MMC_RPMB_ProgramAuthenticationKey_IT (MMC_HandleTypeDef * hmmc, const uint8_t * pKey, uint32_t Timeout)

Function description

HAL_MMC_RPMB_GetWriteCounter

Function name

uint32_t HAL_MMC_RPMB_GetWriteCounter (MMC_HandleTypeDef * hmmc, uint8_t * pNonce, uint32_t Timeout)

Function description

Allows to get the value of write counter within the RPMB partition.

Parameters

- **hmmc:** Pointer to MMC handle
- **Nonce:** pointer to the value of nonce (16 bytes)
- **Timeout:** Specify timeout value

Return values

- **write:** counter value.

HAL_MMC_RPMB_GetWriteCounter_IT

Function name

uint32_t HAL_MMC_RPMB_GetWriteCounter_IT (MMC_HandleTypeDef * hmmc, uint8_t * pNonce)

Function description

HAL_MMC_RPMB_WriteBlocks

Function name

HAL_StatusTypeDef HAL_MMC_RPMB_WriteBlocks (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint16_t BlockAdd, uint16_t NumberOfBlocks, const uint8_t * pMAC, uint32_t Timeout)

Function description

Allows to write block(s) to a specified address in the RPMB partition.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** Pointer to the buffer that will contain the data to transmit
- **BlockAdd:** Block Address where data will be written
- **NumberOfBlocks:** Number of blocks to write
- **pMAC:** Pointer to the authentication MAC buffer
- **Timeout:** Specify timeout value

Return values

- **HAL:** status

HAL_MMC_RPMB_WriteBlocks_IT

Function name

HAL_StatusTypeDef HAL_MMC_RPMB_WriteBlocks_IT (MMC_HandleTypeDef * hmmc, const uint8_t * pData, uint16_t BlockAdd, uint16_t NumberOfBlocks, const uint8_t * pMAC)

Function description

HAL_MMC_RPMB_ReadBlocks

Function name

HAL_StatusTypeDef HAL_MMC_RPMB_ReadBlocks (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint16_t BlockAdd, uint16_t NumberOfBlocks, const uint8_t * pNonce, uint8_t * pMAC, uint32_t Timeout)

Function description

Allows to read block(s) to a specified address in the RPMB partition.

Parameters

- **hmmc:** Pointer to MMC handle
- **pData:** Pointer to the buffer that will contain the data to transmit
- **BlockAdd:** Block Address where data will be written
- **NumberOfBlocks:** Number of blocks to write
- **pNonce:** Pointer to the buffer that will contain the nonce to transmit
- **pMAC:** Pointer to the authentication MAC buffer
- **Timeout:** Specify timeout value

Return values

- **HAL:** status

HAL_MMC_RPMB_ReadBlocks_IT

Function name

HAL_StatusTypeDef HAL_MMC_RPMB_ReadBlocks_IT (MMC_HandleTypeDef * hmmc, uint8_t * pData, uint16_t BlockAdd, uint16_t NumberOfBlocks, const uint8_t * pNonce, uint8_t * pMAC)

Function description

49.3 MMC Firmware driver defines

The following section lists the various define and macros of the module.

49.3.1 MMC

MMC

MMC Error status enumeration Structure definition

HAL_MMC_ERROR_NONE

No error

HAL_MMC_ERROR_CMD_CRC_FAIL

Command response received (but CRC check failed)

HAL_MMC_ERROR_DATA_CRC_FAIL

Data block sent/received (CRC check failed)

HAL_MMC_ERROR_CMD_RSP_TIMEOUT

Command response timeout

HAL_MMC_ERROR_DATA_TIMEOUT

Data timeout

HAL_MMC_ERROR_TX_UNDERRUN

Transmit FIFO underrun

HAL_MMC_ERROR_RX_OVERRUN

Receive FIFO overrun

HAL_MMC_ERROR_ADDR_MISALIGNED

Misaligned address

HAL_MMC_ERROR_BLOCK_LEN_ERR

Transferred block length is not allowed for the card or the number of transferred bytes does not match the block length

HAL_MMC_ERROR_ERASE_SEQ_ERR

An error in the sequence of erase command occurs

HAL_MMC_ERROR_BAD_ERASE_PARAM

An invalid selection for erase groups

HAL_MMC_ERROR_WRITE_PROT_VIOLATION

Attempt to program a write protect block

HAL_MMC_ERROR_LOCK_UNLOCK_FAILED

Sequence or password error has been detected in unlock command or if there was an attempt to access a locked card

HAL_MMC_ERROR_COM_CRC_FAILED

CRC check of the previous command failed

HAL_MMC_ERROR_ILLEGAL_CMD

Command is not legal for the card state

HAL_MMC_ERROR_CARD_ECC_FAILED

Card internal ECC was applied but failed to correct the data

HAL_MMC_ERROR_CC_ERR

Internal card controller error

HAL_MMC_ERROR_GENERAL_UNKNOWN_ERR

General or unknown error

HAL_MMC_ERROR_STREAM_READ_UNDERRUN

The card could not sustain data reading in stream rmode

HAL_MMC_ERROR_STREAM_WRITE_OVERRUN

The card could not sustain data programming in stream mode

HAL_MMC_ERROR_CID_CSD_OVERWRITE

CID/CSD overwrite error

HAL_MMC_ERROR_WP_ERASE_SKIP

Only partial address space was erased

HAL_MMC_ERROR_CARD_ECC_DISABLED

Command has been executed without using internal ECC

HAL_MMC_ERROR_ERASE_RESET

Erase sequence was cleared before executing because an out of erase sequence command was received

HAL_MMC_ERROR_AKE_SEQ_ERR

Error in sequence of authentication

HAL_MMC_ERROR_INVALID_VOLTRANGE
Error in case of invalid voltage range

HAL_MMC_ERROR_ADDR_OUT_OF_RANGE
Error when addressed block is out of range

HAL_MMC_ERROR_REQUEST_NOT_APPLICABLE
Error when command request is not applicable

HAL_MMC_ERROR_PARAM
the used parameter is not valid

HAL_MMC_ERROR_UNSUPPORTED_FEATURE
Error when feature is not insupported

HAL_MMC_ERROR_BUSY
Error when transfer process is busy

HAL_MMC_ERROR_DMA
Error while DMA transfer

HAL_MMC_ERROR_TIMEOUT
Timeout error response results after operating with RPMB partition

HAL_MMC_ERROR_RPMB_OPERATION_OK
Operation OK

HAL_MMC_ERROR_RPMB_GENERAL_FAILURE
General failure

HAL_MMC_ERROR_RPMB_AUTHENTICATION_FAILURE
Authentication failure

HAL_MMC_ERROR_RPMB_COUNTER_FAILURE
Counter failure

HAL_MMC_ERROR_RPMB_ADDRESS_FAILURE
Address failure

HAL_MMC_ERROR_RPMB_WRITE_FAILURE
Write failure

HAL_MMC_ERROR_RPMB_READ_FAILURE
Read failure

HAL_MMC_ERROR_RPMB_KEY_NOT_YET_PROG
Authentication Key not yet programmed

HAL_MMC_ERROR_RPMB_COUNTER_EXPIRED
Write Counter has expired i.e. reached its max value

HAL_MMC_ERROR_INVALID_CALLBACK
Invalid callback error

MMC context enumeration

MMC_CONTEXT_NONE
None

MMC_CONTEXT_READ_SINGLE_BLOCK
Read single block operation

MMC_CONTEXT_READ_MULTIPLE_BLOCK
Read multiple blocks operation

MMC_CONTEXT_WRITE_SINGLE_BLOCK
Write single block operation

MMC_CONTEXT_WRITE_MULTIPLE_BLOCK
Write multiple blocks operation

MMC_CONTEXT_IT
Process in Interrupt mode

MMC_CONTEXT_DMA
Process in DMA mode

MMC Voltage mode

MMC_HIGH_VOLTAGE_RANGE
High voltage in byte mode

MMC_DUAL_VOLTAGE_RANGE
Dual voltage in byte mode

MMC_LOW_VOLTAGE_RANGE
Low voltage in byte mode

EMMC_HIGH_VOLTAGE_RANGE
High voltage in sector mode

EMMC_DUAL_VOLTAGE_RANGE
Dual voltage in sector mode

EMMC_LOW_VOLTAGE_RANGE
Low voltage in sector mode

MMC_INVALID_VOLTAGE_RANGE

MMC Memory Cards

MMC_LOW_CAPACITY_CARD
MMC Card Capacity <=2Gbytes

MMC_HIGH_CAPACITY_CARD
MMC Card Capacity >2Gbytes and <2Tbytes

MMC Erase Type

HAL_MMC_ERASE
Erase the erase groups identified by CMD35 & 36

HAL_MMC_TRIM
Erase the write blocks identified by CMD35 & 36

HAL_MMC_DISCARD
Discard the write blocks identified by CMD35 & 36

HAL_MMC_SECURE_ERASE

Perform a secure purge according SRT on the erase groups identified by CMD35 & 36

HAL_MMC_SECURE_TRIM_STEP1

Mark the write blocks identified by CMD35 & 36 for secure erase

HAL_MMC_SECURE_TRIM_STEP2

Perform a secure purge according SRT on the write blocks previously identified

IS_MMC_ERASE_TYPE

MMC Secure Removal Type

HAL_MMC_SRT_ERASE

Information removed by an erase

HAL_MMC_SRT_WRITE_CHAR_ERASE

Information removed by an overwriting with a character followed by an erase

HAL_MMC_SRT_WRITE_CHAR_COMPL_RANDOM

Information removed by an overwriting with a character, its complement then a random character

HAL_MMC_SRT_VENDOR_DEFINED

Information removed using a vendor defined

IS_MMC_SRT_TYPE

MMC Partitions types

HAL_MMC_USER_AREA_PARTITION

User area partition

HAL_MMC_BOOT_PARTITION1

Boot partition 1

HAL_MMC_BOOT_PARTITION2

Boot partition 2

HAL_MMC_RPMB_PARTITION

RPMB partition

Exported Constants

MMC_BLOCKSIZE

Block size is 512 bytes

MMC Exported Macros

__HAL_MMC_RESET_HANDLE_STATE

Description:

- Reset MMC handle state.

Parameters:

- __HANDLE__: MMC Handle.

Return value:

- None

__HAL_MMC_ENABLE_IT

Description:

- Enable the MMC device interrupt.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the SDMMC interrupt sources to be enabled. This parameter can be one or a combination of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- None

__HAL_MMC_DISABLE_IT

Description:

- Disable the MMC device interrupt.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the SDMMC interrupt sources to be disabled. This parameter can be one or a combination of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- None

__HAL_MMC_GET_FLAG

Description:

- Check whether the specified MMC flag is set or not.

Parameters:

- __HANDLE__: MMC Handle.
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - SDMMC_FLAG_CCRCFAIL: Command response received (CRC check failed)
  - SDMMC_FLAG_DCRCFAIL: Data block sent/received (CRC check failed)
  - SDMMC_FLAG_CTIMEOUT: Command response timeout
  - SDMMC_FLAG_DTIMEOUT: Data timeout
  - SDMMC_FLAG_TXUNDERR: Transmit FIFO underrun error
  - SDMMC_FLAG_RXOVERR: Received FIFO overrun error
  - SDMMC_FLAG_CMDREND: Command response received (CRC check passed)
  - SDMMC_FLAG_CMDSENT: Command sent (no response required)
  - SDMMC_FLAG_DATAEND: Data end (data counter, DATACOUNT, is zero)
  - SDMMC_FLAG_DHOLD: Data transfer Hold
  - SDMMC_FLAG_DBCKEND: Data block sent/received (CRC check passed)
  - SDMMC_FLAG_DABORT: Data transfer aborted by CMD12
  - SDMMC_FLAG_DPSMACT: Data path state machine active
  - SDMMC_FLAG_CPSMACT: Command path state machine active
  - SDMMC_FLAG_TXFIFOHE: Transmit FIFO Half Empty
  - SDMMC_FLAG_RXFIFOHF: Receive FIFO Half Full
  - SDMMC_FLAG_TXFIFOF: Transmit FIFO full
  - SDMMC_FLAG_RXFIFOF: Receive FIFO full
  - SDMMC_FLAG_TXFIFOE: Transmit FIFO empty
  - SDMMC_FLAG_RXFIFOE: Receive FIFO empty
  - SDMMC_FLAG_BUSYD0: Inverted value of SDMMC_D0 line (Busy)
  - SDMMC_FLAG_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected
  - SDMMC_FLAG_SDIOIT: SD I/O interrupt received
  - SDMMC_FLAG_ACKFAIL: Boot Acknowledgment received
  - SDMMC_FLAG_ACKTIMEOUT: Boot Acknowledgment timeout
  - SDMMC_FLAG_VSWEND: Voltage switch critical timing section completion
  - SDMMC_FLAG_CKSTOP: SDMMC_CK stopped in Voltage switch procedure
  - SDMMC_FLAG_IDMATE: IDMA transfer error
  - SDMMC_FLAG_IDMABTC: IDMA buffer transfer complete

Return value:

- The: new state of MMC FLAG (SET or RESET).

__HAL_MMC_CLEAR_FLAG

Description:

- Clear the MMC's pending flags.

Parameters:

- __HANDLE__: MMC Handle.
- __FLAG__: specifies the flag to clear. This parameter can be one or a combination of the following values:
  - SDMMC_FLAG_CCRCFAIL: Command response received (CRC check failed)
  - SDMMC_FLAG_DCRCFAIL: Data block sent/received (CRC check failed)
  - SDMMC_FLAG_CTIMEOUT: Command response timeout
  - SDMMC_FLAG_DTIMEOUT: Data timeout
  - SDMMC_FLAG_TXUNDERR: Transmit FIFO underrun error
  - SDMMC_FLAG_RXOVERR: Received FIFO overrun error
  - SDMMC_FLAG_CMDREND: Command response received (CRC check passed)
  - SDMMC_FLAG_CMDSENT: Command sent (no response required)
  - SDMMC_FLAG_DATAEND: Data end (data counter, DATACOUNT, is zero)
  - SDMMC_FLAG_DHOLD: Data transfer Hold
  - SDMMC_FLAG_DBCKEND: Data block sent/received (CRC check passed)
  - SDMMC_FLAG_DABORT: Data transfer aborted by CMD12
  - SDMMC_FLAG_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected
  - SDMMC_FLAG_SDIOIT: SD I/O interrupt received
  - SDMMC_FLAG_ACKFAIL: Boot Acknowledgment received
  - SDMMC_FLAG_ACKTIMEOUT: Boot Acknowledgment timeout
  - SDMMC_FLAG_VSWEND: Voltage switch critical timing section completion
  - SDMMC_FLAG_CKSTOP: SDMMC_CK stopped in Voltage switch procedure
  - SDMMC_FLAG_IDMATE: IDMA transfer error
  - SDMMC_FLAG_IDMABTC: IDMA buffer transfer complete

Return value:

- None

__HAL_MMC_GET_IT

Description:

- Check whether the specified MMC interrupt has occurred or not.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the SDMMC interrupt source to check. This parameter can be one of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- The: new state of MMC IT (SET or RESET).

__HAL_MMC_CLEAR_IT

Description:

- Clear the MMC's interrupt pending bits.

Parameters:

- __HANDLE__: MMC Handle.
- __INTERRUPT__: specifies the interrupt pending bit to clear. This parameter can be one or a combination of the following values:
  - SDMMC_IT_CCRCFAIL: Command response received (CRC check failed) interrupt
  - SDMMC_IT_DCRCFAIL: Data block sent/received (CRC check failed) interrupt
  - SDMMC_IT_CTIMEOUT: Command response timeout interrupt
  - SDMMC_IT_DTIMEOUT: Data timeout interrupt
  - SDMMC_IT_TXUNDERR: Transmit FIFO underrun error interrupt
  - SDMMC_IT_RXOVERR: Received FIFO overrun error interrupt
  - SDMMC_IT_CMDREND: Command response received (CRC check passed) interrupt
  - SDMMC_IT_CMDSENT: Command sent (no response required) interrupt
  - SDMMC_IT_DATAEND: Data end (data counter, DATACOUNT, is zero) interrupt
  - SDMMC_IT_DHOLD: Data transfer Hold interrupt
  - SDMMC_IT_DBCKEND: Data block sent/received (CRC check passed) interrupt
  - SDMMC_IT_DABORT: Data transfer aborted by CMD12 interrupt
  - SDMMC_IT_TXFIFOHE: Transmit FIFO Half Empty interrupt
  - SDMMC_IT_RXFIFOHF: Receive FIFO Half Full interrupt
  - SDMMC_IT_RXFIFOF: Receive FIFO full interrupt
  - SDMMC_IT_TXFIFOE: Transmit FIFO empty interrupt
  - SDMMC_IT_BUSYD0END: End of SDMMC_D0 Busy following a CMD response detected interrupt
  - SDMMC_IT_SDIOIT: SD I/O interrupt received interrupt
  - SDMMC_IT_ACKFAIL: Boot Acknowledgment received interrupt
  - SDMMC_IT_ACKTIMEOUT: Boot Acknowledgment timeout interrupt
  - SDMMC_IT_VSWEND: Voltage switch critical timing section completion interrupt
  - SDMMC_IT_CKSTOP: SDMMC_CK stopped in Voltage switch procedure interrupt
  - SDMMC_IT_IDMABTC: IDMA buffer transfer complete interrupt

Return value:

- None

MMC Card State enumeration structure

HAL_MMC_CARD_IDLE

Card is in idle state (can't be checked by CMD13)

HAL_MMC_CARD_READY

Card state is ready (can't be checked by CMD13)

HAL_MMC_CARD_IDENTIFICATION

Card is in identification state (can't be checked by CMD13)

HAL_MMC_CARD_STANDBY

Card is in standby state

HAL_MMC_CARD_TRANSFER

Card is in transfer state

HAL_MMC_CARD_SENDING

Card is sending an operation

HAL_MMC_CARD_RECEIVING

Card is receiving operation information

HAL_MMC_CARD_PROGRAMMING

Card is in programming state

HAL_MMC_CARD_DISCONNECTED

Card is disconnected

HAL_MMC_CARD_BUSTEST

Card is in bus test state

HAL_MMC_CARD_SLEEP

Card is in sleep state (can't be checked by CMD13)

HAL_MMC_CARD_ERROR

Card response Error (can't be checked by CMD13)

50 HAL MMC Extension Driver

50.1 MMCEx Firmware driver API description

The following section lists the various functions of the MMCEx library.

50.1.1 How to use this driver

The MMC Extension HAL driver can be used as follows:

- Configure Buffer0 and Buffer1 start address and Buffer size using HAL_MMCEx_ConfigDMAMultiBuffer() function.
- Start Read and Write for multibuffer mode using HAL_MMCEx_ReadBlocksDMAMultiBuffer() and HAL_MMCEx_WriteBlocksDMAMultiBuffer() functions.

50.1.2 Linked List management functions

This subsection provides a set of functions allowing to manage the needed functions.

This section contains the following APIs:

- *HAL_MMCEx_DMALinkedList_BuildNode()*
- *HAL_MMCEx_DMALinkedList_InsertNode()*
- *HAL_MMCEx_DMALinkedList_RemoveNode()*
- *HAL_MMCEx_DMALinkedList_LockNode()*
- *HAL_MMCEx_DMALinkedList_UnlockNode()*
- *HAL_MMCEx_DMALinkedList_EnableCircularMode()*
- *HAL_MMCEx_DMALinkedList_DisableCircularMode()*
- *HAL_MMCEx_DMALinkedList_ReadBlocks()*
- *HAL_MMCEx_DMALinkedList_WriteBlocks()*
- *HAL_MMCEx_DMALinkedList_ReadBlocks()*
- *HAL_MMCEx_DMALinkedList_WriteBlocks()*
- *HAL_MMCEx_DMALinkedList_EnableCircularMode()*
- *HAL_MMCEx_DMALinkedList_DisableCircularMode()*
- *HAL_MMCEx_Read_DMALnkLstBufCpltCallback()*
- *HAL_MMCEx_Write_DMALnkLstBufCpltCallback()*

50.1.3 Detailed description of functions

HAL_MMCEx_DMALinkedList_ReadBlocks

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_ReadBlocks (MMC_HandleTypeDef * hmmc, SDMMC_DMALinkedListTypeDef * pLinkedList, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

HAL_MMCEx_DMALinkedList_WriteBlocks

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_WriteBlocks (MMC_HandleTypeDef * hmmc, SDMMC_DMALinkedListTypeDef * pLinkedList, uint32_t BlockAdd, uint32_t NumberOfBlocks)

Function description

HAL_MMCEx_DMALinkedList_BuildNode

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_BuildNode (MMC_DMALinkNodeTypeDef * pNode, MMC_DMALinkNodeConfTypeDef * pNodeConf)

Function description

Build Linked List node.

Parameters

- **pNode:** Pointer to new node to add.
- **pNodeConf:** Pointer to configuration parameters for new node to add.

Return values

- **HAL:** status

HAL_MMCEx_DMALinkedList_InsertNode

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_InsertNode (MMC_DMALinkedListTypeDef * pLinkedList, MMC_DMALinkNodeTypeDef * pPrevNode, MMC_DMALinkNodeTypeDef * pNewNode)

Function description

Insert Linked List node.

Parameters

- **pLinkedList:** Pointer to the linkedlist that contains transfer nodes
- **pPrevNode:** Pointer to previous node.
- **pNewNode:** Pointer to new node to insert.

Return values

- **HAL:** status

HAL_MMCEx_DMALinkedList_RemoveNode

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_RemoveNode (MMC_DMALinkedListTypeDef * pLinkedList, MMC_DMALinkNodeTypeDef * pNode)

Function description

Remove Linked List node.

Parameters

- **pLinkedList:** Pointer to the linkedlist that contains transfer nodes
- **pNode:** Pointer to node to remove.

Return values

- **HAL:** status

HAL_MMCEx_DMALinkedList_LockNode

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_LockNode (MMC_DMALinkNodeTypeDef * pNode)

Function description

Lock Linked List node.

Parameters

- **pNode:** Pointer to node to remove.

Return values

- **HAL:** status

HAL_MMCEx_DMALinkedList_UnlockNode

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_UnlockNode (MMC_DMALinkNodeTypeDef * pNode)

Function description

Unlock Linked List node.

Parameters

- **pNode:** Pointer to node to remove.

Return values

- **HAL:** status

HAL_MMCEx_DMALinkedList_EnableCircularMode

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_EnableCircularMode (SDMMC_DMALinkedListTypeDef * pLinkedList)

Function description

HAL_MMCEx_DMALinkedList_DisableCircularMode

Function name

HAL_StatusTypeDef HAL_MMCEx_DMALinkedList_DisableCircularMode (SDMMC_DMALinkedListTypeDef * pLinkedList)

Function description

HAL_MMCEx_Read_DMALnkLstBufCpltCallback

Function name

void HAL_MMCEx_Read_DMALnkLstBufCpltCallback (MMC_HandleTypeDef * hmmc)

Function description

Read DMA Linked list node Transfer completed callbacks.

Parameters

- **hmmc:** MMC handle

Return values

- **None:**

HAL_MMCEx_Write_DMALnkLstBufCpltCallback

Function name

void HAL_MMCEx_Write_DMALnkLstBufCpltCallback (MMC_HandleTypeDef * hmmc)

Function description

Read DMA Linked list node Transfer completed callbacks.

Parameters

- **hmmc:** MMC handle

Return values

- **None:**

50.2 MMCEx Firmware driver defines

The following section lists the various define and macros of the module.

50.2.1 MMCEx

MMCEx

Linked List Wrapper

MMC_DMALinkNodeTypeDef

MMC_DMALinkNodeConfTypeDef

MMC_DMALinkedListTypeDef

HAL_MMCx_DMALinkedList_WriteCpltCallback

HAL_MMCx_DMALinkedList_ReadCpltCallback

51 HAL NAND Generic Driver

51.1 NAND Firmware driver registers structures

51.1.1 NAND_IDTypeDef

NAND_IDTypeDef is defined in the stm32u5xx_hal_nand.h

Data Fields

- ***uint8_t Maker_Id***
- ***uint8_t Device_Id***
- ***uint8_t Third_Id***
- ***uint8_t Fourth_Id***

Field Documentation

- ***uint8_t NAND_IDTypeDef::Maker_Id***
- ***uint8_t NAND_IDTypeDef::Device_Id***
- ***uint8_t NAND_IDTypeDef::Third_Id***
- ***uint8_t NAND_IDTypeDef::Fourth_Id***

51.1.2 NAND_AddressTypeDef

NAND_AddressTypeDef is defined in the stm32u5xx_hal_nand.h

Data Fields

- ***uint16_t Page***
- ***uint16_t Plane***
- ***uint16_t Block***

Field Documentation

- ***uint16_t NAND_AddressTypeDef::Page***
  NAND memory Page address
- ***uint16_t NAND_AddressTypeDef::Plane***
  NAND memory Zone address
- ***uint16_t NAND_AddressTypeDef::Block***
  NAND memory Block address

51.1.3 NAND_DeviceConfigTypeDef

NAND_DeviceConfigTypeDef is defined in the stm32u5xx_hal_nand.h

Data Fields

- ***uint32_t PageSize***
- ***uint32_t SpareAreaSize***
- ***uint32_t BlockSize***
- ***uint32_t BlockNbr***
- ***uint32_t PlaneNbr***
- ***uint32_t PlaneSize***
- ***FunctionalState ExtraCommandEnable***

Field Documentation

- ***uint32_t NAND_DeviceConfigTypeDef::PageSize***
  NAND memory page (without spare area) size measured in bytes for 8 bits addressing or words for 16 bits addressing
- ***uint32_t NAND_DeviceConfigTypeDef::SpareAreaSize***
  NAND memory spare area size measured in bytes for 8 bits addressing or words for 16 bits addressing
- ***uint32_t NAND_DeviceConfigTypeDef::BlockSize***
  NAND memory block size measured in number of pages

- ***uint32_t NAND_DeviceConfigTypeDef::BlockNbr***
  NAND memory number of total blocks
- ***uint32_t NAND_DeviceConfigTypeDef::PlaneNbr***
  NAND memory number of planes
- ***uint32_t NAND_DeviceConfigTypeDef::PlaneSize***
  NAND memory zone size measured in number of blocks
- ***FunctionalState NAND_DeviceConfigTypeDef::ExtraCommandEnable***
  NAND extra command needed for Page reading mode. This parameter is mandatory for some NAND parts after the read command (NAND_CMD_AREA_TRUE1) and before DATA reading sequence. This parameter could be ENABLE or DISABLE Please check the Read Mode sequence in the NAND device datasheet

51.1.4 __NAND_HandleTypeDef

__NAND_HandleTypeDef is defined in the stm32u5xx_hal_nand.h

Data Fields

- ***FMC_NAND_TypeDef * Instance***
- ***FMC_NAND_InitTypeDef Init***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_NAND_StateTypeDef State***
- ***NAND_DeviceConfigTypeDef Config***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***
- ***void(* ItCallback***

Field Documentation

- ***FMC_NAND_TypeDef* __NAND_HandleTypeDef::Instance***
  Register base address
- ***FMC_NAND_InitTypeDef __NAND_HandleTypeDef::Init***
  NAND device control configuration parameters
- ***HAL_LockTypeDef __NAND_HandleTypeDef::Lock***
  NAND locking object
- ***__IO HAL_NAND_StateTypeDef __NAND_HandleTypeDef::State***
  NAND device access state
- ***NAND_DeviceConfigTypeDef __NAND_HandleTypeDef::Config***
  NAND physical characteristic information structure
- ***void(* __NAND_HandleTypeDef::MspInitCallback)(struct __NAND_HandleTypeDef *hnand)***
  NAND Msp Init callback
- ***void(* __NAND_HandleTypeDef::MspDeInitCallback)(struct __NAND_HandleTypeDef *hnand)***
  NAND Msp DeInit callback
- ***void(* __NAND_HandleTypeDef::ItCallback)(struct __NAND_HandleTypeDef *hnand)***
  NAND IT callback

51.2 NAND Firmware driver API description

The following section lists the various functions of the NAND library.

51.2.1 How to use this driver

This driver is a generic layered driver which contains a set of APIs used to control NAND flash memories. It uses the FMC layer functions to interface with NAND devices. This driver is used as follows:

- NAND flash memory configuration sequence using the function HAL_NAND_Init() with control and timing parameters for both common and attribute spaces.
- Read NAND flash memory maker and device IDs using the function HAL_NAND_Read_ID(). The read information is stored in the NAND_ID_TypeDef structure declared by the function caller.

- Access NAND flash memory by read/write operations using the functions HAL_NAND_Read_Page_8b()/ HAL_NAND_Read_SpareArea_8b(), HAL_NAND_Write_Page_8b()/HAL_NAND_Write_SpareArea_8b(), HAL_NAND_Read_Page_16b()/HAL_NAND_Read_SpareArea_16b(), HAL_NAND_Write_Page_16b()/ HAL_NAND_Write_SpareArea_16b() to read/write page(s)/spare area(s). These functions use specific device information (Block, page size..) predefined by the user in the NAND_DeviceConfigTypeDef structure. The read/write address information is contained by the Nand_Address_Typedef structure passed as parameter.
- Perform NAND flash Reset chip operation using the function HAL_NAND_Reset().
- Perform NAND flash erase block operation using the function HAL_NAND_Erase_Block(). The erase block address information is contained in the Nand_Address_Typedef structure passed as parameter.
- Read the NAND flash status operation using the function HAL_NAND_Read_Status().
- You can also control the NAND device by calling the control APIs HAL_NAND_ECC_Enable()/ HAL_NAND_ECC_Disable() to respectively enable/disable the ECC code correction feature or the function HAL_NAND_GetECC() to get the ECC correction code.
- You can monitor the NAND device HAL state by calling the function HAL_NAND_GetState()

Note: This driver is a set of generic APIs which handle standard NAND flash operations. If a NAND flash device contains different operations and/or implementations, it should be implemented separately.

Callback registration

The compilation define USE_HAL_NAND_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_NAND_RegisterCallback() to register a user callback, it allows to register following callbacks:

- MspInitCallback : NAND MspInit.
- MspDeInitCallback : NAND MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_NAND_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:
- MspInitCallback : NAND MspInit.
- MspDeInitCallback : NAND MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_NAND_Init and if the state is HAL_NAND_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_NAND_Init and HAL_NAND_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_NAND_Init and HAL_NAND_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_NAND_RegisterCallback before calling HAL_NAND_DeInit or HAL_NAND_Init function. When The compilation define USE_HAL_NAND_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

51.2.2 NAND Initialization and de-initialization functions

This section provides functions allowing to initialize/de-initialize the NAND memory

This section contains the following APIs:

- *HAL_NAND_Init()*
- *HAL_NAND_DeInit()*
- *HAL_NAND_MspInit()*
- *HAL_NAND_MspDeInit()*
- *HAL_NAND_IRQHandler()*
- *HAL_NAND_ITCallback()*
- *HAL_NAND_ConfigDevice()*
- *HAL_NAND_Read_ID()*

51.2.3 NAND Input and Output functions

This section provides functions allowing to use and control the NAND memory

This section contains the following APIs:
- *HAL_NAND_Read_ID()*
- *HAL_NAND_Reset()*
- *HAL_NAND_ConfigDevice()*
- *HAL_NAND_Read_Page_8b()*
- *HAL_NAND_Read_Page_16b()*
- *HAL_NAND_Write_Page_8b()*
- *HAL_NAND_Write_Page_16b()*
- *HAL_NAND_Read_SpareArea_8b()*
- *HAL_NAND_Read_SpareArea_16b()*
- *HAL_NAND_Write_SpareArea_8b()*
- *HAL_NAND_Write_SpareArea_16b()*
- *HAL_NAND_Erase_Block()*
- *HAL_NAND_Address_Inc()*
- *HAL_NAND_RegisterCallback()*
- *HAL_NAND_UnRegisterCallback()*

51.2.4 NAND Control functions

This subsection provides a set of functions allowing to control dynamically the NAND interface.

This section contains the following APIs:
- *HAL_NAND_ECC_Enable()*
- *HAL_NAND_ECC_Disable()*
- *HAL_NAND_GetECC()*

51.2.5 NAND State functions

This subsection permits to get in run-time the status of the NAND controller and the data flow.

This section contains the following APIs:
- *HAL_NAND_GetState()*
- *HAL_NAND_Read_Status()*

51.2.6 Detailed description of functions

HAL_NAND_Init

Function name

HAL_StatusTypeDef HAL_NAND_Init (NAND_HandleTypeDef * hnand, FMC_NAND_PCC_TimingTypeDef * ComSpace_Timing, FMC_NAND_PCC_TimingTypeDef * AttSpace_Timing)

Function description

Perform NAND memory Initialization sequence.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **ComSpace_Timing:** pointer to Common space timing structure
- **AttSpace_Timing:** pointer to Attribute space timing structure

Return values

- **HAL:** status

HAL_NAND_DeInit

Function name

HAL_StatusTypeDef HAL_NAND_DeInit (NAND_HandleTypeDef * hnand)

Function description

Perform NAND memory De-Initialization sequence.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** status

HAL_NAND_ConfigDevice

Function name

HAL_StatusTypeDef HAL_NAND_ConfigDevice (NAND_HandleTypeDef * hnand, NAND_DeviceConfigTypeDef * pDeviceConfig)

Function description

Configure the device: Enter the physical parameters of the device.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pDeviceConfig:** pointer to NAND_DeviceConfigTypeDef structure

Return values

- **HAL:** status

HAL_NAND_Read_ID

Function name

HAL_StatusTypeDef HAL_NAND_Read_ID (NAND_HandleTypeDef * hnand, NAND_IDTypeDef * pNAND_ID)

Function description

Read the NAND memory electronic signature.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pNAND_ID:** NAND ID structure

Return values

- **HAL:** status

HAL_NAND_MspInit

Function name

void HAL_NAND_MspInit (NAND_HandleTypeDef * hnand)

Function description

NAND MSP Init.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **None:**

HAL_NAND_MspDeInit

Function name

void HAL_NAND_MspDeInit (NAND_HandleTypeDef * hnand)

Function description

NAND MSP DeInit.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **None:**

HAL_NAND_IRQHandler

Function name

void HAL_NAND_IRQHandler (NAND_HandleTypeDef * hnand)

Function description

This function handles NAND device interrupt request.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** status

HAL_NAND_ITCallback

Function name

void HAL_NAND_ITCallback (NAND_HandleTypeDef * hnand)

Function description

NAND interrupt feature callback.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **None:**

HAL_NAND_Reset

Function name

HAL_StatusTypeDef HAL_NAND_Reset (NAND_HandleTypeDef * hnand)

Function description

NAND memory reset.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** status

HAL_NAND_Read_Page_8b

Function name

HAL_StatusTypeDef HAL_NAND_Read_Page_8b (NAND_HandleTypeDef * hnand, const NAND_AddressTypeDef * pAddress, uint8_t * pBuffer, uint32_t NumPageToRead)

Function description

Read Page(s) from NAND memory block (8-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to destination read buffer
- **NumPageToRead:** number of pages to read from block

Return values

- **HAL:** status

HAL_NAND_Write_Page_8b

Function name

HAL_StatusTypeDef HAL_NAND_Write_Page_8b (NAND_HandleTypeDef * hnand, const NAND_AddressTypeDef * pAddress, const uint8_t * pBuffer, uint32_t NumPageToWrite)

Function description

Write Page(s) to NAND memory block (8-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write
- **NumPageToWrite:** number of pages to write to block

Return values

- **HAL:** status

HAL_NAND_Read_SpareArea_8b

Function name

HAL_StatusTypeDef HAL_NAND_Read_SpareArea_8b (NAND_HandleTypeDef * hnand, const NAND_AddressTypeDef * pAddress, uint8_t * pBuffer, uint32_t NumSpareAreaToRead)

Function description

Read Spare area(s) from NAND memory (8-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write
- **NumSpareAreaToRead:** Number of spare area to read

Return values

- **HAL:** status

HAL_NAND_Write_SpareArea_8b

Function name

HAL_StatusTypeDef HAL_NAND_Write_SpareArea_8b (NAND_HandleTypeDef * hnand, const NAND_AddressTypeDef * pAddress, const uint8_t * pBuffer, uint32_t NumSpareAreaTowrite)

Function description

Write Spare area(s) to NAND memory (8-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write
- **NumSpareAreaTowrite:** number of spare areas to write to block

Return values

- **HAL:** status

HAL_NAND_Read_Page_16b

Function name

HAL_StatusTypeDef HAL_NAND_Read_Page_16b (NAND_HandleTypeDef * hnand, const NAND_AddressTypeDef * pAddress, uint16_t * pBuffer, uint32_t NumPageToRead)

Function description

Read Page(s) from NAND memory block (16-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to destination read buffer. pBuffer should be 16bits aligned
- **NumPageToRead:** number of pages to read from block

Return values

- **HAL:** status

HAL_NAND_Write_Page_16b

Function name

HAL_StatusTypeDef HAL_NAND_Write_Page_16b (NAND_HandleTypeDef * hnand, const NAND_AddressTypeDef * pAddress, const uint16_t * pBuffer, uint32_t NumPageToWrite)

Function description

Write Page(s) to NAND memory block (16-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write. pBuffer should be 16bits aligned
- **NumPageToWrite:** number of pages to write to block

Return values

- **HAL:** status

HAL_NAND_Read_SpareArea_16b

Function name

HAL_StatusTypeDef HAL_NAND_Read_SpareArea_16b (NAND_HandleTypeDef * hnand, const NAND_AddressTypeDef * pAddress, uint16_t * pBuffer, uint32_t NumSpareAreaToRead)

Function description

Read Spare area(s) from NAND memory (16-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write. pBuffer should be 16bits aligned.
- **NumSpareAreaToRead:** Number of spare area to read

Return values

- **HAL:** status

HAL_NAND_Write_SpareArea_16b

Function name

HAL_StatusTypeDef HAL_NAND_Write_SpareArea_16b (NAND_HandleTypeDef * hnand, const NAND_AddressTypeDef * pAddress, const uint16_t * pBuffer, uint32_t NumSpareAreaTowrite)

Function description

Write Spare area(s) to NAND memory (16-bits addressing)

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure
- **pBuffer:** pointer to source buffer to write. pBuffer should be 16bits aligned.
- **NumSpareAreaTowrite:** number of spare areas to write to block

Return values

- **HAL:** status

HAL_NAND_Erase_Block

Function name

HAL_StatusTypeDef HAL_NAND_Erase_Block (NAND_HandleTypeDef * hnand, const NAND_AddressTypeDef * pAddress)

Function description

NAND memory Block erase.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure

Return values

- **HAL:** status

HAL_NAND_Address_Inc

Function name

uint32_t HAL_NAND_Address_Inc (const NAND_HandleTypeDef * hnand, NAND_AddressTypeDef * pAddress)

Function description

Increment the NAND memory address.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **pAddress:** pointer to NAND address structure

Return values

- **The:** new status of the increment address operation. It can be:
  – NAND_VALID_ADDRESS: When the new address is valid address
  – NAND_INVALID_ADDRESS: When the new address is invalid address

HAL_NAND_RegisterCallback

Function name

HAL_StatusTypeDef HAL_NAND_RegisterCallback (NAND_HandleTypeDef * hnand, HAL_NAND_CallbackIDTypeDef CallbackId, pNAND_CallbackTypeDef pCallback)

Function description

Register a User NAND Callback To be used to override the weak predefined callback.

Parameters

- **hnand:** : NAND handle
- **CallbackId:** : ID of the callback to be registered This parameter can be one of the following values:
  – HAL_NAND_MSP_INIT_CB_ID NAND MspInit callback ID
  – HAL_NAND_MSP_DEINIT_CB_ID NAND MspDeInit callback ID
  – HAL_NAND_IT_CB_ID NAND IT callback ID
- **pCallback:** : pointer to the Callback function

Return values

- **status:**

HAL_NAND_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_NAND_UnRegisterCallback (NAND_HandleTypeDef * hnand, HAL_NAND_CallbackIDTypeDef CallbackId)

Function description

Unregister a User NAND Callback NAND Callback is redirected to the weak predefined callback.

Parameters

- **hnand:** : NAND handle
- **CallbackId:** : ID of the callback to be unregistered This parameter can be one of the following values:
  – HAL_NAND_MSP_INIT_CB_ID NAND MspInit callback ID
  – HAL_NAND_MSP_DEINIT_CB_ID NAND MspDeInit callback ID
  – HAL_NAND_IT_CB_ID NAND IT callback ID

Return values

- **status:**

HAL_NAND_ECC_Enable

Function name

HAL_StatusTypeDef HAL_NAND_ECC_Enable (NAND_HandleTypeDef * hnand)

Function description

Enables dynamically NAND ECC feature.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** status

HAL_NAND_ECC_Disable

Function name

HAL_StatusTypeDef HAL_NAND_ECC_Disable (NAND_HandleTypeDef * hnand)

Function description

Disables dynamically FMC_NAND ECC feature.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** status

HAL_NAND_GetECC

Function name

HAL_StatusTypeDef HAL_NAND_GetECC (NAND_HandleTypeDef * hnand, uint32_t * ECCval, uint32_t Timeout)

Function description

Disables dynamically NAND ECC feature.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.
- **ECCval:** pointer to ECC value
- **Timeout:** maximum timeout to wait

Return values

- **HAL:** status

HAL_NAND_GetState

Function name

HAL_NAND_StateTypeDef HAL_NAND_GetState (const NAND_HandleTypeDef * hnand)

Function description

return the NAND state

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **HAL:** state

HAL_NAND_Read_Status

Function name

uint32_t HAL_NAND_Read_Status (const NAND_HandleTypeDef * hnand)

Function description

NAND memory read status.

Parameters

- **hnand:** pointer to a NAND_HandleTypeDef structure that contains the configuration information for NAND module.

Return values

- **NAND:** status

51.3 NAND Firmware driver defines

The following section lists the various define and macros of the module.

51.3.1 NAND

NAND

NAND Exported Macros

__HAL_NAND_RESET_HANDLE_STATE

Description:

- Reset NAND handle state.

Parameters:

- __HANDLE__: specifies the NAND handle.

Return value:

- None

52 HAL NOR Generic Driver

52.1 NOR Firmware driver registers structures

52.1.1 NOR_IDTypeDef

NOR_IDTypeDef is defined in the stm32u5xx_hal_nor.h

Data Fields

- ***uint16_t Manufacturer_Code***
- ***uint16_t Device_Code1***
- ***uint16_t Device_Code2***
- ***uint16_t Device_Code3***

Field Documentation

- ***uint16_t NOR_IDTypeDef::Manufacturer_Code***
  Defines the device's manufacturer code used to identify the memory
- ***uint16_t NOR_IDTypeDef::Device_Code1***
- ***uint16_t NOR_IDTypeDef::Device_Code2***
- ***uint16_t NOR_IDTypeDef::Device_Code3***
  Defines the device's codes used to identify the memory. These codes can be accessed by performing read operations with specific control signals and addresses set.They can also be accessed by issuing an Auto Select command

52.1.2 NOR_CFITypeDef

NOR_CFITypeDef is defined in the stm32u5xx_hal_nor.h

Data Fields

- ***uint16_t CFI_1***

  NOR Msp DeInit callback

52.2 NOR Firmware driver API description

The following section lists the various functions of the NOR library.

52.2.1 How to use this driver

This driver is a generic layered driver which contains a set of APIs used to control NOR flash memories. It uses the FMC layer functions to interface with NOR devices. This driver is used as follows:

- NOR flash memory configuration sequence using the function HAL_NOR_Init() with control and timing parameters for both normal and extended mode.
- Read NOR flash memory manufacturer code and device IDs using the function HAL_NOR_Read_ID(). The read information is stored in the NOR_ID_TypeDef structure declared by the function caller.
- Access NOR flash memory by read/write data unit operations using the functions HAL_NOR_Read(), HAL_NOR_Program().
- Perform NOR flash erase block/chip operations using the functions HAL_NOR_Erase_Block() and HAL_NOR_Erase_Chip().
- Read the NOR flash CFI (common flash interface) IDs using the function HAL_NOR_Read_CFI(). The read information is stored in the NOR_CFI_TypeDef structure declared by the function caller.
- You can also control the NOR device by calling the control APIs HAL_NOR_WriteOperation_Enable()/ HAL_NOR_WriteOperation_Disable() to respectively enable/disable the NOR write operation
- You can monitor the NOR device HAL state by calling the function HAL_NOR_GetState()

Note: *This driver is a set of generic APIs which handle standard NOR flash operations. If a NOR flash device contains different operations and/or implementations, it should be implemented separately.*

NOR HAL driver macros list

Below the list of most used macros in NOR HAL driver.

- NOR_WRITE : NOR memory write data to specified address

Callback registration

The compilation define USE_HAL_NOR_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks. Use Functions HAL_NOR_RegisterCallback() to register a user callback, it allows to register following callbacks:

- MspInitCallback : NOR MspInit.
- MspDeInitCallback : NOR MspDeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function. Use function HAL_NOR_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:
- MspInitCallback : NOR MspInit.

- MspDeInitCallback : NOR MspDeInit. This function) takes as parameters the HAL peripheral handle and the Callback ID. By default, after the HAL_NOR_Init and if the state is HAL_NOR_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_NOR_Init and HAL_NOR_DeInit only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_NOR_Init and HAL_NOR_DeInit keep and use the user MspInit/MspDeInit callbacks (registered beforehand) Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_NOR_RegisterCallback before calling HAL_NOR_DeInit or HAL_NOR_Init function. When The compilation define USE_HAL_NOR_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

52.2.2 NOR Initialization and de_initialization functions

This section provides functions allowing to initialize/de-initialize the NOR memory

This section contains the following APIs:

- *HAL_NOR_Init()*
- *HAL_NOR_DeInit()*
- *HAL_NOR_MspInit()*
- *HAL_NOR_MspDeInit()*
- *HAL_NOR_MspWait()*

52.2.3 NOR Input and Output functions

This section provides functions allowing to use and control the NOR memory

This section contains the following APIs:

- *HAL_NOR_Read_ID()*
- *HAL_NOR_ReturnToReadMode()*
- *HAL_NOR_Read()*
- *HAL_NOR_Program()*
- *HAL_NOR_ReadBuffer()*
- *HAL_NOR_ProgramBuffer()*
- *HAL_NOR_Erase_Block()*
- *HAL_NOR_Erase_Chip()*
- *HAL_NOR_Read_CFI()*
- *HAL_NOR_RegisterCallback()*
- *HAL_NOR_UnRegisterCallback()*

52.2.4 NOR Control functions

This subsection provides a set of functions allowing to control dynamically the NOR interface.

This section contains the following APIs:

- *HAL_NOR_WriteOperation_Enable()*
- *HAL_NOR_WriteOperation_Disable()*

52.2.5 NOR State functions

This subsection permits to get in run-time the status of the NOR controller and the data flow.

This section contains the following APIs:

- *HAL_NOR_GetState()*
- *HAL_NOR_GetStatus()*

52.2.6 Detailed description of functions

HAL_NOR_Init

Function name

HAL_StatusTypeDef HAL_NOR_Init (NOR_HandleTypeDef * hnor, FMC_NORSRAM_TimingTypeDef * Timing, FMC_NORSRAM_TimingTypeDef * ExtTiming)

Function description

Perform the NOR memory Initialization sequence.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **Timing:** pointer to NOR control timing structure
- **ExtTiming:** pointer to NOR extended mode timing structure

Return values

- **HAL:** status

HAL_NOR_DeInit

Function name

HAL_StatusTypeDef HAL_NOR_DeInit (NOR_HandleTypeDef * hnor)

Function description

Perform NOR memory De-Initialization sequence.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **HAL:** status

HAL_NOR_MspInit

Function name

void HAL_NOR_MspInit (NOR_HandleTypeDef * hnor)

Function description

NOR MSP Init.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **None:**

HAL_NOR_MspDeInit

Function name

void HAL_NOR_MspDeInit (NOR_HandleTypeDef * hnor)

Function description

NOR MSP DeInit.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **None:**

HAL_NOR_MspWait

Function name

void HAL_NOR_MspWait (NOR_HandleTypeDef * hnor, uint32_t Timeout)

Function description

NOR MSP Wait for Ready/Busy signal.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **Timeout:** Maximum timeout value

Return values

- **None:**

HAL_NOR_Read_ID

Function name

HAL_StatusTypeDef HAL_NOR_Read_ID (NOR_HandleTypeDef * hnor, NOR_IDTypeDef * pNOR_ID)

Function description

Read NOR flash IDs.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **pNOR_ID:** pointer to NOR ID structure

Return values

- **HAL:** status

HAL_NOR_ReturnToReadMode

Function name

HAL_StatusTypeDef HAL_NOR_ReturnToReadMode (NOR_HandleTypeDef * hnor)

Function description

Returns the NOR memory to Read mode.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **HAL:** status

HAL_NOR_Read

Function name

HAL_StatusTypeDef HAL_NOR_Read (NOR_HandleTypeDef * hnor, uint32_t * pAddress, uint16_t * pData)

Function description

Read data from NOR memory.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **pAddress:** pointer to Device address
- **pData:** pointer to read data

Return values

- **HAL:** status

HAL_NOR_Program

Function name

HAL_StatusTypeDef HAL_NOR_Program (NOR_HandleTypeDef * hnor, uint32_t * pAddress, uint16_t * pData)

Function description

Program data to NOR memory.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **pAddress:** Device address
- **pData:** pointer to the data to write

Return values

- **HAL:** status

HAL_NOR_ReadBuffer

Function name

HAL_StatusTypeDef HAL_NOR_ReadBuffer (NOR_HandleTypeDef * hnor, uint32_t uwAddress, uint16_t * pData, uint32_t uwBufferSize)

Function description

Reads a half-word buffer from the NOR memory.

Parameters

- **hnor:** pointer to the NOR handle
- **uwAddress:** NOR memory internal address to read from.
- **pData:** pointer to the buffer that receives the data read from the NOR memory.
- **uwBufferSize:** number of Half word to read.

Return values

- **HAL:** status

HAL_NOR_ProgramBuffer

Function name

HAL_StatusTypeDef HAL_NOR_ProgramBuffer (NOR_HandleTypeDef * hnor, uint32_t uwAddress, uint16_t * pData, uint32_t uwBufferSize)

Function description

Writes a half-word buffer to the NOR memory.

Parameters

- **hnor:** pointer to the NOR handle
- **uwAddress:** NOR memory internal start write address
- **pData:** pointer to source data buffer.
- **uwBufferSize:** Size of the buffer to write

Return values

- **HAL:** status

HAL_NOR_Erase_Block

Function name

HAL_StatusTypeDef HAL_NOR_Erase_Block (NOR_HandleTypeDef * hnor, uint32_t BlockAddress, uint32_t Address)

Function description

Erase the specified block of the NOR memory.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **BlockAddress:** Block to erase address
- **Address:** Device address

Return values

- **HAL:** status

HAL_NOR_Erase_Chip

Function name

HAL_StatusTypeDef HAL_NOR_Erase_Chip (NOR_HandleTypeDef * hnor, uint32_t Address)

Function description

Erase the entire NOR chip.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **Address:** Device address

Return values

- **HAL:** status

HAL_NOR_Read_CFI

Function name

HAL_StatusTypeDef HAL_NOR_Read_CFI (NOR_HandleTypeDef * hnor, NOR_CFITypeDef * pNOR_CFI)

Function description

Read NOR flash CFI IDs.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **pNOR_CFI:** pointer to NOR CFI IDs structure

Return values

- **HAL:** status

HAL_NOR_RegisterCallback

Function name

HAL_StatusTypeDef HAL_NOR_RegisterCallback (NOR_HandleTypeDef * hnor, HAL_NOR_CallbackIDTypeDef CallbackId, pNOR_CallbackTypeDef pCallback)

Function description

Register a User NOR Callback To be used to override the weak predefined callback.

Parameters

- **hnor:** : NOR handle
- **CallbackId:** : ID of the callback to be registered This parameter can be one of the following values:
  - HAL_NOR_MSP_INIT_CB_ID NOR MspInit callback ID
  - HAL_NOR_MSP_DEINIT_CB_ID NOR MspDeInit callback ID
- **pCallback:** : pointer to the Callback function

Return values

- **status:**

HAL_NOR_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_NOR_UnRegisterCallback (NOR_HandleTypeDef * hnor, HAL_NOR_CallbackIDTypeDef CallbackId)

Function description

Unregister a User NOR Callback NOR Callback is redirected to the weak predefined callback.

Parameters

- **hnor:** : NOR handle
- **CallbackId:** : ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_NOR_MSP_INIT_CB_ID NOR MspInit callback ID
  - HAL_NOR_MSP_DEINIT_CB_ID NOR MspDeInit callback ID

Return values

- **status:**

HAL_NOR_WriteOperation_Enable

Function name

HAL_StatusTypeDef HAL_NOR_WriteOperation_Enable (NOR_HandleTypeDef * hnor)

Function description

Enables dynamically NOR write operation.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **HAL:** status

HAL_NOR_WriteOperation_Disable

Function name

HAL_StatusTypeDef HAL_NOR_WriteOperation_Disable (NOR_HandleTypeDef * hnor)

Function description

Disables dynamically NOR write operation.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **HAL:** status

HAL_NOR_GetState

Function name

HAL_NOR_StateTypeDef HAL_NOR_GetState (const NOR_HandleTypeDef * hnor)

Function description

return the NOR controller state

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.

Return values

- **NOR:** controller state

HAL_NOR_GetStatus

Function name

HAL_NOR_StatusTypeDef HAL_NOR_GetStatus (NOR_HandleTypeDef * hnor, uint32_t Address, uint32_t Timeout)

Function description

Returns the NOR operation status.

Parameters

- **hnor:** pointer to a NOR_HandleTypeDef structure that contains the configuration information for NOR module.
- **Address:** Device address
- **Timeout:** NOR programming Timeout

Return values

- **NOR_Status:** The returned value can be: HAL_NOR_STATUS_SUCCESS, HAL_NOR_STATUS_ERROR or HAL_NOR_STATUS_TIMEOUT

52.3 NOR Firmware driver defines

The following section lists the various define and macros of the module.

52.3.1 NOR

NOR

NOR Exported Macros

__HAL_NOR_RESET_HANDLE_STATE

Description:

- Reset NOR handle state.

Parameters:

- __HANDLE__: specifies the NOR handle.

Return value:

- None

53 HAL OPAMP Generic Driver

53.1 OPAMP Firmware driver registers structures

53.1.1 OPAMP_InitTypeDef

OPAMP_InitTypeDef is defined in the stm32u5xx_hal_opamp.h

Data Fields

- ***uint32_t PowerSupplyRange***
- ***uint32_t PowerMode***
- ***uint32_t Mode***
- ***uint32_t InvertingInput***
- ***uint32_t NonInvertingInput***
- ***uint32_t PgaGain***
- ***uint32_t UserTrimming***
- ***uint32_t TrimmingValueP***
- ***uint32_t TrimmingValueN***
- ***uint32_t TrimmingValuePLowPower***
- ***uint32_t TrimmingValueNLowPower***

Field Documentation

- ***uint32_t OPAMP_InitTypeDef::PowerSupplyRange***
  Specifies the power supply range: above or under 2.4V. This parameter is not used, but kept for compatibility with other families. Caution: Whatever this parameter, the effective PowerSupplyRange is forced to OPAMP_POWERSUPPLY_HIGH in HAL_OPAMP_Init. This parameter applies to the both OPAMP instances.
- ***uint32_t OPAMP_InitTypeDef::PowerMode***
  Specifies the power mode Normal or Low-Power and the speed mode Normal or High. This parameter must be a value of ***OPAMP_PowerMode***
- ***uint32_t OPAMP_InitTypeDef::Mode***
  Specifies the OPAMP mode (Standalone, Follower or PGA) This parameter must be a value of ***OPAMP_Mode***
- ***uint32_t OPAMP_InitTypeDef::InvertingInput***
  Specifies the inverting input in Standalone & PGA modes. In Follower mode this parameter is Not Applicable. This parameter must be a value of ***OPAMP_InvertingInput***
- ***uint32_t OPAMP_InitTypeDef::NonInvertingInput***
  Specifies the non inverting input of the opamp. This parameter must be a value of ***OPAMP_NonInvertingInput***
- ***uint32_t OPAMP_InitTypeDef::PgaGain***
  Specifies the gain (2, 4, 8 or 16) in PGA mode i.e. when mode is OPAMP_PGA_MODE. This parameter must be a value of ***OPAMP_PgaGain***
- ***uint32_t OPAMP_InitTypeDef::UserTrimming***
  Specifies the trimming mode is either factory or user trimming This parameter must be a value of ***OPAMP_UserTrimming***.
- ***uint32_t OPAMP_InitTypeDef::TrimmingValueP***
  Specifies the offset trimming value (PMOS) i.e. when UserTrimming is OPAMP_TRIMMING_USER. This parameter must be a number between Min_Data = 0 and Max_Data = 31 16 is typical default value
- ***uint32_t OPAMP_InitTypeDef::TrimmingValueN***
  Specifies the offset trimming value (NMOS) i.e. when UserTrimming is OPAMP_TRIMMING_USER. This parameter must be a number between Min_Data = 0 and Max_Data = 31 16 is typical default value
- ***uint32_t OPAMP_InitTypeDef::TrimmingValuePLowPower***
  Specifies the offset trimming value (PMOS) in lowpower mode i.e. when UserTrimming is OPAMP_TRIMMING_USER. This parameter must be a number between Min_Data = 0 and Max_Data = 31 16 is typical default value

- ***uint32_t OPAMP_InitTypeDef::TrimmingValueNLowPower***
  Specifies the offset trimming value (NMOS) in lowpower mode i.e. when UserTrimming is OPAMP_TRIMMING_USER. This parameter must be a number between Min_Data = 0 and Max_Data = 31 16 is typical default value

53.1.2 __OPAMP_HandleTypeDef

__OPAMP_HandleTypeDef is defined in the stm32u5xx_hal_opamp.h

Data Fields

- ***OPAMP_TypeDef * Instance***
- ***OPAMP_InitTypeDef Init***
- ***HAL_StatusTypeDef Status***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_OPAMP_StateTypeDef State***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***OPAMP_TypeDef* __OPAMP_HandleTypeDef::Instance***
  OPAMP instance's registers base address
- ***OPAMP_InitTypeDef __OPAMP_HandleTypeDef::Init***
  OPAMP required parameters
- ***HAL_StatusTypeDef __OPAMP_HandleTypeDef::Status***
  OPAMP peripheral status
- ***HAL_LockTypeDef __OPAMP_HandleTypeDef::Lock***
  Locking object
- ***__IO HAL_OPAMP_StateTypeDef __OPAMP_HandleTypeDef::State***
  OPAMP communication state

53.2 OPAMP Firmware driver API description

The following section lists the various functions of the OPAMP library.

53.2.1 OPAMP Peripheral Features

The device integrates 1 or 2 operational amplifiers OPAMP1 & OPAMP2

1. The OPAMP(s) provide(s) several exclusive running modes.
   - Standalone mode
   - Programmable Gain Amplifier (PGA) mode (Resistor feedback output)
   - Follower mode
2. Each OPAMP(s) can be configured in normal and low power mode with different speeds.
3. The OPAMP(s) provide(s) calibration capabilities.
   - Calibration aims at correcting some offset for running mode.
   - The OPAMP uses either factory calibration settings OR user defined calibration (trimming) settings (i.e. trimming mode).
   - The user defined settings can be figured out using self calibration handled by HAL_OPAMP_SelfCalibrate, HAL_OPAMPEx_SelfCalibrateAll
   - HAL_OPAMP_SelfCalibrate:
     - Runs automatically the calibration.
     - Enables the user trimming mode
     - Updates the init structure with trimming values with fresh calibration results. The user may store the calibration results for larger (ex monitoring the trimming as a function of temperature for instance)
     - HAL_OPAMPEx_SelfCalibrateAll runs calibration of all OPAMPs in parallel to save search time.

4. Running mode: Standalone mode
   – Gain is set externally (gain depends on external loads).
   – Follower mode also possible externally by connecting the inverting input to the output.
5. Running mode: Follower mode
   – No Inverting Input is connected.
6. Running mode: Programmable Gain Amplifier (PGA) mode (Resistor feedback output)
   – The OPAMP(s) output(s) can be internally connected to resistor feedback output.
   – OPAMP gain is either 2, 4, 8 or 16.
7. The OPAMPs inverting input can be selected according to the Reference Manual "OPAMP function description" chapter.
8. The OPAMPs non inverting input can be selected according to the Reference Manual "OPAMP function description" chapter.

53.2.2 How to use this driver

Speed & power mode

To run in low power mode with different speed:
1. Configure the OPAMP using HAL_OPAMP_Init() function:
   – Select OPAMP_POWERMODE_LOWPOWER_NORMALSPEED
   – Select OPAMP_POWERMODE_LOWPOWER_HIGHSPEED
   – Select OPAMP_POWERMODE_NORMALPOWER_NORMALSPEED
   – Select OPAMP_POWERMODE_NORMALPOWER_HIGHSPEED

Calibration

To run the OPAMP calibration self calibration:
1. Start calibration using HAL_OPAMP_SelfCalibrate. Store the calibration results.

Running mode

To use the OPAMP, perform the following steps:
1. Fill in the HAL_OPAMP_MspInit() to
   – Enable the OPAMP Peripheral clock using macro __HAL_RCC_OPAMP_CLK_ENABLE()
   – Configure the OPAMP input and output in analog mode using HAL_GPIO_Init() to map the OPAMP output to the GPIO pin.
2. Registrate Callbacks
   – The compilation define USE_HAL_OPAMP_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.
   – Use Functions @ref HAL_OPAMP_RegisterCallback() to register a user callback, it allows to register following callbacks:
     ◦ MspInitCallback : OPAMP MspInit.
     ◦ MspDeInitCallback : OPAMP MspFeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.
   – Use function @ref HAL_OPAMP_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:
     ◦ MspInitCallback : OPAMP MspInit.
     ◦ MspDeInitCallback : OPAMP MspdeInit.
     ◦ All Callbacks

3. Configure the OPAMP using HAL_OPAMP_Init() function:
   – Select the mode
   – Select the inverting input
   – Select the non-inverting input
   – If PGA mode is enabled, Select if inverting input is connected.
   – Select either factory or user defined trimming mode.
   – If the user-defined trimming mode is enabled, select PMOS & NMOS trimming values (typically values set by HAL_OPAMP_SelfCalibrate function).
4. Enable the OPAMP using HAL_OPAMP_Start() function.
5. Disable the OPAMP using HAL_OPAMP_Stop() function.
6. Lock the OPAMP in running mode using HAL_OPAMP_Lock() function. Caution: On STM32U5, HAL OPAMP lock is software lock only (not hardware lock as on some other STM32 devices)
7. If needed, unlock the OPAMP using HAL_OPAMPEx_Unlock() function.

Running mode: change of configuration while OPAMP ON

To Re-configure OPAMP when OPAMP is ON (change on the fly)

1. If needed, fill in the HAL_OPAMP_MspInit()
   – This is the case for instance if you wish to use new OPAMP I/O
2. Configure the OPAMP using HAL_OPAMP_Init() function:
   – As in configure case, select first the parameters you wish to modify.
3. Change from low power mode to normal power mode (& vice versa) requires first HAL_OPAMP_DeInit() (force OPAMP OFF) and then HAL_OPAMP_Init(). In other words, of OPAMP is ON, HAL_OPAMP_Init can NOT change power mode alone.

53.2.3 Initialization and de-initialization functions

This section contains the following APIs:

- *HAL_OPAMP_Init()*
- *HAL_OPAMP_DeInit()*
- *HAL_OPAMP_MspInit()*
- *HAL_OPAMP_MspDeInit()*

53.2.4 IO operation functions

This subsection provides a set of functions allowing to manage the OPAMP start, stop and calibration actions.

This section contains the following APIs:

- *HAL_OPAMP_Start()*
- *HAL_OPAMP_Stop()*
- *HAL_OPAMP_SelfCalibrate()*

53.2.5 Peripheral Control functions

This subsection provides a set of functions allowing to control the OPAMP data transfers.

This section contains the following APIs:

- *HAL_OPAMP_Lock()*
- *HAL_OPAMP_GetTrimOffset()*

53.2.6 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_OPAMP_GetState()*

53.2.7 Peripheral Callback functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *HAL_OPAMP_RegisterCallback()*
- *HAL_OPAMP_UnRegisterCallback()*

53.2.8 Extended IO operation functions

- OPAMP Self calibration.

This section contains the following APIs:

- *Section 53.2.9: HAL_OPAMPEx_SelfCalibrateAll()*

53.2.9 Detailed description of functions

HAL_OPAMP_Init

Function name

HAL_StatusTypeDef HAL_OPAMP_Init (OPAMP_HandleTypeDef * hopamp)

Function description

Initializes the OPAMP according to the specified parameters in the OPAMP_InitTypeDef and initialize the associated handle.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

Notes

- If the selected opamp is locked, initialization can't be performed. To unlock the configuration, perform a system reset.

HAL_OPAMP_DeInit

Function name

HAL_StatusTypeDef HAL_OPAMP_DeInit (OPAMP_HandleTypeDef * hopamp)

Function description

DeInitialize the OPAMP peripheral.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

Notes

- Deinitialization can be performed if the OPAMP configuration is locked. (the lock is SW in U5)

HAL_OPAMP_MspInit

Function name

void HAL_OPAMP_MspInit (OPAMP_HandleTypeDef * hopamp)

Function description

Initialize the OPAMP MSP.

Parameters

- **hopamp:** OPAMP handle

Return values

- **None:**

HAL_OPAMP_MspDeInit

Function name

void HAL_OPAMP_MspDeInit (OPAMP_HandleTypeDef * hopamp)

Function description

DeInitialize OPAMP MSP.

Parameters

- **hopamp:** OPAMP handle

Return values

- **None:**

HAL_OPAMP_Start

Function name

HAL_StatusTypeDef HAL_OPAMP_Start (OPAMP_HandleTypeDef * hopamp)

Function description

Start the OPAMP.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

HAL_OPAMP_Stop

Function name

HAL_StatusTypeDef HAL_OPAMP_Stop (OPAMP_HandleTypeDef * hopamp)

Function description

Stop the OPAMP.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

HAL_OPAMP_SelfCalibrate

Function name

HAL_StatusTypeDef HAL_OPAMP_SelfCalibrate (OPAMP_HandleTypeDef * hopamp)

Function description

Run the self calibration of one OPAMP.

Parameters

- **hopamp:** handle

Return values

- **Updated:** offset trimming values (PMOS & NMOS), user trimming is enabled
- **HAL:** status

Notes

- Calibration is performed in the mode specified in OPAMP init structure (mode normal or low-power). To perform calibration for both modes, repeat this function twice after OPAMP init structure accordingly updated.
- Calibration runs about 10 ms.

HAL_OPAMP_Lock

Function name

HAL_StatusTypeDef HAL_OPAMP_Lock (OPAMP_HandleTypeDef * hopamp)

Function description

Lock the selected OPAMP configuration.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

Notes

- On STM32U5, HAL OPAMP lock is software lock only (in contrast of hardware lock available on some other STM32 devices).

HAL_OPAMP_GetTrimOffset

Function name

HAL_OPAMP_TrimmingValueTypeDef HAL_OPAMP_GetTrimOffset (const OPAMP_HandleTypeDef * hopamp, uint32_t trimmingoffset)

Function description

Return the OPAMP factory trimming value.

Parameters

- **hopamp:** : OPAMP handle
- **trimmingoffset:** : Trimming offset (P or N) This parameter must be a value of OPAMP Factory Trimming

Return values

- **Trimming:** value (P or N): range: 0->31 or OPAMP_FACTORYTRIMMING_DUMMY if trimming value is not available

Notes

- On STM32U5 OPAMP, user can retrieve factory trimming if OPAMP has never been set to user trimming before. Therefore, this function must be called when OPAMP init parameter "UserTrimming" is set to trimming factory, and before OPAMP calibration (function "HAL_OPAMP_SelfCalibrate()"). Otherwise, factory trimming value cannot be retrieved and error status is returned.
- Calibration parameter retrieved is corresponding to the mode specified in OPAMP init structure (mode normal or low-power). To retrieve calibration parameters for both modes, repeat this function after OPAMP init structure accordingly updated.

HAL_OPAMP_GetState

Function name

HAL_OPAMP_StateTypeDef HAL_OPAMP_GetState (const OPAMP_HandleTypeDef * hopamp)

Function description

Return the OPAMP handle state.

Parameters

- **hopamp:** : OPAMP handle

Return values

- **HAL:** state

HAL_OPAMP_RegisterCallback

Function name

HAL_StatusTypeDef HAL_OPAMP_RegisterCallback (OPAMP_HandleTypeDef * hopamp, HAL_OPAMP_CallbackIDTypeDef CallbackID, pOPAMP_CallbackTypeDef pCallback)

Function description

Register a User OPAMP Callback To be used instead of the weak (overridden) predefined callback.

Parameters

- **hopamp:** : OPAMP handle
- **CallbackID:** : ID of the callback to be registered This parameter can be one of the following values:
  – HAL_OPAMP_MSP_INIT_CB_ID OPAMP MspInit callback ID
  – HAL_OPAMP_MSP_DEINIT_CB_ID OPAMP MspDeInit callback ID
- **pCallback:** : pointer to the Callback function

Return values

- **status:**

HAL_OPAMP_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_OPAMP_UnRegisterCallback (OPAMP_HandleTypeDef * hopamp, HAL_OPAMP_CallbackIDTypeDef CallbackID)

Function description

Unregister a User OPAMP Callback OPAMP Callback is redirected to the weak (overridden) predefined callback.

Parameters

- **hopamp:** : OPAMP handle
- **CallbackID:** : ID of the callback to be unregistered This parameter can be one of the following values:
  – HAL_OPAMP_MSP_INIT_CB_ID OPAMP MSP Init Callback ID
  – HAL_OPAMP_MSP_DEINIT_CB_ID OPAMP MSP DeInit Callback ID
  – HAL_OPAMP_ALL_CB_ID OPAMP All Callbacks

Return values

- **status:**

53.3 OPAMP Firmware driver defines

The following section lists the various define and macros of the module.

53.3.1 OPAMP

OPAMP

OPAMP Exported Macros

__HAL_OPAMP_RESET_HANDLE_STATE

Description:

- Reset OPAMP handle state.

Parameters:

- __HANDLE__: OPAMP handle.

Return value:

- None

OPAMP Factory Trimming

OPAMP_FACTORYTRIMMING_DUMMY

Dummy value if trimming value could not be retrieved

OPAMP_FACTORYTRIMMING_N

Offset trimming N

OPAMP_FACTORYTRIMMING_P

Offset trimming P

OPAMP Inverting Input

OPAMP_INVERTINGINPUT_IO0

OPAMP inverting input connected to dedicated IO pin low-leakage

OPAMP_INVERTINGINPUT_IO1

OPAMP inverting input connected to alternative IO pin available on some device packages

OPAMP_INVERTINGINPUT_CONNECT_NO

OPAMP inverting input not connected externally (PGA mode only)

OPAMP Mode

OPAMP_STANDALONE_MODE

standalone mode

OPAMP_PGA_MODE

PGA mode

OPAMP_FOLLOWER_MODE

follower mode

OPAMP Non Inverting Input

OPAMP_NONINVERTINGINPUT_IO0

OPAMP non-inverting input connected to dedicated IO pin

OPAMP_NONINVERTINGINPUT_DAC_CH

OPAMP non-inverting input connected internally to DAC channel

OPAMP Pga Gain

OPAMP_PGA_GAIN_2

PGA gain = 2

OPAMP_PGA_GAIN_4

PGA gain = 4

OPAMP_PGA_GAIN_8

PGA gain = 8

OPAMP_PGA_GAIN_16

PGA gain = 16

OPAMP PowerMode

OPAMP_POWERMODE_NORMALPOWER_NORMALSPEED

OPAMP power mode normal speed normal

OPAMP_POWERMODE_LOWPOWER_NORMALSPEED

OPAMP power mode low-power speed normal

OPAMP_POWERMODE_NORMALPOWER_HIGHSPEED

OPAMP power mode normal speed high

OPAMP_POWERMODE_LOWPOWER_HIGHSPEED

OPAMP power mode low-power speed high

OPAMP PowerSupplyRange

OPAMP_POWERSUPPLY_LOW

Power supply range low (VDDA lower than 2.4V)

OPAMP_POWERSUPPLY_HIGH

Power supply range high (VDDA higher than 2.4V)

OPAMP User Trimming

OPAMP_TRIMMING_FACTORY

Factory trimming

OPAMP_TRIMMING_USER

User trimming

54 HAL OPAMP Extension Driver

54.1 OPAMPEx Firmware driver API description

The following section lists the various functions of the OPAMPEx library.

54.1.1 Initialization and de-initialization functions

This section contains the following APIs:

- *Section 54.1.7: HAL_OPAMP_Init()*
- *Section 54.1.7: HAL_OPAMP_DeInit()*
- *Section 54.1.7: HAL_OPAMP_MspInit()*
- *Section 54.1.7: HAL_OPAMP_MspDeInit()*

54.1.2 IO operation functions

This subsection provides a set of functions allowing to manage the OPAMP start, stop and calibration actions.

This section contains the following APIs:

- *Section 54.1.7: HAL_OPAMP_Start()*
- *Section 54.1.7: HAL_OPAMP_Stop()*
- *Section 54.1.7: HAL_OPAMP_SelfCalibrate()*

54.1.3 Peripheral Control functions

This subsection provides a set of functions allowing to control the OPAMP data transfers.

This section contains the following APIs:

- *Section 54.1.7: HAL_OPAMP_Lock()*
- *Section 54.1.7: HAL_OPAMP_GetTrimOffset()*

54.1.4 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *Section 54.1.7: HAL_OPAMP_GetState()*

54.1.5 Peripheral Callback functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:

- *Section 54.1.7: HAL_OPAMP_RegisterCallback()*
- *Section 54.1.7: HAL_OPAMP_UnRegisterCallback()*

54.1.6 Extended IO operation functions

- OPAMP Self calibration.

This section contains the following APIs:

- *HAL_OPAMPEx_SelfCalibrateAll()*

54.1.7 Detailed description of functions

HAL_OPAMPEx_SelfCalibrateAll

Function name

HAL_StatusTypeDef HAL_OPAMPEx_SelfCalibrateAll (OPAMP_HandleTypeDef * hopamp1, OPAMP_HandleTypeDef * hopamp2)

Function description

Run the self calibration of the 2 OPAMPs in parallel.

Parameters

- **hopamp1:** handle
- **hopamp2:** handle

Return values

- **HAL:** status

Notes

- Trimming values (PMOS & NMOS) are updated and user trimming is enabled is calibration is successful.
- Calibration is performed in the mode specified in OPAMP init structure (mode normal or low-power). To perform calibration for both modes, repeat this function twice after OPAMP init structure accordingly updated.
- Calibration runs about 10 ms (5 dichotomy steps, repeated for P and N transistors: 10 steps with 1 ms for each step).

HAL_OPAMPEx_Unlock

Function name

HAL_StatusTypeDef HAL_OPAMPEx_Unlock (OPAMP_HandleTypeDef * hopamp)

Function description

Unlock the selected OPAMP configuration.

Parameters

- **hopamp:** OPAMP handle

Return values

- **HAL:** status

Notes

- This function must be called only when OPAMP is in state "locked".

55 HAL OSPI Generic Driver

55.1 OSPI Firmware driver registers structures

55.1.1 OSPI_InitTypeDef

OSPI_InitTypeDef is defined in the stm32u5xx_hal_ospi.h

Data Fields

- ***uint32_t FifoThreshold***
- ***uint32_t DualQuad***
- ***uint32_t MemoryType***
- ***uint32_t DeviceSize***
- ***uint32_t ChipSelectHighTime***
- ***uint32_t FreeRunningClock***
- ***uint32_t ClockMode***
- ***uint32_t WrapSize***
- ***uint32_t ClockPrescaler***
- ***uint32_t SampleShifting***
- ***uint32_t DelayHoldQuarterCycle***
- ***uint32_t ChipSelectBoundary***
- ***uint32_t DelayBlockBypass***
- ***uint32_t MaxTran***
- ***uint32_t Refresh***

Field Documentation

- ***uint32_t OSPI_InitTypeDef::FifoThreshold***
  This is the threshold used by the Peripheral to generate the interrupt indicating that data are available in reception or free place is available in transmission. This parameter can be a value between 1 and 32
- ***uint32_t OSPI_InitTypeDef::DualQuad***
  It enables or not the dual-quad mode which allow to access up to quad mode on two different devices to increase the throughput. This parameter can be a value of ***OSPI_DualQuad***
- ***uint32_t OSPI_InitTypeDef::MemoryType***
  It indicates the external device type connected to the OSPI. This parameter can be a value of ***OSPI_MemoryType***
- ***uint32_t OSPI_InitTypeDef::DeviceSize***
  It defines the size of the external device connected to the OSPI, it corresponds to the number of address bits required to access the external device. This parameter can be a value between 1 and 32
- ***uint32_t OSPI_InitTypeDef::ChipSelectHighTime***
  It defines the minimum number of clocks which the chip select must remain high between commands. This parameter can be a value between 1 and 8
- ***uint32_t OSPI_InitTypeDef::FreeRunningClock***
  It enables or not the free running clock. This parameter can be a value of ***OSPI_FreeRunningClock***
- ***uint32_t OSPI_InitTypeDef::ClockMode***
  It indicates the level of clock when the chip select is released. This parameter can be a value of ***OSPI_ClockMode***
- ***uint32_t OSPI_InitTypeDef::WrapSize***
  It indicates the wrap-size corresponding the external device configuration. This parameter can be a value of ***OSPI_WrapSize***
- ***uint32_t OSPI_InitTypeDef::ClockPrescaler***
  It specifies the prescaler factor used for generating the external clock based on the AHB clock. This parameter can be a value between 1 and 256
- ***uint32_t OSPI_InitTypeDef::SampleShifting***
  It allows to delay to 1/2 cycle the data sampling in order to take in account external signal delays. This parameter can be a value of ***OSPI_SampleShifting***

- ***uint32_t OSPI_InitTypeDef::DelayHoldQuarterCycle***
  It allows to hold to 1/4 cycle the data. This parameter can be a value of ***OSPI_DelayHoldQuarterCycle***
- ***uint32_t OSPI_InitTypeDef::ChipSelectBoundary***
  It enables the transaction boundary feature and defines the boundary of bytes to release the chip select. This parameter can be a value between 0 and 31
- ***uint32_t OSPI_InitTypeDef::DelayBlockBypass***
  It enables the delay block bypass, so the sampling is not affected by the delay block. This parameter can be a value of ***OSPI_DelayBlockBypass***
- ***uint32_t OSPI_InitTypeDef::MaxTran***
  It enables the communication regulation feature. The chip select is released every MaxTran+1 bytes when the other OctoSPI request the access to the bus. This parameter can be a value between 0 and 255
- ***uint32_t OSPI_InitTypeDef::Refresh***
  It enables the refresh rate feature. The chip select is released every Refresh+1 clock cycles. This parameter can be a value between 0 and 0xFFFFFFFF

55.1.2 __OSPI_HandleTypeDef

__OSPI_HandleTypeDef is defined in the stm32u5xx_hal_ospi.h

Data Fields

- ***OCTOSPI_TypeDef * Instance***
- ***OSPI_InitTypeDef Init***
- ***uint8_t * pBuffPtr***
- ***__IO uint32_t XferSize***
- ***__IO uint32_t XferCount***
- ***DMA_HandleTypeDef * hdma***
- ***__IO uint32_t State***
- ***__IO uint32_t ErrorCode***
- ***uint32_t Timeout***
- ***void(* ErrorCallback***
- ***void(* AbortCpltCallback***
- ***void(* FifoThresholdCallback***
- ***void(* CmdCpltCallback***
- ***void(* RxCpltCallback***
- ***void(* TxCpltCallback***
- ***void(* RxHalfCpltCallback***
- ***void(* TxHalfCpltCallback***
- ***void(* StatusMatchCallback***
- ***void(* TimeOutCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***OCTOSPI_TypeDef* __OSPI_HandleTypeDef::Instance***
  OSPI registers base address
- ***OSPI_InitTypeDef __OSPI_HandleTypeDef::Init***
  OSPI initialization parameters
- ***uint8_t* __OSPI_HandleTypeDef::pBuffPtr***
  Address of the OSPI buffer for transfer
- ***__IO uint32_t __OSPI_HandleTypeDef::XferSize***
  Number of data to transfer
- ***__IO uint32_t __OSPI_HandleTypeDef::XferCount***
  Counter of data transferred
- ***DMA_HandleTypeDef* __OSPI_HandleTypeDef::hdma***
  Handle of the DMA channel used for the transfer

- ***__IO uint32_t __OSPI_HandleTypeDef::State***
  Internal state of the OSPI HAL driver
- ***__IO uint32_t __OSPI_HandleTypeDef::ErrorCode***
  Error code in case of HAL driver internal error
- ***uint32_t __OSPI_HandleTypeDef::Timeout***
  Timeout used for the OSPI external device access
- ***void(* __OSPI_HandleTypeDef::ErrorCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::AbortCpltCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::FifoThresholdCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::CmdCpltCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::RxCpltCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::TxCpltCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::RxHalfCpltCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::TxHalfCpltCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::StatusMatchCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::TimeOutCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::MspInitCallback)(struct __OSPI_HandleTypeDef *hospi)***
- ***void(* __OSPI_HandleTypeDef::MspDeInitCallback)(struct __OSPI_HandleTypeDef *hospi)***

55.1.3 OSPI_RegularCmdTypeDef

OSPI_RegularCmdTypeDef is defined in the stm32u5xx_hal_ospi.h

Data Fields

- ***uint32_t OperationType***
- ***uint32_t FlashId***
- ***uint32_t Instruction***
- ***uint32_t InstructionMode***
- ***uint32_t InstructionSize***
- ***uint32_t InstructionDtrMode***
- ***uint32_t Address***
- ***uint32_t AddressMode***
- ***uint32_t AddressSize***
- ***uint32_t AddressDtrMode***
- ***uint32_t AlternateBytes***
- ***uint32_t AlternateBytesMode***
- ***uint32_t AlternateBytesSize***
- ***uint32_t AlternateBytesDtrMode***
- ***uint32_t DataMode***
- ***uint32_t NbData***
- ***uint32_t DataDtrMode***
- ***uint32_t DummyCycles***
- ***uint32_t DQSMode***
- ***uint32_t SIOOMode***

Field Documentation

- ***uint32_t OSPI_RegularCmdTypeDef::OperationType***
  It indicates if the configuration applies to the common registers or to the registers for the write operation (these registers are only used for memory-mapped mode). This parameter can be a value of ***OSPI_OperationType***
- ***uint32_t OSPI_RegularCmdTypeDef::FlashId***
  It indicates which external device is selected for this command (it applies only if Dualquad is disabled in the initialization structure). This parameter can be a value of ***OSPI_FlashID***

- ***uint32_t OSPI_RegularCmdTypeDef::Instruction***
  It contains the instruction to be sent to the device. This parameter can be a value between 0 and 0xFFFFFFFF
- ***uint32_t OSPI_RegularCmdTypeDef::InstructionMode***
  It indicates the mode of the instruction. This parameter can be a value of ***OSPI_InstructionMode***
- ***uint32_t OSPI_RegularCmdTypeDef::InstructionSize***
  It indicates the size of the instruction. This parameter can be a value of ***OSPI_InstructionSize***
- ***uint32_t OSPI_RegularCmdTypeDef::InstructionDtrMode***
  It enables or not the DTR mode for the instruction phase. This parameter can be a value of ***OSPI_InstructionDtrMode***
- ***uint32_t OSPI_RegularCmdTypeDef::Address***
  It contains the address to be sent to the device. This parameter can be a value between 0 and 0xFFFFFFFF
- ***uint32_t OSPI_RegularCmdTypeDef::AddressMode***
  It indicates the mode of the address. This parameter can be a value of ***OSPI_AddressMode***
- ***uint32_t OSPI_RegularCmdTypeDef::AddressSize***
  It indicates the size of the address. This parameter can be a value of ***OSPI_AddressSize***
- ***uint32_t OSPI_RegularCmdTypeDef::AddressDtrMode***
  It enables or not the DTR mode for the address phase. This parameter can be a value of ***OSPI_AddressDtrMode***
- ***uint32_t OSPI_RegularCmdTypeDef::AlternateBytes***
  It contains the alternate bytes to be sent to the device. This parameter can be a value between 0 and 0xFFFFFFFF
- ***uint32_t OSPI_RegularCmdTypeDef::AlternateBytesMode***
  It indicates the mode of the alternate bytes. This parameter can be a value of ***OSPI_AlternateBytesMode***
- ***uint32_t OSPI_RegularCmdTypeDef::AlternateBytesSize***
  It indicates the size of the alternate bytes. This parameter can be a value of ***OSPI_AlternateBytesSize***
- ***uint32_t OSPI_RegularCmdTypeDef::AlternateBytesDtrMode***
  It enables or not the DTR mode for the alternate bytes phase. This parameter can be a value of ***OSPI_AlternateBytesDtrMode***
- ***uint32_t OSPI_RegularCmdTypeDef::DataMode***
  It indicates the mode of the data. This parameter can be a value of ***OSPI_DataMode***
- ***uint32_t OSPI_RegularCmdTypeDef::NbData***
  It indicates the number of data transferred with this command. This field is only used for indirect mode. This parameter can be a value between 1 and 0xFFFFFFFF
- ***uint32_t OSPI_RegularCmdTypeDef::DataDtrMode***
  It enables or not the DTR mode for the data phase. This parameter can be a value of ***OSPI_DataDtrMode***
- ***uint32_t OSPI_RegularCmdTypeDef::DummyCycles***
  It indicates the number of dummy cycles inserted before data phase. This parameter can be a value between 0 and 31
- ***uint32_t OSPI_RegularCmdTypeDef::DQSMode***
  It enables or not the data strobe management. This parameter can be a value of ***OSPI_DQSMode***
- ***uint32_t OSPI_RegularCmdTypeDef::SIOOMode***
  It enables or not the SIOO mode. This parameter can be a value of ***OSPI_SIOOMode***

55.1.4 OSPI_HyperbusCfgTypeDef

OSPI_HyperbusCfgTypeDef is defined in the stm32u5xx_hal_ospi.h

Data Fields

- ***uint32_t RWRecoveryTime***
- ***uint32_t AccessTime***
- ***uint32_t WriteZeroLatency***
- ***uint32_t LatencyMode***

Field Documentation

- ***uint32_t OSPI_HyperbusCfgTypeDef::RWRecoveryTime***
  It indicates the number of cycles for the device read write recovery time. This parameter can be a value between 0 and 255
- ***uint32_t OSPI_HyperbusCfgTypeDef::AccessTime***
  It indicates the number of cycles for the device access time. This parameter can be a value between 0 and 255
- ***uint32_t OSPI_HyperbusCfgTypeDef::WriteZeroLatency***
  It enables or not the latency for the write access. This parameter can be a value of ***OSPI_WriteZeroLatency***
- ***uint32_t OSPI_HyperbusCfgTypeDef::LatencyMode***
  It configures the latency mode. This parameter can be a value of ***OSPI_LatencyMode***

55.1.5 OSPI_HyperbusCmdTypeDef

OSPI_HyperbusCmdTypeDef is defined in the stm32u5xx_hal_ospi.h

Data Fields

- ***uint32_t AddressSpace***
- ***uint32_t Address***
- ***uint32_t AddressSize***
- ***uint32_t NbData***
- ***uint32_t DQSMode***

Field Documentation

- ***uint32_t OSPI_HyperbusCmdTypeDef::AddressSpace***
  It indicates the address space accessed by the command. This parameter can be a value of ***OSPI_AddressSpace***
- ***uint32_t OSPI_HyperbusCmdTypeDef::Address***
  It contains the address to be sent tot he device. This parameter can be a value between 0 and 0xFFFFFFFF
- ***uint32_t OSPI_HyperbusCmdTypeDef::AddressSize***
  It indicates the size of the address. This parameter can be a value of ***OSPI_AddressSize***
- ***uint32_t OSPI_HyperbusCmdTypeDef::NbData***
  It indicates the number of data transferred with this command. This field is only used for indirect mode. This parameter can be a value between 1 and 0xFFFFFFFF In case of autopolling mode, this parameter can be any value between 1 and 4
- ***uint32_t OSPI_HyperbusCmdTypeDef::DQSMode***
  It enables or not the data strobe management. This parameter can be a value of ***OSPI_DQSMode***

55.1.6 OSPI_AutoPollingTypeDef

OSPI_AutoPollingTypeDef is defined in the stm32u5xx_hal_ospi.h

Data Fields

- ***uint32_t Match***
- ***uint32_t Mask***
- ***uint32_t MatchMode***
- ***uint32_t AutomaticStop***
- ***uint32_t Interval***

Field Documentation

- ***uint32_t OSPI_AutoPollingTypeDef::Match***
  Specifies the value to be compared with the masked status register to get a match. This parameter can be any value between 0 and 0xFFFFFFFF
- ***uint32_t OSPI_AutoPollingTypeDef::Mask***
  Specifies the mask to be applied to the status bytes received. This parameter can be any value between 0 and 0xFFFFFFFF
- ***uint32_t OSPI_AutoPollingTypeDef::MatchMode***
  Specifies the method used for determining a match. This parameter can be a value of ***OSPI_MatchMode***

- ***uint32_t OSPI_AutoPollingTypeDef::AutomaticStop***
  Specifies if automatic polling is stopped after a match. This parameter can be a value of *OSPI_AutomaticStop*
- ***uint32_t OSPI_AutoPollingTypeDef::Interval***
  Specifies the number of clock cycles between two read during automatic polling phases. This parameter can be any value between 0 and 0xFFFF

55.1.7 OSPI_MemoryMappedTypeDef

OSPI_MemoryMappedTypeDef is defined in the stm32u5xx_hal_ospi.h

Data Fields

- ***uint32_t TimeOutActivation***
- ***uint32_t TimeOutPeriod***

Field Documentation

- ***uint32_t OSPI_MemoryMappedTypeDef::TimeOutActivation***
  Specifies if the timeout counter is enabled to release the chip select. This parameter can be a value of *OSPI_TimeOutActivation*
- ***uint32_t OSPI_MemoryMappedTypeDef::TimeOutPeriod***
  Specifies the number of clock to wait when the FIFO is full before to release the chip select. This parameter can be any value between 0 and 0xFFFF

55.1.8 OSPIM_CfgTypeDef

OSPIM_CfgTypeDef is defined in the stm32u5xx_hal_ospi.h

Data Fields

- ***uint32_t ClkPort***
- ***uint32_t DQSPort***
- ***uint32_t NCSPort***
- ***uint32_t IOLowPort***
- ***uint32_t IOHighPort***
- ***uint32_t Req2AckTime***

Field Documentation

- ***uint32_t OSPIM_CfgTypeDef::ClkPort***
  It indicates which port of the OSPI IO Manager is used for the CLK pins. This parameter can be a value between 1 and 8
- ***uint32_t OSPIM_CfgTypeDef::DQSPort***
  It indicates which port of the OSPI IO Manager is used for the DQS pin. This parameter can be a value between 0 and 8, 0 means that signal not used
- ***uint32_t OSPIM_CfgTypeDef::NCSPort***
  It indicates which port of the OSPI IO Manager is used for the NCS pin. This parameter can be a value between 1 and 8
- ***uint32_t OSPIM_CfgTypeDef::IOLowPort***
  It indicates which port of the OSPI IO Manager is used for the IO[3:0] pins. This parameter can be a value of OSPIM_IOPort
- ***uint32_t OSPIM_CfgTypeDef::IOHighPort***
  It indicates which port of the OSPI IO Manager is used for the IO[7:4] pins. This parameter can be a value of OSPIM_IOPort
- ***uint32_t OSPIM_CfgTypeDef::Req2AckTime***
  It indicates the minimum switching duration (in number of clock cycles) expected if some signals are multiplexed in the OSPI IO Manager with the other OSPI. This parameter can be a value between 1 and 256

55.2 OSPI Firmware driver API description

The following section lists the various functions of the OSPI library.

55.2.1 How to use this driver

Initialization

As prerequisite, fill in the HAL_OSPI_MspInit() :

- Enable OctoSPI and OctoSPIM clocks interface with __HAL_RCC_OSPIx_CLK_ENABLE().
- Reset OctoSPI Peripheral with __HAL_RCC_OSPIx_FORCE_RESET() and __HAL_RCC_OSPIx_RELEASE_RESET().
- Enable the clocks for the OctoSPI GPIOS with __HAL_RCC_GPIOx_CLK_ENABLE().
- Configure these OctoSPI pins in alternate mode using HAL_GPIO_Init().
- If interrupt or DMA mode is used, enable and configure OctoSPI global interrupt with HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().
- If DMA mode is used, enable the clocks for the OctoSPI DMA channel with __HAL_RCC_DMAx_CLK_ENABLE(), configure DMA with HAL_DMA_Init(), link it with OctoSPI handle using __HAL_LINKDMA(), enable and configure DMA channel global interrupt with HAL_NVIC_SetPriority() and HAL_NVIC_EnableIRQ().

Configure the fifo threshold, the dual-quad mode, the memory type, the device size, the CS high time, the free running clock, the clock mode, the wrap size, the clock prescaler, the sample shifting, the hold delay and the CS boundary using the HAL_OSPI_Init() function.

When using Hyperbus, configure the RW recovery time, the access time, the write latency and the latency mode using the HAL_OSPI_HyperbusCfg() function.

Indirect functional mode

In regular mode, configure the command sequence using the HAL_OSPI_Command() or HAL_OSPI_Command_IT() functions :

- Instruction phase : the mode used and if present the size, the instruction opcode and the DTR mode.
- Address phase : the mode used and if present the size, the address value and the DTR mode.
- Alternate-bytes phase : the mode used and if present the size, the alternate bytes values and the DTR mode.
- Dummy-cycles phase : the number of dummy cycles (mode used is same as data phase).
- Data phase : the mode used and if present the number of bytes and the DTR mode.
- Data strobe (DQS) mode : the activation (or not) of this mode
- Sending Instruction Only Once (SIOO) mode : the activation (or not) of this mode.
- Flash identifier : in dual-quad mode, indicates which flash is concerned
- Operation type : always common configuration

In Hyperbus mode, configure the command sequence using the HAL_OSPI_HyperbusCmd() function :

- Address space : indicate if the access will be done in register or memory
- Address size
- Number of data
- Data strobe (DQS) mode : the activation (or not) of this mode

If no data is required for the command (only for regular mode, not for Hyperbus mode), it is sent directly to the memory :

- In polling mode, the output of the function is done when the transfer is complete.
- In interrupt mode, HAL_OSPI_CmdCpltCallback() will be called when the transfer is complete.

For the indirect write mode, use HAL_OSPI_Transmit(), HAL_OSPI_Transmit_DMA() or HAL_OSPI_Transmit_IT() after the command configuration :

- In polling mode, the output of the function is done when the transfer is complete.
- In interrupt mode, HAL_OSPI_FifoThresholdCallback() will be called when the fifo threshold is reached and HAL_OSPI_TxCpltCallback() will be called when the transfer is complete.
- In DMA mode, HAL_OSPI_TxHalfCpltCallback() will be called at the half transfer and HAL_OSPI_TxCpltCallback() will be called when the transfer is complete.

For the indirect read mode, use HAL_OSPI_Receive(), HAL_OSPI_Receive_DMA() or HAL_OSPI_Receive_IT() after the command configuration :

- In polling mode, the output of the function is done when the transfer is complete.

- In interrupt mode, HAL_OSPI_FifoThresholdCallback() will be called when the fifo threshold is reached and HAL_OSPI_RxCpltCallback() will be called when the transfer is complete.
- In DMA mode, HAL_OSPI_RxHalfCpltCallback() will be called at the half transfer and HAL_OSPI_RxCpltCallback() will be called when the transfer is complete.

Auto-polling functional mode

Configure the command sequence by the same way than the indirect mode

Configure the auto-polling functional mode using the HAL_OSPI_AutoPolling() or HAL_OSPI_AutoPolling_IT() functions :

- The size of the status bytes, the match value, the mask used, the match mode (OR/AND), the polling interval and the automatic stop activation.

After the configuration :

- In polling mode, the output of the function is done when the status match is reached. The automatic stop is activated to avoid an infinite loop.
- In interrupt mode, HAL_OSPI_StatusMatchCallback() will be called each time the status match is reached.

Memory-mapped functional mode

Configure the command sequence by the same way than the indirect mode except for the operation type in regular mode :

- Operation type equals to read configuration : the command configuration applies to read access in memory-mapped mode
- Operation type equals to write configuration : the command configuration applies to write access in memory-mapped mode
- Both read and write configuration should be performed before activating memory-mapped mode

Configure the memory-mapped functional mode using the HAL_OSPI_MemoryMapped() functions :

- The timeout activation and the timeout period.

After the configuration, the OctoSPI will be used as soon as an access on the AHB is done on the address range. HAL_OSPI_TimeOutCallback() will be called when the timeout expires.

Errors management and abort functionality

HAL_OSPI_GetError() function gives the error raised during the last operation.

HAL_OSPI_Abort() and HAL_OSPI_AbortIT() functions aborts any on-going operation and flushes the fifo :

- In polling mode, the output of the function is done when the transfer complete bit is set and the busy bit cleared.
- In interrupt mode, HAL_OSPI_AbortCpltCallback() will be called when the transfer complete bit is set.

Control functions

HAL_OSPI_GetState() function gives the current state of the HAL OctoSPI driver.

HAL_OSPI_SetTimeout() function configures the timeout value used in the driver.

HAL_OSPI_SetFifoThreshold() function configures the threshold on the Fifo of the OSPI Peripheral.

HAL_OSPI_GetFifoThreshold() function gives the current of the Fifo's threshold

IO manager configuration functions

HAL_OSPIM_Config() function configures the IO manager for the OctoSPI instance.

Callback registration

The compilation define USE_HAL_OSPI_REGISTER_CALLBACKS when set to 1 allows the user to configure dynamically the driver callbacks.

Use function HAL_OSPI_RegisterCallback() to register a user callback, it allows to register following callbacks:

- ErrorCallback : callback when error occurs.
- AbortCpltCallback : callback when abort is completed.
- FifoThresholdCallback : callback when the fifo threshold is reached.

- CmdCpltCallback : callback when a command without data is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- TxCpltCallback : callback when a transmission transfer is completed.
- RxHalfCpltCallback : callback when half of the reception transfer is completed.
- TxHalfCpltCallback : callback when half of the transmission transfer is completed.
- StatusMatchCallback : callback when a status match occurs.
- TimeOutCallback : callback when the timeout perioed expires.
- MspInitCallback : OSPI MspInit.
- MspDeInitCallback : OSPI MspDeInit.

This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_OSPI_UnRegisterCallback() to reset a callback to the default weak (overridden) function. It allows to reset following callbacks:

- ErrorCallback : callback when error occurs.
- AbortCpltCallback : callback when abort is completed.
- FifoThresholdCallback : callback when the fifo threshold is reached.
- CmdCpltCallback : callback when a command without data is completed.
- RxCpltCallback : callback when a reception transfer is completed.
- TxCpltCallback : callback when a transmission transfer is completed.
- RxHalfCpltCallback : callback when half of the reception transfer is completed.
- TxHalfCpltCallback : callback when half of the transmission transfer is completed.
- StatusMatchCallback : callback when a status match occurs.
- TimeOutCallback : callback when the timeout perioed expires.
- MspInitCallback : OSPI MspInit.
- MspDeInitCallback : OSPI MspDeInit.

This function) takes as parameters the HAL peripheral handle and the Callback ID.

By default, after the HAL_OSPI_Init() and if the state is HAL_OSPI_STATE_RESET all callbacks are reset to the corresponding legacy weak (overridden) functions. Exception done for MspInit and MspDeInit callbacks that are respectively reset to the legacy weak (overridden) functions in the HAL_OSPI_Init() and HAL_OSPI_DeInit() only when these callbacks are null (not registered beforehand). If not, MspInit or MspDeInit are not null, the HAL_OSPI_Init() and HAL_OSPI_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand)

Callbacks can be registered/unregistered in READY state only. Exception done for MspInit/MspDeInit callbacks that can be registered/unregistered in READY or RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/DeInit. In that case first register the MspInit/MspDeInit user callbacks using HAL_OSPI_RegisterCallback() before calling HAL_OSPI_DeInit() or HAL_OSPI_Init() function.

When The compilation define USE_HAL_OSPI_REGISTER_CALLBACKS is set to 0 or not defined, the callback registering feature is not available and weak (overridden) callbacks are used.

55.2.2 Initialization and Configuration functions

This subsection provides a set of functions allowing to :

- Initialize the OctoSPI.
- De-initialize the OctoSPI.

This section contains the following APIs:

- *HAL_OSPI_Init()*
- *HAL_OSPI_MspInit()*
- *HAL_OSPI_DeInit()*
- *HAL_OSPI_MspDeInit()*

55.2.3 IO operation functions

This subsection provides a set of functions allowing to :

- Handle the interrupts.

- Handle the command sequence (regular and Hyperbus).
- Handle the Hyperbus configuration.
- Transmit data in blocking, interrupt or DMA mode.
- Receive data in blocking, interrupt or DMA mode.
- Manage the auto-polling functional mode.
- Manage the memory-mapped functional mode.

This section contains the following APIs:

- *HAL_OSPI_IRQHandler()*
- *HAL_OSPI_Command()*
- *HAL_OSPI_Command_IT()*
- *HAL_OSPI_HyperbusCfg()*
- *HAL_OSPI_HyperbusCmd()*
- *HAL_OSPI_Transmit()*
- *HAL_OSPI_Receive()*
- *HAL_OSPI_Transmit_IT()*
- *HAL_OSPI_Receive_IT()*
- *HAL_OSPI_Transmit_DMA()*
- *HAL_OSPI_Receive_DMA()*
- *HAL_OSPI_AutoPolling()*
- *HAL_OSPI_AutoPolling_IT()*
- *HAL_OSPI_MemoryMapped()*
- *HAL_OSPI_ErrorCallback()*
- *HAL_OSPI_AbortCpltCallback()*
- *HAL_OSPI_FifoThresholdCallback()*
- *HAL_OSPI_CmdCpltCallback()*
- *HAL_OSPI_RxCpltCallback()*
- *HAL_OSPI_TxCpltCallback()*
- *HAL_OSPI_RxHalfCpltCallback()*
- *HAL_OSPI_TxHalfCpltCallback()*
- *HAL_OSPI_StatusMatchCallback()*
- *HAL_OSPI_TimeOutCallback()*
- *HAL_OSPI_RegisterCallback()*
- *HAL_OSPI_UnRegisterCallback()*

55.2.4 Peripheral Control and State functions

This subsection provides a set of functions allowing to :

- Check in run-time the state of the driver.
- Check the error code set during last operation.
- Abort any operation.
- Manage the Fifo threshold.
- Configure the timeout duration used in the driver.

This section contains the following APIs:

- *HAL_OSPI_Abort()*
- *HAL_OSPI_Abort_IT()*
- *HAL_OSPI_SetFifoThreshold()*
- *HAL_OSPI_GetFifoThreshold()*
- *HAL_OSPI_SetTimeout()*
- *HAL_OSPI_GetError()*
- *HAL_OSPI_GetState()*

55.2.5 IO Manager configuration function

This subsection provides a set of functions allowing to :
- Configure the IO manager.

This section contains the following APIs:
- *HAL_OSPIM_Config()*

55.2.6 Detailed description of functions

HAL_OSPI_Init

Function name

HAL_StatusTypeDef HAL_OSPI_Init (OSPI_HandleTypeDef * hospi)

Function description

Initialize the OSPI mode according to the specified parameters in the OSPI_InitTypeDef and initialize the associated handle.

Parameters
- **hospi:** : OSPI handle

Return values
- **HAL:** status

HAL_OSPI_MspInit

Function name

void HAL_OSPI_MspInit (OSPI_HandleTypeDef * hospi)

Function description

Initialize the OSPI MSP.

Parameters
- **hospi:** : OSPI handle

Return values
- **None:**

HAL_OSPI_DeInit

Function name

HAL_StatusTypeDef HAL_OSPI_DeInit (OSPI_HandleTypeDef * hospi)

Function description

De-Initialize the OSPI peripheral.

Parameters
- **hospi:** : OSPI handle

Return values
- **HAL:** status

HAL_OSPI_MspDeInit

Function name

void HAL_OSPI_MspDeInit (OSPI_HandleTypeDef * hospi)

Function description

DeInitialize the OSPI MSP.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_IRQHandler

Function name

void HAL_OSPI_IRQHandler (OSPI_HandleTypeDef * hospi)

Function description

Handle OSPI interrupt request.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_Command

Function name

HAL_StatusTypeDef HAL_OSPI_Command (OSPI_HandleTypeDef * hospi, OSPI_RegularCmdTypeDef * cmd, uint32_t Timeout)

Function description

Set the command configuration.

Parameters

- **hospi:** : OSPI handle
- **cmd:** : structure that contains the command configuration information
- **Timeout:** : Timeout duration

Return values

- **HAL:** status

HAL_OSPI_Command_IT

Function name

HAL_StatusTypeDef HAL_OSPI_Command_IT (OSPI_HandleTypeDef * hospi, OSPI_RegularCmdTypeDef * cmd)

Function description

Set the command configuration in interrupt mode.

Parameters

- **hospi:** : OSPI handle
- **cmd:** : structure that contains the command configuration information

Return values

- **HAL:** status

Notes

- This function is used only in Indirect Read or Write Modes

HAL_OSPI_HyperbusCfg

Function name

HAL_StatusTypeDef HAL_OSPI_HyperbusCfg (OSPI_HandleTypeDef * hospi, OSPI_HyperbusCfgTypeDef * cfg, uint32_t Timeout)

Function description

Configure the Hyperbus parameters.

Parameters

- **hospi:** : OSPI handle
- **cfg:** : Structure containing the Hyperbus configuration
- **Timeout:** : Timeout duration

Return values

- **HAL:** status

HAL_OSPI_HyperbusCmd

Function name

HAL_StatusTypeDef HAL_OSPI_HyperbusCmd (OSPI_HandleTypeDef * hospi, OSPI_HyperbusCmdTypeDef * cmd, uint32_t Timeout)

Function description

Set the Hyperbus command configuration.

Parameters

- **hospi:** : OSPI handle
- **cmd:** : Structure containing the Hyperbus command
- **Timeout:** : Timeout duration

Return values

- **HAL:** status

HAL_OSPI_Transmit

Function name

HAL_StatusTypeDef HAL_OSPI_Transmit (OSPI_HandleTypeDef * hospi, uint8_t * pData, uint32_t Timeout)

Function description

Transmit an amount of data in blocking mode.

Parameters

- **hospi:** : OSPI handle
- **pData:** : pointer to data buffer
- **Timeout:** : Timeout duration

Return values

- **HAL:** status

Notes

- This function is used only in Indirect Write Mode

HAL_OSPI_Receive

Function name

HAL_StatusTypeDef HAL_OSPI_Receive (OSPI_HandleTypeDef * hospi, uint8_t * pData, uint32_t Timeout)

Function description

Receive an amount of data in blocking mode.

Parameters

- **hospi:** : OSPI handle
- **pData:** : pointer to data buffer
- **Timeout:** : Timeout duration

Return values

- **HAL:** status

Notes

- This function is used only in Indirect Read Mode

HAL_OSPI_Transmit_IT

Function name

HAL_StatusTypeDef HAL_OSPI_Transmit_IT (OSPI_HandleTypeDef * hospi, uint8_t * pData)

Function description

Send an amount of data in non-blocking mode with interrupt.

Parameters

- **hospi:** : OSPI handle
- **pData:** : pointer to data buffer

Return values

- **HAL:** status

Notes

- This function is used only in Indirect Write Mode

HAL_OSPI_Receive_IT

Function name

HAL_StatusTypeDef HAL_OSPI_Receive_IT (OSPI_HandleTypeDef * hospi, uint8_t * pData)

Function description

Receive an amount of data in non-blocking mode with interrupt.

Parameters

- **hospi:** : OSPI handle
- **pData:** : pointer to data buffer

Return values

- **HAL:** status

Notes

- This function is used only in Indirect Read Mode

HAL_OSPI_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_OSPI_Transmit_DMA (OSPI_HandleTypeDef * hospi, uint8_t * pData)

Function description

Send an amount of data in non-blocking mode with DMA.

Parameters

- **hospi:** : OSPI handle
- **pData:** : pointer to data buffer

Return values

- **HAL:** status

Notes

- This function is used only in Indirect Write Mode
- If DMA peripheral access is configured as halfword, the number of data and the fifo threshold should be aligned on halfword
- If DMA peripheral access is configured as word, the number of data and the fifo threshold should be aligned on word

HAL_OSPI_Receive_DMA

Function name

HAL_StatusTypeDef HAL_OSPI_Receive_DMA (OSPI_HandleTypeDef * hospi, uint8_t * pData)

Function description

Receive an amount of data in non-blocking mode with DMA.

Parameters

- **hospi:** : OSPI handle
- **pData:** : pointer to data buffer.

Return values

- **HAL:** status

Notes

- This function is used only in Indirect Read Mode
- If DMA peripheral access is configured as halfword, the number of data and the fifo threshold should be aligned on halfword
- If DMA peripheral access is configured as word, the number of data and the fifo threshold should be aligned on word

HAL_OSPI_AutoPolling

Function name

HAL_StatusTypeDef HAL_OSPI_AutoPolling (OSPI_HandleTypeDef * hospi, OSPI_AutoPollingTypeDef * cfg, uint32_t Timeout)

Function description

Configure the OSPI Automatic Polling Mode in blocking mode.

Parameters

- **hospi:** : OSPI handle
- **cfg:** : structure that contains the polling configuration information.
- **Timeout:** : Timeout duration

Return values

- **HAL:** status

Notes

- This function is used only in Automatic Polling Mode

HAL_OSPI_AutoPolling_IT

Function name

HAL_StatusTypeDef HAL_OSPI_AutoPolling_IT (OSPI_HandleTypeDef * hospi, OSPI_AutoPollingTypeDef * cfg)

Function description

Configure the OSPI Automatic Polling Mode in non-blocking mode.

Parameters

- **hospi:** : OSPI handle
- **cfg:** : structure that contains the polling configuration information.

Return values

- **HAL:** status

Notes

- This function is used only in Automatic Polling Mode

HAL_OSPI_MemoryMapped

Function name

HAL_StatusTypeDef HAL_OSPI_MemoryMapped (OSPI_HandleTypeDef * hospi, OSPI_MemoryMappedTypeDef * cfg)

Function description

Configure the Memory Mapped mode.

Parameters

- **hospi:** : OSPI handle
- **cfg:** : structure that contains the memory mapped configuration information.

Return values

- **HAL:** status

Notes

- This function is used only in Memory mapped Mode

HAL_OSPI_ErrorCallback

Function name

void HAL_OSPI_ErrorCallback (OSPI_HandleTypeDef * hospi)

Function description

Transfer Error callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_AbortCpltCallback

Function name

void HAL_OSPI_AbortCpltCallback (OSPI_HandleTypeDef * hospi)

Function description

Abort completed callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_FifoThresholdCallback

Function name

void HAL_OSPI_FifoThresholdCallback (OSPI_HandleTypeDef * hospi)

Function description

FIFO Threshold callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_CmdCpltCallback

Function name

void HAL_OSPI_CmdCpltCallback (OSPI_HandleTypeDef * hospi)

Function description

Command completed callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_RxCpltCallback

Function name

void HAL_OSPI_RxCpltCallback (OSPI_HandleTypeDef * hospi)

Function description

Rx Transfer completed callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_TxCpltCallback

Function name

void HAL_OSPI_TxCpltCallback (OSPI_HandleTypeDef * hospi)

Function description

Tx Transfer completed callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_RxHalfCpltCallback

Function name

void HAL_OSPI_RxHalfCpltCallback (OSPI_HandleTypeDef * hospi)

Function description

Rx Half Transfer completed callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_TxHalfCpltCallback

Function name

void HAL_OSPI_TxHalfCpltCallback (OSPI_HandleTypeDef * hospi)

Function description

Tx Half Transfer completed callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_StatusMatchCallback

Function name

void HAL_OSPI_StatusMatchCallback (OSPI_HandleTypeDef * hospi)

Function description

Status Match callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_TimeOutCallback

Function name

void HAL_OSPI_TimeOutCallback (OSPI_HandleTypeDef * hospi)

Function description

Timeout callback.

Parameters

- **hospi:** : OSPI handle

Return values

- **None:**

HAL_OSPI_RegisterCallback

Function name

HAL_StatusTypeDef HAL_OSPI_RegisterCallback (OSPI_HandleTypeDef * hospi, HAL_OSPI_CallbackIDTypeDef CallbackID, pOSPI_CallbackTypeDef pCallback)

Function description

Register a User OSPI Callback To be used to override the weak predefined callback.

Parameters

- **hospi:** : OSPI handle
- **CallbackID:** : ID of the callback to be registered This parameter can be one of the following values:
  – HAL_OSPI_ERROR_CB_ID OSPI Error Callback ID
  – HAL_OSPI_ABORT_CB_ID OSPI Abort Callback ID
  – HAL_OSPI_FIFO_THRESHOLD_CB_ID OSPI FIFO Threshold Callback ID
  – HAL_OSPI_CMD_CPLT_CB_ID OSPI Command Complete Callback ID
  – HAL_OSPI_RX_CPLT_CB_ID OSPI Rx Complete Callback ID
  – HAL_OSPI_TX_CPLT_CB_ID OSPI Tx Complete Callback ID
  – HAL_OSPI_RX_HALF_CPLT_CB_ID OSPI Rx Half Complete Callback ID
  – HAL_OSPI_TX_HALF_CPLT_CB_ID OSPI Tx Half Complete Callback ID
  – HAL_OSPI_STATUS_MATCH_CB_ID OSPI Status Match Callback ID
  – HAL_OSPI_TIMEOUT_CB_ID OSPI Timeout Callback ID
  – HAL_OSPI_MSP_INIT_CB_ID OSPI MspInit callback ID
  – HAL_OSPI_MSP_DEINIT_CB_ID OSPI MspDeInit callback ID
- **pCallback:** : pointer to the Callback function

Return values

- **status:**

HAL_OSPI_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_OSPI_UnRegisterCallback (OSPI_HandleTypeDef * hospi, HAL_OSPI_CallbackIDTypeDef CallbackID)

Function description

Unregister a User OSPI Callback OSPI Callback is redirected to the weak predefined callback.

Parameters

- **hospi:** : OSPI handle
- **CallbackID:** : ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_OSPI_ERROR_CB_ID OSPI Error Callback ID
  - HAL_OSPI_ABORT_CB_ID OSPI Abort Callback ID
  - HAL_OSPI_FIFO_THRESHOLD_CB_ID OSPI FIFO Threshold Callback ID
  - HAL_OSPI_CMD_CPLT_CB_ID OSPI Command Complete Callback ID
  - HAL_OSPI_RX_CPLT_CB_ID OSPI Rx Complete Callback ID
  - HAL_OSPI_TX_CPLT_CB_ID OSPI Tx Complete Callback ID
  - HAL_OSPI_RX_HALF_CPLT_CB_ID OSPI Rx Half Complete Callback ID
  - HAL_OSPI_TX_HALF_CPLT_CB_ID OSPI Tx Half Complete Callback ID
  - HAL_OSPI_STATUS_MATCH_CB_ID OSPI Status Match Callback ID
  - HAL_OSPI_TIMEOUT_CB_ID OSPI Timeout Callback ID
  - HAL_OSPI_MSP_INIT_CB_ID OSPI MspInit callback ID
  - HAL_OSPI_MSP_DEINIT_CB_ID OSPI MspDeInit callback ID

Return values

- **status:**

HAL_OSPI_Abort

Function name

HAL_StatusTypeDef HAL_OSPI_Abort (OSPI_HandleTypeDef * hospi)

Function description

Abort the current transmission.

Parameters

- **hospi:** : OSPI handle

Return values

- **HAL:** status

HAL_OSPI_Abort_IT

Function name

HAL_StatusTypeDef HAL_OSPI_Abort_IT (OSPI_HandleTypeDef * hospi)

Function description

Abort the current transmission (non-blocking function)

Parameters

- **hospi:** : OSPI handle

Return values

- **HAL:** status

HAL_OSPI_SetFifoThreshold

Function name

HAL_StatusTypeDef HAL_OSPI_SetFifoThreshold (OSPI_HandleTypeDef * hospi, uint32_t Threshold)

Function description

Set OSPI Fifo threshold.

Parameters

- **hospi:** : OSPI handle.
- **Threshold:** : Threshold of the Fifo.

Return values

- **HAL:** status

HAL_OSPI_GetFifoThreshold

Function name

uint32_t HAL_OSPI_GetFifoThreshold (const OSPI_HandleTypeDef * hospi)

Function description

Get OSPI Fifo threshold.

Parameters

- **hospi:** : OSPI handle.

Return values

- **Fifo:** threshold

HAL_OSPI_SetTimeout

Function name

HAL_StatusTypeDef HAL_OSPI_SetTimeout (OSPI_HandleTypeDef * hospi, uint32_t Timeout)

Function description

Set OSPI timeout.

Parameters

- **hospi:** : OSPI handle.
- **Timeout:** : Timeout for the memory access.

Return values

- **None:**

HAL_OSPI_GetError

Function name

uint32_t HAL_OSPI_GetError (const OSPI_HandleTypeDef * hospi)

Function description

Return the OSPI error code.

Parameters

- **hospi:** : OSPI handle

Return values

- **OSPI:** Error Code

HAL_OSPI_GetState

Function name

uint32_t HAL_OSPI_GetState (const OSPI_HandleTypeDef * hospi)

Function description

Return the OSPI handle state.

Parameters

- **hospi:** : OSPI handle

Return values

- **HAL:** state

HAL_OSPIM_Config

Function name

HAL_StatusTypeDef HAL_OSPIM_Config (OSPI_HandleTypeDef * hospi, OSPIM_CfgTypeDef * cfg, uint32_t Timeout)

Function description

Configure the OctoSPI IO manager.

Parameters

- **hospi:** : OSPI handle
- **cfg:** : Configuration of the IO Manager for the instance
- **Timeout:** : Timeout duration

Return values

- **HAL:** status

HAL_OSPI_DLYB_SetConfig

Function name

HAL_StatusTypeDef HAL_OSPI_DLYB_SetConfig (OSPI_HandleTypeDef * hospi, HAL_OSPI_DLYB_CfgTypeDef * pdlyb_cfg)

Function description

HAL_OSPI_DLYB_GetConfig

Function name

HAL_StatusTypeDef HAL_OSPI_DLYB_GetConfig (const OSPI_HandleTypeDef * hospi, HAL_OSPI_DLYB_CfgTypeDef * pdlyb_cfg)

Function description

HAL_OSPI_DLYB_GetClockPeriod

Function name

HAL_StatusTypeDef HAL_OSPI_DLYB_GetClockPeriod (OSPI_HandleTypeDef * hospi, HAL_OSPI_DLYB_CfgTypeDef * pdlyb_cfg)

Function description

55.3 OSPI Firmware driver defines

The following section lists the various define and macros of the module.

55.3.1 OSPI

OSPI

OSPI Address DTR Mode

HAL_OSPI_ADDRESS_DTR_DISABLE

DTR mode disabled for address phase

HAL_OSPI_ADDRESS_DTR_ENABLE

DTR mode enabled for address phase

OSPI Address Mode

HAL_OSPI_ADDRESS_NONE

No address

HAL_OSPI_ADDRESS_1_LINE

Address on a single line

HAL_OSPI_ADDRESS_2_LINES

Address on two lines

HAL_OSPI_ADDRESS_4_LINES

Address on four lines

HAL_OSPI_ADDRESS_8_LINES

Address on eight lines

OSPI Address Size

HAL_OSPI_ADDRESS_8_BITS

8-bit address

HAL_OSPI_ADDRESS_16_BITS

16-bit address

HAL_OSPI_ADDRESS_24_BITS

24-bit address

HAL_OSPI_ADDRESS_32_BITS

32-bit address

OSPI Hyperbus Address Space

HAL_OSPI_MEMORY_ADDRESS_SPACE

HyperBus memory mode

HAL_OSPI_REGISTER_ADDRESS_SPACE

HyperBus register mode

OSPI Alternate Bytes DTR Mode

HAL_OSPI_ALTERNATE_BYTES_DTR_DISABLE

DTR mode disabled for alternate bytes phase

HAL_OSPI_ALTERNATE_BYTES_DTR_ENABLE

DTR mode enabled for alternate bytes phase

OSPI Alternate Bytes Mode

HAL_OSPI_ALTERNATE_BYTES_NONE

No alternate bytes

HAL_OSPI_ALTERNATE_BYTES_1_LINE

Alternate bytes on a single line

HAL_OSPI_ALTERNATE_BYTES_2_LINES
Alternate bytes on two lines

HAL_OSPI_ALTERNATE_BYTES_4_LINES
Alternate bytes on four lines

HAL_OSPI_ALTERNATE_BYTES_8_LINES
Alternate bytes on eight lines

OSPI Alternate Bytes Size

HAL_OSPI_ALTERNATE_BYTES_8_BITS
8-bit alternate bytes

HAL_OSPI_ALTERNATE_BYTES_16_BITS
16-bit alternate bytes

HAL_OSPI_ALTERNATE_BYTES_24_BITS
24-bit alternate bytes

HAL_OSPI_ALTERNATE_BYTES_32_BITS
32-bit alternate bytes

OSPI Automatic Stop

HAL_OSPI_AUTOMATIC_STOP_DISABLE
AutoPolling stops only with abort or OSPI disabling

HAL_OSPI_AUTOMATIC_STOP_ENABLE
AutoPolling stops as soon as there is a match

OSPI Clock Mode

HAL_OSPI_CLOCK_MODE_0
CLK must stay low while nCS is high

HAL_OSPI_CLOCK_MODE_3
CLK must stay high while nCS is high

OSPI Data DTR Mode

HAL_OSPI_DATA_DTR_DISABLE
DTR mode disabled for data phase

HAL_OSPI_DATA_DTR_ENABLE
DTR mode enabled for data phase

OSPI Data Mode

HAL_OSPI_DATA_NONE
No data

HAL_OSPI_DATA_1_LINE
Data on a single line

HAL_OSPI_DATA_2_LINES
Data on two lines

HAL_OSPI_DATA_4_LINES

Data on four lines

HAL_OSPI_DATA_8_LINES

Data on eight lines

OSPI Delay Block Bypaas

HAL_OSPI_DELAY_BLOCK_USED

Sampling clock is delayed by the delay block

HAL_OSPI_DELAY_BLOCK_BYPASSED

Delay block is bypassed

OSPI Delay Hold Quarter Cycle

HAL_OSPI_DHQC_DISABLE

No Delay

HAL_OSPI_DHQC_ENABLE

Delay Hold 1/4 cycle

OSPI DQS Mode

HAL_OSPI_DQS_DISABLE

DQS disabled

HAL_OSPI_DQS_ENABLE

DQS enabled

OSPI Dual-Quad

HAL_OSPI_DUALQUAD_DISABLE

Dual-Quad mode disabled

HAL_OSPI_DUALQUAD_ENABLE

Dual-Quad mode enabled

OSPI Error Code

HAL_OSPI_ERROR_NONE

No error

HAL_OSPI_ERROR_TIMEOUT

Timeout error

HAL_OSPI_ERROR_TRANSFER

Transfer error

HAL_OSPI_ERROR_DMA

DMA transfer error

HAL_OSPI_ERROR_INVALID_PARAM

Invalid parameters error

HAL_OSPI_ERROR_INVALID_SEQUENCE

Sequence of the state machine is incorrect

HAL_OSPI_ERROR_INVALID_CALLBACK

Invalid callback error

OSPI Exported Macros

__HAL_OSPI_RESET_HANDLE_STATE

Description:

- Reset OSPI handle state.

Parameters:

- __HANDLE__: specifies the OSPI Handle.

Return value:

- None

__HAL_OSPI_ENABLE

Description:

- Enable the OSPI peripheral.

Parameters:

- __HANDLE__: specifies the OSPI Handle.

Return value:

- None

__HAL_OSPI_DISABLE

Description:

- Disable the OSPI peripheral.

Parameters:

- __HANDLE__: specifies the OSPI Handle.

Return value:

- None

__HAL_OSPI_ENABLE_IT

Description:

- Enable the specified OSPI interrupt.

Parameters:

- __HANDLE__: specifies the OSPI Handle.
- __INTERRUPT__: specifies the OSPI interrupt source to enable. This parameter can be one of the following values:
  – HAL_OSPI_IT_TO: OSPI Timeout interrupt
  – HAL_OSPI_IT_SM: OSPI Status match interrupt
  – HAL_OSPI_IT_FT: OSPI FIFO threshold interrupt
  – HAL_OSPI_IT_TC: OSPI Transfer complete interrupt
  – HAL_OSPI_IT_TE: OSPI Transfer error interrupt

Return value:

- None

__HAL_OSPI_DISABLE_IT

Description:

- Disable the specified OSPI interrupt.

Parameters:

- __HANDLE__: specifies the OSPI Handle.
- __INTERRUPT__: specifies the OSPI interrupt source to disable. This parameter can be one of the following values:
  – HAL_OSPI_IT_TO: OSPI Timeout interrupt
  – HAL_OSPI_IT_SM: OSPI Status match interrupt
  – HAL_OSPI_IT_FT: OSPI FIFO threshold interrupt
  – HAL_OSPI_IT_TC: OSPI Transfer complete interrupt
  – HAL_OSPI_IT_TE: OSPI Transfer error interrupt

Return value:

- None

__HAL_OSPI_GET_IT_SOURCE

Description:

- Check whether the specified OSPI interrupt source is enabled or not.

Parameters:

- __HANDLE__: specifies the OSPI Handle.
- __INTERRUPT__: specifies the OSPI interrupt source to check. This parameter can be one of the following values:
  – HAL_OSPI_IT_TO: OSPI Timeout interrupt
  – HAL_OSPI_IT_SM: OSPI Status match interrupt
  – HAL_OSPI_IT_FT: OSPI FIFO threshold interrupt
  – HAL_OSPI_IT_TC: OSPI Transfer complete interrupt
  – HAL_OSPI_IT_TE: OSPI Transfer error interrupt

Return value:

- The: new state of __INTERRUPT__ (TRUE or FALSE).

__HAL_OSPI_GET_FLAG

Description:

- Check whether the selected OSPI flag is set or not.

Parameters:

- __HANDLE__: specifies the OSPI Handle.
- __FLAG__: specifies the OSPI flag to check. This parameter can be one of the following values:
  – HAL_OSPI_FLAG_BUSY: OSPI Busy flag
  – HAL_OSPI_FLAG_TO: OSPI Timeout flag
  – HAL_OSPI_FLAG_SM: OSPI Status match flag
  – HAL_OSPI_FLAG_FT: OSPI FIFO threshold flag
  – HAL_OSPI_FLAG_TC: OSPI Transfer complete flag
  – HAL_OSPI_FLAG_TE: OSPI Transfer error flag

Return value:

- None

__HAL_OSPI_CLEAR_FLAG

Description:
- Clears the specified OSPI's flag status.

Parameters:
- __HANDLE__: specifies the OSPI Handle.
- __FLAG__: specifies the OSPI clear register flag that needs to be set This parameter can be one of the following values:
  - HAL_OSPI_FLAG_TO: OSPI Timeout flag
  - HAL_OSPI_FLAG_SM: OSPI Status match flag
  - HAL_OSPI_FLAG_TC: OSPI Transfer complete flag
  - HAL_OSPI_FLAG_TE: OSPI Transfer error flag

Return value:
- None

OSPI Exported Types

HAL_OSPI_DLYB_CfgTypeDef

OSPI Flags

HAL_OSPI_FLAG_BUSY

Busy flag: operation is ongoing

HAL_OSPI_FLAG_TO

Timeout flag: timeout occurs in memory-mapped mode

HAL_OSPI_FLAG_SM

Status match flag: received data matches in autopolling mode

HAL_OSPI_FLAG_FT

Fifo threshold flag: Fifo threshold reached or data left after read from memory is complete

HAL_OSPI_FLAG_TC

Transfer complete flag: programmed number of data have been transferred or the transfer has been aborted

HAL_OSPI_FLAG_TE

Transfer error flag: invalid address is being accessed

OSPI Flash Id

HAL_OSPI_FLASH_ID_1

FLASH 1 selected

HAL_OSPI_FLASH_ID_2

FLASH 2 selected

OSPI Free Running Clock

HAL_OSPI_FREERUNCLK_DISABLE

CLK is not free running

HAL_OSPI_FREERUNCLK_ENABLE

CLK is free running (always provided)

OSPI Instruction DTR Mode

HAL_OSPI_INSTRUCTION_DTR_DISABLE

DTR mode disabled for instruction phase

HAL_OSPI_INSTRUCTION_DTR_ENABLE

DTR mode enabled for instruction phase

OSPI Instruction Mode

HAL_OSPI_INSTRUCTION_NONE

No instruction

HAL_OSPI_INSTRUCTION_1_LINE

Instruction on a single line

HAL_OSPI_INSTRUCTION_2_LINES

Instruction on two lines

HAL_OSPI_INSTRUCTION_4_LINES

Instruction on four lines

HAL_OSPI_INSTRUCTION_8_LINES

Instruction on eight lines

OSPI Instruction Size

HAL_OSPI_INSTRUCTION_8_BITS

8-bit instruction

HAL_OSPI_INSTRUCTION_16_BITS

16-bit instruction

HAL_OSPI_INSTRUCTION_24_BITS

24-bit instruction

HAL_OSPI_INSTRUCTION_32_BITS

32-bit instruction

OSPI Interrupts

HAL_OSPI_IT_TO

Interrupt on the timeout flag

HAL_OSPI_IT_SM

Interrupt on the status match flag

HAL_OSPI_IT_FT

Interrupt on the fifo threshold flag

HAL_OSPI_IT_TC

Interrupt on the transfer complete flag

HAL_OSPI_IT_TE

Interrupt on the transfer error flag

OSPI IO Manager IO Port

OSPI Hyperbus Latency Mode

HAL_OSPI_VARIABLE_LATENCY
Variable initial latency

HAL_OSPI_FIXED_LATENCY
Fixed latency

OSPI Match Mode

HAL_OSPI_MATCH_MODE_AND

AND match mode between unmasked bits

HAL_OSPI_MATCH_MODE_OR

OR match mode between unmasked bits

OSPI Memory Type

HAL_OSPI_MEMTYPE_MICRON

Micron mode

HAL_OSPI_MEMTYPE_MACRONIX

Macronix mode

HAL_OSPI_MEMTYPE_APMEMORY

AP Memory mode

HAL_OSPI_MEMTYPE_MACRONIX_RAM

Macronix RAM mode

HAL_OSPI_MEMTYPE_HYPERBUS

Hyperbus mode

OSPI Operation Type

HAL_OSPI_OPTYPE_COMMON_CFG

Common configuration (indirect or auto-polling mode)

HAL_OSPI_OPTYPE_READ_CFG

Read configuration (memory-mapped mode)

HAL_OSPI_OPTYPE_WRITE_CFG

Write configuration (memory-mapped mode)

HAL_OSPI_OPTYPE_WRAP_CFG

Wrap configuration (memory-mapped mode)

OSPI Sample Shifting

HAL_OSPI_SAMPLE_SHIFTING_NONE

No shift

HAL_OSPI_SAMPLE_SHIFTING_HALFCYCLE

1/2 cycle shift

OSPI SIOO Mode

HAL_OSPI_SIOO_INST_EVERY_CMD

Send instruction on every transaction

HAL_OSPI_SIOO_INST_ONLY_FIRST_CMD

Send instruction only for the first command

OSPI State

HAL_OSPI_STATE_RESET

Initial state

HAL_OSPI_STATE_HYPERBUS_INIT

Initialization done in hyperbus mode but timing configuration not done

HAL_OSPI_STATE_READY

Driver ready to be used

HAL_OSPI_STATE_CMD_CFG

Command (regular or hyperbus) configured, ready for an action

HAL_OSPI_STATE_READ_CMD_CFG

Read command configuration done, not the write command configuration

HAL_OSPI_STATE_WRITE_CMD_CFG

Write command configuration done, not the read command configuration

HAL_OSPI_STATE_BUSY_CMD

Command without data on-going

HAL_OSPI_STATE_BUSY_TX

Indirect Tx on-going

HAL_OSPI_STATE_BUSY_RX

Indirect Rx on-going

HAL_OSPI_STATE_BUSY_AUTO_POLLING

Auto-polling on-going

HAL_OSPI_STATE_BUSY_MEM_MAPPED

Memory-mapped on-going

HAL_OSPI_STATE_ABORT

Abort on-going

HAL_OSPI_STATE_ERROR

Blocking error, driver should be re-initialized

OSPI Timeout Activation

HAL_OSPI_TIMEOUT_COUNTER_DISABLE

Timeout counter disabled, nCS remains active

HAL_OSPI_TIMEOUT_COUNTER_ENABLE

Timeout counter enabled, nCS released when timeout expires

OSPI Timeout definition

HAL_OSPI_TIMEOUT_DEFAULT_VALUE

OSPI Wrap-Size

HAL_OSPI_WRAP_NOT_SUPPORTED

wrapped reads are not supported by the memory

HAL_OSPI_WRAP_16_BYTES

external memory supports wrap size of 16 bytes

HAL_OSPI_WRAP_32_BYTES

external memory supports wrap size of 32 bytes

HAL_OSPI_WRAP_64_BYTES

external memory supports wrap size of 64 bytes

HAL_OSPI_WRAP_128_BYTES

external memory supports wrap size of 128 bytes

OSPI Hyperbus Write Zero Latency Activation

HAL_OSPI_LATENCY_ON_WRITE

Latency on write accesses

HAL_OSPI_NO_LATENCY_ON_WRITE

No latency on write accesses

56 HAL OTFDEC Generic Driver

56.1 OTFDEC Firmware driver registers structures

56.1.1 OTFDEC_RegionConfigTypeDef

OTFDEC_RegionConfigTypeDef is defined in the stm32u5xx_hal_otfdec.h

  OTFDEC Msp Init callback
- ***void(* __OTFDEC_HandleTypeDef::MspDeInitCallback)(struct __OTFDEC_HandleTypeDef *hotfdec)***
  OTFDEC Msp DeInit callback

56.2 OTFDEC Firmware driver API description

The following section lists the various functions of the OTFDEC library.

56.2.1 How to use this driver

The OTFDEC HAL driver can be used as follows:

1. Declare an OTFDEC_HandleTypeDef handle structure (eg. OTFDEC_HandleTypeDef hotfdec).
2. Initialize the OTFDEC low level resources by implementing the HAL_OTFDEC_MspInit() API:
   - Enable the OTFDEC interface clock.
   - NVIC configuration if interrupts are used
     - Configure the OTFDEC interrupt priority.
     - Enable the NVIC OTFDEC IRQ handle.
3. Initialize the OTFDEC peripheral by calling the HAL_OTFDEC_Init() API.
4. In the case of encryption, enable ciphering mode for the peripheral
5. For each region,
   - Configure the region deciphering mode by calling the HAL_OTFDEC_RegionSetMode() API.
   - Write the region Key by calling the HAL_OTFDEC_RegionSetKey() API. If desired, read the key CRC by calling HAL_OTFDEC_RegionGetKeyCRC() API and compare the result with the theoretically expected CRC.
   - Initialize the OTFDEC region config structure with the Nonce, protected region start and end addresses and firmware version, and wrap-up the region configuration by calling HAL_OTFDEC_RegionConfig() API.
6. At this point, the OTFDEC region configuration is done and the deciphering or enciphering enabled. The region can be deciphered on the fly after having made sure the OctoSPI is configured in memory-mapped mode or data can be enciphered by calling HAL_OTFDEC_Cipher() API.

Note: *Warning: the OTFDEC en/deciphering is based on a different endianness compared to the AES-CTR as implemented in the AES peripheral. E.g., if the OTFEC resorts to the Key (B0, B1, B2, B3) where Bi are 32-bit longwords and B0 is the Least Significant Word, the AES has to be configured with the Key (B3, B2, B1, B0) to report the same result (with the same swapping applied to the Initialization Vector).*

Callback registration

The compilation flag USE_HAL_OTFDEC_REGISTER_CALLBACKS, when set to 1, allows the user to configure dynamically the driver callbacks. Use Functions @ref HAL_OTFDEC_RegisterCallback() to register an interrupt callback.

Function @ref HAL_OTFDEC_RegisterCallback() allows to register following callbacks:

- ErrorCallback : OTFDEC error callback
- MspInitCallback : OTFDEC Msp Init callback
- MspDeInitCallback : OTFDEC Msp DeInit callback This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function @ref HAL_OTFDEC_UnRegisterCallback to reset a callback to the default weak function.

@ref HAL_OTFDEC_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- ErrorCallback : OTFDEC error callback
- MspInitCallback : OTFDEC Msp Init callback
- MspDeInitCallback : OTFDEC Msp DeInit callback

By default, after the @ref HAL_OTFDEC_Init() and when the state is @ref HAL_OTFDEC_STATE_RESET all callbacks are set to the corresponding weak functions: example @ref HAL_OTFDEC_ErrorCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the @ref HAL_OTFDEC_Init()/ @ref HAL_OTFDEC_DeInit() only when these callbacks are null (not registered beforehand).

If MspInit or MspDeInit are not null, the @ref HAL_OTFDEC_Init()/ @ref HAL_OTFDEC_DeInit() keep and use the user MspInit/MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in @ref HAL_OTFDEC_STATE_READY state only. Exception done MspInit/MspDeInit functions that can be registered/unregistered in @ref HAL_OTFDEC_STATE_READY or @ref HAL_OTFDEC_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit.

Then, the user first registers the MspInit/MspDeInit user callbacks using @ref HAL_OTFDEC_RegisterCallback() before calling @ref HAL_OTFDEC_DeInit() or @ref HAL_OTFDEC_Init() function.

When the compilation flag USE_HAL_OTFDEC_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

56.2.2 Initialization and de-initialization functions

This section contains the following APIs:
- *HAL_OTFDEC_Init()*
- *HAL_OTFDEC_DeInit()*
- *HAL_OTFDEC_MspInit()*
- *HAL_OTFDEC_MspDeInit()*
- *HAL_OTFDEC_RegisterCallback()*
- *HAL_OTFDEC_UnRegisterCallback()*

56.2.3 OTFDEC IRQ handler management

This section provides OTFDEC IRQ handler function.

This section contains the following APIs:
- *HAL_OTFDEC_IRQHandler()*
- *HAL_OTFDEC_ErrorCallback()*

56.2.4 Peripheral Control functions

This subsection permits to configure the OTFDEC peripheral

This section contains the following APIs:
- *HAL_OTFDEC_RegionKeyLock()*
- *HAL_OTFDEC_RegionSetKey()*
- *HAL_OTFDEC_RegionSetMode()*
- *HAL_OTFDEC_RegionConfig()*
- *HAL_OTFDEC_ConfigAttributes()*
- *HAL_OTFDEC_KeyCRCComputation()*
- *HAL_OTFDEC_EnableEnciphering()*
- *HAL_OTFDEC_DisableEnciphering()*
- *HAL_OTFDEC_Cipher()*
- *HAL_OTFDEC_RegionEnable()*
- *HAL_OTFDEC_RegionDisable()*

56.2.5 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral.

This section contains the following APIs:
- *HAL_OTFDEC_GetState()*
- *HAL_OTFDEC_GetConfigAttributes()*
- *HAL_OTFDEC_RegionGetKeyCRC()*
- *HAL_OTFDEC_RegionGetConfig()*

56.2.6 Detailed description of functions

HAL_OTFDEC_Init

Function name

HAL_StatusTypeDef HAL_OTFDEC_Init (OTFDEC_HandleTypeDef * hotfdec)

Function description

Initialize the OTFDEC peripheral and create the associated handle.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **HAL:** status

HAL_OTFDEC_DeInit

Function name

HAL_StatusTypeDef HAL_OTFDEC_DeInit (OTFDEC_HandleTypeDef * hotfdec)

Function description

DeInitialize the OTFDEC peripheral.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **HAL:** status

HAL_OTFDEC_MspInit

Function name

void HAL_OTFDEC_MspInit (OTFDEC_HandleTypeDef * hotfdec)

Function description

Initialize the OTFDEC MSP.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **None:**

HAL_OTFDEC_MspDeInit

Function name

void HAL_OTFDEC_MspDeInit (OTFDEC_HandleTypeDef * hotfdec)

Function description

DeInitialize OTFDEC MSP.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **None:**

HAL_OTFDEC_RegisterCallback

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegisterCallback (OTFDEC_HandleTypeDef * hotfdec, HAL_OTFDEC_CallbackIDTypeDef CallbackID, pOTFDEC_CallbackTypeDef pCallback)

Function description

Register a User OTFDEC Callback To be used instead of the weak predefined callback.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  – HAL_OTFDEC_ERROR_CB_ID OTFDEC error callback ID
  – HAL_OTFDEC_MSPINIT_CB_ID MspInit callback ID
  – HAL_OTFDEC_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_OTFDEC_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_OTFDEC_UnRegisterCallback (OTFDEC_HandleTypeDef * hotfdec, HAL_OTFDEC_CallbackIDTypeDef CallbackID)

Function description

Unregister a OTFDEC Callback OTFDEC callback is redirected to the weak predefined callback.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  – HAL_OTFDEC_ERROR_CB_ID OTFDEC error callback ID
  – HAL_OTFDEC_MSPINIT_CB_ID MspInit callback ID
  – HAL_OTFDEC_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_OTFDEC_IRQHandler

Function name

void HAL_OTFDEC_IRQHandler (OTFDEC_HandleTypeDef * hotfdec)

Function description

Handle OTFDEC interrupt request.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **None:**

HAL_OTFDEC_ErrorCallback

Function name

void HAL_OTFDEC_ErrorCallback (OTFDEC_HandleTypeDef * hotfdec)

Function description

OTFDEC error callback.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **None:**

HAL_OTFDEC_RegionKeyLock

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionKeyLock (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex)

Function description

Lock region keys.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the keys of which are locked

Return values

- **HAL:** state

Notes

- Writes to this region KEYRx registers are ignored until next OTFDEC reset.

HAL_OTFDEC_RegionSetKey

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionSetKey (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex, uint32_t * pKey)

Function description

Set region keys.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the keys of which are set
- **pKey:** pointer at set of keys

Return values

- **HAL:** state

Notes

- The API reads the key CRC computed by the peripheral and compares it with that theoretically expected. An error is reported if they are different.

HAL_OTFDEC_RegionSetMode

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionSetMode (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex, uint32_t mode)

Function description

Set region mode.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the mode of which is set
- **mode:** This parameter can be only:
  - OTFDEC_REG_MODE_INSTRUCTION_OR_DATA_ACCESSES All read accesses are decrypted (instruction or data)
  - OTFDEC_REG_MODE_INSTRUCTION_ACCESSES_ONLY_WITH_CIPHER Only instruction accesses are decrypted with proprietary cipher activated

Return values

- **HAL:** state

HAL_OTFDEC_RegionConfig

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionConfig (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex, const OTFDEC_RegionConfigTypeDef * Config, uint32_t lock)

Function description

Set region configuration.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region that is configured
- **Config:** pointer on structure containing the region configuration parameters
- **lock:** configuration lock enable or disable parameter This parameter can be one of the following values:
  - OTFDEC_REG_CONFIGR_LOCK_DISABLE OTFDEC region configuration is not locked
  - OTFDEC_REG_CONFIGR_LOCK_ENABLE OTFDEC region configuration is locked

Return values

- **HAL:** state

Notes

- Region enciphering/deciphering is enabled at the end of this function

HAL_OTFDEC_KeyCRCComputation

Function name

uint32_t HAL_OTFDEC_KeyCRCComputation (uint32_t * pKey)

Function description

Compute Key CRC.

Parameters

- **pKey:** pointer at set of keys

Return values

- **CRC:** value

HAL_OTFDEC_RegionEnable

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionEnable (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex)

Function description

Enable region processing (enciphering or deciphering).

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the enciphering or deciphering is enabled

Return values

- **HAL:** state

Notes

- An error is reported when the configuration is locked.

HAL_OTFDEC_RegionDisable

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionDisable (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex)

Function description

Disable region processing (enciphering or deciphering).

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the enciphering or deciphering is disabled

Return values

- **HAL:** state

Notes

- An error is reported when the configuration is locked.

HAL_OTFDEC_ConfigAttributes

Function name

HAL_StatusTypeDef HAL_OTFDEC_ConfigAttributes (OTFDEC_HandleTypeDef * hotfdec, uint32_t Attributes)

Function description

Configure OTFDEC attributes.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **Attributes:** This parameter can be only:
  - OTFDEC_ATTRIBUTE_PRIV Set privileged access protection
  - OTFDEC_ATTRIBUTE_NPRIV Reset privileged access protection

Return values

- **HAL:** state

Notes

- This function sets or resets regions privileged access protection.

HAL_OTFDEC_EnableEnciphering

Function name

HAL_StatusTypeDef HAL_OTFDEC_EnableEnciphering (OTFDEC_HandleTypeDef * hotfdec)

Function description

Enable peripheral enciphering.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **HAL:** state

Notes

- By default, deciphering mode is enabled at reset

HAL_OTFDEC_DisableEnciphering

Function name

HAL_StatusTypeDef HAL_OTFDEC_DisableEnciphering (OTFDEC_HandleTypeDef * hotfdec)

Function description

Disable peripheral enciphering.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **HAL:** state

HAL_OTFDEC_Cipher

Function name

HAL_StatusTypeDef HAL_OTFDEC_Cipher (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex, const uint32_t * input, uint32_t * output, uint32_t size, uint32_t start_address)

Function description

Cipher data.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the configuration of which is used to encipher
- **input:** plain data
- **output:** ciphered data
- **size:** plain data size in words
- **start_address:** starting address in the external memory area where the enciphered data will be eventually stored

Return values

- **HAL:** state

Notes

- Region configuration parameters and OTFDEC_CR ENC bit must be set.
- output pointer points at a temporary area in RAM to store the ciphered data. It is up to the user code to copy the ciphered data in external RAM once the enciphering process is over.

HAL_OTFDEC_GetState

Function name

HAL_OTFDEC_StateTypeDef HAL_OTFDEC_GetState (OTFDEC_HandleTypeDef * hotfdec)

Function description

Return the OTFDEC state.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return values

- **HAL:** state

HAL_OTFDEC_GetConfigAttributes

Function name

HAL_StatusTypeDef HAL_OTFDEC_GetConfigAttributes (OTFDEC_HandleTypeDef * hotfdec, uint32_t * Attributes)

Function description

Get OTFDEC configuration attributes.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **Attributes:** pointer to attributes variable. This parameter can be only:
  - OTFDEC_ATTRIBUTE_PRIV Set privileged access protection
  - OTFDEC_ATTRIBUTE_NPRIV Reset privileged access protection

Return values

- **HAL:** state

Notes

- This function returns whether or not the regions access protection is in privileged mode.

HAL_OTFDEC_RegionGetKeyCRC

Function name

uint32_t HAL_OTFDEC_RegionGetKeyCRC (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex)

Function description

Return region keys CRC.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the keys CRC of which is read

Return values

- **Key:** CRC

HAL_OTFDEC_RegionGetConfig

Function name

HAL_StatusTypeDef HAL_OTFDEC_RegionGetConfig (OTFDEC_HandleTypeDef * hotfdec, uint32_t RegionIndex, OTFDEC_RegionConfigTypeDef * Config)

Function description

Return region configuration parameters.

Parameters

- **hotfdec:** pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- **RegionIndex:** index of region the configuration of which is read
- **Config:** pointer on structure that will be filled up with the region configuration parameters

Return values

- **HAL:** state

56.3 OTFDEC Firmware driver defines

The following section lists the various define and macros of the module.

56.3.1 OTFDEC

OTFDEC

OTFDEC Configuration Attributes

OTFDEC_ATTRIBUTE_NPRIV

Non-privileged access protection

OTFDEC_ATTRIBUTE_PRIV

Privileged access protection

OTFDEC Error Definition

HAL_OTFDEC_ERROR_NONE

No error

HAL_OTFDEC_SECURITY_ERROR

Security error

HAL_OTFDEC_EXECUTE_ERROR

Execute-only Execute-Never error

HAL_OTFDEC_KEY_ERROR

Key error

HAL_OTFDEC_ERROR_INVALID_CALLBACK

Invalid Callback error

OTFDEC Exported Macros

__HAL_OTFDEC_RESET_HANDLE_STATE

Description:

- Reset OTFDEC handle state.

Parameters:

- __HANDLE__: pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module

Return value:

- None

__HAL_OTFDEC_ENABLE_IT

Description:

- Enable OTFDEC peripheral interrupts combination.

Parameters:

- __HANDLE__: pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- __INTERRUPT__: mask on enabled interrupts This parameter can be one of the following values:
  – OTFDEC_SEC_ERROR_INT OTFDEC security error interrupt
  – OTFDEC_EXE_ERROR_INT OTFDEC execution error interrupt
  – OTFDEC_KEY_ERROR_INT OTFDEC key error interrupt
  – OTFDEC_SEC_EXE_ERROR_INT OTFDEC security and execution errors interrupts
  – OTFDEC_SEC_KEY_ERROR_INT OTFDEC security and key errors interrupts
  – OTFDEC_EXE_KEY_ERROR_INT OTFDEC execution and key errors interrupts
  – OTFDEC_ALL_INT OTFDEC all interrupts

Return value:

- None

__HAL_OTFDEC_DISABLE_IT

Description:

- Disable OTFDEC peripheral interrupts combination.

Parameters:

- __HANDLE__: pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- __INTERRUPT__: mask on disabled interrupts This parameter can be one of the following values:
  – OTFDEC_SEC_ERROR_INT OTFDEC security error interrupt
  – OTFDEC_EXE_ERROR_INT OTFDEC execution error interrupt
  – OTFDEC_KEY_ERROR_INT OTFDEC key error interrupt
  – OTFDEC_SEC_EXE_ERROR_INT OTFDEC security and execution errors interrupts
  – OTFDEC_SEC_KEY_ERROR_INT OTFDEC security and key errors interrupts
  – OTFDEC_EXE_KEY_ERROR_INT OTFDEC execution and key errors interrupts
  – OTFDEC_ALL_INT OTFDEC all interrupts

Return value:

- None

__HAL_OTFDEC_GET_FLAG

Description:

- Check whether the specified combination of OTFDEC interrupt flags is set or not.

Parameters:

- __HANDLE__: pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- __FLAG__: mask on combination of interrupts flags This parameter can be one of the following values:
  – OTFDEC_SEC_ERROR_INT OTFDEC security error interrupt flag
  – OTFDEC_EXE_ERROR_INT OTFDEC execution error interrupt flag
  – OTFDEC_KEY_ERROR_INT OTFDEC key error interrupt flag
  – OTFDEC_SEC_EXE_ERROR_INT OTFDEC security and execution errors interrupts flags
  – OTFDEC_SEC_KEY_ERROR_INT OTFDEC security and key errors interrupts flags
  – OTFDEC_EXE_KEY_ERROR_INT OTFDEC execution and key errors interrupts flag
  – OTFDEC_ALL_INT OTFDEC all interrupts flags

Return value:

- The: state of __FLAG__ (TRUE or FALSE).

__HAL_OTFDEC_CLEAR_FLAG

Description:

- Clear the specified combination of OTFDEC interrupt flags.

Parameters:

- __HANDLE__: pointer to an OTFDEC_HandleTypeDef structure that contains the configuration information for OTFDEC module
- __FLAG__: mask on combination of interrupts flags This parameter can be one of the following values:
  – OTFDEC_SEC_ERROR_INT OTFDEC security error interrupt flag
  – OTFDEC_EXE_ERROR_INT OTFDEC execution error interrupt flag
  – OTFDEC_KEY_ERROR_INT OTFDEC key error interrupt flag
  – OTFDEC_SEC_EXE_ERROR_INT OTFDEC security and execution errors interrupts flags
  – OTFDEC_SEC_KEY_ERROR_INT OTFDEC security and key errors interrupts flags
  – OTFDEC_EXE_KEY_ERROR_INT OTFDEC execution and key errors interrupts flag
  – OTFDEC_ALL_INT OTFDEC all interrupts flags

Return value:

- None

OTFDEC Interrupts

OTFDEC_SEC_ERROR_INT

OTFDEC security error interrupt

OTFDEC_EXE_ERROR_INT

OTFDEC execution error interrupt

OTFDEC_KEY_ERROR_INT

OTFDEC key error interrupt

OTFDEC_SEC_EXE_ERROR_INT

OTFDEC security and execution errors interrupts

OTFDEC_SEC_KEY_ERROR_INT

OTFDEC security and key errors interrupts

OTFDEC_EXE_KEY_ERROR_INT

OTFDEC execution and key errors interrupts

OTFDEC_ALL_INT

OTFDEC all interrupts

OTFDEC Regions Index

OTFDEC_REGION1

OTFDEC region 1

OTFDEC_REGION2

OTFDEC region 2

OTFDEC_REGION3

OTFDEC region 3

OTFDEC_REGION4

OTFDEC region 4

OTFDEC Region Configuration Lock

OTFDEC_REG_CONFIGR_LOCK_DISABLE

OTFDEC region configuration lock disable

OTFDEC_REG_CONFIGR_LOCK_ENABLE

OTFDEC region configuration lock enable

OTFDEC Region Enable

OTFDEC_REG_CONFIGR_REG_DISABLE

OTFDEC region encryption or on-the-fly decryption disable

OTFDEC_REG_CONFIGR_REG_ENABLE

OTFDEC region encryption or on-the-fly decryption enable

OTFDEC Region Operating Mode

OTFDEC_REG_MODE_INSTRUCTION_OR_DATA_ACCESSES

All read accesses are decrypted

OTFDEC_REG_MODE_INSTRUCTION_ACCESSES_ONLY_WITH_CIPHER

Only instruction accesses are decrypted with proprietary cipher activated

57 HAL PCD Generic Driver

57.2 PCD Firmware driver API description

The following section lists the various functions of the PCD library.

57.2.1 How to use this driver

The PCD HAL driver can be used as follows:

1. Declare a PCD_HandleTypeDef handle structure, for example: PCD_HandleTypeDef hpcd;
2. Fill parameters of Init structure in HCD handle
3. Call HAL_PCD_Init() API to initialize the PCD peripheral (Core, Device core, ...)
4. Initialize the PCD low level resources through the HAL_PCD_MspInit() API:
   a. Enable the PCD/USB Low Level interface clock using
      - __HAL_RCC_USB_CLK_ENABLE(); For USB Device FS peripheral
      - __HAL_RCC_USB_OTG_FS_CLK_ENABLE();
      - __HAL_RCC_USB_OTG_HS_CLK_ENABLE(); (For High Speed Mode)
   b. Initialize the related GPIO clocks
   c. Configure PCD pin-out
   d. Configure PCD NVIC interrupt
5. Associate the Upper USB device stack to the HAL PCD Driver:
   a. hpcd.pData = pdev;
6. Enable PCD transmission and reception:
   a. HAL_PCD_Start();

57.2.2 Initialization and de-initialization functions

This section provides functions allowing to:

This section contains the following APIs:

- *HAL_PCD_Init()*
- *HAL_PCD_DeInit()*
- *HAL_PCD_MspInit()*
- *HAL_PCD_MspDeInit()*
- *HAL_PCD_RegisterCallback()*
- *HAL_PCD_UnRegisterCallback()*
- *HAL_PCD_RegisterDataOutStageCallback()*
- *HAL_PCD_UnRegisterDataOutStageCallback()*
- *HAL_PCD_RegisterDataInStageCallback()*
- *HAL_PCD_UnRegisterDataInStageCallback()*
- *HAL_PCD_RegisterIsoOutIncpltCallback()*
- *HAL_PCD_UnRegisterIsoOutIncpltCallback()*
- *HAL_PCD_RegisterIsoInIncpltCallback()*
- *HAL_PCD_UnRegisterIsoInIncpltCallback()*
- *HAL_PCD_RegisterBcdCallback()*
- *HAL_PCD_UnRegisterBcdCallback()*
- *HAL_PCD_RegisterLpmCallback()*
- *HAL_PCD_UnRegisterLpmCallback()*

57.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the PCD data transfers.

This section contains the following APIs:

- *HAL_PCD_Start()*
- *HAL_PCD_Stop()*
- *HAL_PCD_IRQHandler()*

- *HAL_PCD_DataOutStageCallback()*
- *HAL_PCD_DataInStageCallback()*
- *HAL_PCD_SetupStageCallback()*
- *HAL_PCD_SOFCallback()*
- *HAL_PCD_ResetCallback()*
- *HAL_PCD_SuspendCallback()*
- *HAL_PCD_ResumeCallback()*
- *HAL_PCD_ISOOUTIncompleteCallback()*
- *HAL_PCD_ISOINIncompleteCallback()*
- *HAL_PCD_ConnectCallback()*
- *HAL_PCD_DisconnectCallback()*

57.2.4 Peripheral Control functions

This subsection provides a set of functions allowing to control the PCD data transfers.

This section contains the following APIs:

- *HAL_PCD_DevConnect()*
- *HAL_PCD_DevDisconnect()*
- *HAL_PCD_SetAddress()*
- *HAL_PCD_EP_Open()*
- *HAL_PCD_EP_Close()*
- *HAL_PCD_EP_Receive()*
- *HAL_PCD_EP_GetRxCount()*
- *HAL_PCD_EP_Transmit()*
- *HAL_PCD_EP_SetStall()*
- *HAL_PCD_EP_ClrStall()*
- *HAL_PCD_EP_Abort()*
- *HAL_PCD_EP_Flush()*
- *HAL_PCD_ActivateRemoteWakeup()*
- *HAL_PCD_DeActivateRemoteWakeup()*
- *HAL_PCD_SetTestMode()*

57.2.5 Peripheral State functions

This subsection permits to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- *HAL_PCD_GetState()*
- *HAL_PCD_SetTestMode()*

57.2.6 Detailed description of functions

HAL_PCD_Init

Function name

HAL_StatusTypeDef HAL_PCD_Init (PCD_HandleTypeDef * hpcd)

Function description

Initializes the PCD according to the specified parameters in the PCD_InitTypeDef and initialize the associated handle.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_DeInit

Function name

HAL_StatusTypeDef HAL_PCD_DeInit (PCD_HandleTypeDef * hpcd)

Function description

DeInitializes the PCD peripheral.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_MspInit

Function name

void HAL_PCD_MspInit (PCD_HandleTypeDef * hpcd)

Function description

Initializes the PCD MSP.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_MspDeInit

Function name

void HAL_PCD_MspDeInit (PCD_HandleTypeDef * hpcd)

Function description

DeInitializes PCD MSP.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_RegisterCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterCallback (PCD_HandleTypeDef * hpcd, HAL_PCD_CallbackIDTypeDef CallbackID, pPCD_CallbackTypeDef pCallback)

Function description

Register a User USB PCD Callback To be used instead of the weak predefined callback.

Parameters

- **hpcd:** USB PCD handle
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  - HAL_PCD_SOF_CB_ID USB PCD SOF callback ID
  - HAL_PCD_SETUPSTAGE_CB_ID USB PCD Setup callback ID
  - HAL_PCD_RESET_CB_ID USB PCD Reset callback ID
  - HAL_PCD_SUSPEND_CB_ID USB PCD Suspend callback ID
  - HAL_PCD_RESUME_CB_ID USB PCD Resume callback ID
  - HAL_PCD_CONNECT_CB_ID USB PCD Connect callback ID
  - HAL_PCD_DISCONNECT_CB_ID USB PCD Disconnect callback ID
  - HAL_PCD_MSPINIT_CB_ID MspDeInit callback ID
  - HAL_PCD_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterCallback (PCD_HandleTypeDef * hpcd, HAL_PCD_CallbackIDTypeDef CallbackID)

Function description

Unregister an USB PCD Callback USB PCD callback is redirected to the weak predefined callback.

Parameters

- **hpcd:** USB PCD handle
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  - HAL_PCD_SOF_CB_ID USB PCD SOF callback ID
  - HAL_PCD_SETUPSTAGE_CB_ID USB PCD Setup callback ID
  - HAL_PCD_RESET_CB_ID USB PCD Reset callback ID
  - HAL_PCD_SUSPEND_CB_ID USB PCD Suspend callback ID
  - HAL_PCD_RESUME_CB_ID USB PCD Resume callback ID
  - HAL_PCD_CONNECT_CB_ID USB PCD Connect callback ID
  - HAL_PCD_DISCONNECT_CB_ID USB PCD Disconnect callback ID
  - HAL_PCD_MSPINIT_CB_ID MspDeInit callback ID
  - HAL_PCD_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_PCD_RegisterDataOutStageCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterDataOutStageCallback (PCD_HandleTypeDef * hpcd, pPCD_DataOutStageCallbackTypeDef pCallback)

Function description

Register USB PCD Data OUT Stage Callback To be used instead of the weak HAL_PCD_DataOutStageCallback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD Data OUT Stage Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterDataOutStageCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterDataOutStageCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD Data OUT Stage Callback USB PCD Data OUT Stage Callback is redirected to the weak HAL_PCD_DataOutStageCallback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_RegisterDataInStageCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterDataInStageCallback (PCD_HandleTypeDef * hpcd, pPCD_DataInStageCallbackTypeDef pCallback)

Function description

Register USB PCD Data IN Stage Callback To be used instead of the weak HAL_PCD_DataInStageCallback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD Data IN Stage Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterDataInStageCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterDataInStageCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD Data IN Stage Callback USB PCD Data OUT Stage Callback is redirected to the weak HAL_PCD_DataInStageCallback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_RegisterIsoOutIncpltCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterIsoOutIncpltCallback (PCD_HandleTypeDef * hpcd, pPCD_IsoOutIncpltCallbackTypeDef pCallback)

Function description

Register USB PCD Iso OUT incomplete Callback To be used instead of the weak HAL_PCD_ISOOUTIncompleteCallback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD Iso OUT incomplete Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterIsoOutIncpltCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterIsoOutIncpltCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD Iso OUT incomplete Callback USB PCD Iso OUT incomplete Callback is redirected to the weak HAL_PCD_ISOOUTIncompleteCallback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_RegisterIsoInIncpltCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterIsoInIncpltCallback (PCD_HandleTypeDef * hpcd, pPCD_IsoInIncpltCallbackTypeDef pCallback)

Function description

Register USB PCD Iso IN incomplete Callback To be used instead of the weak HAL_PCD_ISOINIncompleteCallback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD Iso IN incomplete Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterIsoInIncpltCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterIsoInIncpltCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD Iso IN incomplete Callback USB PCD Iso IN incomplete Callback is redirected to the weak HAL_PCD_ISOINIncompleteCallback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_RegisterBcdCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterBcdCallback (PCD_HandleTypeDef * hpcd, pPCD_BcdCallbackTypeDef pCallback)

Function description

Register USB PCD BCD Callback To be used instead of the weak HAL_PCDEx_BCD_Callback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD BCD Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterBcdCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterBcdCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD BCD Callback USB BCD Callback is redirected to the weak HAL_PCDEx_BCD_Callback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_RegisterLpmCallback

Function name

HAL_StatusTypeDef HAL_PCD_RegisterLpmCallback (PCD_HandleTypeDef * hpcd, pPCD_LpmCallbackTypeDef pCallback)

Function description

Register USB PCD LPM Callback To be used instead of the weak HAL_PCDEx_LPM_Callback() predefined callback.

Parameters

- **hpcd:** PCD handle
- **pCallback:** pointer to the USB PCD LPM Callback function

Return values

- **HAL:** status

HAL_PCD_UnRegisterLpmCallback

Function name

HAL_StatusTypeDef HAL_PCD_UnRegisterLpmCallback (PCD_HandleTypeDef * hpcd)

Function description

Unregister the USB PCD LPM Callback USB LPM Callback is redirected to the weak HAL_PCDEx_LPM_Callback() predefined callback.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_Start

Function name

HAL_StatusTypeDef HAL_PCD_Start (PCD_HandleTypeDef * hpcd)

Function description

Start the USB device.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_Stop

Function name

HAL_StatusTypeDef HAL_PCD_Stop (PCD_HandleTypeDef * hpcd)

Function description

Stop the USB device.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_IRQHandler

Function name

void HAL_PCD_IRQHandler (PCD_HandleTypeDef * hpcd)

Function description

Handles PCD interrupt request.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_SOFCallback

Function name

void HAL_PCD_SOFCallback (PCD_HandleTypeDef * hpcd)

Function description

USB Start Of Frame callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_SetupStageCallback

Function name

void HAL_PCD_SetupStageCallback (PCD_HandleTypeDef * hpcd)

Function description

Setup stage callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_ResetCallback

Function name

void HAL_PCD_ResetCallback (PCD_HandleTypeDef * hpcd)

Function description

USB Reset callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_SuspendCallback

Function name

void HAL_PCD_SuspendCallback (PCD_HandleTypeDef * hpcd)

Function description

Suspend event callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_ResumeCallback

Function name

void HAL_PCD_ResumeCallback (PCD_HandleTypeDef * hpcd)

Function description

Resume event callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_ConnectCallback

Function name

void HAL_PCD_ConnectCallback (PCD_HandleTypeDef * hpcd)

Function description

Connection event callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_DisconnectCallback

Function name

void HAL_PCD_DisconnectCallback (PCD_HandleTypeDef * hpcd)

Function description

Disconnection event callback.

Parameters

- **hpcd:** PCD handle

Return values

- **None:**

HAL_PCD_DataOutStageCallback

Function name

void HAL_PCD_DataOutStageCallback (PCD_HandleTypeDef * hpcd, uint8_t epnum)

Function description

Data OUT stage callback.

Parameters

- **hpcd:** PCD handle
- **epnum:** endpoint number

Return values

- **None:**

HAL_PCD_DataInStageCallback

Function name

void HAL_PCD_DataInStageCallback (PCD_HandleTypeDef * hpcd, uint8_t epnum)

Function description

Data IN stage callback.

Parameters

- **hpcd:** PCD handle
- **epnum:** endpoint number

Return values

- **None:**

HAL_PCD_ISOOUTIncompleteCallback

Function name

void HAL_PCD_ISOOUTIncompleteCallback (PCD_HandleTypeDef * hpcd, uint8_t epnum)

Function description

Incomplete ISO OUT callback.

Parameters

- **hpcd:** PCD handle
- **epnum:** endpoint number

Return values

- **None:**

HAL_PCD_ISOINIncompleteCallback

Function name

void HAL_PCD_ISOINIncompleteCallback (PCD_HandleTypeDef * hpcd, uint8_t epnum)

Function description

Incomplete ISO IN callback.

Parameters

- **hpcd:** PCD handle
- **epnum:** endpoint number

Return values

- **None:**

HAL_PCD_DevConnect

Function name

HAL_StatusTypeDef HAL_PCD_DevConnect (PCD_HandleTypeDef * hpcd)

Function description

Connect the USB device.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_DevDisconnect

Function name

HAL_StatusTypeDef HAL_PCD_DevDisconnect (PCD_HandleTypeDef * hpcd)

Function description

Disconnect the USB device.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_SetAddress

Function name

HAL_StatusTypeDef HAL_PCD_SetAddress (PCD_HandleTypeDef * hpcd, uint8_t address)

Function description

Set the USB Device address.

Parameters

- **hpcd:** PCD handle
- **address:** new device address

Return values

- **HAL:** status

HAL_PCD_EP_Open

Function name

HAL_StatusTypeDef HAL_PCD_EP_Open (PCD_HandleTypeDef * hpcd, uint8_t ep_addr, uint16_t ep_mps, uint8_t ep_type)

Function description

Open and configure an endpoint.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address
- **ep_mps:** endpoint max packet size
- **ep_type:** endpoint type

Return values

- **HAL:** status

HAL_PCD_EP_Close

Function name

HAL_StatusTypeDef HAL_PCD_EP_Close (PCD_HandleTypeDef * hpcd, uint8_t ep_addr)

Function description

Deactivate an endpoint.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **HAL:** status

HAL_PCD_EP_Receive

Function name

HAL_StatusTypeDef HAL_PCD_EP_Receive (PCD_HandleTypeDef * hpcd, uint8_t ep_addr, uint8_t * pBuf, uint32_t len)

Function description

Receive an amount of data.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address
- **pBuf:** pointer to the reception buffer
- **len:** amount of data to be received

Return values

- **HAL:** status

HAL_PCD_EP_Transmit

Function name

HAL_StatusTypeDef HAL_PCD_EP_Transmit (PCD_HandleTypeDef * hpcd, uint8_t ep_addr, uint8_t * pBuf, uint32_t len)

Function description

Send an amount of data.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address
- **pBuf:** pointer to the transmission buffer
- **len:** amount of data to be sent

Return values

- **HAL:** status

HAL_PCD_EP_SetStall

Function name

HAL_StatusTypeDef HAL_PCD_EP_SetStall (PCD_HandleTypeDef * hpcd, uint8_t ep_addr)

Function description

Set a STALL condition over an endpoint.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **HAL:** status

HAL_PCD_EP_ClrStall

Function name

HAL_StatusTypeDef HAL_PCD_EP_ClrStall (PCD_HandleTypeDef * hpcd, uint8_t ep_addr)

Function description

Clear a STALL condition over in an endpoint.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **HAL:** status

HAL_PCD_EP_Flush

Function name

HAL_StatusTypeDef HAL_PCD_EP_Flush (PCD_HandleTypeDef * hpcd, uint8_t ep_addr)

Function description

Flush an endpoint.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **HAL:** status

HAL_PCD_EP_Abort

Function name

HAL_StatusTypeDef HAL_PCD_EP_Abort (PCD_HandleTypeDef * hpcd, uint8_t ep_addr)

Function description

Abort an USB EP transaction.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **HAL:** status

HAL_PCD_ActivateRemoteWakeup

Function name

HAL_StatusTypeDef HAL_PCD_ActivateRemoteWakeup (PCD_HandleTypeDef * hpcd)

Function description

Activate remote wakeup signalling.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_DeActivateRemoteWakeup

Function name

HAL_StatusTypeDef HAL_PCD_DeActivateRemoteWakeup (PCD_HandleTypeDef * hpcd)

Function description

De-activate remote wakeup signalling.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCD_SetTestMode

Function name

HAL_StatusTypeDef HAL_PCD_SetTestMode (const PCD_HandleTypeDef * hpcd, uint8_t testmode)

Function description

Set the USB Device high speed test mode.

Parameters

- **hpcd:** PCD handle
- **testmode:** USB Device high speed test mode

Return values

- **HAL:** status

HAL_PCD_EP_GetRxCount

Function name

uint32_t HAL_PCD_EP_GetRxCount (PCD_HandleTypeDef const * hpcd, uint8_t ep_addr)

Function description

Get Received Data Size.

Parameters

- **hpcd:** PCD handle
- **ep_addr:** endpoint address

Return values

- **Data:** Size

HAL_PCD_GetState

Function name

PCD_StateTypeDef HAL_PCD_GetState (PCD_HandleTypeDef const * hpcd)

Function description

Return the PCD handle state.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** state

57.3 PCD Firmware driver defines

The following section lists the various define and macros of the module.

57.3.1 PCD

PCD

PCD Error Code definition

HAL_PCD_ERROR_INVALID_CALLBACK

Invalid Callback error

PCD Exported Macros

__HAL_PCD_ENABLE

__HAL_PCD_DISABLE

__HAL_PCD_GET_FLAG

__HAL_PCD_CLEAR_FLAG

__HAL_PCD_IS_INVALID_INTERRUPT

__HAL_PCD_UNGATE_PHYCLOCK

__HAL_PCD_GATE_PHYCLOCK

__HAL_PCD_IS_PHY_SUSPENDED

PCD PHY Module

PCD_PHY_ULPI

PCD_PHY_EMBEDDED

PCD_PHY_UTMI

PCD Speed

PCD_SPEED_HIGH

PCD_SPEED_HIGH_IN_FULL

PCD_SPEED_FULL

58 HAL PCD Extension Driver

58.1 PCDEx Firmware driver API description

The following section lists the various functions of the PCDEx library.

58.1.1 Extended features functions

This section provides functions allowing to:

- Update FIFO configuration

This section contains the following APIs:

- *HAL_PCDEx_SetTxFiFo()*
- *HAL_PCDEx_SetRxFiFo()*
- *HAL_PCDEx_ActivateLPM()*
- *HAL_PCDEx_DeActivateLPM()*
- *HAL_PCDEx_BCD_VBUSDetect()*
- *HAL_PCDEx_ActivateBCD()*
- *HAL_PCDEx_DeActivateBCD()*
- *HAL_PCDEx_LPM_Callback()*
- *HAL_PCDEx_BCD_Callback()*

58.1.2 Detailed description of functions

HAL_PCDEx_SetTxFiFo

Function name

HAL_StatusTypeDef HAL_PCDEx_SetTxFiFo (PCD_HandleTypeDef * hpcd, uint8_t fifo, uint16_t size)

Function description

Set Tx FIFO.

Parameters

- **hpcd:** PCD handle
- **fifo:** The number of Tx fifo
- **size:** Fifo size

Return values

- **HAL:** status

HAL_PCDEx_SetRxFiFo

Function name

HAL_StatusTypeDef HAL_PCDEx_SetRxFiFo (PCD_HandleTypeDef * hpcd, uint16_t size)

Function description

Set Rx FIFO.

Parameters

- **hpcd:** PCD handle
- **size:** Size of Rx fifo

Return values

- **HAL:** status

HAL_PCDEx_ActivateLPM

Function name

HAL_StatusTypeDef HAL_PCDEx_ActivateLPM (PCD_HandleTypeDef * hpcd)

Function description

Activate LPM feature.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCDEx_DeActivateLPM

Function name

HAL_StatusTypeDef HAL_PCDEx_DeActivateLPM (PCD_HandleTypeDef * hpcd)

Function description

Deactivate LPM feature.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCDEx_ActivateBCD

Function name

HAL_StatusTypeDef HAL_PCDEx_ActivateBCD (PCD_HandleTypeDef * hpcd)

Function description

Activate BatteryCharging feature.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCDEx_DeActivateBCD

Function name

HAL_StatusTypeDef HAL_PCDEx_DeActivateBCD (PCD_HandleTypeDef * hpcd)

Function description

Deactivate BatteryCharging feature.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCDEx_BCD_VBUSDetect

Function name

void HAL_PCDEx_BCD_VBUSDetect (PCD_HandleTypeDef * hpcd)

Function description

Handle BatteryCharging Process.

Parameters

- **hpcd:** PCD handle

Return values

- **HAL:** status

HAL_PCDEx_LPM_Callback

Function name

void HAL_PCDEx_LPM_Callback (PCD_HandleTypeDef * hpcd, PCD_LPM_MsgTypeDef msg)

Function description

Send LPM message to user layer callback.

Parameters

- **hpcd:** PCD handle
- **msg:** LPM message

Return values

- **HAL:** status

HAL_PCDEx_BCD_Callback

Function name

void HAL_PCDEx_BCD_Callback (PCD_HandleTypeDef * hpcd, PCD_BCD_MsgTypeDef msg)

Function description

Send BatteryCharging message to user layer callback.

Parameters

- **hpcd:** PCD handle
- **msg:** LPM message

Return values

- **HAL:** status

59 HAL PKA Generic Driver

59.1 PKA Firmware driver registers structures

59.1.1 __PKA_HandleTypeDef

__PKA_HandleTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***PKA_TypeDef * Instance***
- ***__IO HAL_PKA_StateTypeDef State***
- ***__IO uint32_t ErrorCode***
- ***void(* OperationCpltCallback***
- ***void(* ErrorCallback***
- ***void(* MspInitCallback***
- ***void(* MspDeInitCallback***

Field Documentation

- ***PKA_TypeDef* __PKA_HandleTypeDef::Instance***
  Register base address
- ***__IO HAL_PKA_StateTypeDef __PKA_HandleTypeDef::State***
  PKA state
- ***__IO uint32_t __PKA_HandleTypeDef::ErrorCode***
  PKA Error code
- ***void(* __PKA_HandleTypeDef::OperationCpltCallback)(struct __PKA_HandleTypeDef *hpka)***
  PKA End of operation callback
- ***void(* __PKA_HandleTypeDef::ErrorCallback)(struct __PKA_HandleTypeDef *hpka)***
  PKA Error callback
- ***void(* __PKA_HandleTypeDef::MspInitCallback)(struct __PKA_HandleTypeDef *hpka)***
  PKA Msp Init callback
- ***void(* __PKA_HandleTypeDef::MspDeInitCallback)(struct __PKA_HandleTypeDef *hpka)***
  PKA Msp DeInit callback

59.1.2 PKA_ECCMulInTypeDef

PKA_ECCMulInTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint32_t scalarMulSize***
- ***uint32_t modulusSize***
- ***uint32_t coefSign***
- ***const uint8_t * coefA***
- ***const uint8_t * coefB***
- ***const uint8_t * modulus***
- ***const uint8_t * pointX***
- ***const uint8_t * pointY***
- ***const uint8_t * scalarMul***
- ***const uint8_t * primeOrder***

Field Documentation

- ***uint32_t PKA_ECCMulInTypeDef::scalarMulSize***
  Number of element in scalarMul array
- ***uint32_t PKA_ECCMulInTypeDef::modulusSize***
  Number of element in modulus, coefA, pointX and pointY arrays
- ***uint32_t PKA_ECCMulInTypeDef::coefSign***
  Curve coefficient a sign

- ***const uint8_t* PKA_ECCMulInTypeDef::coefA***
  Pointer to curve coefficient |a| (Array of modulusSize elements)
- ***const uint8_t* PKA_ECCMulInTypeDef::coefB***
  pointer to curve coefficient b
- ***const uint8_t* PKA_ECCMulInTypeDef::modulus***
  Pointer to curve modulus value p (Array of modulusSize elements)
- ***const uint8_t* PKA_ECCMulInTypeDef::pointX***
  Pointer to point P coordinate xP (Array of modulusSize elements)
- ***const uint8_t* PKA_ECCMulInTypeDef::pointY***
  Pointer to point P coordinate yP (Array of modulusSize elements)
- ***const uint8_t* PKA_ECCMulInTypeDef::scalarMul***
  Pointer to scalar multiplier k (Array of scalarMulSize elements)
- ***const uint8_t* PKA_ECCMulInTypeDef::primeOrder***
  pointer to order of the curve

59.1.3 PKA_ECCMulExInTypeDef

PKA_ECCMulExInTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint32_t primeOrderSize***
- ***uint32_t scalarMulSize***
- ***uint32_t modulusSize***
- ***uint32_t coefSign***
- ***const uint8_t * coefA***
- ***const uint8_t * coefB***
- ***const uint8_t * modulus***
- ***const uint8_t * pointX***
- ***const uint8_t * pointY***
- ***const uint8_t * scalarMul***
- ***const uint8_t * primeOrder***

Field Documentation

- ***uint32_t PKA_ECCMulExInTypeDef::primeOrderSize***
  Number of element in primeOrder array
- ***uint32_t PKA_ECCMulExInTypeDef::scalarMulSize***
  Number of element in scalarMul array
- ***uint32_t PKA_ECCMulExInTypeDef::modulusSize***
  Number of element in modulus, coefA, pointX and pointY arrays
- ***uint32_t PKA_ECCMulExInTypeDef::coefSign***
  Curve coefficient a sign
- ***const uint8_t* PKA_ECCMulExInTypeDef::coefA***
  Pointer to curve coefficient |a| (Array of modulusSize elements)
- ***const uint8_t* PKA_ECCMulExInTypeDef::coefB***
  pointer to curve coefficient b
- ***const uint8_t* PKA_ECCMulExInTypeDef::modulus***
  Pointer to curve modulus value p (Array of modulusSize elements)
- ***const uint8_t* PKA_ECCMulExInTypeDef::pointX***
  Pointer to point P coordinate xP (Array of modulusSize elements)
- ***const uint8_t* PKA_ECCMulExInTypeDef::pointY***
  Pointer to point P coordinate yP (Array of modulusSize elements)
- ***const uint8_t* PKA_ECCMulExInTypeDef::scalarMul***
  Pointer to scalar multiplier k (Array of scalarMulSize elements)
- ***const uint8_t* PKA_ECCMulExInTypeDef::primeOrder***
  pointer to order of the curve

59.1.4 PKA_PointCheckInTypeDef

PKA_PointCheckInTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint32_t modulusSize***
- ***uint32_t coefSign***
- ***const uint8_t * coefA***
- ***const uint8_t * coefB***
- ***const uint8_t * modulus***
- ***const uint8_t * pointX***
- ***const uint8_t * pointY***
- ***const uint32_t * pMontgomeryParam***

Field Documentation

- ***uint32_t PKA_PointCheckInTypeDef::modulusSize***
  Number of element in coefA, coefB, modulus, pointX and pointY arrays
- ***uint32_t PKA_PointCheckInTypeDef::coefSign***
  Curve coefficient a sign
- ***const uint8_t* PKA_PointCheckInTypeDef::coefA***
  Pointer to curve coefficient |a| (Array of modulusSize elements)
- ***const uint8_t* PKA_PointCheckInTypeDef::coefB***
  Pointer to curve coefficient b (Array of modulusSize elements)
- ***const uint8_t* PKA_PointCheckInTypeDef::modulus***
  Pointer to curve modulus value p (Array of modulusSize elements)
- ***const uint8_t* PKA_PointCheckInTypeDef::pointX***
  Pointer to point P coordinate xP (Array of modulusSize elements)
- ***const uint8_t* PKA_PointCheckInTypeDef::pointY***
  Pointer to point P coordinate yP (Array of modulusSize elements)
- ***const uint32_t* PKA_PointCheckInTypeDef::pMontgomeryParam***
  pointer to montgomery param R2 (modulus N)

59.1.5 PKA_RSACRTExpInTypeDef

PKA_RSACRTExpInTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint32_t size***
- ***const uint8_t * pOpDp***
- ***const uint8_t * pOpDq***
- ***const uint8_t * pOpQinv***
- ***const uint8_t * pPrimeP***
- ***const uint8_t * pPrimeQ***
- ***const uint8_t * popA***

Field Documentation

- ***uint32_t PKA_RSACRTExpInTypeDef::size***
  Number of element in popA array
- ***const uint8_t* PKA_RSACRTExpInTypeDef::pOpDp***
  Pointer to operand dP (Array of size/2 elements)
- ***const uint8_t* PKA_RSACRTExpInTypeDef::pOpDq***
  Pointer to operand dQ (Array of size/2 elements)
- ***const uint8_t* PKA_RSACRTExpInTypeDef::pOpQinv***
  Pointer to operand qinv (Array of size/2 elements)
- ***const uint8_t* PKA_RSACRTExpInTypeDef::pPrimeP***
  Pointer to prime p (Array of size/2 elements)
- ***const uint8_t* PKA_RSACRTExpInTypeDef::pPrimeQ***
  Pointer to prime Q (Array of size/2 elements)

- ***const uint8_t* PKA_RSACRTExpInTypeDef::popA***
  Pointer to operand A (Array of size elements)

59.1.6 PKA_ECDSAVerifInTypeDef

PKA_ECDSAVerifInTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint32_t primeOrderSize***
- ***uint32_t modulusSize***
- ***uint32_t coefSign***
- ***const uint8_t * coef***
- ***const uint8_t * modulus***
- ***const uint8_t * basePointX***
- ***const uint8_t * basePointY***
- ***const uint8_t * pPubKeyCurvePtX***
- ***const uint8_t * pPubKeyCurvePtY***
- ***const uint8_t * RSign***
- ***const uint8_t * SSign***
- ***const uint8_t * hash***
- ***const uint8_t * primeOrder***

Field Documentation

- ***uint32_t PKA_ECDSAVerifInTypeDef::primeOrderSize***
  Number of element in primeOrder array
- ***uint32_t PKA_ECDSAVerifInTypeDef::modulusSize***
  Number of element in modulus array
- ***uint32_t PKA_ECDSAVerifInTypeDef::coefSign***
  Curve coefficient a sign
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::coef***
  Pointer to curve coefficient |a| (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::modulus***
  Pointer to curve modulus value p (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::basePointX***
  Pointer to curve base point xG (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::basePointY***
  Pointer to curve base point yG (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::pPubKeyCurvePtX***
  Pointer to public-key curve point xQ (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::pPubKeyCurvePtY***
  Pointer to public-key curve point yQ (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::RSign***
  Pointer to signature part r (Array of primeOrderSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::SSign***
  Pointer to signature part s (Array of primeOrderSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::hash***
  Pointer to hash of the message e (Array of primeOrderSize elements)
- ***const uint8_t* PKA_ECDSAVerifInTypeDef::primeOrder***
  Pointer to order of the curve n (Array of primeOrderSize elements)

59.1.7 PKA_ECDSASignInTypeDef

PKA_ECDSASignInTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint32_t primeOrderSize***
- ***uint32_t modulusSize***
- ***uint32_t coefSign***

- ***const uint8_t * coef***
- ***const uint8_t * coefB***
- ***const uint8_t * modulus***
- ***const uint8_t * integer***
- ***const uint8_t * basePointX***
- ***const uint8_t * basePointY***
- ***const uint8_t * hash***
- ***const uint8_t * privateKey***
- ***const uint8_t * primeOrder***

Field Documentation

- ***uint32_t PKA_ECDSASignInTypeDef::primeOrderSize***
  Number of element in primeOrder array
- ***uint32_t PKA_ECDSASignInTypeDef::modulusSize***
  Number of element in modulus array
- ***uint32_t PKA_ECDSASignInTypeDef::coefSign***
  Curve coefficient a sign
- ***const uint8_t* PKA_ECDSASignInTypeDef::coef***
  Pointer to curve coefficient |a| (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::coefB***
  Pointer to B coefficient (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::modulus***
  Pointer to curve modulus value p (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::integer***
  Pointer to random integer k (Array of primeOrderSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::basePointX***
  Pointer to curve base point xG (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::basePointY***
  Pointer to curve base point yG (Array of modulusSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::hash***
  Pointer to hash of the message (Array of primeOrderSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::privateKey***
  Pointer to private key d (Array of primeOrderSize elements)
- ***const uint8_t* PKA_ECDSASignInTypeDef::primeOrder***
  Pointer to order of the curve n (Array of primeOrderSize elements)

59.1.8 PKA_ECDSASignOutTypeDef

PKA_ECDSASignOutTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint8_t * RSign***
- ***uint8_t * SSign***

Field Documentation

- ***uint8_t* PKA_ECDSASignOutTypeDef::RSign***
  Pointer to signature part r (Array of modulusSize elements)
- ***uint8_t* PKA_ECDSASignOutTypeDef::SSign***
  Pointer to signature part s (Array of modulusSize elements)

59.1.9 PKA_ECDSASignOutExtParamTypeDef

PKA_ECDSASignOutExtParamTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint8_t * ptX***
- ***uint8_t * ptY***

Field Documentation

- ***uint8_t* PKA_ECDSASignOutExtParamTypeDef::ptX***
  Pointer to point P coordinate xP (Array of modulusSize elements)
- ***uint8_t* PKA_ECDSASignOutExtParamTypeDef::ptY***
  Pointer to point P coordinate yP (Array of modulusSize elements)

59.1.10 PKA_ECCCompleteAdditionOutTypeDef

PKA_ECCCompleteAdditionOutTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint8_t * ptX***
- ***uint8_t * ptY***
- ***uint8_t * ptZ***

Field Documentation

- ***uint8_t* PKA_ECCCompleteAdditionOutTypeDef::ptX***
  pointer to point P coordinate xP
- ***uint8_t* PKA_ECCCompleteAdditionOutTypeDef::ptY***
  pointer to point P coordinate yP
- ***uint8_t* PKA_ECCCompleteAdditionOutTypeDef::ptZ***
  pointer to point P coordinate zP

59.1.11 PKA_ModExpInTypeDef

PKA_ModExpInTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint32_t expSize***
- ***uint32_t OpSize***
- ***const uint8_t * pExp***
- ***const uint8_t * pOp1***
- ***const uint8_t * pMod***

Field Documentation

- ***uint32_t PKA_ModExpInTypeDef::expSize***
  Number of element in pExp array
- ***uint32_t PKA_ModExpInTypeDef::OpSize***
  Number of element in pOp1 and pMod arrays
- ***const uint8_t* PKA_ModExpInTypeDef::pExp***
  Pointer to Exponent (Array of expSize elements)
- ***const uint8_t* PKA_ModExpInTypeDef::pOp1***
  Pointer to Operand (Array of OpSize elements)
- ***const uint8_t* PKA_ModExpInTypeDef::pMod***
  Pointer to modulus (Array of OpSize elements)

59.1.12 PKA_ModExpProtectModeInTypeDef

PKA_ModExpProtectModeInTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint32_t expSize***
- ***uint32_t OpSize***
- ***const uint8_t * pOp1***
- ***const uint8_t * pExp***
- ***const uint8_t * pMod***
- ***const uint8_t * pPhi***

Field Documentation

- ***uint32_t PKA_ModExpProtectModeInTypeDef::expSize***
  Size of the operand in bytes

- ***uint32_t PKA_ModExpProtectModeInTypeDef::OpSize***
  Size of the operand in bytes
- ***const uint8_t* PKA_ModExpProtectModeInTypeDef::pOp1***
  Pointer to Operand 1
- ***const uint8_t* PKA_ModExpProtectModeInTypeDef::pExp***
  Pointer to Exponent
- ***const uint8_t* PKA_ModExpProtectModeInTypeDef::pMod***
  Pointer to Operand 1
- ***const uint8_t* PKA_ModExpProtectModeInTypeDef::pPhi***
  Pointer to Phi value

59.1.13 PKA_ModExpFastModeInTypeDef

PKA_ModExpFastModeInTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint32_t expSize***
- ***uint32_t OpSize***
- ***const uint8_t * pExp***
- ***const uint8_t * pOp1***
- ***const uint8_t * pMod***
- ***const uint32_t * pMontgomeryParam***

Field Documentation

- ***uint32_t PKA_ModExpFastModeInTypeDef::expSize***
  Number of element in pExp and pMontgomeryParam arrays
- ***uint32_t PKA_ModExpFastModeInTypeDef::OpSize***
  Number of element in pOp1 and pMod arrays
- ***const uint8_t* PKA_ModExpFastModeInTypeDef::pExp***
  Pointer to Exponent (Array of expSize elements)
- ***const uint8_t* PKA_ModExpFastModeInTypeDef::pOp1***
  Pointer to Operand (Array of OpSize elements)
- ***const uint8_t* PKA_ModExpFastModeInTypeDef::pMod***
  Pointer to modulus (Array of OpSize elements)
- ***const uint32_t* PKA_ModExpFastModeInTypeDef::pMontgomeryParam***
  Pointer to Montgomery parameter (Array of expSize/4 elements)

59.1.14 PKA_MontgomeryParamInTypeDef

PKA_MontgomeryParamInTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint32_t size***
- ***const uint8_t * pOp1***

Field Documentation

- ***uint32_t PKA_MontgomeryParamInTypeDef::size***
  Number of element in pOp1 array
- ***const uint8_t* PKA_MontgomeryParamInTypeDef::pOp1***
  Pointer to Operand (Array of size elements)

59.1.15 PKA_AddInTypeDef

PKA_AddInTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint32_t size***
- ***const uint32_t * pOp1***
- ***const uint32_t * pOp2***

Field Documentation

- ***uint32_t PKA_AddInTypeDef::size***
  Number of element in pOp1 and pOp2 arrays
- ***const uint32_t* PKA_AddInTypeDef::pOp1***
  Pointer to Operand 1 (Array of size elements)
- ***const uint32_t* PKA_AddInTypeDef::pOp2***
  Pointer to Operand 2 (Array of size elements)

59.1.16 PKA_ModInvInTypeDef

PKA_ModInvInTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint32_t size***
- ***const uint32_t * pOp1***
- ***const uint8_t * pMod***

Field Documentation

- ***uint32_t PKA_ModInvInTypeDef::size***
  Number of element in pOp1 array
- ***const uint32_t* PKA_ModInvInTypeDef::pOp1***
  Pointer to Operand 1 (Array of size elements)
- ***const uint8_t* PKA_ModInvInTypeDef::pMod***
  Pointer to modulus value n (Array of size*4 elements)

59.1.17 PKA_ModRedInTypeDef

PKA_ModRedInTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint32_t OpSize***
- ***uint32_t modSize***
- ***const uint32_t * pOp1***
- ***const uint8_t * pMod***

Field Documentation

- ***uint32_t PKA_ModRedInTypeDef::OpSize***
  Number of element in pOp1 array
- ***uint32_t PKA_ModRedInTypeDef::modSize***
  Number of element in pMod array
- ***const uint32_t* PKA_ModRedInTypeDef::pOp1***
  Pointer to Operand 1 (Array of OpSize elements)
- ***const uint8_t* PKA_ModRedInTypeDef::pMod***
  Pointer to modulus value n (Array of modSize elements)

59.1.18 PKA_ModAddInTypeDef

PKA_ModAddInTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint32_t size***
- ***const uint32_t * pOp1***
- ***const uint32_t * pOp2***
- ***const uint8_t * pOp3***

Field Documentation

- ***uint32_t PKA_ModAddInTypeDef::size***
  Number of element in pOp1 and pOp2 arrays
- ***const uint32_t* PKA_ModAddInTypeDef::pOp1***
  Pointer to Operand 1 (Array of size elements)
- ***const uint32_t* PKA_ModAddInTypeDef::pOp2***
  Pointer to Operand 2 (Array of size elements)

- ***const uint8_t* PKA_ModAddInTypeDef::pOp3***
  Pointer to Operand 3 (Array of size*4 elements)

59.1.19 PKA_ECCDoubleBaseLadderInTypeDef

PKA_ECCDoubleBaseLadderInTypeDef is defined in the stm32u5xx_hal_pka.h

Data Fields

- ***uint32_t primeOrderSize***
- ***uint32_t modulusSize***
- ***uint32_t coefSign***
- ***const uint8_t * coefA***
- ***const uint8_t * modulus***
- ***const uint8_t * integerK***
- ***const uint8_t * integerM***
- ***const uint8_t * basePointX1***
- ***const uint8_t * basePointY1***
- ***const uint8_t * basePointZ1***
- ***const uint8_t * basePointX2***
- ***const uint8_t * basePointY2***
- ***const uint8_t * basePointZ2***

Field Documentation

- ***uint32_t PKA_ECCDoubleBaseLadderInTypeDef::primeOrderSize***
  curve prime order n length
- ***uint32_t PKA_ECCDoubleBaseLadderInTypeDef::modulusSize***
  curve modulus p length
- ***uint32_t PKA_ECCDoubleBaseLadderInTypeDef::coefSign***
  curve coefficient a sign
- ***const uint8_t* PKA_ECCDoubleBaseLadderInTypeDef::coefA***
  pointer to curve coefficient |a|
- ***const uint8_t* PKA_ECCDoubleBaseLadderInTypeDef::modulus***
  pointer to curve modulus value p
- ***const uint8_t* PKA_ECCDoubleBaseLadderInTypeDef::integerK***
  pointer to cryptographically secure random integer k
- ***const uint8_t* PKA_ECCDoubleBaseLadderInTypeDef::integerM***
  pointer to cryptographically secure random integer m
- ***const uint8_t* PKA_ECCDoubleBaseLadderInTypeDef::basePointX1***
  pointer to curve base first point coordinate x

59.2 PKA Firmware driver API description

The following section lists the various functions of the PKA library.

59.2.1 How to use this driver

The PKA HAL driver can be used as follows:

1. Declare a PKA_HandleTypeDef handle structure, for example: PKA_HandleTypeDef hpka;
2. Initialize the PKA low level resources by implementing the HAL_PKA_MspInit() API:
   a. Enable the PKA interface clock
   b. NVIC configuration if you need to use interrupt process
      - Configure the PKA interrupt priority
      - Enable the NVIC PKA IRQ Channel
3. Initialize the PKA registers by calling the HAL_PKA_Init() API which trig HAL_PKA_MspInit().
4. Fill entirely the input structure corresponding to your operation: For instance: PKA_ModExpInTypeDef for HAL_PKA_ModExp().
5. Execute the operation (in polling or interrupt) and check the returned value.
6. Retrieve the result of the operation (For instance, HAL_PKA_ModExp_GetResult for HAL_PKA_ModExp operation). The function to gather the result is different for each kind of operation. The correspondence can be found in the following section.
7. Call the function HAL_PKA_DeInit() to restore the default configuration which trig HAL_PKA_MspDeInit().

High level operation

- Input structure requires buffers as uint8_t array.
- Output structure requires buffers as uint8_t array.
- Modular exponentiation using:
  – HAL_PKA_ModExp().
  – HAL_PKA_ModExp_IT().
  – HAL_PKA_ModExpFastMode().
  – HAL_PKA_ModExpFastMode_IT().
  – HAL_PKA_ModExpProtectMode().
  – HAL_PKA_ModExpProtectMode_IT().
  – HAL_PKA_ModExp_GetResult() to retrieve the result of the operation.
- RSA Chinese Remainder Theorem (CRT) using:
  – HAL_PKA_RSACRTExp().
  – HAL_PKA_RSACRTExp_IT().
  – HAL_PKA_RSACRTExp_GetResult() to retrieve the result of the operation.
- ECC Point Check using:
  – HAL_PKA_PointCheck().
  – HAL_PKA_PointCheck_IT().
  – HAL_PKA_PointCheck_IsOnCurve() to retrieve the result of the operation.
- ECDSA Sign
  – HAL_PKA_ECDSASign().
  – HAL_PKA_ECDSASign_IT().
  – HAL_PKA_ECDSASign_GetResult() to retrieve the result of the operation.
- ECDSA Verify
  – HAL_PKA_ECDSAVerif().
  – HAL_PKA_ECDSAVerif_IT().
  – HAL_PKA_ECDSAVerif_IsValidSignature() to retrieve the result of the operation.

- ECC Scalar Multiplication using:
  – HAL_PKA_ECCMul().
  – HAL_PKA_ECCMul_IT().
  – HAL_PKA_ECCMul_GetResult() to retrieve the result of the operation.
- ECC double base ladder using:
  – HAL_PKA_ECCDoubleBaseLadder().
  – HAL_PKA_ECCDoubleBaseLadder_IT().
  – HAL_PKA_ECCDoubleBaseLadder_GetResult() to retrieve the result of the operation.
- ECC projective to affine using:
  – HAL_PKA_ECCProjective2Affine().
  – HAL_PKA_ECCProjective2Affine_IT().
  – HAL_PKA_ECCProjective2Affine_GetResult() to retrieve the result of the operation.
- ECC complete addition using:
  – HAL_PKA_ECCCompleteAddition().
  – HAL_PKA_ECCCompleteAddition_IT().
  – HAL_PKA_ECCCompleteAddition_GetResult() to retrieve the result of the operation.

Low level operation

- Input structure requires buffers as uint32_t array.
- Output structure requires buffers as uint32_t array.
- Arithmetic addition using:
  – HAL_PKA_Add().
  – HAL_PKA_Add_IT().
  – HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation. The resulting size can be the input parameter or the input parameter size + 1 (overflow).
- Arithmetic subtraction using:
  – HAL_PKA_Sub().
  – HAL_PKA_Sub_IT().
  – HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.
- Arithmetic multiplication using:
  – HAL_PKA_Mul().
  – HAL_PKA_Mul_IT().
  – HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.
- Comparison using:
  – HAL_PKA_Cmp().
  – HAL_PKA_Cmp_IT().
  – HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.
- Modular addition using:
  – HAL_PKA_ModAdd().
  – HAL_PKA_ModAdd_IT().
  – HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.
- Modular subtraction using:
  – HAL_PKA_ModSub().
  – HAL_PKA_ModSub_IT().
  – HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.
- Modular inversion using:
  – HAL_PKA_ModInv().
  – HAL_PKA_ModInv_IT().
  – HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.

- Modular reduction using:
  - HAL_PKA_ModRed().
  - HAL_PKA_ModRed_IT().
  - HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.
- Montgomery multiplication using:
  - HAL_PKA_MontgomeryMul().
  - HAL_PKA_MontgomeryMul_IT().
  - HAL_PKA_Arithmetic_GetResult() to retrieve the result of the operation.

Montgomery parameter

Polling mode operation

- When an operation is started in polling mode, the function returns when:
  - A timeout is encounter.
  - The operation is completed.

Interrupt mode operation

- Add HAL_PKA_IRQHandler to the IRQHandler of PKA.
- Enable the IRQ using HAL_NVIC_EnableIRQ().
- When an operation is started in interrupt mode, the function returns immediately.
- When the operation is completed, the callback HAL_PKA_OperationCpltCallback is called.
- When an error is encountered, the callback HAL_PKA_ErrorCallback is called.
- To stop any operation in interrupt mode, use HAL_PKA_Abort().

Utilities

- To clear the PKA RAM, use HAL_PKA_RAMReset().
- To get current state, use HAL_PKA_GetState().
- To get current error, use HAL_PKA_GetError().

Callback registration

The compilation flag USE_HAL_PKA_REGISTER_CALLBACKS, when set to 1, allows the user to configure dynamically the driver callbacks. Use Functions HAL_PKA_RegisterCallback() to register an interrupt callback.

Function HAL_PKA_RegisterCallback() allows to register following callbacks:

- OperationCpltCallback : callback for End of operation.
- ErrorCallback : callback for error detection.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit. This function takes as parameters the HAL peripheral handle, the Callback ID and a pointer to the user callback function.

Use function HAL_PKA_UnRegisterCallback to reset a callback to the default weak function.

HAL_PKA_UnRegisterCallback takes as parameters the HAL peripheral handle, and the Callback ID. This function allows to reset following callbacks:

- OperationCpltCallback : callback for End of operation.
- ErrorCallback : callback for error detection.
- MspInitCallback : callback for Msp Init.
- MspDeInitCallback : callback for Msp DeInit.

By default, after the HAL_PKA_Init() and when the state is HAL_PKA_STATE_RESET all callbacks are set to the corresponding weak functions: examples HAL_PKA_OperationCpltCallback(), HAL_PKA_ErrorCallback(). Exception done for MspInit and MspDeInit functions that are reset to the legacy weak functions in the HAL_PKA_Init()/ HAL_PKA_DeInit() only when these callbacks are null (not registered beforehand).

If MspInit or MspDeInit are not null, the HAL_PKA_Init()/ HAL_PKA_DeInit() keep and use the user MspInit/ MspDeInit callbacks (registered beforehand) whatever the state.

Callbacks can be registered/unregistered in HAL_PKA_STATE_READY state only. Exception done MspInit/ MspDeInit functions that can be registered/unregistered in HAL_PKA_STATE_READY or HAL_PKA_STATE_RESET state, thus registered (user) MspInit/DeInit callbacks can be used during the Init/ DeInit.

Then, the user first registers the MspInit/MspDeInit user callbacks using HAL_PKA_RegisterCallback() before calling HAL_PKA_DeInit() or HAL_PKA_Init() function.

When the compilation flag USE_HAL_PKA_REGISTER_CALLBACKS is set to 0 or not defined, the callback registration feature is not available and all callbacks are set to the corresponding weak functions.

59.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and deinitialize the PKAx peripheral:

- User must implement HAL_PKA_MspInit() function in which he configures all related peripherals resources (CLOCK, IT and NVIC).
- Call the function HAL_PKA_Init() to configure the device.
- Call the function HAL_PKA_DeInit() to restore the default configuration of the selected PKAx peripheral.

This section contains the following APIs:

- ***HAL_PKA_Init()***
- ***HAL_PKA_DeInit()***
- ***HAL_PKA_MspInit()***
- ***HAL_PKA_MspDeInit()***
- ***HAL_PKA_RegisterCallback()***
- ***HAL_PKA_UnRegisterCallback()***

59.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the PKA operations.

1. There are two modes of operation:
   – Blocking mode : The operation is performed in the polling mode. These functions return when data operation is completed.
   – No-Blocking mode : The operation is performed using Interrupts. These functions return immediately. The end of the operation is indicated by HAL_PKA_ErrorCallback in case of error. The end of the operation is indicated by HAL_PKA_OperationCpltCallback in case of success. To stop any operation in interrupt mode, use HAL_PKA_Abort().

2. Blocking mode functions are :
   - HAL_PKA_ModExp()
   - HAL_PKA_ModExpFastMode()
   - HAL_PKA_ModExpProtectMode()
   - HAL_PKA_ModExp_GetResult();
   - HAL_PKA_ECDSASign()
   - HAL_PKA_ECDSASign_GetResult();
   - HAL_PKA_ECDSAVerif()
   - HAL_PKA_ECDSAVerif_IsValidSignature();
   - HAL_PKA_RSACRTExp()
   - HAL_PKA_RSACRTExp_GetResult();
   - HAL_PKA_PointCheck()
   - HAL_PKA_PointCheck_IsOnCurve();
   - HAL_PKA_ECCMul()
   - HAL_PKA_ECCMulFastMode()
   - HAL_PKA_ECCMul_GetResult();
   - HAL_PKA_ECCMulEx()
   - HAL_PKA_ECCDoubleBaseLadder()
   - HAL_PKA_ECCDoubleBaseLadder_GetResult();
   - HAL_PKA_ECCProjective2Affine()
   - HAL_PKA_ECCProjective2Affine_GetResult();
   - HAL_PKA_ECCCompleteAddition()
   - HAL_PKA_ECCCompleteAddition_GetResult();
   - HAL_PKA_Add()
   - HAL_PKA_Sub()
   - HAL_PKA_Cmp()
   - HAL_PKA_Mul()
   - HAL_PKA_ModAdd()
   - HAL_PKA_ModSub()
   - HAL_PKA_ModInv()
   - HAL_PKA_ModRed()
   - HAL_PKA_MontgomeryMul()
   - HAL_PKA_Arithmetic_GetResult(P);
   - HAL_PKA_MontgomeryParam()
   - HAL_PKA_MontgomeryParam_GetResult();

3. No-Blocking mode functions with Interrupt are :
   – HAL_PKA_ModExp_IT();
   – HAL_PKA_ModExpFastMode_IT();
   – HAL_PKA_ModExpProtectMode_IT()
   – HAL_PKA_ModExp_GetResult();
   – HAL_PKA_ECDSASign_IT();
   – HAL_PKA_ECDSASign_GetResult();
   – HAL_PKA_ECDSAVerif_IT();
   – HAL_PKA_ECDSAVerif_IsValidSignature();
   – HAL_PKA_RSACRTExp_IT();
   – HAL_PKA_RSACRTExp_GetResult();
   – HAL_PKA_PointCheck_IT();
   – HAL_PKA_PointCheck_IsOnCurve();
   – HAL_PKA_ECCMul_IT();
   – HAL_PKA_ECCMulFastMode_IT();
   – HAL_PKA_ECCMul_GetResult();
   – HAL_PKA_ECCMulEx_IT();
   – HAL_PKA_ECCDoubleBaseLadder_IT()
   – HAL_PKA_ECCDoubleBaseLadder_GetResult();
   – HAL_PKA_ECCProjective2Affine_IT()
   – HAL_PKA_ECCProjective2Affine_GetResult();
   – HAL_PKA_ECCCompleteAddition_IT()
   – HAL_PKA_ECCCompleteAddition_GetResult();
   – HAL_PKA_Add_IT();
   – HAL_PKA_Sub_IT();
   – HAL_PKA_Cmp_IT();
   – HAL_PKA_Mul_IT();
   – HAL_PKA_ModAdd_IT();
   – HAL_PKA_ModSub_IT();
   – HAL_PKA_ModInv_IT();
   – HAL_PKA_ModRed_IT();
   – HAL_PKA_MontgomeryMul_IT();
   – HAL_PKA_Arithmetic_GetResult();
   – HAL_PKA_MontgomeryParam_IT();
   – HAL_PKA_MontgomeryParam_GetResult();
   – HAL_PKA_Abort();

This section contains the following APIs:
- *HAL_PKA_ModExp()*
- *HAL_PKA_ModExp_IT()*
- *HAL_PKA_ModExpFastMode()*

59.2.4 Peripheral State and Error functions

This subsection permit to get in run-time the status of the peripheral.

This section contains the following APIs:
- *HAL_PKA_GetState()*
- *HAL_PKA_GetError()*

59.2.5 Detailed description of functions

HAL_PKA_Init

Function name

HAL_StatusTypeDef HAL_PKA_Init (PKA_HandleTypeDef * hpka)

Function description

Initialize the PKA according to the specified parameters in the PKA_InitTypeDef and initialize the associated handle.

Parameters

- **hpka:** PKA handle

Return values

- **HAL:** status

HAL_PKA_DeInit

Function name

HAL_StatusTypeDef HAL_PKA_DeInit (PKA_HandleTypeDef * hpka)

Function description

DeInitialize the PKA peripheral.

Parameters

- **hpka:** PKA handle

Return values

- **HAL:** status

HAL_PKA_MspInit

Function name

void HAL_PKA_MspInit (PKA_HandleTypeDef * hpka)

Function description

Initialize the PKA MSP.

Parameters

- **hpka:** PKA handle

Return values

- **None:**

HAL_PKA_MspDeInit

Function name

void HAL_PKA_MspDeInit (PKA_HandleTypeDef * hpka)

Function description

DeInitialize the PKA MSP.

Parameters

- **hpka:** PKA handle

Return values

- **None:**

HAL_PKA_RegisterCallback

Function name

HAL_StatusTypeDef HAL_PKA_RegisterCallback (PKA_HandleTypeDef * hpka, HAL_PKA_CallbackIDTypeDef CallbackID, pPKA_CallbackTypeDef pCallback)

Function description

Register a User PKA Callback To be used instead of the weak predefined callback.

Parameters

- **hpka:** Pointer to a PKA_HandleTypeDef structure that contains the configuration information for the specified PKA.
- **CallbackID:** ID of the callback to be registered This parameter can be one of the following values:
  – HAL_PKA_OPERATION_COMPLETE_CB_ID End of operation callback ID
  – HAL_PKA_ERROR_CB_ID Error callback ID
  – HAL_PKA_MSPINIT_CB_ID MspInit callback ID
  – HAL_PKA_MSPDEINIT_CB_ID MspDeInit callback ID
- **pCallback:** pointer to the Callback function

Return values

- **HAL:** status

HAL_PKA_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_PKA_UnRegisterCallback (PKA_HandleTypeDef * hpka, HAL_PKA_CallbackIDTypeDef CallbackID)

Function description

Unregister a PKA Callback PKA callback is redirected to the weak predefined callback.

Parameters

- **hpka:** Pointer to a PKA_HandleTypeDef structure that contains the configuration information for the specified PKA.
- **CallbackID:** ID of the callback to be unregistered This parameter can be one of the following values:
  – HAL_PKA_OPERATION_COMPLETE_CB_ID End of operation callback ID
  – HAL_PKA_ERROR_CB_ID Error callback ID
  – HAL_PKA_MSPINIT_CB_ID MspInit callback ID
  – HAL_PKA_MSPDEINIT_CB_ID MspDeInit callback ID

Return values

- **HAL:** status

HAL_PKA_ModExp

Function name

HAL_StatusTypeDef HAL_PKA_ModExp (PKA_HandleTypeDef * hpka, PKA_ModExpInTypeDef * in, uint32_t Timeout)

Function description

Modular exponentiation in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ModExp_IT

Function name

HAL_StatusTypeDef HAL_PKA_ModExp_IT (PKA_HandleTypeDef * hpka, PKA_ModExpInTypeDef * in)

Function description

Modular exponentiation in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ModExpFastMode

Function name

HAL_StatusTypeDef HAL_PKA_ModExpFastMode (PKA_HandleTypeDef * hpka, PKA_ModExpFastModeInTypeDef * in, uint32_t Timeout)

Function description

Modular exponentiation in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ModExpFastMode_IT

Function name

HAL_StatusTypeDef HAL_PKA_ModExpFastMode_IT (PKA_HandleTypeDef * hpka, PKA_ModExpFastModeInTypeDef * in)

Function description

Modular exponentiation in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ModExpProtectMode

Function name

HAL_StatusTypeDef HAL_PKA_ModExpProtectMode (PKA_HandleTypeDef * hpka, PKA_ModExpProtectModeInTypeDef * in, uint32_t Timeout)

Function description

Modular exponentiation (protected) in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ModExpProtectMode_IT

Function name

HAL_StatusTypeDef HAL_PKA_ModExpProtectMode_IT (PKA_HandleTypeDef * hpka, PKA_ModExpProtectModeInTypeDef * in)

Function description

Modular exponentiation (protected) in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ModExp_GetResult

Function name

void HAL_PKA_ModExp_GetResult (PKA_HandleTypeDef * hpka, uint8_t * pRes)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **pRes:** Output buffer

Return values

- **HAL:** status

HAL_PKA_ECDSASign

Function name

HAL_StatusTypeDef HAL_PKA_ECDSASign (PKA_HandleTypeDef * hpka, PKA_ECDSASignInTypeDef * in, uint32_t Timeout)

Function description

Sign a message using elliptic curves over prime fields in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ECDSASign_IT

Function name

HAL_StatusTypeDef HAL_PKA_ECDSASign_IT (PKA_HandleTypeDef * hpka, PKA_ECDSASignInTypeDef * in)

Function description

Sign a message using elliptic curves over prime fields in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ECDSASign_GetResult

Function name

void HAL_PKA_ECDSASign_GetResult (PKA_HandleTypeDef * hpka, PKA_ECDSASignOutTypeDef * out, PKA_ECDSASignOutExtParamTypeDef * outExt)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **out:** Output information
- **outExt:** Additional Output information (facultative)

HAL_PKA_ECDSAVerif

Function name

HAL_StatusTypeDef HAL_PKA_ECDSAVerif (PKA_HandleTypeDef * hpka, PKA_ECDSAVerifInTypeDef * in, uint32_t Timeout)

Function description

Verify the validity of a signature using elliptic curves over prime fields in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ECDSAVerif_IT

Function name

HAL_StatusTypeDef HAL_PKA_ECDSAVerif_IT (PKA_HandleTypeDef * hpka, PKA_ECDSAVerifInTypeDef * in)

Function description

Verify the validity of a signature using elliptic curves over prime fields in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ECDSAVerif_IsValidSignature

Function name

uint32_t HAL_PKA_ECDSAVerif_IsValidSignature (PKA_HandleTypeDef const *const hpka)

Function description

Return the result of the ECDSA verification operation.

Parameters

- **hpka:** PKA handle

Return values

- **1:** if signature is verified, 0 in other case

HAL_PKA_RSACRTExp

Function name

HAL_StatusTypeDef HAL_PKA_RSACRTExp (PKA_HandleTypeDef * hpka, PKA_RSACRTExpInTypeDef * in, uint32_t Timeout)

Function description

RSA CRT exponentiation in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_RSACRTExp_IT

Function name

HAL_StatusTypeDef HAL_PKA_RSACRTExp_IT (PKA_HandleTypeDef * hpka, PKA_RSACRTExpInTypeDef * in)

Function description

RSA CRT exponentiation in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_RSACRTExp_GetResult

Function name

void HAL_PKA_RSACRTExp_GetResult (PKA_HandleTypeDef * hpka, uint8_t * pRes)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **pRes:** Pointer to memory location to receive the result of the operation

Return values

- **HAL:** status

HAL_PKA_PointCheck

Function name

HAL_StatusTypeDef HAL_PKA_PointCheck (PKA_HandleTypeDef * hpka, PKA_PointCheckInTypeDef * in, uint32_t Timeout)

Function description

Point on elliptic curve check in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_PointCheck_IT

Function name

HAL_StatusTypeDef HAL_PKA_PointCheck_IT (PKA_HandleTypeDef * hpka, PKA_PointCheckInTypeDef * in)

Function description

Point on elliptic curve check in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_PointCheck_IsOnCurve

Function name

uint32_t HAL_PKA_PointCheck_IsOnCurve (PKA_HandleTypeDef const *const hpka)

Function description

Return the result of the point check operation.

Parameters

- **hpka:** PKA handle

Return values

- **1:** if point is on curve, 0 in other case

HAL_PKA_ECCMul

Function name

HAL_StatusTypeDef HAL_PKA_ECCMul (PKA_HandleTypeDef * hpka, PKA_ECCMulInTypeDef * in, uint32_t Timeout)

Function description

ECC scalar multiplication in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ECCMul_IT

Function name

HAL_StatusTypeDef HAL_PKA_ECCMul_IT (PKA_HandleTypeDef * hpka, PKA_ECCMulInTypeDef * in)

Function description

ECC scalar multiplication in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ECCMulEx

Function name

HAL_StatusTypeDef HAL_PKA_ECCMulEx (PKA_HandleTypeDef * hpka, PKA_ECCMulExInTypeDef * in, uint32_t Timeout)

Function description

ECC scalar multiplication extended in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ECCMulEx_IT

Function name

HAL_StatusTypeDef HAL_PKA_ECCMulEx_IT (PKA_HandleTypeDef * hpka, PKA_ECCMulExInTypeDef * in)

Function description

ECC scalar multiplication extended in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ECCMul_GetResult

Function name

void HAL_PKA_ECCMul_GetResult (PKA_HandleTypeDef * hpka, PKA_ECCMulOutTypeDef * out)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **out:** Output information

Return values

- **HAL:** status

HAL_PKA_Add

Function name

HAL_StatusTypeDef HAL_PKA_Add (PKA_HandleTypeDef * hpka, PKA_AddInTypeDef * in, uint32_t Timeout)

Function description

Arithmetic addition in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_Add_IT

Function name

HAL_StatusTypeDef HAL_PKA_Add_IT (PKA_HandleTypeDef * hpka, PKA_AddInTypeDef * in)

Function description

Arithmetic addition in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_Sub

Function name

HAL_StatusTypeDef HAL_PKA_Sub (PKA_HandleTypeDef * hpka, PKA_SubInTypeDef * in, uint32_t Timeout)

Function description

Arithmetic subtraction in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_Sub_IT

Function name

HAL_StatusTypeDef HAL_PKA_Sub_IT (PKA_HandleTypeDef * hpka, PKA_SubInTypeDef * in)

Function description

Arithmetic subtraction in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_Cmp

Function name

HAL_StatusTypeDef HAL_PKA_Cmp (PKA_HandleTypeDef * hpka, PKA_CmpInTypeDef * in, uint32_t Timeout)

Function description

Comparison in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_Cmp_IT

Function name

HAL_StatusTypeDef HAL_PKA_Cmp_IT (PKA_HandleTypeDef * hpka, PKA_CmpInTypeDef * in)

Function description

Comparison in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_Mul

Function name

HAL_StatusTypeDef HAL_PKA_Mul (PKA_HandleTypeDef * hpka, PKA_MulInTypeDef * in, uint32_t Timeout)

Function description

Arithmetic multiplication in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_Mul_IT

Function name

HAL_StatusTypeDef HAL_PKA_Mul_IT (PKA_HandleTypeDef * hpka, PKA_MulInTypeDef * in)

Function description

Arithmetic multiplication in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ModAdd

Function name

HAL_StatusTypeDef HAL_PKA_ModAdd (PKA_HandleTypeDef * hpka, PKA_ModAddInTypeDef * in, uint32_t Timeout)

Function description

Modular addition in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ModAdd_IT

Function name

HAL_StatusTypeDef HAL_PKA_ModAdd_IT (PKA_HandleTypeDef * hpka, PKA_ModAddInTypeDef * in)

Function description

Modular addition in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ModSub

Function name

HAL_StatusTypeDef HAL_PKA_ModSub (PKA_HandleTypeDef * hpka, PKA_ModSubInTypeDef * in, uint32_t Timeout)

Function description

Modular subtraction in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ModSub_IT

Function name

HAL_StatusTypeDef HAL_PKA_ModSub_IT (PKA_HandleTypeDef * hpka, PKA_ModSubInTypeDef * in)

Function description

Modular subtraction in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ModInv

Function name

HAL_StatusTypeDef HAL_PKA_ModInv (PKA_HandleTypeDef * hpka, PKA_ModInvInTypeDef * in, uint32_t Timeout)

Function description

Modular inversion in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ModInv_IT

Function name

HAL_StatusTypeDef HAL_PKA_ModInv_IT (PKA_HandleTypeDef * hpka, PKA_ModInvInTypeDef * in)

Function description

Modular inversion in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ModRed

Function name

HAL_StatusTypeDef HAL_PKA_ModRed (PKA_HandleTypeDef * hpka, PKA_ModRedInTypeDef * in, uint32_t Timeout)

Function description

Modular reduction in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ModRed_IT

Function name

HAL_StatusTypeDef HAL_PKA_ModRed_IT (PKA_HandleTypeDef * hpka, PKA_ModRedInTypeDef * in)

Function description

Modular reduction in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_MontgomeryMul

Function name

HAL_StatusTypeDef HAL_PKA_MontgomeryMul (PKA_HandleTypeDef * hpka, PKA_MontgomeryMulInTypeDef * in, uint32_t Timeout)

Function description

Montgomery multiplication in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_MontgomeryMul_IT

Function name

HAL_StatusTypeDef HAL_PKA_MontgomeryMul_IT (PKA_HandleTypeDef * hpka, PKA_MontgomeryMulInTypeDef * in)

Function description

Montgomery multiplication in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_Arithmetic_GetResult

Function name

void HAL_PKA_Arithmetic_GetResult (PKA_HandleTypeDef * hpka, uint32_t * pRes)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **pRes:** Pointer to memory location to receive the result of the operation

HAL_PKA_MontgomeryParam

Function name

HAL_StatusTypeDef HAL_PKA_MontgomeryParam (PKA_HandleTypeDef * hpka, PKA_MontgomeryParamInTypeDef * in, uint32_t Timeout)

Function description

Montgomery parameter computation in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_MontgomeryParam_IT

Function name

HAL_StatusTypeDef HAL_PKA_MontgomeryParam_IT (PKA_HandleTypeDef * hpka, PKA_MontgomeryParamInTypeDef * in)

Function description

Montgomery parameter computation in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_MontgomeryParam_GetResult

Function name

void HAL_PKA_MontgomeryParam_GetResult (PKA_HandleTypeDef * hpka, uint32_t * pRes)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **pRes:** pointer to buffer where the result will be copied

Return values

- **HAL:** status

HAL_PKA_ECCDoubleBaseLadder

Function name

HAL_StatusTypeDef HAL_PKA_ECCDoubleBaseLadder (PKA_HandleTypeDef * hpka, PKA_ECCDoubleBaseLadderInTypeDef * in, uint32_t Timeout)

Function description

ECC double base ladder in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ECCDoubleBaseLadder_IT

Function name

HAL_StatusTypeDef HAL_PKA_ECCDoubleBaseLadder_IT (PKA_HandleTypeDef * hpka, PKA_ECCDoubleBaseLadderInTypeDef * in)

Function description

ECC double base ladder in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ECCDoubleBaseLadder_GetResult

Function name

void HAL_PKA_ECCDoubleBaseLadder_GetResult (PKA_HandleTypeDef * hpka, PKA_ECCDoubleBaseLadderOutTypeDef * out)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **out:** Output information

Return values

- **HAL:** status

HAL_PKA_ECCProjective2Affine

Function name

HAL_StatusTypeDef HAL_PKA_ECCProjective2Affine (PKA_HandleTypeDef * hpka, PKA_ECCProjective2AffineInTypeDef * in, uint32_t Timeout)

Function description

ECC projective to affine in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ECCProjective2Affine_IT

Function name

HAL_StatusTypeDef HAL_PKA_ECCProjective2Affine_IT (PKA_HandleTypeDef * hpka, PKA_ECCProjective2AffineInTypeDef * in)

Function description

ECC projective to affine in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ECCProjective2Affine_GetResult

Function name

void HAL_PKA_ECCProjective2Affine_GetResult (PKA_HandleTypeDef * hpka, PKA_ECCProjective2AffineOutTypeDef * out)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **out:** Output information

Return values

- **HAL:** status

HAL_PKA_ECCCompleteAddition

Function name

HAL_StatusTypeDef HAL_PKA_ECCCompleteAddition (PKA_HandleTypeDef * hpka, PKA_ECCCompleteAdditionInTypeDef * in, uint32_t Timeout)

Function description

ECC complete addition in blocking mode.

Parameters

- **hpka:** PKA handle
- **in:** Input information
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PKA_ECCCompleteAddition_IT

Function name

HAL_StatusTypeDef HAL_PKA_ECCCompleteAddition_IT (PKA_HandleTypeDef * hpka, PKA_ECCCompleteAdditionInTypeDef * in)

Function description

ECC complete addition in non-blocking mode with Interrupt.

Parameters

- **hpka:** PKA handle
- **in:** Input information

Return values

- **HAL:** status

HAL_PKA_ECCCompleteAddition_GetResult

Function name

void HAL_PKA_ECCCompleteAddition_GetResult (PKA_HandleTypeDef * hpka, PKA_ECCCompleteAdditionOutTypeDef * out)

Function description

Retrieve operation result.

Parameters

- **hpka:** PKA handle
- **out:** Output information

Return values

- **HAL:** status

HAL_PKA_Abort

Function name

HAL_StatusTypeDef HAL_PKA_Abort (PKA_HandleTypeDef * hpka)

Function description

Abort any ongoing operation.

Parameters

- **hpka:** PKA handle

Return values

- **HAL:** status

HAL_PKA_RAMReset

Function name

void HAL_PKA_RAMReset (PKA_HandleTypeDef * hpka)

Function description

Reset the PKA RAM.

Parameters

- **hpka:** PKA handle

Return values

- **None:**

HAL_PKA_OperationCpltCallback

Function name

void HAL_PKA_OperationCpltCallback (PKA_HandleTypeDef * hpka)

Function description

Process completed callback.

Parameters

- **hpka:** PKA handle

Return values

- **None:**

HAL_PKA_ErrorCallback

Function name

void HAL_PKA_ErrorCallback (PKA_HandleTypeDef * hpka)

Function description

Error callback.

Parameters

- **hpka:** PKA handle

Return values

- **None:**

HAL_PKA_IRQHandler

Function name

void HAL_PKA_IRQHandler (PKA_HandleTypeDef * hpka)

Function description

This function handles PKA event interrupt request.

Parameters

- **hpka:** PKA handle

Return values

- **None:**

HAL_PKA_GetState

Function name

HAL_PKA_StateTypeDef HAL_PKA_GetState (const PKA_HandleTypeDef * hpka)

Function description

Return the PKA handle state.

Parameters

- **hpka:** PKA handle

Return values

- **HAL:** status

HAL_PKA_GetError

Function name

uint32_t HAL_PKA_GetError (const PKA_HandleTypeDef * hpka)

Function description

Return the PKA error code.

Parameters

- **hpka:** PKA handle

Return values

- **PKA:** error code

59.3 PKA Firmware driver defines

The following section lists the various define and macros of the module.

59.3.1 PKA

PKA

PKA Error Code definition

HAL_PKA_ERROR_NONE

HAL_PKA_ERROR_ADDRERR

HAL_PKA_ERROR_RAMERR

HAL_PKA_ERROR_TIMEOUT

HAL_PKA_ERROR_OPERATION

HAL_PKA_ERROR_INVALID_CALLBACK

Invalid Callback error

PKA Exported Macros

__HAL_PKA_RESET_HANDLE_STATE

Description:

- Reset PKA handle state.

Parameters:

- __HANDLE__: specifies the PKA Handle

Return value:

- None

__HAL_PKA_ENABLE_IT

Description:
- Enable the specified PKA interrupt.

Parameters:
- __HANDLE__: specifies the PKA Handle
- __INTERRUPT__: specifies the interrupt source to enable. This parameter can be one of the following values:
  – PKA_IT_PROCEND End Of Operation interrupt enable
  – PKA_IT_ADDRERR Address error interrupt enable
  – PKA_IT_RAMERR RAM error interrupt enable
  – PKA_IT_OPERR Operation error interrupt enable

Return value:
- None

__HAL_PKA_DISABLE_IT

Description:
- Disable the specified PKA interrupt.

Parameters:
- __HANDLE__: specifies the PKA Handle
- __INTERRUPT__: specifies the interrupt source to disable. This parameter can be one of the following values:
  – PKA_IT_PROCEND End Of Operation interrupt enable
  – PKA_IT_ADDRERR Address error interrupt enable
  – PKA_IT_RAMERR RAM error interrupt enable
  – PKA_IT_OPERR Operation error interrupt enable

Return value:
- None

__HAL_PKA_GET_IT_SOURCE

Description:
- Check whether the specified PKA interrupt source is enabled or not.

Parameters:
- __HANDLE__: specifies the PKA Handle
- __INTERRUPT__: specifies the PKA interrupt source to check. This parameter can be one of the following values:
  – PKA_IT_PROCEND End Of Operation interrupt enable
  – PKA_IT_ADDRERR Address error interrupt enable
  – PKA_IT_RAMERR RAM error interrupt enable
  – PKA_IT_OPERR Operation error interrupt enable

Return value:
- The: new state of __INTERRUPT__ (SET or RESET)

__HAL_PKA_GET_FLAG

Description:

- Check whether the specified PKA flag is set or not.

Parameters:

- __HANDLE__: specifies the PKA Handle
- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - PKA_FLAG_PROCEND End Of Operation
  - PKA_FLAG_ADDRERR Address error
  - PKA_FLAG_RAMERR RAM error
  - PKA_FLAG_OPERR Operation error

Return value:

- The: new state of __FLAG__ (SET or RESET)

__HAL_PKA_CLEAR_FLAG

Description:

- Clear the PKA pending flags which are cleared by writing 1 in a specific bit.

Parameters:

- __HANDLE__: specifies the PKA Handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - PKA_FLAG_PROCEND End Of Operation
  - PKA_FLAG_ADDRERR Address error
  - PKA_FLAG_RAMERR RAM error
  - PKA_FLAG_OPERR Operation error

Return value:

- None

__HAL_PKA_ENABLE

Description:

- Enable the specified PKA peripheral.

Parameters:

- __HANDLE__: specifies the PKA Handle

Return value:

- None

__HAL_PKA_DISABLE

Description:

- Disable the specified PKA peripheral.

Parameters:

- __HANDLE__: specifies the PKA Handle

Return value:

- None

__HAL_PKA_START

Description:

- Start a PKA operation.

Parameters:

- __HANDLE__: specifies the PKA Handle

Return value:

- None

60.1.2 PSSI_HandleTypeDef

PSSI_HandleTypeDef is defined in the stm32u5xx_hal_pssi.h

Data Fields

- ***PSSI_TypeDef * Instance***
- ***PSSI_InitTypeDef Init***
- ***uint32_t * pBuffPtr***
- ***uint32_t XferCount***
- ***uint32_t XferSize***
- ***DMA_HandleTypeDef * hdmatx***
- ***DMA_HandleTypeDef * hdmarx***
- ***HAL_LockTypeDef Lock***
- ***__IO HAL_PSSI_StateTypeDef State***
- ***__IO uint32_t ErrorCode***

Field Documentation

- ***PSSI_TypeDef* PSSI_HandleTypeDef::Instance***
  PSSI register base address.
- ***PSSI_InitTypeDef PSSI_HandleTypeDef::Init***
  PSSI Initialization Structure.
- ***uint32_t* PSSI_HandleTypeDef::pBuffPtr***
  PSSI Data buffer.
- ***uint32_t PSSI_HandleTypeDef::XferCount***
  PSSI transfer count
- ***uint32_t PSSI_HandleTypeDef::XferSize***
  PSSI transfer size
- ***DMA_HandleTypeDef* PSSI_HandleTypeDef::hdmatx***
  PSSI Tx DMA Handle parameters
- ***DMA_HandleTypeDef* PSSI_HandleTypeDef::hdmarx***
  PSSI Rx DMA Handle parameters

- ***HAL_LockTypeDef PSSI_HandleTypeDef::Lock***
  PSSI lock.
- ***__IO HAL_PSSI_StateTypeDef PSSI_HandleTypeDef::State***
  PSSI transfer state.
- ***__IO uint32_t PSSI_HandleTypeDef::ErrorCode***
  PSSI error code.

60.2 PSSI Firmware driver API description

The following section lists the various functions of the PSSI library.

60.2.1 How to use this driver

The PSSI HAL driver can be used as follows:

1. Declare a PSSI_HandleTypeDef handle structure, for example: PSSI_HandleTypeDef hpssi;
2. Initialize the PSSI low level resources by implementing the @ref HAL_PSSI_MspInit() API:
   a. Enable the PSSIx interface clock
   b. PSSI pins configuration
      - Enable the clock for the PSSI GPIOs
      - Configure PSSI pins as alternate function open-drain
   c. NVIC configuration if you need to use interrupt process
      - Configure the PSSIx interrupt priority
      - Enable the NVIC PSSI IRQ Channel
   d. DMA Configuration if you need to use DMA process
      - Declare DMA_HandleTypeDef handles structure for the transmit and receive
      - Enable the DMAx interface clock
      - Configure the DMA handle parameters
      - Configure the DMA Tx and Rx
      - Associate the initialized DMA handle to the hpssi DMA Tx and Rx handle
      - Configure the priority and enable the NVIC for the transfer complete interrupt on the DMA Tx and Rx
3. Configure the Communication Bus Width, Control Signals, Input Polarity and Output Polarity in the hpssi Init structure.
4. Initialize the PSSI registers by calling the @ref HAL_PSSI_Init(), configure also the low level Hardware (GPIO, CLOCK, NVIC...etc) by calling the customized @ref HAL_PSSI_MspInit(&hpssi) API.
5. For PSSI IO operations, two operation modes are available within this driver :

Polling mode IO operation

- Transmit an amount of data by byte in blocking mode using @ref HAL_PSSI_Transmit()
- Receive an amount of data by byte in blocking mode using @ref HAL_PSSI_Receive()

DMA mode IO operation

- Transmit an amount of data in non-blocking mode (DMA) using @ref HAL_PSSI_Transmit_DMA()
- At transmission end of transfer, @ref HAL_PSSI_TxCpltCallback() is executed and user can add his own code by customization of function pointer @ref HAL_PSSI_TxCpltCallback()
- Receive an amount of data in non-blocking mode (DMA) using @ref HAL_PSSI_Receive_DMA()
- At reception end of transfer, @ref HAL_PSSI_RxCpltCallback() is executed and user can add his own code by customization of function pointer @ref HAL_PSSI_RxCpltCallback()
- In case of transfer Error, @ref HAL_PSSI_ErrorCallback() function is executed and user can add his own code by customization of function pointer @ref HAL_PSSI_ErrorCallback()
- Abort a PSSI process communication with Interrupt using @ref HAL_PSSI_Abort_IT()
- End of abort process, @ref HAL_PSSI_AbortCpltCallback() is executed and user can add his own code by customization of function pointer @ref HAL_PSSI_AbortCpltCallback()

PSSI HAL driver macros list

Below the list of most used macros in PSSI HAL driver.

- @ref HAL_PSSI_ENABLE : Enable the PSSI peripheral
- @ref HAL_PSSI_DISABLE : Disable the PSSI peripheral
- @ref HAL_PSSI_GET_FLAG : Check whether the specified PSSI flag is set or not
- @ref HAL_PSSI_CLEAR_FLAG : Clear the specified PSSI pending flag
- @ref HAL_PSSI_ENABLE_IT : Enable the specified PSSI interrupt
- @ref HAL_PSSI_DISABLE_IT : Disable the specified PSSI interrupt

Callback registration

Note: You can refer to the PSSI HAL driver header file for more useful macros

60.2.2 Initialization and de-initialization functions

This subsection provides a set of functions allowing to initialize and deinitialize the PSSIx peripheral:

- User must implement HAL_PSSI_MspInit() function in which he configures all related peripherals resources (CLOCK, GPIO, DMA, IT and NVIC).
- Call the function HAL_PSSI_Init() to configure the selected device with the selected configuration:
  - Data Width
  - Control Signals
  - Input Clock polarity
  - Output Clock polarity
- Call the function HAL_PSSI_DeInit() to restore the default configuration of the selected PSSIx peripheral.

This section contains the following APIs:

- ***HAL_PSSI_Init()***
- ***HAL_PSSI_DeInit()***
- ***HAL_PSSI_MspInit()***
- ***HAL_PSSI_MspDeInit()***

60.2.3 IO operation functions

This subsection provides a set of functions allowing to manage the PSSI data transfers.

1. There are two modes of transfer:
   - Blocking mode : The communication is performed in the polling mode. The status of all data processing is returned by the same function after finishing transfer.
   - No-Blocking mode : The communication is performed using DMA. These functions return the status of the transfer startup. The end of the data processing will be indicated through the dedicated the DMA IRQ .
2. Blocking mode functions are :
   - HAL_PSSI_Transmit()
   - HAL_PSSI_Receive()
3. No-Blocking mode functions with DMA are :
   - HAL_PSSI_Transmit_DMA()
   - HAL_PSSI_Receive_DMA()
4. A set of Transfer Complete Callbacks are provided in non Blocking mode:
   - HAL_PSSI_TxCpltCallback()
   - HAL_PSSI_RxCpltCallback()
   - HAL_PSSI_ErrorCallback()
   - HAL_PSSI_AbortCpltCallback()

This section contains the following APIs:

- ***HAL_PSSI_Transmit()***

- *HAL_PSSI_Receive()*
- *HAL_PSSI_Transmit_DMA()*
- *HAL_PSSI_Receive_DMA()*
- *HAL_PSSI_Abort_DMA()*

60.2.4 Peripheral State, Mode and Error functions

This subsection permit to get in run-time the status of the peripheral and the data flow.

This section contains the following APIs:

- *HAL_PSSI_GetState()*
- *HAL_PSSI_GetError()*

60.2.5 Detailed description of functions

HAL_PSSI_Init

Function name

HAL_StatusTypeDef HAL_PSSI_Init (PSSI_HandleTypeDef * hpssi)

Function description

Initializes the PSSI according to the specified parameters in the PSSI_InitTypeDef and initialize the associated handle.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **HAL:** status

HAL_PSSI_DeInit

Function name

HAL_StatusTypeDef HAL_PSSI_DeInit (PSSI_HandleTypeDef * hpssi)

Function description

DeInitialize the PSSI peripheral.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **HAL:** status

HAL_PSSI_MspInit

Function name

void HAL_PSSI_MspInit (PSSI_HandleTypeDef * hpssi)

Function description

Initialize the PSSI MSP.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_MspDeInit

Function name

void HAL_PSSI_MspDeInit (PSSI_HandleTypeDef * hpssi)

Function description

De-Initialize the PSSI MSP.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_Transmit

Function name

HAL_StatusTypeDef HAL_PSSI_Transmit (PSSI_HandleTypeDef * hpssi, uint8_t * pData, uint32_t Size, uint32_t Timeout)

Function description

Transmits in master mode an amount of data in blocking mode.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent (in bytes)
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PSSI_Receive

Function name

HAL_StatusTypeDef HAL_PSSI_Receive (PSSI_HandleTypeDef * hpssi, uint8_t * pData, uint32_t Size, uint32_t Timeout)

Function description

Receives an amount of data in blocking mode.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be received (in bytes)
- **Timeout:** Timeout duration

Return values

- **HAL:** status

HAL_PSSI_Transmit_DMA

Function name

HAL_StatusTypeDef HAL_PSSI_Transmit_DMA (PSSI_HandleTypeDef * hpssi, uint32_t * pData, uint32_t Size)

Function description

Transmit an amount of data in non-blocking mode with DMA.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be sent (in bytes)

Return values

- **HAL:** status

HAL_PSSI_Receive_DMA

Function name

HAL_StatusTypeDef HAL_PSSI_Receive_DMA (PSSI_HandleTypeDef * hpssi, uint32_t * pData, uint32_t Size)

Function description

Receive an amount of data in non-blocking mode with DMA.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.
- **pData:** Pointer to data buffer
- **Size:** Amount of data to be received (in bytes)

Return values

- **HAL:** status

HAL_PSSI_Abort_DMA

Function name

HAL_StatusTypeDef HAL_PSSI_Abort_DMA (PSSI_HandleTypeDef * hpssi)

Function description

Abort a DMA process communication with Interrupt.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **HAL:** status

HAL_PSSI_GetState

Function name

HAL_PSSI_StateTypeDef HAL_PSSI_GetState (const PSSI_HandleTypeDef * hpssi)

Function description

Return the PSSI handle state.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **HAL:** state

HAL_PSSI_GetError

Function name

uint32_t HAL_PSSI_GetError (const PSSI_HandleTypeDef * hpssi)

Function description

Return the PSSI error code.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **PSSI:** Error Code

HAL_PSSI_IRQHandler

Function name

void HAL_PSSI_IRQHandler (PSSI_HandleTypeDef * hpssi)

Function description

This function handles PSSI event interrupt request.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_TxCpltCallback

Function name

void HAL_PSSI_TxCpltCallback (PSSI_HandleTypeDef * hpssi)

Function description

Tx Transfer complete callback.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_RxCpltCallback

Function name

void HAL_PSSI_RxCpltCallback (PSSI_HandleTypeDef * hpssi)

Function description

Rx Transfer complete callback.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_ErrorCallback

Function name

void HAL_PSSI_ErrorCallback (PSSI_HandleTypeDef * hpssi)

Function description

PSSI error callback.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

HAL_PSSI_AbortCpltCallback

Function name

void HAL_PSSI_AbortCpltCallback (PSSI_HandleTypeDef * hpssi)

Function description

PSSI abort callback.

Parameters

- **hpssi:** Pointer to a PSSI_HandleTypeDef structure that contains the configuration information for the specified PSSI.

Return values

- **None:**

60.3 PSSI Firmware driver defines

The following section lists the various define and macros of the module.

60.3.1 PSSI

PSSI

PSSI Bus Width

HAL_PSSI_8LINES

8 data lines

HAL_PSSI_16LINES

16 data lines

PSSI Data Width

HAL_PSSI_8BITS

8 Bits

HAL_PSSI_16BITS

16 Bits

HAL_PSSI_32BITS

32 Bits

PSSI definitions

PSSI_MAX_NBYTE_SIZE

PSSI_TIMEOUT_TRANSMIT

Timeout Value

PSSI_CR_OUTEN_INPUT

Input Mode

PSSI_CR_OUTEN_OUTPUT

Output Mode

PSSI_CR_DMA_ENABLE

DMA Mode Enable

PSSI_CR_DMA_DISABLE

DMA Mode Disable

PSSI_CR_16BITS

16 Lines Mode

PSSI_CR_8BITS

8 Lines Mode

PSSI_FLAG_RTT1B

1 Byte Fifo Flag

PSSI_FLAG_RTT4B

4 Bytes Fifo Flag

PSSI Error Code

HAL_PSSI_ERROR_NONE

No error

HAL_PSSI_ERROR_NOT_SUPPORTED

Not supported operation

HAL_PSSI_ERROR_UNDER_RUN

FIFO Under-run error

HAL_PSSI_ERROR_OVER_RUN

FIFO Over-run error

HAL_PSSI_ERROR_DMA

Dma error

HAL_PSSI_ERROR_TIMEOUT

Timeout error

PSSI Exported Macros

HAL_PSSI_RESET_HANDLE_STATE

Description:
- Reset PSSI handle state.

Parameters:
- __HANDLE__: specifies the PSSI handle.

Return value:
- None

HAL_PSSI_ENABLE

Description:
- Enable the PSSI.

Parameters:
- __HANDLE__: PSSI handle

Return value:
- None.

HAL_PSSI_DISABLE

Description:
- Disable the PSSI.

Parameters:
- __HANDLE__: PSSI handle

Return value:
- None.

HAL_PSSI_GET_STATUS

Description:
- Get the PSSI pending flags.

Parameters:
- __HANDLE__: PSSI handle
- __FLAG__: flag to check. This parameter can be any combination of the following values:
  – PSSI_FLAG_RTT1B: FIFO is ready to transfer one byte
  – PSSI_FLAG_RTT4B: FIFO is ready to transfer four bytes

Return value:
- The: state of FLAG.

HAL_PSSI_GET_FLAG

Description:
- Get the PSSI pending flags.

Parameters:
- __HANDLE__: PSSI handle
- __FLAG__: flag to check. This parameter can be any combination of the following values:
  - PSSI_FLAG_OVR_RIS: Data Buffer overrun/underrun error flag

Return value:
- The: state of FLAG.

HAL_PSSI_CLEAR_FLAG

Description:
- Clear the PSSI pending flags.

Parameters:
- __HANDLE__: PSSI handle
- __FLAG__: specifies the flag to clear. This parameter can be any combination of the following values:
  - PSSI_FLAG_OVR_RIS: Data Buffer overrun/underrun error flag

Return value:
- None

HAL_PSSI_ENABLE_IT

Description:
- Enable the specified PSSI interrupts.

Parameters:
- __HANDLE__: PSSI handle
- __INTERRUPT__: specifies the PSSI interrupt sources to be enabled. This parameter can be any combination of the following values:
  - PSSI_FLAG_OVR_RIS: Configuration error mask

Return value:
- None

HAL_PSSI_DISABLE_IT

Description:
- Disable the specified PSSI interrupts.

Parameters:
- __HANDLE__: PSSI handle
- __INTERRUPT__: specifies the PSSI interrupt sources to be disabled. This parameter can be any combination of the following values:
  - PSSI_IT_OVR_IE: Configuration error mask

Return value:
- None

HAL_PSSI_GET_IT_SOURCE

Description:
- Check whether the specified PSSI interrupt source is enabled or not.

Parameters:
- __HANDLE__: PSSI handle
- __INTERRUPT__: specifies the PSSI interrupt source to check. This parameter can be one of the following values:
  – PSSI_IT_OVR_IE: Data Buffer overrun/underrun error interrupt mask

Return value:
- The: state of INTERRUPT source.

IS_PSSI_CONTROL_SIGNAL

Description:
- Check whether the PSSI Control signal is valid.

Parameters:
- __CONTROL__: Control signals configuration

Return value:
- Valid: or not.

IS_PSSI_BUSWIDTH

Description:
- Check whether the PSSI Bus Width is valid.

Parameters:
- __BUSWIDTH__: PSSI Bush width

Return value:
- Valid: or not.

IS_PSSI_CLOCK_POLARITY

Description:
- Check whether the PSSI Clock Polarity is valid.

Parameters:
- __CLOCKPOL__: PSSI Clock Polarity

Return value:
- Valid: or not.

IS_PSSI_DE_POLARITY

Description:
- Check whether the PSSI Data Enable Polarity is valid.

Parameters:
- __DEPOL__: PSSI DE Polarity

Return value:
- Valid: or not.

IS_PSSI_RDY_POLARITY

Description:
- Check whether the PSSI Ready Polarity is valid.

Parameters:
- __RDYPOL__: PSSI RDY Polarity

Return value:
- Valid: or not.

PSSI Interrupts

PSSI_FLAG_OVR_RIS

Overrun, Underrun errors flag

PSSI_FLAG_MASK

Overrun, Underrun errors Mask

PSSI_FLAG_OVR_MIS

Overrun, Underrun masked errors flag

PSSI mode

HAL_PSSI_UNIDIRECTIONAL

Uni-directional mode

HAL_PSSI_BIDIRECTIONAL

Bi-directional mode

61 HAL PWR Generic Driver

61.1 PWR Firmware driver registers structures

61.1.1 PWR_PVDTypeDef

PWR_PVDTypeDef is defined in the stm32u5xx_hal_pwr.h

Data Fields

- ***uint32_t PVDLevel***
- ***uint32_t Mode***

Field Documentation

- ***uint32_t PWR_PVDTypeDef::PVDLevel***
  Specifies the PVD detection level. This parameter can be a value of ***PWR_PVD_Detection_Level***.
- ***uint32_t PWR_PVDTypeDef::Mode***
  Specifies the operating mode for the selected pins. This parameter can be a value of ***PWR_PVD_Mode***.

61.2 PWR Firmware driver API description

The following section lists the various functions of the PWR library.

61.2.1 PWR peripheral overview

1. The Power control (PWR) provides an overview of the supply architecture for the different power domains and of the supply configuration controller.
2. Domain architecture overview for the U5 devices: (+) U5 devices have 2 power domains (CD and SRD). The core domain (CD) contains a CPU (Cortex-M33), a Flash memory and some peripherals dedicated for general purpose. The SRD domain contains the system control and low-power peripherals.
3. Every entity has low power mode as described below :
4. The CPU low power modes are : (+) CPU CRun. (+) CPU CSleep. (+) CPU CStop.
5. The system low power modes are : (+) Run. (+) Stop 0. (+) Stop 1. (+) Stop 2. (+) Stop 3. (+) Standby. (+) Shutdown.
   ==

(#) The Power control (PWR) provides an overview of the supply architecture for the different power domains and of the supply configuration controller. (#) Domain architecture overview for the U5 devices:

- U5 devices have 2 power domains (CD and SRD). The core domain (CD) contains a CPU (Cortex-M33), a Flash memory and some peripherals dedicated for general purpose. The SRD domain contains the system control and low-power peripherals. (#) Every entity has low power mode as described below : (#) The CPU low power modes are :
- CPU CRun.
- CPU CSleep.
- CPU CStop. (#) The system low power modes are :
- Run.
- Stop 0.
- Stop 1.
- Stop 2.
- Stop 3.
- Standby.
- Shutdown.
  ==

61.2.2 How to use this driver

1. After startup, power management peripheral is not active by default. Use __HAL_RCC_PWR_CLK_ENABLE() macro to enable power interface.

2. Call HAL_PWR_EnableBkUpAccess() and HAL_PWR_DisableBkUpAccess() functions to enable/disable access to the backup domain (RCC Backup domain control register RCC_BDCR, RTC registers, TAMP registers, backup registers and backup SRAM).
3. Call HAL_PWR_ConfigPVD() after setting parameters to be configured (event mode and voltage threshold) in order to set up the Programmed Voltage Detector, then use HAL_PWR_EnablePVD() and HAL_PWR_DisablePVD() functions to start and stop the PVD detection. (+) PVD level can be one of the following values :
   – 2V0
   – 2V2
   – 2V4
   – 2V5
   – 2V6
   – 2V8
   – 2V9
   – External input analog voltage PVD_IN (compared internally to VREFINT)
4. Call HAL_PWR_EnableWakeUpPin() and HAL_PWR_DisableWakeUpPin() functions with the right parameter to configure the wake up pin polarity (Low or High), the wake up pin selection and to enable and disable it.
5. Call HAL_PWR_EnterSLEEPMode() function to enter the CPU in Sleep mode. Wake-up from Sleep mode could be following to an event or an interrupt according to low power mode intrinsic request called (__WFI() or __WFE()).
6. Call HAL_PWR_EnterSTOPMode() function to enter the whole system to Stop 0 mode. Wake-up from Stop 0 mode could be following to an event or an interrupt according to low power mode intrinsic request called (__WFI() or __WFE()). (Regulator state on U5 devices is managed internally but regulator parameter is kept for product compatibility).
7. Call HAL_PWR_EnterSTANDBYMode() function to enter the whole system in Standby mode. Wake-up from Standby mode can be following only by an interrupt.
8. Call HAL_PWR_EnableSleepOnExit() and HAL_PWR_DisableSleepOnExit() APIs to enable and disable the Cortex-M33 re-entry in Sleep mode after an interruption handling is over.
9. Call HAL_PWR_EnableSEVOnPend() and HAL_PWR_DisableSEVOnPend() functions to configure the Cortex-M33 to wake-up after any pending event / interrupt even if it's disabled or has insufficient priority to cause exception entry.
10. Call HAL_PWR_PVD_IRQHandler() under PVD_AVD_IRQHandler() function to handle the PWR PVD interrupt request.
11. Call HAL_PWR_ConfigAttributes() function to configure PWR item secure and privilege attributes and call HAL_PWR_GetConfigAttributes() function to get the attribute configuration for the selected item.

(#) After startup, power management peripheral is not active by default. Use __HAL_RCC_PWR_CLK_ENABLE() macro to enable power interface. (#) Call HAL_PWR_EnableBkUpAccess() and HAL_PWR_DisableBkUpAccess() functions to enable/disable access to the backup domain (RCC Backup domain control register RCC_BDCR, RTC registers, TAMP registers, backup registers and backup SRAM). (#) Call HAL_PWR_ConfigPVD() after setting parameters to be configured (event mode and voltage threshold) in order to set up the Programmed Voltage Detector, then use HAL_PWR_EnablePVD() and HAL_PWR_DisablePVD() functions to start and stop the PVD detection.

- PVD level can be one of the following values :
  - 2V0
  - 2V2
  - 2V4
  - 2V5
  - 2V6
  - 2V8
  - 2V9
  - External input analog voltage PVD_IN (compared internally to VREFINT) (#) Call HAL_PWR_EnableWakeUpPin() and HAL_PWR_DisableWakeUpPin() functions with the right parameter to configure the wake up pin polarity (Low or High), the wake up pin selection and to enable and disable it. (#) Call HAL_PWR_EnterSLEEPMode() function to enter the CPU in Sleep mode. Wake-up from Sleep mode could be following to an event or an interrupt according to low power mode intrinsic request called (__WFI() or __WFE()). (#) Call HAL_PWR_EnterSTOPMode() function to enter the whole system to Stop 0 mode. Wake-up from Stop 0 mode could be following to an event or an interrupt according to low power mode intrinsic request called (__WFI() or __WFE()). (Regulator state on U5 devices is managed internally but regulator parameter is kept for product compatibility). (#) Call HAL_PWR_EnterSTANDBYMode() function to enter the whole system in Standby mode. Wake-up from Standby mode can be following only by an interrupt. (#) Call HAL_PWR_EnableSleepOnExit() and HAL_PWR_DisableSleepOnExit() APIs to enable and disable the Cortex-M33 re-entry in Sleep mode after an interruption handling is over. (#) Call HAL_PWR_EnableSEVOnPend() and HAL_PWR_DisableSEVOnPend() functions to configure the Cortex-M33 to wake-up after any pending event / interrupt even if it's disabled or has insufficient priority to cause exception entry. (#) Call HAL_PWR_PVD_IRQHandler() under PVD_AVD_IRQHandler() function to handle the PWR PVD interrupt request. (#) Call HAL_PWR_ConfigAttributes() function to configure PWR item secure and privilege attributes and call HAL_PWR_GetConfigAttributes() function to get the attribute configuration for the selected item.

PWR HAL driver macros list

Below the list of most used macros in PWR HAL driver.

- __HAL_PWR_GET_FLAG() : Get the PWR pending flags.
- __HAL_PWR_CLEAR_FLAG() : Clear the PWR pending flags.

61.2.3 Initialization and De-Initialization Functions

This section provides functions allowing to deinitialize power peripheral and to manage backup domain access.

After system reset, the backup domain (RCC Backup domain control register RCC_BDCR, RTC registers, TAMP registers, backup registers and backup SRAM) is protected against possible unwanted write accesses. The HAL_PWR_EnableBkUpAccess() function enables the access to the backup domain. The HAL_PWR_DisableBkUpAccess() function disables the access to the backup domain.

This section contains the following APIs:

- *HAL_PWR_DeInit()*
- *HAL_PWR_EnableBkUpAccess()*
- *HAL_PWR_DisableBkUpAccess()*

61.2.4 Peripheral Control functions

This section provides functions allowing to control power peripheral.

PVD configuration

- The PVD can be used to monitor the VDD power supply by comparing it to a threshold selected by the PVDLS[2:0] bits in the PWR supply voltage monitoring control register (PWR_SVMCR) and can be enabled by setting the PVDE bit.
- A PVDO flag is available in the PWR supply voltage monitoring control register (PWR_SVMCR) to indicate if VDD is higher or lower than the PVD threshold. This event is internally connected to the EXTI line 16 and can generate an interrupt if enabled through the EXTI registers. It is configurable through __HAL_PWR_PVD_EXTI_ENABLE_IT() macro.

- The PVD can remain active in Stop 0, Stop 1, Stop 2 modes, and the PVM interrupt can wake up from the Stop mode. The PVD is not functional in Stop 3 mode.
- During Stop 1, Stop 2 and Stop 3 modes, it is possible to set the PVD in ultra-low-power mode to further reduce the current consumption by setting the ULPMEN bit in PWR_CR1 register.

Wake-up pin configuration

- Wake-up pin is used to wake up the system from Stop 3, Standby and Shutdown mode. The pin selection is configurable through the WUCR3 register to map internal signal to wake up pin line. The pin polarity is configurable through the WUCR2 register to be active on rising or falling edges.
- There are up to 24 wake-up signals that can be mapped to up to 8 wake-up lines in the STM32U5 family.

Low Power modes configuration

This section presents 3 principles low-power modes :

- Sleep mode : Cortex-M33 is stopped and all PWR domains are remaining active (powered and clocked).
- Stop 0 mode : Cortex-M33 is stopped, clocks are stopped and the regulator is running.
- Standby mode : All PWR domains enter DSTANDBY mode and the VCORE supply regulator is powered off.

Sleep mode

- Entry : The Sleep mode is entered by using the HAL_PWR_EnterSLEEPMode() function.
  - PWR_SLEEPENTRY_WFI : Enter SLEEP mode with WFI instruction.
  - PWR_SLEEPENTRY_WFE : Enter SLEEP mode with WFE instruction and clear of pending events before.
  - PWR_SLEEPENTRY_WFE_NO_EVT_CLEAR: Enter SLEEP mode with WFE instruction and no clear of pending event before.

Note: The Regulator parameter is not used for the STM32U5 family and is kept as parameter just to maintain compatibility with other families.

- Exit : According to Sleep entry, any event when entry is __WFE() intrinsic and any interrupt when entry is __WFI() intrinsic can wake up the device from Sleep mode.

Stop 0 mode

The Stop 0 mode is based on the Cortex-M33 Deepsleep mode combined with the peripheral clock gating. The voltage regulator is configured in main regulator mode. In Stop 0 mode, all clocks in the VCORE domain are stopped. The PLL, MSIS, MSIK, HSI16 and HSE oscillators are disabled. Some peripherals with the LPBAM capability can switch on HSI16 or MSIS or MSIK for transferring data. All SRAMs and register contents are preserved, but the SRAMs can be totally or partially switched off to further reduced consumption. The BOR is always available in Stop 0 mode.

- Entry: The Stop mode is entered using the HAL_PWR_EnterSTOPMode() function with :
  - StopEntry:
    - PWR_STOPENTRY_WFI : Enter STOP mode with WFI instruction.
    - PWR_STOPENTRY_WFE : Enter STOP mode with WFE instruction and clear of pending events before.
    - PWR_STOPENTRY_WFE_NO_EVT_CLEAR: Enter STOP mode with WFE instruction and no clear of pending event before. -@@- The Regulator parameter is not used for the STM32U5 family and is kept as parameter just to maintain compatibility with other families.
- Exit: Any EXTI line configured in interrupt mode (the corresponding EXTI interrupt vector must be enabled in the NVIC). The interrupt source can be external interrupts or peripherals with wakeup capability. Any peripheral interrupt occurring when the AHB/APB clocks are present due to an autonomous peripheral clock request (the peripheral vector must be enabled in the NVIC).

Standby mode

The Standby mode is used to achieve the lowest power consumption with BOR. The internal regulator is switched off so that the VCORE domain is powered off. The PLL, the MSI (MSIS and MSIK) RC, the HSI16 RC and the HSE crystal oscillators are also switched off. The RTC can remain active (Standby mode with RTC, Standby mode without RTC). The Brownout reset (BOR) always remains active in Standby mode. The state of each I/O during Standby mode can be selected by software: I/O with internal pull-up, internal pull-down or floating. After entering Standby mode, SRAMs and register contents are lost except for registers and backup SRAM in the Backup domain and Standby circuitry. Optionally, the full SRAM2 or 8 Kbytes or 56 Kbytes can be retained in Standby mode, supplied by the low-power regulator (Standby with RAM2 retention mode). The BORL (Brownout reset detector low) can be configured in ultra low power mode to further reduce power consumption during Standby mode. The device exits Standby mode upon an external reset (NRST pin), an IWDG reset, WKUP pin event (configurable rising or falling edge), an RTC event occurs (alarm, periodic wakeup, timestamp), or a tamper detection. The system clock after wakeup is MSIS up to 4 MHz. (++) Entry: The Standby mode is entered using the HAL_PWR_EnterSTANDBYMode() function. (++) Exit: WKUPx pin edge, RTC event, external Reset in NRST pin, IWDG Reset, BOR reset.

This section contains the following APIs:
- *HAL_PWR_ConfigPVD()*
- *HAL_PWR_EnablePVD()*
- *HAL_PWR_DisablePVD()*
- *HAL_PWR_EnableWakeUpPin()*
- *HAL_PWR_DisableWakeUpPin()*
- *HAL_PWR_EnterSLEEPMode()*
- *HAL_PWR_EnterSTOPMode()*
- *HAL_PWR_EnterSTANDBYMode()*
- *HAL_PWR_EnableSleepOnExit()*
- *HAL_PWR_DisableSleepOnExit()*
- *HAL_PWR_EnableSEVOnPend()*
- *HAL_PWR_DisableSEVOnPend()*
- *HAL_PWR_PVD_IRQHandler()*
- *HAL_PWR_PVDCallback()*

61.2.5 PWR Attributes Functions

When the TrustZone security is activated by the TZEN option bit in the FLASH_OPTR register, some PWR register fields can be secured against non-secure access. The PWR TrustZone security allows the following features to be secured through the PWR_SECCFGR register : (++) Low-power mode. (++) Wake-up (WKUP) pins. (++) Voltage detection and monitoring. (++) VBAT mode. (++) I/Os pull-up/pull-down configuration. Other PWR configuration bits are secure when : (++) The system clock selection is secure in RCC: the voltage scaling (VOS) configuration and the regulator booster (BOOSTEN) are secure. (++) A GPIO is configured as secure: its corresponding bit for pull-up / pull-down configuration in Standby mode is secure. (++) The UCPD1 is secure in the GTZC: the PWR_UCPDR register is secure. A non-secure access to a secure-protected register bit is denied : (++) The secured bits are not written (WI) with a non-secure write access. (++) The secured bits are read as 0 (RAZ) with a non-secure read access.

When the TrustZone security is disabled (TZEN = 0), PWR_SECCFGR is RAZ/WI and all other registers are non-secure.

By default, after a reset, all PWR registers can be read or written with both privileged and unprivileged accesses, except PWR_PRIVCFGR that can be written with privileged access only. PWR_PRIVCFGR can be read by secure and non secure, privileged and unprivileged accesses. The SPRIV bit in PWR_PRIVCFGR can be written with secure privileged access only. This bit configures the privileged access of all PWR secure functions (defined by PWR_SECCFGR, GTZC, RCC or GPIO). When the SPRIV bit is set in PWR_PRIVCFGR: (++) The PWR secure bits can be written only with privileged access, including PWR_SECCFGR. (++) The PWR secure bits can be read only with privileged access except PWR_SECCFGR and PWR_PRIVCFGR that can be read by privileged or unprivileged access. (++) An unprivileged access to a privileged PWR bit or register is discarded : the bits are read as zero and the write to these bits is ignored (RAZ/WI). The NSPRIV bit of PWR_PRIVCFGR can be written with privileged access only, secure or non-secure. This bit configures the privileged access of all PWR securable functions that are configured as non-secure (defined by PWR_SECCFGR, GTZC, RCC or GPIO). When the NSPRIV bit is set in PWR_PRIVCFGR : (++) The PWR securable bits that are configured as non-secure, can be written only with privileged access. (++) The PWR securable bits that are configured as non-secure, can be read only with privileged access except PWR_PRIVCFGR that can be read by privileged or unprivileged accesses. (++) The VOSRDY and BOOSTRDY bits in PWR_VOSR, PWR_SR, PWR_SVMSR, PWR_BDSR and PWR_WUSR, can be read with privileged or unprivileged accesses. (++) An unprivileged access to a privileged PWR bit or register is discarded : the bits are read as zero and the write to these bits is ignored (RAZ/WI).

This section contains the following APIs:

- *HAL_PWR_ConfigAttributes()*
- *HAL_PWR_GetConfigAttributes()*

61.2.6 Detailed description of functions

HAL_PWR_DeInit

Function name

void HAL_PWR_DeInit (void)

Function description

Deinitialize the HAL PWR peripheral registers to their default reset values.

Return values

- **None.:**

Notes

- This functionality is not available in this product. The prototype is kept just to maintain compatibility with other products.

HAL_PWR_EnableBkUpAccess

Function name

void HAL_PWR_EnableBkUpAccess (void)

Function description

Enable access to the backup domain (RCC Backup domain control register RCC_BDCR, RTC registers, TAMP registers, backup registers and backup SRAM).

Return values

- **None.:**

Notes

- After a system reset, the backup domain is protected against possible unwanted write accesses.

HAL_PWR_DisableBkUpAccess

Function name

void HAL_PWR_DisableBkUpAccess (void)

Function description

Disable access to the backup domain (RCC Backup domain control register RCC_BDCR, RTC registers, TAMP registers, backup registers and backup SRAM).

Return values

- **None.:**

HAL_PWR_ConfigPVD

Function name

HAL_StatusTypeDef HAL_PWR_ConfigPVD (PWR_PVDTypeDef * pConfigPVD)

Function description

Configure the voltage threshold detected by the Programmed Voltage Detector (PVD).

Parameters

- **pConfigPVD:** : Pointer to a PWR_PVDTypeDef structure that contains the PVD configuration information (PVDLevel and EventMode).

Return values

- **HAL:** Status.

HAL_PWR_EnablePVD

Function name

void HAL_PWR_EnablePVD (void)

Function description

Enable the programmable voltage detector (PVD).

Return values

- **None.:**

HAL_PWR_DisablePVD

Function name

void HAL_PWR_DisablePVD (void)

Function description

Disable the programmable voltage detector (PVD).

Return values

- **None.:**

HAL_PWR_EnableWakeUpPin

Function name

void HAL_PWR_EnableWakeUpPin (uint32_t WakeUpPin)

Function description

Enable the wake up line functionality.

Parameters

- **WakeUpPin:** : Specifies which wake up line to enable. This parameter can be one of PWR_WakeUp_Pins_High_Polarity define group where every param select the wake up line, the wake up source with high polarity detection and the wake up selected I/O or can be one of PWR_WakeUp_Pins_Low_Polarity define group where every param select the wake up line, the wake up source with low polarity and the wake up selected I/O or can be one of PWR_WakeUp_Pins define group where every param select the wake up line, the wake up source with high polarity and the first wake up I/O.

Return values

- **None.:**

Notes

- Wake up lines are used to wake up the system from Stop 3, Standby and Shutdown modes.

HAL_PWR_DisableWakeUpPin

Function name

void HAL_PWR_DisableWakeUpPin (uint32_t WakeUpPin)

Function description

Disable the wake up line functionality.

Parameters

- **WakeUpPin:** : Specifies the wake up line to disable. This parameter can be a combination of all the following values :
  – PWR_WAKEUP_PIN1
  – PWR_WAKEUP_PIN2
  – PWR_WAKEUP_PIN3
  – PWR_WAKEUP_PIN4
  – PWR_WAKEUP_PIN6
  – PWR_WAKEUP_PIN5
  – PWR_WAKEUP_PIN7
  – PWR_WAKEUP_PIN8

Return values

- **None:**

HAL_PWR_EnterSLEEPMode

Function name

void HAL_PWR_EnterSLEEPMode (uint32_t Regulator, uint8_t SleepEntry)

Function description

Enter the CPU in Sleep mode.

Parameters

- **Regulator:** : Specifies the regulator state in Sleep mode. This parameter can be one of the following values :
  – PWR_MAINREGULATOR_ON
  – PWR_LOWPOWERREGULATOR_ON
- **SleepEntry:** : Specifies if Sleep mode is entered with WFI or WFE instruction.
  – PWR_SLEEPENTRY_WFI : Enter SLEEP mode with WFI instruction.
  – PWR_SLEEPENTRY_WFE : Enter SLEEP mode with WFE instruction and clear of pending events before.
  – PWR_SLEEPENTRY_WFE_NO_EVT_CLEAR : Enter SLEEP mode with WFE instruction and no clear of pending event before.

Return values

- **None.:**

Notes

- In Sleep mode, all I/O pins keep the same state as in Run mode.
- CPU clock is off and all peripherals including Cortex-M33 core such as NVIC and SysTick can run and wake up the CPU when an interrupt or an event occurs.
- This parameter is not available in this product. The parameter is kept just to maintain compatibility with other products.

HAL_PWR_EnterSTOPMode

Function name

void HAL_PWR_EnterSTOPMode (uint32_t Regulator, uint8_t StopEntry)

Function description

Enter the whole system to Stop 0 mode.

Parameters

- **Regulator:** : Specifies the regulator state in Stop mode. This parameter can be one of the following values :
  – PWR_MAINREGULATOR_ON
  – PWR_LOWPOWERREGULATOR_ON
- **StopEntry:** : Specifies if Stop mode is entered with WFI or WFE instruction. This parameter can be one of the following values :
  – PWR_STOPENTRY_WFI : Enter STOP mode with WFI instruction.
  – PWR_STOPENTRY_WFE : Enter STOP mode with WFE instruction and clear of pending events before.
  – PWR_STOPENTRY_WFE_NO_EVT_CLEAR : Enter STOP mode with WFE instruction and no clear of pending event before.

Return values

- **None.:**

Notes

- In Stop 0 mode, the regulator remains in main regulator mode, allowing a very fast wakeup time but with much higher consumption comparing to other Stop modes.
- Stop 0 offers the largest number of active peripherals and wakeup sources, a smaller wakeup time but a higher consumption. Stop mode achieves the lowest power consumption while retaining the content of SRAM and registers. All clocks in the VCORE domain are stopped. The PLL, the MSI (MSIS and MSIK) RC, the HSI16 RC and the HSE crystal oscillators are disabled. The LSE or LSI is still running.
- The system clock when exiting from Stop mode can be either MSIS up to 24 MHz or HSI16, depending on software configuration.
- This parameter is not available in this product. The parameter is kept just to maintain compatibility with other products.
- In System STOP mode, all I/O pins keep the same state as in Run mode.

HAL_PWR_EnterSTANDBYMode

Function name

void HAL_PWR_EnterSTANDBYMode (void)

Function description

Enter the whole system to Standby mode.

Return values

- **None.:**

Notes

- The Standby mode is used to achieve the lowest power consumption with BOR. The internal regulator is switched off so that the VCORE domain is powered off. The PLL, the MSI (MSIS and MSIK) RC, the HSI16 RC and the HSE crystal oscillators are also switched off.
- After entering Standby mode, SRAMs and register contents are lost except for registers and backup SRAM in the Backup domain and Standby circuitry. Optionally, the full SRAM2 or 8 Kbytes or 56 Kbytes can be retained in Standby mode, supplied by the low-power regulator (Standby with RAM2 retention mode) through HAL_PWREx_EnableSRAM2ContentStandbyRetention().
- The state of each I/O during Standby mode can be selected by software : I/O with internal pull-up through HAL_PWREx_EnableGPIOPullUp() and internal pull-down through HAL_PWREx_EnableGPIOPullDown().

HAL_PWR_EnableSleepOnExit

Function name

void HAL_PWR_EnableSleepOnExit (void)

Function description

Indicate SLEEP-ON-EXIT feature when returning from handler mode to thread mode.

Return values

- **None.:**

Notes

- Set SLEEPONEXIT bit of SCR register. When this bit is set, the processor re-enters Sleep mode when an interruption handling is over. Setting this bit is useful when the processor is expected to run only on interruptions handling.

HAL_PWR_DisableSleepOnExit

Function name

void HAL_PWR_DisableSleepOnExit (void)

Function description

Disable SLEEP-ON-EXIT feature when returning from handler mode to thread mode.

Return values

- **None.:**

Notes

- Clears SLEEPONEXIT bit of SCR register. When this bit is set, the processor re-enters Sleep mode when an interruption handling is over.

HAL_PWR_EnableSEVOnPend

Function name

void HAL_PWR_EnableSEVOnPend (void)

Function description

Enable CORTEX SEV-ON-PEND feature.

Return values

- **None.:**

Notes

- Sets SEVONPEND bit of SCR register. When this bit is set, any pending event / interrupt even if it's disabled or has insufficient priority to cause exception entry wakes up the Cortex-M33.

HAL_PWR_DisableSEVOnPend

Function name

void HAL_PWR_DisableSEVOnPend (void)

Function description

Disable CORTEX SEVONPEND feature.

Return values

- **None.:**

Notes

- Resets SEVONPEND bit of SCR register. When this bit is reset, only enabled pending event / interrupt to cause exception entry wakes up the Cortex-M33.

HAL_PWR_PVD_IRQHandler

Function name

void HAL_PWR_PVD_IRQHandler (void)

Function description

This function handles the PWR PVD interrupt request.

Return values

- **None.:**

Notes

- This API should be called under the PVD_AVD_IRQHandler().

HAL_PWR_PVDCallback

Function name

void HAL_PWR_PVDCallback (void)

Function description

PWR PVD interrupt callback.

Return values

- **None.:**

HAL_PWR_ConfigAttributes

Function name

void HAL_PWR_ConfigAttributes (uint32_t Item, uint32_t Attributes)

Function description

Configure the PWR item attributes.

Parameters

- **Item:** : Specifies the item(s) to set attributes on. This parameter can be a combination of PWR Items.
- **Attributes:** : Specifies the available attribute(s). This parameter can be one of PWR Attributes.

Return values

- **None.:**

Notes

- Available attributes are security and privilege protection.
- Security attribute can only be set only by secure access.
- Privilege attribute for secure items can be managed only by a secure privileged access.
- Privilege attribute for nsecure items can be managed by a secure privileged access or by a nsecure privileged access.

HAL_PWR_GetConfigAttributes

Function name

HAL_StatusTypeDef HAL_PWR_GetConfigAttributes (uint32_t Item, uint32_t * pAttributes)

Function description

Get attribute(s) of a PWR item.

Parameters

- **Item:** : Specifies the item(s) to get attributes of. This parameter can be one of PWR Items.
- **pAttributes:** : Pointer to return attribute(s). Returned value could be one of PWR Attributes.

Return values

- **HAL:** Status.

61.3 PWR Firmware driver defines

The following section lists the various define and macros of the module.

61.3.1 PWR

PWR

PWR Attributes

PWR_NSEC_PRIV

NSecure and Privileged attribute

PWR_NSEC_NPRIV

NSecure and NPrivileged attribute

PWR_SEC_PRIV

Secure and Privileged attribute

PWR_SEC_NPRIV

Secure and NPrivileged attribute

PWR Exported Macros

__HAL_PWR_GET_FLAG

Description:

- Check PWR flags are set or not.

Parameters:

- __FLAG__: : Specifies the flag to check. This parameter can be one of the following values :
  - PWR_FLAG_VOSRDY : Voltage scaling ready flag. Indicates that the Vcore level at or above VOS selected level.
  - PWR_FLAG_BOOSTRDY : EPOD booster ready flag. Indicates that EPOD booster ready, frequency could be higher than 50 MHz.
  - PWR_FLAG_USBBOOSTRDY : USB EPOD booster ready flag. Indicates that USB EPOD booster ready, frequency could be higher than 50 MHz. This flag is available only for STM32U59xxx and STM32U5Axxx devices.
  - PWR_FLAG_STOPF : Stop flag. Indicates that the device was resumed from Stop mode.
  - PWR_FLAG_SBF : Standby flag. Indicates that the device was resumed from Standby mode.
  - PWR_FLAG_VDDA2RDY : VDDA2 ready flag (versus 1.8 V threshold). Indicates that VDDA is equal or above the threshold of the VDDA voltage monitor 2 (around 1.8 V).
  - PWR_FLAG_VDDA1RDY : VDDA1 ready flag (versus 1.6 V threshold). Indicates that VDDA is equal or above the threshold of the VDDA voltage monitor 1 (around 1.6 V).
  - PWR_FLAG_VDDIO2RDY : VDDIO2 ready flag (versus 0.9 V threshold). Indicates that VDDIO2 is equal or above the threshold of the VDDIO2 voltage monitor (around 0.9 V).
  - PWR_FLAG_VDDUSBRDY : VDDUSB ready flag (versus 1.2 V threshold). Indicates that VDDUSB is equal or above the threshold of the VDDUSB voltage monitor (around 1.2 V).
  - PWR_FLAG_ACTVOSRDY : Currently applied VOS ready flag. Indicates that Vcore is equal to the current voltage scaling provided by ACTVOS.
  - PWR_FLAG_PVDO VDD : Voltage detector output flag. Indicates that Vdd is equal or above the PVD threshold selected by PVDLS.
  - PWR_FLAG_REGS : Regulator selection flag. Indicates the regulator selected.
  - PWR_FLAG_TEMPH : Temperature level flag (versus high threshold). Indicates the temperature is equal or above high threshold.
  - PWR_FLAG_TEMPL : Temperature level flag (versus low threshold). Indicates the temperature is equal or above low threshold.
  - PWR_FLAG_VBATH : Backup domain voltage level flag (versus high threshold). Indicates the backup domain voltage level is equal or above high threshold.
  - PWR_WAKEUP_FLAG1 : Wakeup flag 1. Indicates that a wakeup event was received from the WKUP line 1.
  - PWR_WAKEUP_FLAG2 : Wakeup flag 2. Indicates that a wakeup event was received from the WKUP line 2.
  - PWR_WAKEUP_FLAG3 : Wakeup flag 3. Indicates that a wakeup event was received from the WKUP line 3.
  - PWR_WAKEUP_FLAG4 : Wakeup flag 4. Indicates that a wakeup event was received from the WKUP line 4.
  - PWR_WAKEUP_FLAG5 : Wakeup flag 5. Indicates that a wakeup event was received from the WKUP line 5.
  - PWR_WAKEUP_FLAG6 : Wakeup flag 6. Indicates that a wakeup event was received from the WKUP line 6.
  - PWR_WAKEUP_FLAG7 : Wakeup flag 7. Indicates that a wakeup event was received from the WKUP line 7.
  - PWR_WAKEUP_FLAG8 : Wakeup flag 8. Indicates that a wakeup event was received from the WKUP line 8.

Return value:

- The: state of __FLAG__ (TRUE or FALSE).

__HAL_PWR_CLEAR_FLAG

Description:
- Clear PWR flags.

Parameters:
- __FLAG__: : Specifies the flag to clear. This parameter can be one of the following values :
  - PWR_FLAG_STOPF : Stop flag. Indicates that the device was resumed from Stop mode.
  - PWR_FLAG_SBF : Standby flag. Indicates that the device was resumed from Standby mode.
  - PWR_WAKEUP_FLAG1 : Wakeup flag 1. Indicates that a wakeup event was received from the WKUP line 1.
  - PWR_WAKEUP_FLAG2 : Wakeup flag 2. Indicates that a wakeup event was received from the WKUP line 2.
  - PWR_WAKEUP_FLAG3 : Wakeup flag 3. Indicates that a wakeup event was received from the WKUP line 3.
  - PWR_WAKEUP_FLAG4 : Wakeup flag 4. Indicates that a wakeup event was received from the WKUP line 4.
  - PWR_WAKEUP_FLAG5 : Wakeup flag 5. Indicates that a wakeup event was received from the WKUP line 5.
  - PWR_WAKEUP_FLAG6 : Wakeup flag 6. Indicates that a wakeup event was received from the WKUP line 6.
  - PWR_WAKEUP_FLAG7 : Wakeup flag 7. Indicates that a wakeup event was received from the WKUP line 7.
  - PWR_WAKEUP_FLAG8 : Wakeup flag 8. Indicates that a wakeup event was received from the WKUP line 8.

Return value:
- None.

__HAL_PWR_PVD_EXTI_ENABLE_IT

Description:
- Enable the PVD Extended Interrupt Line.

Return value:
- None.

__HAL_PWR_PVD_EXTI_DISABLE_IT

Description:
- Disable the PVD Extended Interrupt Line.

Return value:
- None.

__HAL_PWR_PVD_EXTI_ENABLE_EVENT

Description:
- Enable the PVD Event Line.

Return value:
- None.

__HAL_PWR_PVD_EXTI_DISABLE_EVENT

Description:
- Disable the PVD Event Line.

Return value:
- None.

__HAL_PWR_PVD_EXTI_ENABLE_RISING_EDGE

Description:
- Enable the PVD Extended Interrupt Rising Trigger.

Return value:
- None.

__HAL_PWR_PVD_EXTI_DISABLE_RISING_EDGE

Description:
- Disable the PVD Extended Interrupt Rising Trigger.

Return value:
- None.

__HAL_PWR_PVD_EXTI_ENABLE_FALLING_EDGE

Description:
- Enable the PVD Extended Interrupt Falling Trigger.

Return value:
- None.

__HAL_PWR_PVD_EXTI_DISABLE_FALLING_EDGE

Description:
- Disable the PVD Extended Interrupt Falling Trigger.

Return value:
- None.

__HAL_PWR_PVD_EXTI_ENABLE_RISING_FALLING_EDGE

Description:
- Enable the PVD Extended Interrupt Rising & Falling Trigger.

Return value:
- None.

__HAL_PWR_PVD_EXTI_DISABLE_RISING_FALLING_EDGE

Description:
- Disable the PVD Extended Interrupt Rising & Falling Trigger.

Return value:
- None.

__HAL_PWR_PVD_EXTI_GENERATE_SWIT

Description:
- Generate a Software Interrupt on selected EXTI line.

Return value:
- None

__HAL_PWR_PVD_EXTI_GET_FLAG

Description:
- Check whether or not the PVD EXTI Interrupt flag is set.

Return value:
- EXTI: PVD Line Status.

__HAL_PWR_PVD_EXTI_CLEAR_FLAG

Description:
- Clear the PVD EXTI Interrupt flag.

Return value:
- None.

PWR Flags

PWR_FLAG_VOSRDY
Voltage scaling ready flag

PWR_FLAG_BOOSTRDY
EPOD booster ready flag

PWR_FLAG_STOPF
Stop flag

PWR_FLAG_SBF
Standby flag

PWR_FLAG_VDDA2RDY
VDDA ready flag (versus 1.8 V threshold)

PWR_FLAG_VDDA1RDY
VDDA ready flag (versus 1.6 V threshold)

PWR_FLAG_VDDIO2RDY
VDDIO2 ready flag

PWR_FLAG_VDDUSBRDY
VDDUSB ready flag

PWR_FLAG_ACTVOSRDY
Currently applied VOS ready flag

PWR_FLAG_PVDO
VDD voltage detector output flag

PWR_FLAG_REGS
Regulator selection flag

PWR_FLAG_TEMPH
Temperature level flag (versus high threshold)

PWR_FLAG_TEMPL
Temperature level flag (versus low threshold)

PWR_FLAG_VBATH
Backup domain voltage level flag (versus high threshold)

PWR_FLAG_USBBOOSTRDY
USB EPOD booster ready flag

PWR_PVDLEVEL_0

PVD threshold around 2.0 V

PWR_PVDLEVEL_1

PVD threshold around 2.2 V

PWR_PVDLEVEL_2

PVD threshold around 2.4 V

PWR_PVDLEVEL_3

PVD threshold around 2.5 V

PWR_PVDLEVEL_4

PVD threshold around 2.6 V

PWR_PVDLEVEL_5

PVD threshold around 2.8 V

PWR_PVDLEVEL_6

PVD threshold around 2.9 V

PWR_PVDLEVEL_7

External input analog voltage (compared internally to VREFINT)

PWR PVD Mode

PWR_PVD_MODE_NORMAL

Basic Mode is used

PWR_PVD_MODE_IT_RISING

External Interrupt Mode with Rising edge trigger detection

PWR_PVD_MODE_IT_FALLING

External Interrupt Mode with Falling edge trigger detection

PWR_PVD_MODE_IT_RISING_FALLING

External Interrupt Mode with Rising/Falling edge trigger detection

PWR_PVD_MODE_EVENT_RISING

Event Mode with Rising edge trigger detection

PWR_PVD_MODE_EVENT_FALLING

Event Mode with Falling edge trigger detection

PWR_PVD_MODE_EVENT_RISING_FALLING

Event Mode with Rising/Falling edge trigger detection

PWR PVD Mode Mask

PVD_RISING_EDGE

Mask for rising edge set as PVD trigger

PVD_FALLING_EDGE

Mask for falling edge set as PVD trigger

PVD_MODE_IT

Mask for interruption yielded by PVD threshold crossing

PVD_MODE_EVT

Mask for event yielded by PVD threshold crossing

PWR PVM Mode Mask

PVM_RISING_EDGE

Mask for rising edge set as PVM trigger

PVM_FALLING_EDGE

Mask for falling edge set as PVM trigger

PVM_MODE_IT

Mask for interruption yielded by PVM threshold crossing

PVM_MODE_EVT

Mask for event yielded by PVM threshold crossing

PWR Regulator State in Sleep/Stop Mode

PWR_MAINREGULATOR_ON

Main Regulator ON in Run Mode

PWR_LOWPOWERREGULATOR_ON

Main Regulator ON in Low Power Mode

PWR Sleep Mode Entry

PWR_SLEEPENTRY_WFI

62 HAL PWR Extension Driver

62.1 PWREx Firmware driver registers structures

62.1.1 PWR_PVMTypeDef

PWR_PVMTypeDef is defined in the stm32u5xx_hal_pwr_ex.h

Data Fields

- ***uint32_t PVMType***
- ***uint32_t Mode***

Field Documentation

- ***uint32_t PWR_PVMTypeDef::PVMType***
  Specifies which voltage is monitored. This parameter can be a value of ***PWREx_PVM_Type***.
- ***uint32_t PWR_PVMTypeDef::Mode***
  Specifies the operating mode for the selected pins. This parameter can be a value of ***PWREx_PVM_Mode***.

62.2 PWREx Firmware driver API description

The following section lists the various functions of the PWREx library.

62.2.1 How to use this driver

1. Call HAL_PWREx_ControlVoltageScaling() and HAL_PWREx_GetVoltageRange() to set / get the voltage scaling range. (+) Voltage scaling can be one of the following values :
   – voltage output scale 1 : 1V2 => Used when system clock frequency is up to 160 MHz
   – voltage output scale 2 : 1V1 => Used when system clock frequency is up to 100 MHz
   – voltage output scale 3 : 1V0 => Used when system clock frequency is up to 50 MHz
   – voltage output scale 4 : 0V9 => Used when system clock frequency is up to 24 MHz
2. Call HAL_PWREx_EnableFastSoftStart() and HAL_PWREx_DisableFastSoftStart() to enable / disable the fast software startup for the current regulator.
3. Call HAL_PWREx_EnterSTOP1Mode() function to enter the whole system to Stop 1 mode. Wake-up from Stop 1 mode could be following to an event or an interrupt according to low power mode intrinsic request called (__WFI() or __WFE()). (Regulator state on U5 devices is managed internally but regulator parameter is kept for product compatibility).
4. Call HAL_PWREx_EnterSTOP2Mode() function to enter the whole system to Stop 2 mode. Wake-up from Stop 2 mode could be following to an event or an interrupt according to low power mode intrinsic request called (__WFI() or __WFE()). (Regulator state on U5 devices is managed internally but regulator parameter is kept for product compatibility).
5. Call HAL_PWREx_EnterSTOP3Mode() function to enter the whole system to Stop 3 mode. Wake-up from Stop 3 mode could be following to an event or an interrupt according to low power mode intrinsic request called (__WFI() or __WFE()). (Regulator state on U5 devices is managed internally but regulator parameter is kept for product compatibility).
6. Call HAL_PWREx_EnterSHUTDOWNMode() function to enter the whole system in Shutdown mode. Wake-up from Shutdown mode can be following to an external reset (NRST pin), a WKUP pin event (configurable rising or falling edge), or an RTC event occurs (alarm, periodic wakeup, timestamp), or a tamper detection.
7. Call HAL_PWREx_ConfigSRDDomain() to force in Run mode or to enter in Stop mode Smart Run Domain when the system enters Stop mode (Stop 0/1/2).
8. Call HAL_PWREx_EnableUltraLowPowerMode() and HAL_PWREx_DisableUltraLowPowerMode() to enable / disable the BOR ultra low power mode.
9. Call HAL_PWREx_S3WU_IRQHandler() function to handle the PWR Stop 3 wake up interrupt request.
10. Call HAL_PWREx_EnableBatteryCharging() and HAL_PWREx_DisableBatteryCharging() to enable / disable the battery charging capability when VDD alimentation is available.

11. Call HAL_PWREx_EnableVddUSB(), HAL_PWREx_EnableVddIO2() and HAL_PWREx_EnableVddA() to enable respectively VDDUSB, VDDIO2 and VDDA electrical and logical isolation. It is recommended to disable VDDUSB, VDDIO2 and VDDA electrical and logical isolation through HAL_PWREx_DisableVddUSB(), HAL_PWREx_DisableVddIO2() and HAL_PWREx_DisableVddA().
12. Call HAL_PWREx_ConfigPVM() after setting parameters to be configured (event mode and PVD type) in order to set up the Peripheral Voltage Monitor, then use HAL_PWREx_EnableUVM(), HAL_PWREx_EnableIO2VM(), HAL_PWREx_EnableAVM1() and HAL_PWREx_EnableAVM2() functions to start the PVM VDDx monitoring and use HAL_PWREx_DisableUVM(), HAL_PWREx_DisableIO2VM(), HAL_PWREx_DisableAVM1() and HAL_PWREx_DisableAVM2() to stop the PVM VDDx monitoring. (+) PVM monitored voltages are :
    – VDDUSB versus 1V2
    – VDDIO2 versus 0V9
    – VDDA versus 1V6
    – VDDA versus 1V8
13. Call HAL_PWREx_EnableUSBHSTranceiverSupply() and HAL_PWREx_DisableUSBHSTranceiverSupply() to enable / disable the internal USB HS transceiver supply. (+) This feature is available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices
14. Call HAL_PWREx_EnableOTGHSPHYLowPowerRetention() and HAL_PWREx_DisableOTGHSPHYLowPowerRetention() to enable / disable OTG_HS PHY power during low power modes (Stop2, Stop3 and Standby). (+) This feature is available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices
15. Call HAL_PWREx_EnableVDD11USB() and HAL_PWREx_DisableVDD11USB() to enable/ disable the VDD11USB. (+) This feature is available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices
16. Call HAL_PWREx_EnableMonitoring() and HAL_PWREx_DisableMonitoring() to enable / disable the VBAT and temperature monitoring.
17. Call HAL_PWREx_EnableUCPDStandbyMode() and HAL_PWREx_DisableUCPDStandbyMode() to enable / disable the UCPD configuration memorization in Standby mode.
18. Call HAL_PWREx_EnableUCPDDeadBattery() and HAL_PWREx_DisableUCPDDeadBattery() to enable / disable the dead battery behavior.
19. Call HAL_PWREx_PVD_PVM_IRQHandler() function to handle the PWR PVD and PVM interrupt request.
20. Call HAL_PWREx_EnableSRAM2ContentStandbyRetention() and HAL_PWREx_DisableSRAM2ContentStandbyRetention() to enable / disable the SRAM2 content retention in Stop 3 and Standby low power modes.

21. Call HAL_PWREx_EnableRAMsContentStopRetention() and HAL_PWREx_DisableRAMsContentStopRetention() to enable / disable the RAMs content retention in Stop mode (Stop 0/1/2/3). (+) Retained RAM can be one of the following RAMs :
    - SRAM1
    - SRAM2
    - SRAM3 (available only for STM32U575xx, STM32U585xx, STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
    - SRAM4
    - SRAM5 (available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
    - SRAM6 (available only for STM32U5Fxxx and STM32U5Gxxx devices)
    - ICACHE
    - DMA2DRAM (available only for STM32U575xx, STM32U585xx, STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
    - PKA32RAM
    - DCACHE1
    - FMAC
    - FDCAN
    - USB
    - DCACHE2 (available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
    - LTDC (available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
    - GFXMMU (available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
    - DSI (available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
    - JPEG (available only for STM32U5Fxxx and STM32U5Gxxx devices)
22. Call HAL_PWREx_EnableRAMsContentRunRetention() and HAL_PWREx_DisableRAMsContentRunRetention() to enable / disable the RAMs content retention in Run mode. (+) Retained RAM can be one of the following RAMs :
    - SRAM1
    - SRAM2
    - SRAM3 (available only for STM32U575xx, STM32U585xx, STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
    - SRAM4
    - SRAM5 (available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
    - SRAM6 (available only for STM32U5Fxxx and STM32U5Gxxx devices)
23. Call HAL_PWREx_EnableFlashFastWakeUp() and HAL_PWREx_DisableFlashFastWakeUp() to enable / disable the flash memory fast wakeup from Stop mode (Stop 0/1).
24. Call HAL_PWREx_EnableSRAM4FastWakeUp() and HAL_PWREx_DisableSRAM4FastWakeUp() to enable / disable the SRAM4 memory fast wakeup from Stop mode (Stop 0/1/2).
25. Call HAL_PWREx_EnableBkupRAMRetention() and HAL_PWREx_DisableBkupRAMRetention() to enable / disable the Backup RAM content retention in Standby, Shutdown and VBAT modes.
26. Call HAL_PWREx_EnablePullUpPullDownConfig() and HAL_PWREx_DisablePullUpPullDownConfig() to I/O enable / disable pull-up and pull-down configuration.
27. Call HAL_PWREx_EnableGPIOPullUp() and HAL_PWREx_EnableGPIOPullDown() to apply respectively pull-up and pull-down to selected I/O. Call HAL_PWREx_DisableGPIOPullUp() and HAL_PWREx_DisableGPIOPullDown() to disable applied respectively pull-up and pull-down to selected I/O.

(#) Call HAL_PWREx_ControlVoltageScaling() and HAL_PWREx_GetVoltageRange() to set / get the voltage scaling range.

- Voltage scaling can be one of the following values :
  - voltage output scale 1 : 1V2 => Used when system clock frequency is up to 160 MHz
  - voltage output scale 2 : 1V1 => Used when system clock frequency is up to 100 MHz
  - voltage output scale 3 : 1V0 => Used when system clock frequency is up to 50 MHz
  - voltage output scale 4 : 0V9 => Used when system clock frequency is up to 24 MHz (#) Call HAL_PWREx_EnableFastSoftStart() and HAL_PWREx_DisableFastSoftStart() to enable / disable the fast software startup for the current regulator. (#) Call HAL_PWREx_EnterSTOP1Mode() function to enter the whole system to Stop 1 mode. Wake-up from Stop 1 mode could be following to an event or an interrupt according to low power mode intrinsic request called (__WFI() or __WFE()). (Regulator state on U5 devices is managed internally but regulator parameter is kept for product compatibility). (#) Call HAL_PWREx_EnterSTOP2Mode() function to enter the whole system to Stop 2 mode. Wake-up from Stop 2 mode could be following to an event or an interrupt according to low power mode intrinsic request called (__WFI() or __WFE()). (Regulator state on U5 devices is managed internally but regulator parameter is kept for product compatibility). (#) Call HAL_PWREx_EnterSTOP3Mode() function to enter the whole system to Stop 3 mode. Wake-up from Stop 3 mode could be following to an event or an interrupt according to low power mode intrinsic request called (__WFI() or __WFE()). (Regulator state on U5 devices is managed internally but regulator parameter is kept for product compatibility). (#) Call HAL_PWREx_EnterSHUTDOWNMode() function to enter the whole system in Shutdown mode. Wake-up from Shutdown mode can be following to an external reset (NRST pin), a WKUP pin event (configurable rising or falling edge), or an RTC event occurs (alarm, periodic wakeup, timestamp), or a tamper detection. (#) Call HAL_PWREx_ConfigSRDDomain() to force in Run mode or to enter in Stop mode Smart Run Domain when the system enters Stop mode (Stop 0/1/2). (#) Call HAL_PWREx_EnableUltraLowPowerMode() and HAL_PWREx_DisableUltraLowPowerMode() to enable / disable the BOR ultra low power mode. (#) Call HAL_PWREx_S3WU_IRQHandler() function to handle the PWR Stop 3 wake up interrupt request. (#) Call HAL_PWREx_EnableBatteryCharging() and HAL_PWREx_DisableBatteryCharging() to enable / disable the battery charging capability when VDD alimentation is available. (#) Call HAL_PWREx_EnableVddUSB(), HAL_PWREx_EnableVddIO2() and HAL_PWREx_EnableVddA() to enable respectively VDDUSB, VDDIO2 and VDDA electrical and logical isolation. It is recommended to disable VDDUSB, VDDIO2 and VDDA electrical and logical isolation through HAL_PWREx_DisableVddUSB(), HAL_PWREx_DisableVddIO2() and HAL_PWREx_DisableVddA(). (#) Call HAL_PWREx_ConfigPVM() after setting parameters to be configured (event mode and PVD type) in order to set up the Peripheral Voltage Monitor, then use HAL_PWREx_EnableUVM(), HAL_PWREx_EnableIO2VM(), HAL_PWREx_EnableAVM1() and HAL_PWREx_EnableAVM2() functions to start the PVM VDDx monitoring and use HAL_PWREx_DisableUVM(), HAL_PWREx_DisableIO2VM(), HAL_PWREx_DisableAVM1() and HAL_PWREx_DisableAVM2() to stop the PVM VDDx monitoring.
- PVM monitored voltages are :
  - VDDUSB versus 1V2
  - VDDIO2 versus 0V9
  - VDDA versus 1V6
  - VDDA versus 1V8 (#) Call HAL_PWREx_EnableUSBHSTranceiverSupply() and HAL_PWREx_DisableUSBHSTranceiverSupply() to enable / disable the internal USB HS transceiver supply.
- This feature is available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices (#) Call HAL_PWREx_EnableOTGHSPHYLowPowerRetention() and HAL_PWREx_DisableOTGHSPHYLowPowerRetention() to enable / disable OTG_HS PHY power during low power modes (Stop2, Stop3 and Standby).
- This feature is available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices (#) Call HAL_PWREx_EnableVDD11USB() and HAL_PWREx_DisableVDD11USB() to enable/ disable the VDD11USB.

- This feature is available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices (#) Call HAL_PWREx_EnableMonitoring() and HAL_PWREx_DisableMonitoring() to enable / disable the VBAT and temperature monitoring. (#) Call HAL_PWREx_EnableUCPDStandbyMode() and HAL_PWREx_DisableUCPDStandbyMode() to enable / disable the UCPD configuration memorization in Standby mode. (#) Call HAL_PWREx_EnableUCPDDeadBattery() and HAL_PWREx_DisableUCPDDeadBattery() to enable / disable the dead battery behavior. (#) Call HAL_PWREx_PVD_PVM_IRQHandler() function to handle the PWR PVD and PVM interrupt request. (#) Call HAL_PWREx_EnableSRAM2ContentStandbyRetention() and HAL_PWREx_DisableSRAM2ContentStandbyRetention() to enable / disable the SRAM2 content retention in Stop 3 and Standby low power modes. (#) Call HAL_PWREx_EnableRAMsContentStopRetention() and HAL_PWREx_DisableRAMsContentStopRetention() to enable / disable the RAMs content retention in Stop mode (Stop 0/1/2/3).
- Retained RAM can be one of the following RAMs :
  - SRAM1
  - SRAM2
  - SRAM3 (available only for STM32U575xx, STM32U585xx, STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
  - SRAM4
  - SRAM5 (available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
  - SRAM6 (available only for STM32U5Fxxx and STM32U5Gxxx devices)
  - ICACHE
  - DMA2DRAM (available only for STM32U575xx, STM32U585xx, STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
  - PKA32RAM
  - DCACHE1
  - FMAC
  - FDCAN
  - USB
  - DCACHE2 (available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
  - LTDC (available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
  - GFXMMU (available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
  - DSI (available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
  - JPEG (available only for STM32U5Fxxx and STM32U5Gxxx devices) (#) Call HAL_PWREx_EnableRAMsContentRunRetention() and HAL_PWREx_DisableRAMsContentRunRetention() to enable / disable the RAMs content retention in Run mode.

- Retained RAM can be one of the following RAMs :
  - SRAM1
  - SRAM2
  - SRAM3 (available only for STM32U575xx, STM32U585xx, STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
  - SRAM4
  - SRAM5 (available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
  - SRAM6 (available only for STM32U5Fxxx and STM32U5Gxxx devices) (#) Call HAL_PWREx_EnableFlashFastWakeUp() and HAL_PWREx_DisableFlashFastWakeUp() to enable / disable the flash memory fast wakeup from Stop mode (Stop 0/1). (#) Call HAL_PWREx_EnableSRAM4FastWakeUp() and HAL_PWREx_DisableSRAM4FastWakeUp() to enable / disable the SRAM4 memory fast wakeup from Stop mode (Stop 0/1/2). (#) Call HAL_PWREx_EnableBkupRAMRetention() and HAL_PWREx_DisableBkupRAMRetention() to enable / disable the Backup RAM content retention in Standby, Shutdown and VBAT modes. (#) Call HAL_PWREx_EnablePullUpPullDownConfig() and HAL_PWREx_DisablePullUpPullDownConfig() to I/O enable / disable pull-up and pull-down configuration. (#) Call HAL_PWREx_EnableGPIOPullUp() and HAL_PWREx_EnableGPIOPullDown() to apply respectively pull-up and pull-down to selected I/O. Call HAL_PWREx_DisableGPIOPullUp() and HAL_PWREx_DisableGPIOPullDown() to disable applied respectively pull-up and pull-down to selected I/O.

62.2.2 Power supply control functions

This section provides functions allowing to control power supply.

- The STM32U5 Series devices embed two regulators : one LDO (linear voltage regulator) and one SMPS (step down converter) in parallel to provide the VCORE supply for digital peripherals, SRAM1, SRAM2, SRAM3 and SRAM4 and embedded Flash memory.
- The SMPS allows the power consumption to be reduced but some peripherals can be perturbed by the noise generated by the SMPS, requiring the application to switch to LDO when running this peripheral in order to reach the best performances.
- The LDO and the SMPS regulators have two modes: Main regulator mode (used when performance is needed), and Low-power regulator mode. LDO or SMPS can be used in all voltage scaling ranges, and in all Stop modes.
- After reset, the regulator is the LDO, in Range 4. Switching to SMPS provides lower consumption in particular at high VDD voltage. It is possible to switch from LDO to SMPS, or from SMPS to LDO on the fly in any range, by configuring the REGSEL bit. It is recommended to switch first to SMPS before changing the voltage range.
- When exiting the Stop or Standby modes, the regulator is the same than when entering low power modes. The voltage range is the Range 4.
- Both regulators can provide four different voltages (voltage scaling) and can operate in Stop modes. Voltage scaling ranges can be one of the following values :
  - voltage output scale 1 : 1V2 => Used when system clock frequency is up to 160 MHz
  - voltage output scale 2 : 1V1 => Used when system clock frequency is up to 100 MHz
  - voltage output scale 3 : 1V0 => Used when system clock frequency is up to 50 MHz
  - voltage output scale 4 : 0V9 => Used when system clock frequency is up to 24 MHz

This section contains the following APIs:

- *HAL_PWREx_ControlVoltageScaling()*
- *HAL_PWREx_GetVoltageRange()*
- *HAL_PWREx_ConfigSupply()*
- *HAL_PWREx_GetSupplyConfig()*
- *HAL_PWREx_EnableFastSoftStart()*
- *HAL_PWREx_DisableFastSoftStart()*

62.2.3 Low power control functions

This section provides functions allowing to control low power modes.

Low Power modes configuration

This section presents 4 principles low power modes :
- Stop 1 mode : Cortex-M33 is stopped, clocks are stopped and the regulator is in low power mode. Several peripheral can operate in this mode.
- Stop 2 mode : Cortex-M33 is stopped, clocks are stopped and the regulator is in low power mode. Only autonomous peripherals can operate in this mode.
- Stop 3 mode : Cortex-M33 is stopped, clocks are stopped and the regulator is in low power mode. No peripheral can operate in this mode. Only RAMs content is preserved.
- Shutdown mode : All PWR domains enter Shutdown mode and the VCORE supply regulator is powered off. The SRAMs and register contents are lost except for registers in the Backup domain.

Stop 1 mode

The Stop 1 mode is based on the Cortex-M33 Deepsleep mode combined with the peripheral clock gating. The voltage regulator is configured in low power mode. In Stop 1 mode, all clocks in the VCORE domain are stopped. The PLL, MSIS, MSIK, HSI16 and HSE oscillators are disabled. Some peripherals with the LPBAM capability can switch on HSI16 or MSIS or MSIK for transferring data. All SRAMs and register contents are preserved, but the SRAMs can be totally or partially switched off to further reduced consumption. The BOR is always available in Stop 1 mode.
- Entry: The Stop 1 mode is entered by using the HAL_PWREx_EnterSTOP1Mode() function.
  – PWR_STOPENTRY_WFI: enter Stop 1 mode with WFI instruction.
  – PWR_STOPENTRY_WFE: enter Stop 1 mode with WFE instruction.
- Exit: Any EXTI line configured in interrupt mode (the corresponding EXTI interrupt vector must be enabled in the NVIC). The interrupt source can be external interrupts or peripherals with wakeup capability. Any peripheral interrupt occurring when the AHB/APB clocks are present due to an autonomous peripheral clock request (the peripheral vector must be enabled in the NVIC) Any EXTI line configured in event mode.

Stop 2 mode

The Stop 2 mode is based on the Cortex-M33 Deepsleep mode combined with peripheral clock gating. In Stop 2 mode, all clocks in the VCORE domain are stopped. The PLL, MSIS, MSIK, HSI16 and HSE oscillators are disabled. Some peripherals with the LPBAM capability can switch on HSI16 or MSIS or MSIK for transferring data. All SRAMs and register contents are preserved, but the SRAMs can be totally or partially switched off to further reduce consumption. The BOR is always available in Stop 2 mode.
- Entry: The Stop 2 mode is entered by using the HAL_PWREx_EnterSTOP2Mode() function.
  – PWR_STOPENTRY_WFI: enter Stop 2 mode with WFI instruction.
  – PWR_STOPENTRY_WFE: enter Stop 2 mode with WFE instruction.
- Exit: Any EXTI line configured in interrupt mode (the corresponding EXTI interrupt vector must be enabled in the NVIC). The interrupt source can be external interrupts or peripherals with wakeup capability. Any peripheral interrupt occurring when the AHB/APB clocks are present due to an autonomous peripheral clock request (the peripheral vector must be enabled in the NVIC) Any EXTI line configured in event mode.

Stop 3 mode

The Stop 3 mode is based on the Cortex-M33 Deepsleep mode combined with peripheral clock gating. In Stop 3 mode, all clocks in the VCORE domain are stopped. The PLL, MSIS, MSIK, HSI16 and HSE oscillators are disabled. All SRAMs and register contents are preserved, but the SRAMs can be totally or partially switched off to further reduce consumption. The BOR is always available in Stop 3 mode.
- Entry: The Stop 3 mode is entered by using the HAL_PWREx_EnterSTOP3Mode() function.
  – PWR_STOPENTRY_WFI: enter Stop 3 mode with WFI instruction.
  – PWR_STOPENTRY_WFE: enter Stop 3 mode with WFE instruction.
- Exit: WKUPx pin edge, RTC or TAMP event, external Reset in NRST pin, IWDG Reset, BOR reset.

Shutdown mode

The lowest power consumption is reached in Shutdown mode. It is based on the Deepsleep mode with the voltage regulator disabled. The VCORE domain is consequently powered off. The PLL, HSI16, MSIS, MSIK and HSE oscillators are also switched off. The SRAMs and register contents are lost except for registers in the Backup domain. The BOR is not available in Shutdown mode. No power voltage monitoring is possible in this mode, therefore the switch to Backup domain is not supported.

- Entry: The Shutdown mode is entered by using the HAL_PWREx_EnterSHUTDOWNMode() function.
- Exit: WKUPx pin edge, RTC/TAMP event, external Reset in NRST pin.

This section contains the following APIs:

- *HAL_PWREx_EnterSTOP1Mode()*
- *HAL_PWREx_EnterSTOP2Mode()*
- *HAL_PWREx_EnterSTOP3Mode()*
- *HAL_PWREx_EnterSHUTDOWNMode()*
- *HAL_PWREx_ConfigSRDDomain()*
- *HAL_PWREx_EnableUltraLowPowerMode()*
- *HAL_PWREx_DisableUltraLowPowerMode()*
- *HAL_PWREx_S3WU_IRQHandler()*
- *HAL_PWREx_S3WUCallback()*

62.2.4 Voltage Monitoring Functions

This section provides functions allowing voltage monitoring.

PVM configuration

- The supplies (VDDA, VDDIO2 and VDDUSB) can be independent from VDD and can be monitored with four peripheral voltage monitoring (PVM):
  - The UVM monitors the USB supply VDDUSB. VDDUSBRDY indicates if the VDDUSB independent power supply is higher or lower than the VUVM threshold.
  - The IO2VM monitors the PG[15:2] supply VDDIO2. VDDIO2RDY indicates if the VDDIO2 independent power supply is higher or lower than the VIO2VM threshold.
  - The AVM1 monitors the analog supply VDDA. VDDA1RDY indicates if the VDDA independent power supply is higher or lower than the VAVM1 threshold.
  - The AVM2 monitors the analog supply VDDA. VDDA2RDY indicates if the VDDA independent power supply is higher or lower than the VAVM2 threshold.
- Each PVM output is connected to an EXTI line and can generate an interrupt if enabled through the EXTI registers. The PVMx output interrupt is generated when the independent power supply drops below the PVM threshold and/or when it rises above the PVM threshold, depending on EXTI line rising/falling edge configuration.
- Each PVM can remain active in Stop 0, Stop 1, Stop 2 modes, and the PVM interrupt can wake up from the Stop mode. The PVM is not functional in Stop 3 mode.

VBAT charging

When VDD is present, it is possible to charge the external battery on VBAT through an internal resistance. The VBAT charging is done either through a 5 kOhm resistor or through a 1.5 kOhm resistor depending on the VBRS bit value in the PWR_BDCR2 register. The battery charging is enabled by setting VBE bit in the PWR_BDCR2 register. It is automatically disabled in VBAT mode.

Backup domain monitoring

When the Backup domain voltage and temperature monitoring is enabled (MONEN = 1 in the PWR_BDCR1 register), the Backup domain voltage and the temperature are monitored. If the Backup domain voltage monitoring internal tamper is enabled in the TAMP peripheral (ITAMP1E = 1 in the TAMP_CR1 register), a tamper event is generated when the Backup domain voltage is above the functional range. In case the Backup domain voltage is below the functional range, a Brownout reset is generated, erasing all device including Backup domain.

Backup domain battery

- To retain the content of the backup registers and supply the RTC function when VDD is turned off, the VBAT pin can be connected to an optional backup voltage supplied by a battery or by another source. The VBAT pin powers the RTC unit, the LSE oscillator and the PC13 to PC15 I/Os, allowing the RTC to operate even when the main power supply is turned off. The backup SRAM is optionally powered by VBAT pin when the BREN bit is set in the PWR Backup domain control register 1 (PWR_BDCR1). The switch to the VBAT supply is controlled by the power down reset embedded in the Reset block.
- After exiting reset, the USB Type-C (dead battery) behavior is enabled, which may have a pull-down effect on CC1 and CC2 pins. It is recommended to disable it in all cases, either to stop this pull-down or to handover control to the UCPD (the UCPD must be initialized before doing the disable).

This section contains the following APIs:
- *HAL_PWREx_ConfigPVM()*
- *HAL_PWREx_EnableVddUSB()*
- *HAL_PWREx_DisableVddUSB()*
- *HAL_PWREx_EnableVddIO2()*
- *HAL_PWREx_DisableVddIO2()*
- *HAL_PWREx_EnableVddA()*
- *HAL_PWREx_DisableVddA()*
- *HAL_PWREx_EnableUVM()*
- *HAL_PWREx_DisableUVM()*
- *HAL_PWREx_EnableIO2VM()*
- *HAL_PWREx_DisableIO2VM()*
- *HAL_PWREx_EnableAVM1()*
- *HAL_PWREx_DisableAVM1()*
- *HAL_PWREx_EnableAVM2()*
- *HAL_PWREx_DisableAVM2()*
- *HAL_PWREx_EnableMonitoring()*
- *HAL_PWREx_DisableMonitoring()*
- *HAL_PWREx_EnableUSBHSTranceiverSupply()*
- *HAL_PWREx_DisableUSBHSTranceiverSupply()*
- *HAL_PWREx_EnableOTGHSPHYLowPowerRetention()*
- *HAL_PWREx_DisableOTGHSPHYLowPowerRetention()*
- *HAL_PWREx_EnableVDD11USB()*
- *HAL_PWREx_DisableVDD11USB()*
- *HAL_PWREx_EnableUCPDStandbyMode()*
- *HAL_PWREx_DisableUCPDStandbyMode()*
- *HAL_PWREx_EnableUCPDDeadBattery()*
- *HAL_PWREx_DisableUCPDDeadBattery()*
- *HAL_PWREx_EnableBatteryCharging()*
- *HAL_PWREx_DisableBatteryCharging()*
- *HAL_PWREx_PVD_PVM_IRQHandler()*
- *HAL_PWREx_UVMCallback()*
- *HAL_PWREx_IO2VMCallback()*
- *HAL_PWREx_AVM1Callback()*
- *HAL_PWREx_AVM2Callback()*

62.2.5 Memories Retention Functions

Several STM32U5 devices RAMs are configurable to keep / lose RAMs content during Stop mode (Stop 0/1/2/3).

- Retained content RAMs in Stop modes are :
  - SRAM1
  - SRAM2
  - SRAM3 (available only for STM32U575xx, STM32U585xx, STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
  - SRAM4
  - ICACHE
  - DMA2DRAM (available only for STM32U575xx, STM32U585xx, STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
  - PKA32RAM
  - DCACHE
  - FMAC
  - FDCAN
  - USB

Several STM32U5 devices RAMs are configurable to keep / lose RAMs content during Run mode.

- Retained content RAMs in Run modes are :
  - SRAM1
  - SRAM2
  - SRAM3 (available only for STM32U575xx, STM32U585xx, STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices)
  - SRAM4

SRAM2 is configurable to keep / lose its content in Stop 3 and Standby modes. The SRAM2 retention feature granularity is at pages level.

BKPRAM is configurable to keep / lose its content in Standby, Shutdown and VBAT modes.

This section contains the following APIs:

- *HAL_PWREx_EnableSRAM2ContentStandbyRetention()*
- *HAL_PWREx_DisableSRAM2ContentStandbyRetention()*
- *HAL_PWREx_EnableRAMsContentStopRetention()*
- *HAL_PWREx_DisableRAMsContentStopRetention()*
- *HAL_PWREx_EnableRAMsContentRunRetention()*
- *HAL_PWREx_DisableRAMsContentRunRetention()*
- *HAL_PWREx_EnableBkupRAMRetention()*
- *HAL_PWREx_DisableBkupRAMRetention()*
- *HAL_PWREx_EnableFlashFastWakeUp()*
- *HAL_PWREx_DisableFlashFastWakeUp()*
- *HAL_PWREx_EnableSRAM4FastWakeUp()*
- *HAL_PWREx_DisableSRAM4FastWakeUp()*

62.2.6 IO Pull-Up Pull-Down Configuration Functions

In Standby and Shutdown mode, pull up and pull down can be configured to maintain an I/O in the selected state. If the APC bit in the PWR_APCR register is set, the I/Os can be configured either with a pull-up through PWR_PUCRx registers (x=A,B,C,D,E,F,G,H,I,J), or with a pull-down through PWR_PDCRx registers (x=A,B,C,D,E,F,G,H,I,J)), or can be kept in analog state if none of the PWR_PUCRx or PWR_PDCRx register is set.

- Port J is available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices.

The pull-down configuration has highest priority over pull-up configuration in case both PWR_PUCRx and PWR_PDCRx are set for the same I/O. This configuration is lost when exiting the Shutdown but not from Standby mode.

This section contains the following APIs:

- *HAL_PWREx_EnablePullUpPullDownConfig()*
- *HAL_PWREx_DisablePullUpPullDownConfig()*

- *HAL_PWREx_EnableGPIOPullUp()*
- *HAL_PWREx_DisableGPIOPullUp()*
- *HAL_PWREx_EnableGPIOPullDown()*
- *HAL_PWREx_DisableGPIOPullDown()*

62.2.7 Detailed description of functions

HAL_PWREx_ControlVoltageScaling

Function name

HAL_StatusTypeDef HAL_PWREx_ControlVoltageScaling (uint32_t VoltageScaling)

Function description

Configure the main internal regulator output voltage to achieve a tradeoff between performance and power consumption.

Parameters

- **VoltageScaling:** : Specifies the regulator output voltage scale. This parameter can be one of the following values :
  - PWR_REGULATOR_VOLTAGE_SCALE1 : Regulator voltage output scale 1. Provides a typical output voltage at 1.2 V. Used when system clock frequency is up to 160 MHz.
  - PWR_REGULATOR_VOLTAGE_SCALE2 : Regulator voltage output scale 2. Provides a typical output voltage at 1.1 V. Used when system clock frequency is up to 100 MHz.
  - PWR_REGULATOR_VOLTAGE_SCALE3 : Regulator voltage output scale 3. Provides a typical output voltage at 1.0 V. Used when system clock frequency is up to 50 MHz.
  - PWR_REGULATOR_VOLTAGE_SCALE4 : Regulator voltage output scale 4. Provides a typical output voltage at 0.9 V. Used when system clock frequency is up to 24 MHz.

Return values

- **HAL:** Status.

Notes

- Before moving to voltage scaling 2, it is mandatory to ensure that the system frequency is between 50 MHz and 100 MHz.
- Before moving to voltage scaling 3, it is mandatory to ensure that the system frequency is between 24 MHz and 50 MHz.
- Before moving to voltage scaling 4, it is mandatory to ensure that the system frequency is below 24 MHz.

HAL_PWREx_GetVoltageRange

Function name

uint32_t HAL_PWREx_GetVoltageRange (void)

Function description

Return Voltage Scaling Range.

Return values

- **Applied:** voltage scaling value.

HAL_PWREx_ConfigSupply

Function name

HAL_StatusTypeDef HAL_PWREx_ConfigSupply (uint32_t SupplySource)

Function description

Configure the system Power Supply.

Parameters

- **SupplySource:** : Specifies the Power Supply source to set after a system startup. This parameter can be one of the following values :
  – PWR_LDO_SUPPLY : The LDO regulator supplies the Vcore Power Domains.
  – PWR_SMPS_SUPPLY : The SMPS regulator supplies the Vcore Power Domains.

Return values

- **HAL:** Status.

HAL_PWREx_GetSupplyConfig

Function name

uint32_t HAL_PWREx_GetSupplyConfig (void)

Function description

Get the power supply configuration.

Return values

- **The:** supply configured.

HAL_PWREx_EnableFastSoftStart

Function name

void HAL_PWREx_EnableFastSoftStart (void)

Function description

Enable fast soft start for the current regulator.

Return values

- **None.:**

HAL_PWREx_DisableFastSoftStart

Function name

void HAL_PWREx_DisableFastSoftStart (void)

Function description

Disable fast soft start for the current regulator.

Return values

- **None.:**

HAL_PWREx_EnterSTOP1Mode

Function name

void HAL_PWREx_EnterSTOP1Mode (uint8_t STOPEntry)

Function description

Enter the whole system to Stop 1 mode.

Parameters

- **STOPEntry:** : Specifies if Stop mode is entered with WFI or WFE instruction. This parameter can be one of the following values :
  – PWR_STOPENTRY_WFI enter Stop mode with Wait For Interrupt request.
  – PWR_STOPENTRY_WFE enter Stop mode with Wait For Event request.

Return values

- **None.:**

Notes

- Stop 1 offers the largest number of active peripherals and wakeup sources, a smaller wakeup time but a higher consumption.
- Stop mode achieves the lowest power consumption while retaining the content of SRAM and registers. All clocks in the VCORE domain are stopped. The PLL, the MSI (MSIS and MSIK) RC, the HSI16 RC and the HSE crystal oscillators are disabled. The LSE or LSI is still running.
- The system clock when exiting from Stop mode can be either MSIS up to 24 MHz or HSI16, depending on software configuration.

HAL_PWREx_EnterSTOP2Mode

Function name

void HAL_PWREx_EnterSTOP2Mode (uint8_t STOPEntry)

Function description

Enter the whole system to Stop 2 mode.

Parameters

- **STOPEntry:** : Specifies if Stop mode is entered with WFI or WFE instruction. This parameter can be one of the following values :
  - PWR_STOPENTRY_WFI enter Stop mode with Wait For Interrupt request.
  - PWR_STOPENTRY_WFE enter Stop mode with Wait For Event request.

Return values

- **None.:**

Notes

- In Stop 2 mode, all clocks in the VCORE domain are stopped. The PLL, MSIS, MSIK, HSI16 and HSE oscillators are disabled.
- Stop mode achieves the lowest power consumption while retaining the content of SRAM and registers. All clocks in the VCORE domain are stopped. The PLL, the MSI (MSIS and MSIK) RC, the HSI16 RC and the HSE crystal oscillators are disabled. The LSE or LSI is still running.
- The system clock when exiting from Stop mode can be either MSIS up to 24 MHz or HSI16, depending on software configuration.

HAL_PWREx_EnterSTOP3Mode

Function name

void HAL_PWREx_EnterSTOP3Mode (uint8_t STOPEntry)

Function description

Enter the whole system to Stop 3 mode.

Parameters

- **STOPEntry:** : Specifies if Stop mode is entered with WFI or WFE instruction. This parameter can be one of the following values :
  - PWR_STOPENTRY_WFI enter Stop mode with Wait For Interrupt request.
  - PWR_STOPENTRY_WFE enter Stop mode with Wait For Event request.

Return values

- **None.:**

Notes

- Stop 3 is the lowest power mode with full retention, but the functional peripherals and sources of wakeup are reduced to the same ones than in Standby mode.
- Stop mode achieves the lowest power consumption while retaining the content of SRAM and registers. All clocks in the VCORE domain are stopped. The PLL, the MSI (MSIS and MSIK) RC, the HSI16 RC and the HSE crystal oscillators are disabled. The LSE or LSI is still running.
- The system clock when exiting from Stop mode can be either MSIS up to 24 MHz or HSI16, depending on software configuration.

HAL_PWREx_EnterSHUTDOWNMode

Function name

void HAL_PWREx_EnterSHUTDOWNMode (void)

Function description

Enter the whole system to Shutdown mode.

Return values

- **None.:**

Notes

- Shutdown mode allows the lowest power consumption. The internal regulator is switched off so that the VCORE domain is powered off. The PLL, the HSI16, the MSI (MSIS and MSIK), the LSI and the HSE oscillators are also switched off.
- The SRAMs and register contents are lost except for registers in the Backup domain. The BOR is not available in Shutdown mode. No power voltage monitoring is possible in this mode, therefore the switch to Backup domain is not supported.

HAL_PWREx_ConfigSRDDomain

Function name

void HAL_PWREx_ConfigSRDDomain (uint32_t SRDState)

Function description

Configure the SRD domain when the System in Stop 0/1/2 mode.

Parameters

- **SRDState:** : Specifies the SRD state. This parameter can be one of the following values :
  – PWR_SRD_DOMAIN_STOP : SRD in Stop mode when system goes to Stop 0/1/2 mode
  – PWR_SRD_DOMAIN_RUN : SRD in Run mode when system goes to Stop 0/1/2 mode

Return values

- **None.:**

HAL_PWREx_EnableUltraLowPowerMode

Function name

void HAL_PWREx_EnableUltraLowPowerMode (void)

Function description

Enable BOR ultra-low power mode.

Return values

- **None.:**

Notes

- BOR operating can be in discontinuous (ultra-low power) mode in Stop 1, Stop 2, Stop 3 and Standby modes and when the regulator is in Range 4 (Run, Sleep or Stop 0 mode).

HAL_PWREx_DisableUltraLowPowerMode

Function name

void HAL_PWREx_DisableUltraLowPowerMode (void)

Function description

Disable BOR ultra-low power mode.

Return values

- **None.:**

HAL_PWREx_S3WU_IRQHandler

Function name

void HAL_PWREx_S3WU_IRQHandler (uint32_t WakeUpPin)

Function description

This function handles the PWR Wake up from Stop 3 interrupt request.

Parameters

- **WakeUpPin:** : Specifies the wakeup pin interrupt to be handled. This parameter can be a combination of PWR Wake Up Pins (Default polarity and default pin selection).

Return values

- **None.:**

Notes

- This API should be called under the PWR_S3WU_IRQHandler().

HAL_PWREx_S3WUCallback

Function name

void HAL_PWREx_S3WUCallback (uint32_t WakeUpPin)

Function description

PWR S3WU interrupt callback.

Parameters

- **WakeUpPin:** : Specifies the wakeup pin interrupt to be handled. This parameter can be a combination of PWR Wake Up Pins (Default polarity and default pin selection).

Return values

- **None.:**

HAL_PWREx_EnableBatteryCharging

Function name

void HAL_PWREx_EnableBatteryCharging (uint32_t ResistorValue)

Function description

Enable the Battery charging.

Parameters

- **ResistorValue:** : Specifies the charging resistor. This parameter can be one of the following values :
  – PWR_BATTERY_CHARGING_RESISTOR_5 : 5 KOhm resistor.
  – PWR_BATTERY_CHARGING_RESISTOR_1_5 : 1.5 KOhm resistor.

Return values

- **None.:**

Notes

- When VDD is present, charge the external battery through an internal resistor.

HAL_PWREx_DisableBatteryCharging

Function name

void HAL_PWREx_DisableBatteryCharging (void)

Function description

Disable the Battery charging.

Return values

- **None.:**

HAL_PWREx_EnableVddUSB

Function name

void HAL_PWREx_EnableVddUSB (void)

Function description

Enable VDDUSB supply.

Return values

- **None.:**

Notes

- Remove VDDUSB electrical and logical isolation, once VDDUSB supply is present for consumption saving.

HAL_PWREx_DisableVddUSB

Function name

void HAL_PWREx_DisableVddUSB (void)

Function description

Disable VDDUSB supply.

Return values

- **None.:**

HAL_PWREx_EnableVddIO2

Function name

void HAL_PWREx_EnableVddIO2 (void)

Function description

Enable VDDIO2 supply.

Return values

- **None.:**

Notes

- Remove VDDIO2 electrical and logical isolation, once VDDIO2 supply is present for consumption saving.

HAL_PWREx_DisableVddIO2

Function name

void HAL_PWREx_DisableVddIO2 (void)

Function description

Disable VDDIO2 supply.

Return values

- **None.:**

HAL_PWREx_EnableVddA

Function name

void HAL_PWREx_EnableVddA (void)

Function description

Enable VDDA supply.

Return values

- **None.:**

Notes

- Remove VDDA electrical and logical isolation, once VDDA supply is present for consumption saving.

HAL_PWREx_DisableVddA

Function name

void HAL_PWREx_DisableVddA (void)

Function description

Disable VDDA supply.

Return values

- **None.:**

HAL_PWREx_EnableUVM

Function name

void HAL_PWREx_EnableUVM (void)

Function description

Enable the UVM Voltage Monitoring : VDDUSB versus 1.2 V.

Return values

- **None.:**

HAL_PWREx_DisableUVM

Function name

void HAL_PWREx_DisableUVM (void)

Function description

Disable the UVM Voltage Monitoring : VDDUSB versus 1.2 V.

Return values

- **None.:**

HAL_PWREx_EnableIO2VM

Function name

void HAL_PWREx_EnableIO2VM (void)

Function description

Enable the IO2VM Voltage Monitoring : VDDIO2 versus 0.9 V.

Return values

- **None.:**

HAL_PWREx_DisableIO2VM

Function name

void HAL_PWREx_DisableIO2VM (void)

Function description

Disable the IO2VM Voltage Monitoring : VDDIO2 versus 0.9 V.

Return values

- **None.:**

HAL_PWREx_EnableAVM1

Function name

void HAL_PWREx_EnableAVM1 (void)

Function description

Enable the AVM1 Voltage Monitoring : VDDA versus 1.6 V.

Return values

- **None.:**

HAL_PWREx_DisableAVM1

Function name

void HAL_PWREx_DisableAVM1 (void)

Function description

Disable the AVM1 Voltage Monitoring : VDDA versus 1.6 V.

Return values

- **None.:**

HAL_PWREx_EnableAVM2

Function name

void HAL_PWREx_EnableAVM2 (void)

Function description

Enable the AVM2 Voltage Monitoring : VDDA versus 1.8 V.

Return values

- **None.:**

HAL_PWREx_DisableAVM2

Function name

void HAL_PWREx_DisableAVM2 (void)

Function description

Disable the AVM2 Voltage Monitoring : VDDA versus 1.8 V.

Return values

- **None.:**

HAL_PWREx_EnableUSBHSTranceiverSupply

Function name

HAL_StatusTypeDef HAL_PWREx_EnableUSBHSTranceiverSupply (void)

Function description

Enable the internal USB HS transceiver supply.

Return values

- **HAL:** status.

HAL_PWREx_DisableUSBHSTranceiverSupply

Function name

void HAL_PWREx_DisableUSBHSTranceiverSupply (void)

Function description

Disable the internal USB HS transceiver supply.

Return values

- **HAL:** status.

HAL_PWREx_EnableOTGHSPHYLowPowerRetention

Function name

void HAL_PWREx_EnableOTGHSPHYLowPowerRetention (void)

Function description

Enable OTG_HS PHY power during low power modes (Stop2, Stop3 and Standby).

Return values

- **None.:**

HAL_PWREx_DisableOTGHSPHYLowPowerRetention

Function name

void HAL_PWREx_DisableOTGHSPHYLowPowerRetention (void)

Function description

Disable OTG_HS PHY power during low power modes (Stop2, Stop3 and Standby).

Return values

- **None.:**

HAL_PWREx_EnableVDD11USB

Function name

void HAL_PWREx_EnableVDD11USB (void)

Function description

Enable the VDD11USB.

Return values

- **None.:**

HAL_PWREx_DisableVDD11USB

Function name

void HAL_PWREx_DisableVDD11USB (void)

Function description

Disable the VDD11USB.

Return values

- **None.:**

HAL_PWREx_ConfigPVM

Function name

HAL_StatusTypeDef HAL_PWREx_ConfigPVM (PWR_PVMTypeDef * pConfigPVM)

Function description

Configure the voltage monitor threshold detected by the Peripheral voltage monitoring (PVM).

Parameters

- **pConfigPVM:** : Pointer to a PWR_PVMTypeDef structure that contains the PVM configuration information (PVMType and EventMode).

Return values

- **HAL:** Status.

HAL_PWREx_EnableMonitoring

Function name

void HAL_PWREx_EnableMonitoring (void)

Function description

Enable the VBAT and temperature monitoring.

Return values

- **None.:**

HAL_PWREx_DisableMonitoring

Function name

void HAL_PWREx_DisableMonitoring (void)

Function description

Disable the VBAT and temperature monitoring.

Return values

- **None.:**

HAL_PWREx_EnableUCPDStandbyMode

Function name

void HAL_PWREx_EnableUCPDStandbyMode (void)

Function description

Enable UCPD configuration memorization in Standby mode.

Return values

- **None.:**

HAL_PWREx_DisableUCPDStandbyMode

Function name

void HAL_PWREx_DisableUCPDStandbyMode (void)

Function description

Disable UCPD configuration memorization in Standby mode.

Return values

- **None.:**

Notes

- This function must be called on exiting the Standby mode and before any UCPD configuration update.

HAL_PWREx_EnableUCPDDeadBattery

Function name

void HAL_PWREx_EnableUCPDDeadBattery (void)

Function description

Enable dead battery behavior.

Return values

- **None.:**

Notes

- After exiting reset, the USB Type-C (dead battery) behavior is enabled, which may have a pull-down effect on CC1 and CC2 pins. It is recommended to disable it in all cases, either to stop this pull-down or to handover control to the UCPD (the UCPD must be initialized before doing the disable).

HAL_PWREx_DisableUCPDDeadBattery

Function name

void HAL_PWREx_DisableUCPDDeadBattery (void)

Function description

Disable dead battery behavior.

Return values

- **None.:**

Notes

- After exiting reset, the USB Type-C (dead battery) behavior is enabled, which may have a pull-down effect on CC1 and CC2 pins. It is recommended to disable it in all cases, either to stop this pull-down or to handover control to the UCPD (the UCPD must be initialized before doing the disable).

HAL_PWREx_PVD_PVM_IRQHandler

Function name

void HAL_PWREx_PVD_PVM_IRQHandler (void)

Function description

This function handles the PWR PVD/PVM interrupt request.

Return values

- **None.:**

Notes

- This API should be called under the PVD_PVM_IRQHandler().

HAL_PWREx_UVMCallback

Function name

void HAL_PWREx_UVMCallback (void)

Function description

PWR UVM interrupt callback.

Return values

- **None.:**

HAL_PWREx_IO2VMCallback

Function name

void HAL_PWREx_IO2VMCallback (void)

Function description

PWR IO2VM interrupt callback.

Return values

- **None.:**

HAL_PWREx_AVM1Callback

Function name

void HAL_PWREx_AVM1Callback (void)

Function description

PWR AVM1 interrupt callback.

Return values

- **None.:**

HAL_PWREx_AVM2Callback

Function name

void HAL_PWREx_AVM2Callback (void)

Function description

PWR AVM2 interrupt callback.

Return values

- **None.:**

HAL_PWREx_EnableSRAM2ContentStandbyRetention

Function name

void HAL_PWREx_EnableSRAM2ContentStandbyRetention (uint32_t SRAM2Pages)

Function description

Enable SRAM2 page(s) content retention in Stop 3 and Standby mode.

Parameters

- **SRAM2Pages:** : Specifies the SRAM2 pages. This parameter can be one of the following values :
  – PWR_SRAM2_PAGE1_STANDBY : SRAM2 page 1 retention.
  – PWR_SRAM2_PAGE2_STANDBY : SRAM2 page 2 retention.
  – PWR_SRAM2_FULL_STANDBY : SRAM2 page 1 and page 2 retention.

Return values

- **None.:**

Notes

- When RRSx bit is set, SRAM2 is powered by the low-power regulator in Stop 3 and Standby mode and its content is kept.

HAL_PWREx_DisableSRAM2ContentStandbyRetention

Function name

void HAL_PWREx_DisableSRAM2ContentStandbyRetention (uint32_t SRAM2Pages)

Function description

Disable SRAM2 page(s) content retention in Stop 3 and Standby mode.

Parameters

- **SRAM2Pages:** : Specifies the SRAM2 pages. This parameter can be one of the following values :
  – PWR_SRAM2_PAGE1_STANDBY : SRAM2 page 1 retention.
  – PWR_SRAM2_PAGE2_STANDBY : SRAM2 page 2 retention.
  – PWR_SRAM2_FULL_STANDBY : SRAM2 page 1 and page 2 retention.

Return values

- **None.:**

Notes

- When RRSx bit is reset, SRAM2 is powered off in Stop 3 and Standby mode and its content is lost.

HAL_PWREx_EnableRAMsContentStopRetention

Function name

void HAL_PWREx_EnableRAMsContentStopRetention (uint32_t RAMSelection)

Function description

Enable RAM page(s) content retention in Stop mode (Stop 0, 1, 2, 3).

Parameters

- **RAMSelection:** Specifies RAM page(s) to be retained in Stop mode. This parameter can be one or a combination of the same memory PWR Extended RAM Contents Stop Retention.

Return values

- **None.:**

Notes

- When enabling content retention for a given RAM, memory kept powered in Stop mode. (Not optimized power consumption)

HAL_PWREx_DisableRAMsContentStopRetention

Function name

void HAL_PWREx_DisableRAMsContentStopRetention (uint32_t RAMSelection)

Function description

Disable RAM page(s) content lost in Stop mode (Stop 0, 1, 2, 3).

Parameters

- **RAMSelection:** Specifies RAM page(s) to be lost in Stop mode. This parameter can be one or a combination of the same memory PWR Extended RAM Contents Stop Retention.

Return values

- **None.:**

Notes

- When disabling content lost for a given RAM, memory powered down in Stop mode. (Optimized power consumption)

HAL_PWREx_EnableRAMsContentRunRetention

Function name

void HAL_PWREx_EnableRAMsContentRunRetention (uint32_t RAMSelection)

Function description

Enable RAMs full content retention in Run mode.

Parameters

- **RAMSelection:** : Specifies the SRAM content to be retained in Run mode. This parameter can be one or a combination of the following values :
  – PWR_SRAM1_FULL_RUN : SRAM1 full content retention.
  – PWR_SRAM2_FULL_RUN : SRAM2 full content retention.
  – PWR_SRAM3_FULL_RUN : SRAM3 full content retention (available only for STM32U575xx, STM32U585xx STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices).
  – PWR_SRAM4_FULL_RUN : SRAM4 full content retention.
  – PWR_SRAM5_FULL_RUN : SRAM5 full content retention (available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices).
  – PWR_SRAM6_FULL_RUN : SRAM6 full content retention (available only for STM32U5Fxxx and STM32U5Gxxx devices).

Return values

- **None.:**

HAL_PWREx_DisableRAMsContentRunRetention

Function name

void HAL_PWREx_DisableRAMsContentRunRetention (uint32_t RAMSelection)

Function description

Disable RAMs full content retention in Run mode.

Parameters

- **RAMSelection:** : Specifies the SRAM content to be lost in Run mode. This parameter can be one or a combination of the following values :
  - PWR_SRAM1_FULL_RUN : SRAM1 full content lost.
  - PWR_SRAM2_FULL_RUN : SRAM2 full content lost.
  - PWR_SRAM3_FULL_RUN : SRAM3 full content lost (available only for STM32U575xx, STM32U585xx STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices).
  - PWR_SRAM4_FULL_RUN : SRAM4 full content lost.
  - PWR_SRAM5_FULL_RUN : SRAM5 full content retention (available only for STM32U59xxx, STM32U5Axxx, STM32U5Fxxx and STM32U5Gxxx devices).
  - PWR_SRAM6_FULL_RUN : SRAM6 full content retention (available only for STM32U5Fxxx and STM32U5Gxxx devices).

Return values

- **None.:**

HAL_PWREx_EnableFlashFastWakeUp

Function name

void HAL_PWREx_EnableFlashFastWakeUp (void)

Function description

Enable the flash memory fast wakeup from Stop 0 and Stop 1 modes.

Return values

- **None.:**

Notes

- This feature is used to obtain the best trade-off between low-power consumption and wakeup time when exiting the Stop 0 or Stop 1 modes. When this feature is enabled, the Flash memory remains in normal mode in Stop 0 and Stop 1 modes, which offers a faster startup time with higher consumption.

HAL_PWREx_DisableFlashFastWakeUp

Function name

void HAL_PWREx_DisableFlashFastWakeUp (void)

Function description

Disable the Flash Power Down in Stop mode.

Return values

- **None.:**

Notes

- This feature is used to obtain the best trade-off between low-power consumption and wakeup time when exiting the Stop 0 or Stop 1 modes. When this feature is disabled, the Flash memory enters low-power mode in Stop 0 and Stop 1 modes, which causes a slower startup time with lower consumption.

HAL_PWREx_EnableSRAM4FastWakeUp

Function name

void HAL_PWREx_EnableSRAM4FastWakeUp (void)

Function description

Enable the SRAM4 memory fast wakeup from Stop 0, Stop 1 and Stop 2 modes.

Return values

- **None.:**

Notes

- This bit is used to obtain the best trade-off between low-power consumption and wakeup time. SRAM4 wakeup time increases the wakeup time when exiting Stop 0, Stop 1 and Stop 2 modes, and also increases the LPDMA access time to SRAM4 during Stop modes.

HAL_PWREx_DisableSRAM4FastWakeUp

Function name

void HAL_PWREx_DisableSRAM4FastWakeUp (void)

Function description

Disable the SRAM4 memory fast wakeup from Stop 0, Stop 1 and Stop 2 modes.

Return values

- **None.:**

Notes

- This bit is used to obtain the best trade-off between low-power consumption and wakeup time. SRAM4 wakeup time increases the wakeup time when exiting Stop 0, Stop 1 and Stop 2 modes, and also increases the LPDMA access time to SRAM4 during Stop modes.

HAL_PWREx_EnableBkupRAMRetention

Function name

HAL_StatusTypeDef HAL_PWREx_EnableBkupRAMRetention (void)

Function description

Enable the Backup RAM retention in Standby, Shutdown and VBAT modes.

Return values

- **HAL:** Status.

Notes

- If BREN is reset, the backup RAM can still be used in Run, Sleep and Stop modes. However, its content is lost in Standby, Shutdown and VBAT modes.
- This bit can be enabled only when LDO regulator is selected as source supply.

HAL_PWREx_DisableBkupRAMRetention

Function name

void HAL_PWREx_DisableBkupRAMRetention (void)

Function description

Disable the Backup RAM retention in Standby, Shutdown and VBAT modes.

Return values

- **None.:**

Notes

- If BREN is reset, the backup RAM can still be used in Run, Sleep and Stop modes. However, its content is lost in Standby, Shutdown and VBAT modes. This bit can be writte

HAL_PWREx_EnablePullUpPullDownConfig

Function name

void HAL_PWREx_EnablePullUpPullDownConfig (void)

Function description

Enable pull-up and pull-down configuration.

Return values

- **None.:**

Notes

- When APC bit is set, the I/O pull-up and pull-down configurations defined in PWR_PUCRx and PWR_PDCRx registers are applied in Standby and Shutdown modes.
- Pull-up set by PUy bit of PWR_PUCRx register is not activated if the corresponding PDy bit of PWR_PDCRx register is also set (pull-down configuration priority is higher). HAL_PWREx_EnableGPIOPullUp() and HAL_PWREx_EnableGPIOPullDown() API's ensure there is no conflict when setting PUy or PDy bit.

HAL_PWREx_DisablePullUpPullDownConfig

Function name

void HAL_PWREx_DisablePullUpPullDownConfig (void)

Function description

Disable pull-up and pull-down configuration.

Return values

- **None.:**

Notes

- When APC bit is cleared, the I/O pull-up and pull-down configurations defined in PWR_PUCRx and PWR_PDCRx registers are not applied in Standby and Shutdown modes.

HAL_PWREx_EnableGPIOPullUp

Function name

HAL_StatusTypeDef HAL_PWREx_EnableGPIOPullUp (uint32_t GPIO_Port, uint32_t GPIO_Pin)

Function description

Enable GPIO pull-up state in Standby and Shutdown modes.

Parameters

- **GPIO_Port:** : Specify the IO port. This parameter can be a value of PWR Extended GPIO Port.
- **GPIO_Pin:** : Specify the I/O pins numbers. This parameter can be a value of PWR Extended GPIO Pin Mask.

Return values

- **HAL:** Status.

Notes

- Set the relevant PUy bits of PWR_PUCRx register to configure the I/O in pull-up state in Standby and Shutdown modes.
- This state is effective in Standby and Shutdown modes only if APC bit is set through HAL_PWREx_EnablePullUpPullDownConfig() API.
- The configuration is lost when exiting the Shutdown mode due to the power-on reset, maintained when exiting the Standby mode.
- To avoid any conflict at Standby and Shutdown modes exits, the corresponding PDy bit of PWR_PDCRx register is cleared unless it is reserved.
- Even if a PUy bit to set is reserved, the other PUy bits entered as input parameter at the same time are set.

HAL_PWREx_DisableGPIOPullUp

Function name

HAL_StatusTypeDef HAL_PWREx_DisableGPIOPullUp (uint32_t GPIO_Port, uint32_t GPIO_Pin)

Function description

Disable GPIO pull-up state in Standby mode and Shutdown modes.

Parameters

- **GPIO_Port:** : Specify the IO port. This parameter can be a value of PWR Extended GPIO Port.
- **GPIO_Pin:** : Specify the I/O pins numbers. This parameter can be a value of PWR Extended GPIO Pin Mask.

Return values

- **HAL:** Status.

Notes

- Reset the relevant PUy bits of PWR_PUCRx register used to configure the I/O in pull-up state in Standby and Shutdown modes.
- Even if a PUy bit to reset is reserved, the other PUy bits entered as input parameter at the same time are reset.

HAL_PWREx_EnableGPIOPullDown

Function name

HAL_StatusTypeDef HAL_PWREx_EnableGPIOPullDown (uint32_t GPIO_Port, uint32_t GPIO_Pin)

Function description

Enable GPIO pull-down state in Standby and Shutdown modes.

Parameters

- **GPIO_Port:** : Specify the IO port. This parameter can be a value of PWR Extended GPIO Port.
- **GPIO_Pin:** : Specify the I/O pins numbers. This parameter can be a value of PWR Extended GPIO Pin Mask.

Return values

- **HAL:** Status.

Notes

- Set the relevant PDy bits of PWR_PDCRx register to configure the I/O in pull-down state in Standby and Shutdown modes.
- This state is effective in Standby and Shutdown modes only if APC bit is set through HAL_PWREx_EnablePullUpPullDownConfig() API.
- The configuration is lost when exiting the Shutdown mode due to the power-on reset, maintained when exiting the Standby mode.
- To avoid any conflict at Standby and Shutdown modes exits, the corresponding PUy bit of PWR_PUCRx register is cleared unless it is reserved.
- Even if a PDy bit to set is reserved, the other PDy bits entered as input parameter at the same time are set.

HAL_PWREx_DisableGPIOPullDown

Function name

HAL_StatusTypeDef HAL_PWREx_DisableGPIOPullDown (uint32_t GPIO_Port, uint32_t GPIO_Pin)

Function description

Disable GPIO pull-down state in Standby and Shutdown modes.

Parameters

- **GPIO_Port:** : Specify the IO port. This parameter can be a value of PWR Extended GPIO Port.
- **GPIO_Pin:** : Specify the I/O pins numbers. This parameter can be a value of PWR Extended GPIO Pin Mask.

Return values

- **HAL:** Status.

Notes

- Reset the relevant PDy bits of PWR_PDCRx register used to configure the I/O in pull-down state in Standby and Shutdown modes.
- Even if a PDy bit to reset is reserved, the other PDy bits entered as input parameter at the same time are reset.

62.3 PWREx Firmware driver defines

The following section lists the various define and macros of the module.

62.3.1 PWREx

PWREx

PWR Extended Exported Macros

__HAL_PWR_UVM_EXTI_ENABLE_IT

Description:

- Enable the UVM Extended Interrupt Line.

Return value:

- None.

__HAL_PWR_UVM_EXTI_DISABLE_IT

Description:

- Disable the UVM Extended Interrupt Line.

Return value:

- None.

__HAL_PWR_UVM_EXTI_ENABLE_EVENT

Description:
- Enable the UVM Event Line.

Return value:
- None.

__HAL_PWR_UVM_EXTI_DISABLE_EVENT

Description:
- Disable the UVM Event Line.

Return value:
- None.

__HAL_PWR_UVM_EXTI_ENABLE_RISING_EDGE

Description:
- Enable the UVM Extended Interrupt Rising Trigger.

Return value:
- None.

__HAL_PWR_UVM_EXTI_DISABLE_RISING_EDGE

Description:
- Disable the UVM Extended Interrupt Rising Trigger.

Return value:
- None.

__HAL_PWR_UVM_EXTI_ENABLE_FALLING_EDGE

Description:
- Enable the UVM Extended Interrupt Falling Trigger.

Return value:
- None.

__HAL_PWR_UVM_EXTI_DISABLE_FALLING_EDGE

Description:
- Disable the UVM Extended Interrupt Falling Trigger.

Return value:
- None.

__HAL_PWR_UVM_EXTI_ENABLE_RISING_FALLING_EDGE

Description:
- Enable the UVM Extended Interrupt Rising & Falling Trigger.

Return value:
- None.

__HAL_PWR_UVM_EXTI_DISABLE_RISING_FALLING_EDGE

Description:
- Disable the UVM Extended Interrupt Rising & Falling Trigger.

Return value:
- None.

__HAL_PWR_UVM_EXTI_GENERATE_SWIT

Description:

- Generate a Software Interrupt on UVM EXTI Line.

Return value:

- None

__HAL_PWR_UVM_EXTI_GET_FLAG

Description:

- Check whether the specified UVM EXTI flag is set or not.

Return value:

- EXTI: UVM Line Status.

__HAL_PWR_UVM_EXTI_CLEAR_FLAG

Description:

- Clear the UVM EXTI flag.

Return value:

- None.

__HAL_PWR_IO2VM_EXTI_ENABLE_IT

Description:

- Enable the IO2VM Extended Interrupt Line.

Return value:

- None.

__HAL_PWR_IO2VM_EXTI_DISABLE_IT

Description:

- Disable the IO2VM Extended Interrupt Line.

Return value:

- None.

__HAL_PWR_IO2VM_EXTI_ENABLE_EVENT

Description:

- Enable the IO2VM Event Line.

Return value:

- None.

__HAL_PWR_IO2VM_EXTI_DISABLE_EVENT

Description:

- Disable the IO2VM Event Line.

Return value:

- None.

__HAL_PWR_IO2VM_EXTI_ENABLE_RISING_EDGE

Description:

- Enable the IO2VM Extended Interrupt Rising Trigger.

Return value:

- None.

__HAL_PWR_IO2VM_EXTI_DISABLE_RISING_EDGE

Description:
- Disable the IO2VM Extended Interrupt Rising Trigger.

Return value:
- None.

__HAL_PWR_IO2VM_EXTI_ENABLE_FALLING_EDGE

Description:
- Enable the IO2VM Extended Interrupt Falling Trigger.

Return value:
- None.

__HAL_PWR_IO2VM_EXTI_DISABLE_FALLING_EDGE

Description:
- Disable the IO2VM Extended Interrupt Falling Trigger.

Return value:
- None.

__HAL_PWR_IO2VM_EXTI_ENABLE_RISING_FALLING_EDGE

Description:
- Enable the IO2VM Extended Interrupt Rising & Falling Trigger.

Return value:
- None.

__HAL_PWR_IO2VM_EXTI_DISABLE_RISING_FALLING_EDGE

Description:
- Disable the IO2VM Extended Interrupt Rising & Falling Trigger.

Return value:
- None.

__HAL_PWR_IO2VM_EXTI_GENERATE_SWIT

Description:
- Generate a Software Interrupt on IO2VM EXTI Line.

Return value:
- None

__HAL_PWR_IO2VM_EXTI_GET_FLAG

Description:
- Check whether the specified IO2VM EXTI flag is set or not.

Return value:
- EXTI: IO2VM Line Status.

__HAL_PWR_IO2VM_EXTI_CLEAR_FLAG

Description:
- Clear the IO2VM EXTI flag.

Return value:
- None.

__HAL_PWR_AVM1_EXTI_ENABLE_IT

Description:
- Enable the AVM1 Extended Interrupt Line.

Return value:
- None.

__HAL_PWR_AVM1_EXTI_DISABLE_IT

Description:
- Disable the AVM1 Extended Interrupt Line.

Return value:
- None.

__HAL_PWR_AVM1_EXTI_ENABLE_EVENT

Description:
- Enable the AVM1 Event Line.

Return value:
- None.

__HAL_PWR_AVM1_EXTI_DISABLE_EVENT

Description:
- Disable the AVM1 Event Line.

Return value:
- None.

__HAL_PWR_AVM1_EXTI_ENABLE_RISING_EDGE

Description:
- Enable the AVM1 Extended Interrupt Rising Trigger.

Return value:
- None.

__HAL_PWR_AVM1_EXTI_DISABLE_RISING_EDGE

Description:
- Disable the AVM1 Extended Interrupt Rising Trigger.

Return value:
- None.

__HAL_PWR_AVM1_EXTI_ENABLE_FALLING_EDGE

Description:
- Enable the AVM1 Extended Interrupt Falling Trigger.

Return value:
- None.

__HAL_PWR_AVM1_EXTI_DISABLE_FALLING_EDGE

Description:
- Disable the AVM1 Extended Interrupt Falling Trigger.

Return value:
- None.

__HAL_PWR_AVM1_EXTI_ENABLE_RISING_FALLING_EDGE

Description:

- Enable the AVM1 Extended Interrupt Rising & Falling Trigger.

Return value:

- None.

__HAL_PWR_AVM1_EXTI_DISABLE_RISING_FALLING_EDGE

Description:

- Disable the AVM1 Extended Interrupt Rising & Falling Trigger.

Return value:

- None.

__HAL_PWR_AVM1_EXTI_GENERATE_SWIT

Description:

- Generate a Software Interrupt on AVM1 EXTI Line.

Return value:

- None

__HAL_PWR_AVM1_EXTI_GET_FLAG

Description:

- Check whether the specified AVM1 EXTI flag is set or not.

Return value:

- EXTI: AVM1 Line Status.

__HAL_PWR_AVM1_EXTI_CLEAR_FLAG

Description:

- Clear the AVM1 EXTI flag.

Return value:

- None.

__HAL_PWR_AVM2_EXTI_ENABLE_IT

Description:

- Enable the AVM2 Extended Interrupt Line.

Return value:

- None.

__HAL_PWR_AVM2_EXTI_DISABLE_IT

Description:

- Disable the AVM2 Extended Interrupt Line.

Return value:

- None.

__HAL_PWR_AVM2_EXTI_ENABLE_EVENT

Description:

- Enable the AVM2 Event Line.

Return value:

- None.

__HAL_PWR_AVM2_EXTI_DISABLE_EVENT

Description:
- Disable the AVM2 Event Line.

Return value:
- None.

__HAL_PWR_AVM2_EXTI_ENABLE_RISING_EDGE

Description:
- Enable the AVM2 Extended Interrupt Rising Trigger.

Return value:
- None.

__HAL_PWR_AVM2_EXTI_DISABLE_RISING_EDGE

Description:
- Disable the AVM2 Extended Interrupt Rising Trigger.

Return value:
- None.

__HAL_PWR_AVM2_EXTI_ENABLE_FALLING_EDGE

Description:
- Enable the AVM2 Extended Interrupt Falling Trigger.

Return value:
- None.

__HAL_PWR_AVM2_EXTI_DISABLE_FALLING_EDGE

Description:
- Disable the AVM2 Extended Interrupt Falling Trigger.

Return value:
- None.

__HAL_PWR_AVM2_EXTI_ENABLE_RISING_FALLING_EDGE

Description:
- Enable the AVM2 Extended Interrupt Rising & Falling Trigger.

Return value:
- None.

__HAL_PWR_AVM2_EXTI_DISABLE_RISING_FALLING_EDGE

Description:
- Disable the AVM2 Extended Interrupt Rising & Falling Trigger.

Return value:
- None.

__HAL_PWR_AVM2_EXTI_GENERATE_SWIT

Description:
- Generate a Software Interrupt on AVM2 EXTI Line.

Return value:
- None

__HAL_PWR_AVM2_EXTI_GET_FLAG

Description:

- Check whether the specified AVM2 EXTI flag is set or not.

Return value:

- EXTI: AVM2 Line Status.

__HAL_PWR_AVM2_EXTI_CLEAR_FLAG

Description:

- Clear the AVM2 EXTI flag.

Return value:

- None.

__HAL_PWR_VOLTAGESCALING_CONFIG

Description:

- Configure the main internal regulator output voltage.

Parameters:

- __REGULATOR__: : Specifies the regulator output voltage to achieve a tradeoff between performance and power consumption. This parameter can be one of the following values :
  - PWR_REGULATOR_VOLTAGE_SCALE1 : Regulator voltage output scale 1. Provides a typical output voltage at 1.2 V. Used when system clock frequency is up to 160 MHz.
  - PWR_REGULATOR_VOLTAGE_SCALE2 : Regulator voltage output scale 2. Provides a typical output voltage at 1.1 V. Used when system clock frequency is up to 100 MHz.
  - PWR_REGULATOR_VOLTAGE_SCALE3 : Regulator voltage output scale 3. Provides a typical output voltage at 1.0 V. Used when system clock frequency is up to 50 MHz.
  - PWR_REGULATOR_VOLTAGE_SCALE4 : Regulator voltage output scale 4. Provides a typical output voltage at 0.9 V. Used when system clock frequency is up to 24 MHz.

Return value:

- None.

Notes:

- This macro is similar to HAL_PWREx_ControlVoltageScaling() API but doesn't check whether or not VOSREADY flag is set. User may resort to __HAL_PWR_GET_FLAG() macro to check VOSF bit state.

PWR Extended PVM Interrupt and Event Mode

PWR_PVM_MODE_NORMAL

Basic Mode is used

PWR_PVM_MODE_IT_RISING

External Interrupt Mode with Rising edge trigger detection

PWR_PVM_MODE_IT_FALLING

External Interrupt Mode with Falling edge trigger detection

PWR_PVM_MODE_IT_RISING_FALLING

External Interrupt Mode with Rising/Falling edge trigger detection

PWR_PVM_MODE_EVENT_RISING

Event Mode with Rising edge trigger detection

PWR_PVM_MODE_EVENT_FALLING

Event Mode with Falling edge trigger detection

PWR_PVM_MODE_EVENT_RISING_FALLING

Event Mode with Rising/Falling edge trigger detection

PWR Extended Voltage Monitoring Type

PWR_UVM

Independent USB voltage monitor (VDDUSB versus 1.2 V)

PWR_IO2VM

Independent VDDIO2 voltage monitor (VDDIO2 versus 0.9 V)

PWR_AVM1

Independent VDDA voltage monitor (VDDA versus 1.6 V)

PWR_AVM2

Independent VDDA voltage monitor (VDDA versus 1.8 V)

PWR Extended RAM Contents Stop Retention

PWR_SRAM1_PAGE1_STOP

SRAM1 page 1 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM1_PAGE2_STOP

SRAM1 page 2 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM1_PAGE3_STOP

SRAM1 all pages retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM2_PAGE1_STOP

SRAM2 page 1 (8 KB) retention in Stop modes (Stop 0, 1, 2)

PWR_SRAM2_PAGE2_STOP

SRAM2 page 2 (54 KB) retention in Stop modes (Stop 0, 1, 2)

PWR_SRAM2_FULL_STOP

SRAM2 all pages retention in Stop modes (Stop 0, 1, 2)

PWR_SRAM3_PAGE1_STOP

SRAM3 page 1 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM3_PAGE2_STOP

SRAM3 page 2 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM3_PAGE3_STOP

SRAM3 page 3 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM3_PAGE4_STOP

SRAM3 page 4 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM3_PAGE5_STOP

SRAM3 page 5 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM3_PAGE6_STOP

SRAM3 page 6 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM3_PAGE7_STOP

SRAM3 page 7 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM3_PAGE8_STOP

SRAM3 page 8 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM3_PAGE9_STOP

SRAM3 page 9 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM3_PAGE10_STOP
SRAM3 page 10 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM3_PAGE11_STOP
SRAM3 page 11 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM3_PAGE12_STOP
SRAM3 page 12 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM3_PAGE13_STOP
SRAM3 page 13 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM3_FULL_STOP
SRAM3 all pages retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM4_FULL_STOP
SRAM4 retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM5_PAGE1_STOP
SRAM5 page 1 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM5_PAGE2_STOP
SRAM5 page 2 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM5_PAGE3_STOP
SRAM5 page 3 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM5_PAGE4_STOP
SRAM5 page 4 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM5_PAGE5_STOP
SRAM5 page 5 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM5_PAGE6_STOP
SRAM5 page 6 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM5_PAGE7_STOP
SRAM5 page 7 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM5_PAGE8_STOP
SRAM5 page 8 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM5_PAGE9_STOP
SRAM5 page 9 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM5_PAGE10_STOP
SRAM5 page 10 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM5_PAGE11_STOP
SRAM5 page 11 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM5_PAGE12_STOP
SRAM5 page 12 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM5_PAGE13_STOP
SRAM5 page 13 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM5_FULL_STOP

SRAM5 all pages retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM6_PAGE1_STOP

SRAM6 page 1 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM6_PAGE2_STOP

SRAM6 page 2 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM6_PAGE3_STOP

SRAM6 page 3 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM6_PAGE4_STOP

SRAM6 page 4 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM6_PAGE5_STOP

SRAM6 page 5 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM6_PAGE6_STOP

SRAM6 page 6 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM6_PAGE7_STOP

SRAM6 page 7 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM6_PAGE8_STOP

SRAM6 page 8 (64 KB) retention in Stop modes (Stop 0, 1, 2, 3)

PWR_SRAM6_FULL_STOP

SRAM6 all pages retention in Stop modes (Stop 0, 1, 2, 3)

PWR_ICACHE_FULL_STOP

ICACHE page retention in Stop modes (Stop 0, 1, 2, 3)

PWR_DCACHE1_FULL_STOP

DCACHE1 page retention in Stop modes (Stop 0, 1, 2, 3)

PWR_DCACHE2_FULL_STOP

DCACHE2 page retention in Stop modes (Stop 0, 1, 2, 3)

PWR_DMA2DRAM_FULL_STOP

DMA2D RAM retention in Stop modes (Stop 0, 1, 2, 3)

PWR_PERIPHRAM_FULL_STOP

FMAC, FDCAN and USB RAM retention in Stop modes (Stop 0, 1, 2, 3)

PWR_PKA32RAM_FULL_STOP

PKA32 RAM retention in Stop modes (Stop 0, 1, 2, 3)

PWR_GRAPHICPRAM_FULL_STOP

LTDC, GFXMMU retention in Stop modes (Stop 0, 1, 2, 3)

PWR_DSIRAM_FULL_STOP

DSI RAM retention in Stop modes (Stop 0, 1, 2, 3)

PWR_JPEGRAM_FULL_STOP

JPEG RAM retention in Stop modes (Stop 0, 1, 2, 3)

PWR Extended Regulator Voltage Scale

PWR_REGULATOR_VOLTAGE_SCALE1
Voltage scaling range 1

PWR_REGULATOR_VOLTAGE_SCALE2
Voltage scaling range 2

PWR_REGULATOR_VOLTAGE_SCALE3
Voltage scaling range 3

PWR_REGULATOR_VOLTAGE_SCALE4
Voltage scaling range 4

PWR Extended SRAM2 Contents Standby Retention

PWR_SRAM2_PAGE1_STANDBY
SRAM2 page 1 (8 KB) retention in Stop 3 and Standby modes

PWR_SRAM2_PAGE2_STANDBY
SRAM2 page 2 (54 KB) retention in Stop 3 and Standby modes

PWR_SRAM2_FULL_STANDBY
SRAM2 all pages retention in Stop 3 and Standby modes

PWR Extended SRAM Contents Run Retention

PWR_SRAM1_FULL_RUN
SRAM1 full retention in Run mode

PWR_SRAM2_FULL_RUN
SRAM2 full retention in Run mode

PWR_SRAM3_FULL_RUN
SRAM3 full retention in Run mode

PWR_SRAM4_FULL_RUN
SRAM4 full retention in Run mode

PWR_SRAM5_FULL_RUN
SRAM5 full retention in Run mode

PWR_SRAM6_FULL_RUN
SRAM6 full retention in Run mode

PWREx SRD Domain State

PWR_SRD_DOMAIN_STOP
SRD in Stop mode when system goes to Stop 0/1/2 mode

PWR_SRD_DOMAIN_RUN
SRD in Run mode when system goes to Stop 0/1/2 mode

PWR Extended Supply Configuration

PWR_LDO_SUPPLY
LDO supply

PWR_SMPS_SUPPLY
SMPS supply

PWR Extended Battery Charging Resistor Selection

PWR_BATTERY_CHARGING_RESISTOR_5

VBAT charging through a 5 kOhms resistor

PWR_BATTERY_CHARGING_RESISTOR_1_5

VBAT charging through a 1.5 kOhms resistor

63 HAL RAMCFG Generic Driver

63.1 RAMCFG Firmware driver registers structures

63.1.1 __RAMCFG_HandleTypeDef

__RAMCFG_HandleTypeDef is defined in the stm32u5xx_hal_ramcfg.h

Data Fields

- ***RAMCFG_TypeDef * Instance***
- ***__IO HAL_RAMCFG_StateTypeDef State***

- ***void(* __RAMCFG_HandleTypeDef::DetectDoubleErrorCallback)(struct __RAMCFG_HandleTypeDef *hramcfg)***
  RAMCFG Double Error Detect Callback

63.2 RAMCFG Firmware driver API description

The following section lists the various functions of the RAMCFG library.

63.2.1 RAMCFG Peripheral features

- Each SRAM is managed by a RAMCFG instance.
- Each SRAM can be erased independently through its RAMCFG instance.
- The wait state value for each SRAM can be configured independently through its RAMCFG instance.
- SRAM2 is divided to 64 pages with 1 kB granularity. Each page can be write protected independently through its RAMCFG instance.
- SRAM2, SRAM3 and BKPRAM support ECC correction feature. This mechanism adopts the Single Error Correction Double Error Detection (SECDED) algorithm. This feature provides the following information:
  – Single error address.
  – Double error address.
  ==

63.2.2 How to use this driver

1. Call HAL_RAMCFG_Init() to initialize the RAMCFG peripheral before using any feature. Call HAL_RAMCFG_DeInit() to de-initialize the RAMCFG when using this peripheral is no more needed or a hardware issue has occurred. (+) HAL_RAMCFG_Init() and HAL_RAMCFG_DeInit() APIs do not change the activation status of ECC feature. It is managed by HAL_RAMCFG_StartECC(), HAL_RAMCFG_StopECC() or option bytes (When available on the device).

(#) Call HAL_RAMCFG_Init() to initialize the RAMCFG peripheral before using any feature. Call HAL_RAMCFG_DeInit() to de-initialize the RAMCFG when using this peripheral is no more needed or a hardware issue has occurred.

- HAL_RAMCFG_Init() and HAL_RAMCFG_DeInit() APIs do not change the activation status of ECC feature. It is managed by HAL_RAMCFG_StartECC(), HAL_RAMCFG_StopECC() or option bytes (When available on the device).

ECC feature

- Call HAL_RAMCFG_StartECC() and HAL_RAMCFG_StopECC() to enable and disable ECC hardware mechanism.
  – When ECC feature is previously enabled (case of option byte activation), calling HAL_RAMCFG_StartECC() is recommended to enable the ECC address latching feature.
- Call HAL_RAMCFG_EnableNotification() and HAL_RAMCFG_DisableNotification() to enable and disable ECC interrupts. Interrupts can be:
  – Single error interrupt.
  – Double error interrupt.
  – Double error interrupt redirected to Non maskable interrupt (NMI).
- Call HAL_RAMCFG_GetSingleErrorAddress() to get the address of the last fail RAM word detected (only for single error) and call HAL_RAMCFG_GetDoubleErrorAddress() to get the address of the last fail RAM word detected (only for double error).
- Call HAL_RAMCFG_IsECCErrorDetected() to check if an ECC single/double error was detected. This API is used in silent mode (No ECC interrupt is enabled).

Wait State feature

- Call HAL_RAMCFG_ConfigWaitState() to configure the wait state value for a given SRAM according to the HCLK frequency and voltage range scaling.
- Call HAL_RAMCFG_GetWaitState() to get the current configured wait state value.

Write protection feature

- Call HAL_RAMCFG_EnableWriteProtection() to enable the write protection for the given SRAM2 page(s).
- There is no API to disable write protection as this feature can be disabled only by a global peripheral reset or system reset.
- Any write access to a write protected area of SRAM2 causes a HardFault interrupt.

Erase feature

- Call HAL_RAMCFG_Erase() to launch a hardware erase for the given SRAM.
- The erase value is equal to 0 when launching erase hardware through RAMCFG.
- SRAM2 write protected pages are erased when performing an erase through RAMCFG.

RAMCFG HAL driver macros list

Below the list of used macros in RAMCFG HAL driver.

- __HAL_RAMCFG_ENABLE_IT : Enable the specified RAMCFG interrupts.
- __HAL_RAMCFG_DISABLE_IT : Disable the specified RAMCFG interrupts.
- __HAL_RAMCFG_GET_FLAG : Get the RAMCFG pending flags.
- __HAL_RAMCFG_CLEAR_FLAG : Clear the RAMCFG pending flags.
- __HAL_RAMCFG_GET_IT_SOURCE : Check whether the specified RAMCFG interrupt source is enabled or not.

63.2.3 Initialization and de-initialization Functions

This section provides functions allowing to initialize and de-initialize the RAMCFG instance.

The HAL_RAMCFG_Init() function follows the RAMCFG instance configuration procedures as described in the reference manual. The HAL_RAMCFG_DeInit() function allows to deinitialize the RAMCFG instance. HAL_RAMCFG_Init() and HAL_RAMCFG_DeInit() APIs do not change the activation status of ECC feature. It is managed by HAL_RAMCFG_StartECC(), HAL_RAMCFG_StopECC() or option bytes (When available on the device).

This section contains the following APIs:

- *HAL_RAMCFG_Init()*
- *HAL_RAMCFG_DeInit()*
- *HAL_RAMCFG_MspInit()*
- *HAL_RAMCFG_MspDeInit()*

63.2.4 ECC Operations Functions

This section provides functions allowing to manage ECC feature provided by the RAMCFG peripheral.

The HAL_RAMCFG_StartECC() function allows starting the ECC mechanism and enabling ECC address latching for the selected RAMCFG instance. The HAL_RAMCFG_StopECC() function allows stopping the ECC mechanism and disabling ECC address latching for the selected RAMCFG instance. The HAL_RAMCFG_EnableNotification() function allows enabling interrupts for single ECC error, double ECC error and NMI error. The HAL_RAMCFG_DisableNotification() function allows disabling interrupts for single ECC error, double ECC error. When NMI interrupt is enabled it can only be disabled by a global peripheral reset or by a system reset. The HAL_RAMCFG_IsECCErrorDetected() function allows to check if an ECC error has occurred. The HAL_RAMCFG_GetSingleErrorAddress() function allows to get the address of the last single ECC error detected. The HAL_RAMCFG_GetDoubleErrorAddress() function allows to get the address of the last double ECC error detected.

This section contains the following APIs:

- *HAL_RAMCFG_StartECC()*
- *HAL_RAMCFG_StopECC()*
- *HAL_RAMCFG_EnableNotification()*
- *HAL_RAMCFG_DisableNotification()*
- *HAL_RAMCFG_IsECCSingleErrorDetected()*
- *HAL_RAMCFG_IsECCDoubleErrorDetected()*
- *HAL_RAMCFG_GetSingleErrorAddress()*
- *HAL_RAMCFG_GetDoubleErrorAddress()*

63.2.5 Wait State Functions

This section provides functions allowing to get and configure the wait state value.

The HAL_RAMCFG_ConfigWaitState() function allows configuring the wait state value. The HAL_RAMCFG_GetWaitState() function allows getting the current wait state value.

This section contains the following APIs:

- *HAL_RAMCFG_ConfigWaitState()*
- *HAL_RAMCFG_GetWaitState()*

63.2.6 Write Protection Functions

This section provides functions to enable write protection feature for the page(s) of SRAM2.

The HAL_RAMCFG_EnableWriteProtection() function allows the user to enable the write protection for the page(s) of SRAM2. Disabling SRAM2 page(s) protection is performed only by a global peripheral reset or a by a system reset.

This section contains the following APIs:

- *HAL_RAMCFG_EnableWriteProtection()*

63.2.7 Erase Operation Functions

This section provides functions allowing a hardware erase for the given SRAM.

The HAL_RAMCFG_Erase() function allows a hardware mass erase for the given SRAM. The erase value for all SRAMs is 0.

This section contains the following APIs:

- *HAL_RAMCFG_Erase()*

63.2.8 Handle Interrupt and Callbacks Functions

This section provides functions to handle RAMCFG interrupts and Register / UnRegister the different callbacks.

The HAL_RAMCFG_IRQHandler() function allows the user to handle the active RAMCFG interrupt request. The HAL_RAMCFG_RegisterCallback() function allows the user to register the selected RAMCFG callbacks. The HAL_RAMCFG_UnRegisterCallback() function allows the user to unregister the selected RAMCFG callbacks.

This section contains the following APIs:

- *HAL_RAMCFG_IRQHandler()*
- *HAL_RAMCFG_DetectSingleErrorCallback()*
- *HAL_RAMCFG_DetectDoubleErrorCallback()*
- *HAL_RAMCFG_RegisterCallback()*
- *HAL_RAMCFG_UnRegisterCallback()*

63.2.9 State and Error Functions

This section provides functions to check and get the RAMCFG state and the error code.

The HAL_RAMCFG_GetState() function allows the user to get the RAMCFG peripheral state. The HAL_RAMCFG_GetError() function allows the user to get the RAMCFG peripheral error code.

This section contains the following APIs:

- *HAL_RAMCFG_GetState()*
- *HAL_RAMCFG_GetError()*

63.2.10 Detailed description of functions

HAL_RAMCFG_Init

Function name

HAL_StatusTypeDef HAL_RAMCFG_Init (RAMCFG_HandleTypeDef * hramcfg)

Function description

Initialize the RAMCFG by clearing flags and disabling interrupts.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **HAL:** status.

HAL_RAMCFG_DeInit

Function name

HAL_StatusTypeDef HAL_RAMCFG_DeInit (RAMCFG_HandleTypeDef * hramcfg)

Function description

DeInitialize the RAMCFG peripheral.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **HAL:** status.

HAL_RAMCFG_MspInit

Function name

void HAL_RAMCFG_MspInit (RAMCFG_HandleTypeDef * hramcfg)

Function description

Initialize the RAMCFG MSP.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG.

Return values

- **None.:**

HAL_RAMCFG_MspDeInit

Function name

void HAL_RAMCFG_MspDeInit (RAMCFG_HandleTypeDef * hramcfg)

Function description

DeInitialize the RAMCFG MSP.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG.

Return values

- **None.:**

HAL_RAMCFG_StartECC

Function name

HAL_StatusTypeDef HAL_RAMCFG_StartECC (RAMCFG_HandleTypeDef * hramcfg)

Function description

Start ECC mechanism for the given SRAM.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **HAL:** status.

HAL_RAMCFG_StopECC

Function name

HAL_StatusTypeDef HAL_RAMCFG_StopECC (RAMCFG_HandleTypeDef * hramcfg)

Function description

Stop ECC mechanism for the given SRAM.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **HAL:** status.

HAL_RAMCFG_EnableNotification

Function name

HAL_StatusTypeDef HAL_RAMCFG_EnableNotification (RAMCFG_HandleTypeDef * hramcfg, uint32_t Notifications)

Function description

Enable the RAMCFG error interrupts.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.
- **Notifications:** : Select the notification to be enabled. This parameter can be any value of RAMCFG Interrupts group.

Return values

- **HAL:** status.

HAL_RAMCFG_DisableNotification

Function name

HAL_StatusTypeDef HAL_RAMCFG_DisableNotification (RAMCFG_HandleTypeDef * hramcfg, uint32_t Notifications)

Function description

Disable the RAMCFG error interrupts.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.
- **Notifications:** : Select the notification to be disabled. This parameter can be : RAMCFG_IT_SINGLEERR : Single Error Interrupt. RAMCFG_IT_DOUBLEERR : Double Error Interrupt.

Return values

- **HAL:** status.

HAL_RAMCFG_IsECCSingleErrorDetected

Function name

uint32_t HAL_RAMCFG_IsECCSingleErrorDetected (const RAMCFG_HandleTypeDef * hramcfg)

Function description

Check if an ECC single error has occurred.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **State:** of bit (1 or 0).

HAL_RAMCFG_IsECCDoubleErrorDetected

Function name

uint32_t HAL_RAMCFG_IsECCDoubleErrorDetected (const RAMCFG_HandleTypeDef * hramcfg)

Function description

Check if an ECC double error was occurred.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **State:** of bit (1 or 0).

HAL_RAMCFG_GetSingleErrorAddress

Function name

uint32_t HAL_RAMCFG_GetSingleErrorAddress (const RAMCFG_HandleTypeDef * hramcfg)

Function description

Get the RAMCFG single error address.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **Single:** error address offset.

HAL_RAMCFG_GetDoubleErrorAddress

Function name

uint32_t HAL_RAMCFG_GetDoubleErrorAddress (const RAMCFG_HandleTypeDef * hramcfg)

Function description

Get the RAMCFG double error address.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **Double:** error address offset.

HAL_RAMCFG_ConfigWaitState

Function name

HAL_StatusTypeDef HAL_RAMCFG_ConfigWaitState (RAMCFG_HandleTypeDef * hramcfg, uint32_t WaitState)

Function description

Configure the wait state value for the given SRAM.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.
- **WaitState:** : Select the value of wait state to be configured.

Return values

- **HAL:** status.

HAL_RAMCFG_GetWaitState

Function name

uint32_t HAL_RAMCFG_GetWaitState (const RAMCFG_HandleTypeDef * hramcfg)

Function description

Get the current wait state value for the given SRAM.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **Wait:** state value.

HAL_RAMCFG_EnableWriteProtection

Function name

HAL_StatusTypeDef HAL_RAMCFG_EnableWriteProtection (RAMCFG_HandleTypeDef * hramcfg, uint32_t StartPage, uint32_t NbPage)

Function description

Enable write protection for the given page(s).

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.
- **StartPage:** : Select the start page number.
- **NbPage:** : Number of page to be protected.

Return values

- **HAL:** status.

HAL_RAMCFG_Erase

Function name

HAL_StatusTypeDef HAL_RAMCFG_Erase (RAMCFG_HandleTypeDef * hramcfg)

Function description

Launch a Mass Erase for the given SRAM.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **HAL:** status.

HAL_RAMCFG_IRQHandler

Function name

void HAL_RAMCFG_IRQHandler (RAMCFG_HandleTypeDef * hramcfg)

Function description

Handles RAMCFG interrupt request.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **None.:**

HAL_RAMCFG_DetectSingleErrorCallback

Function name

void HAL_RAMCFG_DetectSingleErrorCallback (RAMCFG_HandleTypeDef * hramcfg)

Function description

RAMCFG single error detection callback.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG.

Return values

- **None.:**

HAL_RAMCFG_DetectDoubleErrorCallback

Function name

void HAL_RAMCFG_DetectDoubleErrorCallback (RAMCFG_HandleTypeDef * hramcfg)

Function description

RAMCFG double error detection callback.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG.

Return values

- **None.:**

HAL_RAMCFG_RegisterCallback

Function name

HAL_StatusTypeDef HAL_RAMCFG_RegisterCallback (RAMCFG_HandleTypeDef * hramcfg, HAL_RAMCFG_CallbackIDTypeDef CallbackID, void(*)(RAMCFG_HandleTypeDef *_hramcfg) pCallback)

Function description

Register RAMCFG callbacks.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.
- **CallbackID:** : User Callback identifier a HAL_RAMCFG_CallbackIDTypeDef ENUM as parameter.
- **pCallback:** : Pointer to private callback function.

Return values

- **HAL:** status.

HAL_RAMCFG_UnRegisterCallback

Function name

HAL_StatusTypeDef HAL_RAMCFG_UnRegisterCallback (RAMCFG_HandleTypeDef * hramcfg, HAL_RAMCFG_CallbackIDTypeDef CallbackID)

Function description

UnRegister RAMCFG callbacks.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.
- **CallbackID:** : User Callback identifier a HAL_RAMCFG_CallbackIDTypeDef ENUM as parameter.

Return values

- **HAL:** status.

HAL_RAMCFG_GetError

Function name

uint32_t HAL_RAMCFG_GetError (const RAMCFG_HandleTypeDef * hramcfg)

Function description

Get the RAMCFG peripheral error code.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **RAMCFG:** error code.

HAL_RAMCFG_GetState

Function name

HAL_RAMCFG_StateTypeDef HAL_RAMCFG_GetState (const RAMCFG_HandleTypeDef * hramcfg)

Function description

Get the RAMCFG peripheral state.

Parameters

- **hramcfg:** : Pointer to a RAMCFG_HandleTypeDef structure that contains the configuration information for the specified RAMCFG instance.

Return values

- **RAMCFG:** state.

63.3 RAMCFG Firmware driver defines

The following section lists the various define and macros of the module.

63.3.1 RAMCFG

RAMCFG

RAMCFG Error Codes

HAL_RAMCFG_ERROR_NONE

RAMCFG No Error

HAL_RAMCFG_ERROR_TIMEOUT

RAMCFG Timeout Error

HAL_RAMCFG_ERROR_BUSY

RAMCFG Busy Error

HAL_RAMCFG_ERROR_INVALID_CALLBACK

Invalid Callback error

RAMCFG Exported Macros

__HAL_RAMCFG_ENABLE_IT

Description:

- Enable the specified RAMCFG interrupts.

Parameters:

- __HANDLE__: : Specifies RAMCFG handle.
- __INTERRUPT__: Specifies the RAMCFG interrupt sources to be enabled. This parameter can be one of the following values:
  - RAMCFG_IT_SINGLEERR : Single Error Interrupt Mask.
  - RAMCFG_IT_DOUBLEERR : Double Error Interrupt Mask.
  - RAMCFG_IT_NMIERR : Double Error Interrupt redirection to NMI Mask.
  - RAMCFG_IT_ALL : All Interrupt Mask.

Return value:

- None

__HAL_RAMCFG_DISABLE_IT

Description:

- Disable the specified RAMCFG interrupts.

Parameters:

- __HANDLE__: : Specifies RAMCFG handle.
- __INTERRUPT__: Specifies the RAMCFG interrupt sources to be disabled. This parameter can be one of the following values:
  - RAMCFG_IT_SINGLEERR : Single Error Interrupt Mask.
  - RAMCFG_IT_DOUBLEERR : Double Error Interrupt Mask.

Return value:

- None

Notes:

- This macros is used only to disable RAMCFG_IT_SINGLEERR and RAMCFG_IT_DOUBLEERR interrupts. RAMCFG_IT_NMIERR interrupt can only be disabled by global peripheral reset or system reset.

__HAL_RAMCFG_GET_IT_SOURCE

Description:

- Check whether the specified RAMCFG interrupt source is enabled or not.

Parameters:

- __HANDLE__: : Specifies the RAMCFG Handle.
- __INTERRUPT__: : Specifies the RAMCFG interrupt source to check. This parameter can be one of the following values:
  - RAMCFG_IT_SINGLEERR : Single Error Interrupt Mask.
  - RAMCFG_IT_DOUBLEERR : Double Error Interrupt Mask.
  - RAMCFG_IT_NMIERR : Double Error Interrupt Redirection to NMI Mask.

Return value:

- The: new state of __INTERRUPT__ (SET or RESET).

__HAL_RAMCFG_GET_FLAG

Description:

- Get the RAMCFG pending flags.

Parameters:

- __HANDLE__: : Specifies RAMCFG handle.
- __FLAG__: : Specifies the flag to be checked. This parameter can be one of the following values:
  - RAMCFG_FLAG_SINGLEERR : Single Error Detected and Corrected Flag.
  - RAMCFG_FLAG_DOUBLEERR : Double Error Detected Flag.
  - RAMCFG_FLAG_SRAMBUSY : SRAM Busy Flag.

Return value:

- The: state of FLAG (SET or RESET).

__HAL_RAMCFG_CLEAR_FLAG

Description:

- Clear the RAMCFG pending flags.

Parameters:

- __HANDLE__: : Specifies RAMCFG handle.
- __FLAG__: : Specifies the flag to be cleared. This parameter can be any combination of the following values:
  - RAMCFG_FLAG_SINGLEERR : Single Error Detected and Corrected Flag.
  - RAMCFG_FLAG_DOUBLEERR : Double Error Detected Flag.

Return value:

- None.

__HAL_RAMCFG_RESET_HANDLE_STATE

Description:

- Reset the RAMCFG handle state.

Parameters:

- __HANDLE__: : Specifies the RAMCFG Handle.

Return value:

- None.

RAMCFG Monitor Flags

RAMCFG_FLAG_SINGLEERR

RAMCFG Single Error Detected and Corrected Flag

RAMCFG_FLAG_DOUBLEERR

RAMCFG Double Error Detected Flag

RAMCFG_FLAG_SRAMBUSY

RAMCFG SRAM busy Flag

RAMCFG_FLAGS_ALL

RAMCFG All Flags

RAMCFG Interrupts

RAMCFG_IT_SINGLEERR

RAMCFG Single Error Interrupt

RAMCFG_IT_DOUBLEERR

RAMCFG Double Error Interrupt

RAMCFG_IT_NMIERR

RAMCFG Double Error redirected to NMI Interrupt

RAMCFG_IT_ALL

RAMCFG All RAMCFG interrupt

RAMCFG Keys

RAMCFG_ERASE_KEY1

RAMCFG launch Erase Key 1

RAMCFG_ERASE_KEY2

RAMCFG launch Erase Key 2

RAMCFG_ECC_KEY1

RAMCFG launch ECC Key 1

RAMCFG_ECC_KEY2

RAMCFG launch ECC Key 2

RAMCFG Wait State

RAMCFG_WAITSTATE_0

RAMCFG 0 Wait State

RAMCFG_WAITSTATE_1

RAMCFG 1 Wait State

RAMCFG_WAITSTATE_2

RAMCFG 2 Wait State

RAMCFG_WAITSTATE_3

RAMCFG 3 Wait State

RAMCFG_WAITSTATE_4

RAMCFG 4 Wait State

RAMCFG_WAITSTATE_5

RAMCFG 5 Wait State

RAMCFG_WAITSTATE_6

RAMCFG 6 Wait State

RAMCFG_WAITSTATE_7

RAMCFG 7 Wait State

64 HAL RCC Generic Driver

64.1 RCC Firmware driver registers structures

64.1.1 RCC_PLLInitTypeDef

RCC_PLLInitTypeDef is defined in the stm32u5xx_hal_rcc.h

Data Fields

- ***uint32_t PLLState***
- ***uint32_t PLLSource***
- ***uint32_t PLLM***
- ***uint32_t PLLMBOOST***
- ***uint32_t PLLN***
- ***uint32_t PLLP***
- ***uint32_t PLLQ***
- ***uint32_t PLLR***
- ***uint32_t PLLRGE***
- ***uint32_t PLLFRACN***

Field Documentation

- ***uint32_t RCC_PLLInitTypeDef::PLLState***
  The new state of the PLL. This parameter can be a value of ***RCC_PLL_Config***
- ***uint32_t RCC_PLLInitTypeDef::PLLSource***
  RCC_PLLSource: PLL entry clock source. This parameter must be a value of ***RCC_PLL_Clock_Source***
- ***uint32_t RCC_PLLInitTypeDef::PLLM***
  PLLM: Division factor for PLL VCO input clock. This parameter must be a number between Min_Data = 1 and Max_Data = 16
- ***uint32_t RCC_PLLInitTypeDef::PLLMBOOST***
  PLLMBOOST: Prescaler for EPOD booster input clock. This parameter must be a value of ***RCC_PLLMBOOST_EPOD_Clock_Divider***
- ***uint32_t RCC_PLLInitTypeDef::PLLN***
  PLLN: Multiplication factor for PLL VCO output clock. This parameter must be a number between Min_Data = 4 and Max_Data = 512
- ***uint32_t RCC_PLLInitTypeDef::PLLP***
  PLLP: Division factor for peripheral clocks. This parameter must be a number between Min_Data = 1 and Max_Data = 128
- ***uint32_t RCC_PLLInitTypeDef::PLLQ***
  PLLQ: Division factor for peripheral clocks. This parameter must be a number between Min_Data = 1 and Max_Data = 128
- ***uint32_t RCC_PLLInitTypeDef::PLLR***
  PLLR: Division factor for system clock. This parameter must be a number between Min_Data = 2 and Max_Data = 128 Only division by 1 and even division factors are allowed
- ***uint32_t RCC_PLLInitTypeDef::PLLRGE***
  PLLRGE: PLL1 clock Input range This parameter must be a value of ***RCC_PLL_VCI_Range***
- ***uint32_t RCC_PLLInitTypeDef::PLLFRACN***
  PLLFRACN: Specifies Fractional Part Of The Multiplication Factor for PLL1 VCO It should be a value between 0 and 8191

64.1.2 RCC_OscInitTypeDef

RCC_OscInitTypeDef is defined in the stm32u5xx_hal_rcc.h

Data Fields

- ***uint32_t OscillatorType***
- ***uint32_t HSEState***
- ***uint32_t LSEState***

- ***uint32_t HSIState***
- ***uint32_t HSICalibrationValue***
- ***uint32_t LSIState***
- ***uint32_t LSIDiv***
- ***uint32_t MSIState***
- ***uint32_t MSICalibrationValue***
- ***uint32_t MSIClockRange***
- ***uint32_t MSIKClockRange***
- ***uint32_t HSI48State***
- ***uint32_t SHSIState***
- ***uint32_t MSIKState***
- ***RCC_PLLInitTypeDef PLL***

Field Documentation

- ***uint32_t RCC_OscInitTypeDef::OscillatorType***
  The oscillators to be configured. This parameter can be a value of ***RCC_Oscillator_Type***
- ***uint32_t RCC_OscInitTypeDef::HSEState***
  The new state of the HSE. This parameter can be a value of ***RCC_HSE_Config***
- ***uint32_t RCC_OscInitTypeDef::LSEState***
  The new state of the LSE. This parameter can be a value of ***RCC_LSE_Config***
- ***uint32_t RCC_OscInitTypeDef::HSIState***
  The new state of the HSI. This parameter can be a value of ***RCC_HSI_Config***
- ***uint32_t RCC_OscInitTypeDef::HSICalibrationValue***
  The calibration trimming value (default is RCC_HSICALIBRATION_DEFAULT). This parameter must be a number between Min_Data = 0x00 and Max_Data = 0x7F on the other devices
- ***uint32_t RCC_OscInitTypeDef::LSIState***
  The new state of the LSI. This parameter can be a value of ***RCC_LSI_Config***
- ***uint32_t RCC_OscInitTypeDef::LSIDiv***
  The division factor of the LSI. This parameter can be a value of ***RCC_LSI_Div***
- ***uint32_t RCC_OscInitTypeDef::MSIState***
  The new state of the MSI. This parameter can be a value of ***RCC_MSI_Config***
- ***uint32_t RCC_OscInitTypeDef::MSICalibrationValue***
  The calibration trimming value (default is RCC_MSICALIBRATION_DEFAULT). This parameter must be a number between Min_Data = 0x00 and Max_Data = 0xFF
- ***uint32_t RCC_OscInitTypeDef::MSIClockRange***
  The MSI frequency range. This parameter can be a value of ***RCC_MSI_Clock_Range***
- ***uint32_t RCC_OscInitTypeDef::MSIKClockRange***
  The MSIK frequency range. This parameter can be a value of ***RCC_MSIK_Clock_Range***
- ***uint32_t RCC_OscInitTypeDef::HSI48State***
  The new state of the HSI48. This parameter can be a value of ***RCC_HSI48_Config***
- ***uint32_t RCC_OscInitTypeDef::SHSIState***
  The new state of the SHSI. This parameter can be a value of ***RCC_SHSI_Config***
- ***uint32_t RCC_OscInitTypeDef::MSIKState***
  The new state of the MSIK. This parameter can be a value of ***RCC_MSIK_Config***
- ***RCC_PLLInitTypeDef RCC_OscInitTypeDef::PLL***
  Main PLL structure parameters

64.1.3 RCC_ClkInitTypeDef

RCC_ClkInitTypeDef is defined in the stm32u5xx_hal_rcc.h

Data Fields

- ***uint32_t ClockType***
- ***uint32_t SYSCLKSource***
- ***uint32_t AHBCLKDivider***
- ***uint32_t APB1CLKDivider***

- ***uint32_t APB2CLKDivider***
- ***uint32_t APB3CLKDivider***

Field Documentation

- ***uint32_t RCC_ClkInitTypeDef::ClockType***
  The clock to be configured. This parameter can be a value of ***RCC_System_Clock_Type***
- ***uint32_t RCC_ClkInitTypeDef::SYSCLKSource***
  The clock source used as system clock (SYSCLK). This parameter can be a value of ***RCC_System_Clock_Source***
- ***uint32_t RCC_ClkInitTypeDef::AHBCLKDivider***
  The AHB clock (HCLK) divider. This clock is derived from the system clock (SYSCLK). This parameter can be a value of ***RCC_AHB_Clock_Source***
- ***uint32_t RCC_ClkInitTypeDef::APB1CLKDivider***
  The APB1 clock (PCLK1) divider. This clock is derived from the AHB clock (HCLK). This parameter can be a value of ***RCC_APB1_APB2_APB3_Clock_Source***
- ***uint32_t RCC_ClkInitTypeDef::APB2CLKDivider***
  The APB2 clock (PCLK2) divider. This clock is derived from the AHB clock (HCLK). This parameter can be a value of ***RCC_APB1_APB2_APB3_Clock_Source***
- ***uint32_t RCC_ClkInitTypeDef::APB3CLKDivider***
  The APB3 clock (PCLK3) divider. This clock is derived from the AHB clock (HCLK). This parameter can be a value of ***RCC_APB1_APB2_APB3_Clock_Source***

64.2 RCC Firmware driver API description

The following section lists the various functions of the RCC library.

64.2.1 RCC specific features

After reset the device is running from Multiple Speed Internal oscillator (4 MHz) with Flash 0 wait state. Flash prefetch buffer, D-Cache and I-Cache are disabled, and all peripherals are off except internal SRAM, Flash and JTAG.

- There is no prescaler on High speed (AHBs) and Low speed (APBs) busses: all peripherals mapped on these busses are running at MSI speed.
- The clock for all peripherals is switched off, except the SRAM and FLASH.
- All GPIOs are in analog mode, except the JTAG pins which are assigned to be used for debug purpose.

Once the device started from reset, the user application has to:

- Configure the clock source to be used to drive the System clock (if the application needs higher frequency/ performance)
- Configure the System clock frequency and Flash settings
- Configure the AHB and APB busses prescalers
- Enable the clock for the peripheral(s) to be used
- Configure the clock source(s) for peripherals which clocks are not derived from the System clock (SAIx, SYSTICK, RTC, ADC, USB OTG FS/USB FS/SDMMC1/RNG)

64.2.2 Initialization and de-initialization functions

This section provides functions allowing to configure the internal and external oscillators (HSE, HSI, LSE, MSI, LSI, PLL, CSS and MCO) and the System busses clocks (SYSCLK, AHB, APB1 and APB2).

Internal/external clock and PLL configuration

- HSI (high-speed internal): 16 MHz factory-trimmed RC used directly or through the PLL as System clock source.
- MSI (Multiple Speed Internal): Its frequency is software trimmable from 100KHZ to 48MHZ. It can be used to generate the clock for the USB FS or USB OTG FS (48 MHz). The number of flash wait states is automatically adjusted when MSI range is updated with HAL_RCC_OscConfig() and the MSI is used as System clock source.
- LSI (low-speed internal): 32 KHz low consumption RC used as IWDG and/or RTC clock source.
- HSE (high-speed external): 4 to 48 MHz crystal oscillator used directly or through the PLL as System clock source. Can be used also optionally as RTC clock source.

- LSE (low-speed external): 32.768 KHz oscillator used optionally as RTC clock source.
- PLL (clocked by HSI, HSE or MSI) providing up to three independent output clocks:
  – The first output is used to generate the high speed system clock (up to 80MHz).
  – The second output is used to generate the clock for the USB FS or USB OTG FS (48 MHz), the random analog generator (<=48 MHz) and the SDMMC1 (<= 48 MHz).
  – The third output is used to generate an accurate clock to achieve high-quality audio performance on SAI interface.
- PLL2 (clocked by HSI, HSE or MSI) providing up to three independent output clocks:
  – The first output is used to generate SAR ADC1 clock.
  – The second output is used to generate the clock for the USB Fs or USB OTG FS (48 MHz), the random analog generator (<=48 MHz) and the SDMMC1 (<= 48 MHz).
  – The Third output is used to generate an accurate clock to achieve high-quality audio performance on SAI interface.
- PLL3 (clocked by HSI , HSE or MSI) providing up to two independent output clocks:
  – The first output is used to generate SAR ADC4 clock.
  – The second output is used to generate an accurate clock to achieve high-quality audio performance on SAI interface.
- CSS (Clock security system): once enabled, if a HSE clock failure occurs (HSE used directly or through PLL as System clock source), the System clock is automatically switched to HSI and an interrupt is generated if enabled. The interrupt is linked to the Cortex-M4 NMI (Non-Maskable Interrupt) exception vector.
- MCO (microcontroller clock output): used to output MSI, LSI, HSI, LSE, HSE or main PLL clock (through a configurable prescaler) on PA8 pin.

System, AHB and APB busses clocks configuration

- Several clock sources can be used to drive the System clock (SYSCLK): MSI, HSI, HSE and main PLL. The AHB clock (HCLK) is derived from System clock through configurable prescaler and used to clock the CPU, memory and peripherals mapped on AHB bus (DMA, GPIO...). APB1 (PCLK1) and APB2 (PCLK2) clocks are derived from AHB clock through configurable prescalers and used to clock the peripherals mapped on these busses. You can use "HAL_RCC_GetSysClockFreq()" function to retrieve the frequencies of these clocks.

Note: All the peripheral clocks are derived from the System clock (SYSCLK) except:

- *SAI: the SAI clock can be derived either from a specific PLL (PLL2) or (PLL3) or from an external clock mapped on the SAI_CKIN pin. You have to use HAL_RCCEx_PeriphCLKConfig() function to configure this clock.*
- *RTC: the RTC clock can be derived either from the LSI, LSE or HSE clock divided by 2 to 31. You have to use __HAL_RCC_RTC_ENABLE() and HAL_RCCEx_PeriphCLKConfig() function to configure this clock.*
- *USB FS, USB OTG FS, SDMMC1 and RNG: USB OTG FS or USB FS requires a frequency equal to 48 MHz to work correctly, while the SDMMC1 and RNG peripherals require a frequency equal or lower than to 48 MHz. This clock is derived of the main PLL or PLL2 through PLLQ divider. You have to enable the peripheral clock and use HAL_RCCEx_PeriphCLKConfig() function to configure this clock.*
- *IWDG clock which is always the LSI clock.*

- The maximum frequency of the SYSCLK, HCLK, PCLK1 and PCLK2 is 80 MHz. The clock source frequency should be adapted depending on the device voltage range as listed in the Reference Manual "Clock source frequency versus voltage scaling" chapter.

This section contains the following APIs:

- ***HAL_RCC_DeInit()***
- ***HAL_RCC_OscConfig()***
- ***HAL_RCC_ClockConfig()***

64.2.3 Peripheral Control functions

This subsection provides a set of functions allowing to:

- Output clock to MCO pin.

- Retrieve current clock frequencies.
- Enable the Clock Security System.

This section contains the following APIs:
- *HAL_RCC_MCOConfig()*
- *HAL_RCC_GetSysClockFreq()*
- *HAL_RCC_GetHCLKFreq()*
- *HAL_RCC_GetPCLK1Freq()*
- *HAL_RCC_GetPCLK2Freq()*
- *HAL_RCC_GetPCLK3Freq()*
- *HAL_RCC_GetOscConfig()*
- *HAL_RCC_GetClockConfig()*
- *HAL_RCC_GetResetSource()*
- *HAL_RCC_EnableCSS()*
- *HAL_RCC_NMI_IRQHandler()*
- *HAL_RCC_CSSCallback()*

64.2.4 RCC attributes functions

This section contains the following APIs:
- *HAL_RCC_ConfigAttributes()*

64.2.5 Detailed description of functions

HAL_RCC_DeInit

Function name

HAL_StatusTypeDef HAL_RCC_DeInit (void)

Function description

Reset the RCC clock configuration to the default reset state.

Return values

- **HAL:** status

Notes

- The default reset state of the clock configuration is given below: MSI ON and used as system clock sourceHSE, HSI, PLL, PLL2 and PLLISAI2 OFFAHB, APB1 and APB2 prescaler set to 1CSS, MCO1 OFFAll interrupts disabledAll interrupt and reset flags cleared
- This function doesn't modify the configuration of the Peripheral clocksLSI, LSE and RTC clocks

HAL_RCC_OscConfig

Function name

HAL_StatusTypeDef HAL_RCC_OscConfig (const RCC_OscInitTypeDef * pRCC_OscInitStruct)

Function description

Initialize the RCC Oscillators according to the specified parameters in the RCC_OscInitTypeDef.

Parameters

- **pRCC_OscInitStruct:** pointer to an RCC_OscInitTypeDef structure that contains the configuration information for the RCC Oscillators.

Return values

- **HAL:** status

Notes

- The PLL is not disabled when used as system clock.
- Transitions LSE Bypass to LSE On and LSE On to LSE Bypass are not supported by this function. User should request a transition to LSE Off first and then LSE On or LSE Bypass.
- Transition HSE Bypass to HSE On and HSE On to HSE Bypass are not supported by this function. User should request a transition to HSE Off first and then HSE On or HSE Bypass.

HAL_RCC_ClockConfig

Function name

HAL_StatusTypeDef HAL_RCC_ClockConfig (const RCC_ClkInitTypeDef *const pRCC_ClkInitStruct, uint32_t FLatency)

Function description

Initialize the CPU, AHB and APB busses clocks according to the specified parameters in the pRCC_ClkInitStruct.

Parameters

- **pRCC_ClkInitStruct:** pointer to an RCC_OscInitTypeDef structure that contains the configuration information for the RCC peripheral.
- **FLatency:** FLASH Latency This parameter can be one of the following values:
  - FLASH_LATENCY_0 FLASH 0 Latency cycle
  - FLASH_LATENCY_1 FLASH 1 Latency cycle
  - FLASH_LATENCY_2 FLASH 2 Latency cycles
  - FLASH_LATENCY_3 FLASH 3 Latency cycles
  - FLASH_LATENCY_4 FLASH 4 Latency cycles
  - FLASH_LATENCY_5 FLASH 5 Latency cycles

Return values

- **HAL:** status

Notes

- The SystemCoreClock CMSIS variable is used to store System Clock Frequency and updated by HAL_RCC_GetHCLKFreq() function called within this function
- The MSI is used by default as system clock source after startup from Reset, wake-up from STANDBY mode. After restart from Reset, the MSI frequency is set to its default value 4 MHz.
- The HSI can be selected as system clock source after wakeup from STOP modes or in case of failure of the HSE used directly or indirectly as system clock (if the Clock Security System CSS is enabled).
- A switch from one clock source to another occurs only if the target clock source is ready (clock stable after startup delay or PLL locked). If a clock source which is not yet ready is selected, the switch will occur when the clock source is ready.
- You can use HAL_RCC_GetClockConfig() function to know which clock is currently used as system clock source.
- Depending on the device voltage range, the software has to set correctly HPRE[3:0] bits to ensure that HCLK not exceed the maximum allowed frequency (for more details refer to section above "Initialization/de-initialization functions")

HAL_RCC_MCOConfig

Function name

void HAL_RCC_MCOConfig (uint32_t RCC_MCOx, uint32_t RCC_MCOSource, uint32_t RCC_MCODiv)

Function description

Select the clock source to output on MCO pin(PA8).

Parameters

- **RCC_MCOx:** specifies the output direction for the clock source. For STM32U5xx family this parameter can have only one value:
  – RCC_MCO1 Clock source to output on MCO1 pin(PA8).
- **RCC_MCOSource:** specifies the clock source to output. This parameter can be one of the following values:
  – RCC_MCO1SOURCE_NOCLOCK MCO output disabled, no clock on MCO
  – RCC_MCO1SOURCE_SYSCLK system clock selected as MCO source
  – RCC_MCO1SOURCE_MSI MSI clock selected as MCO source
  – RCC_MCO1SOURCE_HSI HSI clock selected as MCO source
  – RCC_MCO1SOURCE_HSE HSE clock selected as MCO source
  – RCC_MCO1SOURCE_PLL1CLK main PLL clock selected as MCO source
  – RCC_MCO1SOURCE_LSI LSI clock selected as MCO source
  – RCC_MCO1SOURCE_LSE LSE clock selected as MCO source
  – RCC_MCO1SOURCE_HSI48 HSI48 clock selected as MCO source for devices with HSI48
- **RCC_MCODiv:** specifies the MCO prescaler. This parameter can be one of the following values:
  – RCC_MCODIV_1 no division applied to MCO clock
  – RCC_MCODIV_2 division by 2 applied to MCO clock
  – RCC_MCODIV_4 division by 4 applied to MCO clock
  – RCC_MCODIV_8 division by 8 applied to MCO clock
  – RCC_MCODIV_16 division by 16 applied to MCO clock

Return values

- **None:**

Notes

- PA8 should be configured in alternate function mode.

HAL_RCC_EnableCSS

Function name

void HAL_RCC_EnableCSS (void)

Function description

Enable the Clock Security System.

Return values

- **None:**

Notes

- If a failure is detected on the HSE oscillator clock, this oscillator is automatically disabled and an interrupt is generated to inform the software about the failure (Clock Security System Interrupt, CSSI), allowing the MCU to perform rescue operations. The CSSI is linked to the Cortex-M4 NMI (Non-Maskable Interrupt) exception vector.
- The Clock Security System can only be cleared by reset.

HAL_RCC_GetSysClockFreq

Function name

uint32_t HAL_RCC_GetSysClockFreq (void)

Function description

Return the SYSCLK frequency.

Return values

- **SYSCLK:** frequency

Notes

- The system frequency computed by this function is not the real frequency in the chip. It is calculated based on the predefined constant and the selected clock source:
- If SYSCLK source is MSI, function returns values based on MSI Value as defined by the MSI range.
- If SYSCLK source is HSI, function returns values based on HSI_VALUE(*)
- If SYSCLK source is HSE, function returns values based on HSE_VALUE(**)
- If SYSCLK source is PLL, function returns values based on HSE_VALUE(**), HSI_VALUE(*) or MSI Value multiplied/divided by the PLL factors.
- (*) HSI_VALUE is a constant defined in stm32u5xx_hal_conf.h file (default value 16 MHz) but the real value may vary depending on the variations in voltage and temperature.
- (**) HSE_VALUE is a constant defined in stm32u5xx_hal_conf.h file (default value 8 MHz), user has to ensure that HSE_VALUE is same as the real frequency of the crystal used. Otherwise, this function may have wrong result.
- The result of this function could be not correct when using fractional value for HSE crystal.
- This function can be used by the user application to compute the baudrate for the communication peripherals or configure other parameters.
- Each time SYSCLK changes, this function must be called to update the right SYSCLK value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCC_GetHCLKFreq

Function name

uint32_t HAL_RCC_GetHCLKFreq (void)

Function description

Return the HCLK frequency.

Return values

- **HCLK:** frequency in Hz

Notes

- Each time HCLK changes, this function must be called to update the right HCLK value. Otherwise, any configuration based on this function will be incorrect.
- The SystemCoreClock CMSIS variable is used to store System Clock Frequency.

HAL_RCC_GetPCLK1Freq

Function name

uint32_t HAL_RCC_GetPCLK1Freq (void)

Function description

Return the PCLK1 frequency.

Return values

- **PCLK1:** frequency in Hz

Notes

- Each time PCLK1 changes, this function must be called to update the right PCLK1 value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCC_GetPCLK2Freq

Function name

uint32_t HAL_RCC_GetPCLK2Freq (void)

Function description

Return the PCLK2 frequency.

Return values

- **PCLK2:** frequency in Hz

Notes

- Each time PCLK2 changes, this function must be called to update the right PCLK2 value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCC_GetPCLK3Freq

Function name

uint32_t HAL_RCC_GetPCLK3Freq (void)

Function description

Return the PCLK3 frequency.

Return values

- **PCLK3:** frequency in Hz

Notes

- Each time PCLK3 changes, this function must be called to update the right PCLK3 value. Otherwise, any configuration based on this function will be incorrect.

HAL_RCC_GetOscConfig

Function name

void HAL_RCC_GetOscConfig (RCC_OscInitTypeDef * pRCC_OscInitStruct)

Function description

Get the pRCC_OscInitStruct according to the internal RCC configuration registers.

Parameters

- **pRCC_OscInitStruct:** pointer to an RCC_OscInitTypeDef structure that will be configured.

Return values

- **None:**

HAL_RCC_GetClockConfig

Function name

void HAL_RCC_GetClockConfig (RCC_ClkInitTypeDef * pRCC_ClkInitStruct, uint32_t * pFLatency)

Function description

Configure the pRCC_ClkInitStruct according to the internal RCC configuration registers.

Parameters

- **pRCC_ClkInitStruct:** pointer to an RCC_ClkInitTypeDef structure that will be configured.
- **pFLatency:** Pointer on the Flash Latency.

Return values

- **None:**

HAL_RCC_GetResetSource

Function name

uint32_t HAL_RCC_GetResetSource (void)

Function description

Get and clear reset flags.

Return values

- **can:** be a combination of Reset Flag

Notes

- Once reset flags are retrieved, this API is clearing them in order to isolate next reset reason.

HAL_RCC_NMI_IRQHandler

Function name

void HAL_RCC_NMI_IRQHandler (void)

Function description

Handle the RCC Clock Security System interrupt request.

Return values

- **None:**

Notes

- This API should be called under the NMI_Handler().

HAL_RCC_CSSCallback

Function name

void HAL_RCC_CSSCallback (void)

Function description

RCC Clock Security System interrupt callback.

Return values

- **none:**

HAL_RCC_ConfigAttributes

Function name

void HAL_RCC_ConfigAttributes (uint32_t Item, uint32_t Attributes)

Function description

Configure the RCC item attribute(s).

Parameters

- **Item:** Item(s) to set attributes on. This parameter can be a one or a combination of RCC items
- **Attributes:** specifies the RCC secure/privilege attributes. This parameter can be a value of RCC attributes

Return values

- **None:**

Notes

- Available attributes are to secure items and set RCC as privileged.

HAL_RCC_GetConfigAttributes

Function name

HAL_StatusTypeDef HAL_RCC_GetConfigAttributes (uint32_t Item, uint32_t * pAttributes)

Function description

Get the attribute of a RCC item.

Parameters

- **Item:** Single item to get secure/non-secure and privilege/non-privilege attribute from. This parameter can be a one value of RCC items except RCC_ALL.
- **pAttributes:** pointer to return the attributes.

Return values

- **HAL:** Status.

Notes

- Secure and non-secure attributes are only available from secure state when the system implements the security (TZEN=1)

RCC Backup Domain Reset

__HAL_RCC_BACKUPRESET_FORCE

Description:

- Macros to force or release the Backup domain reset.

Return value:

- None

Notes:

- This function resets the RTC peripheral (including the backup registers) and the RTC clock source selection in RCC_CSR register. The BKPSRAM is not affected by this reset.

__HAL_RCC_BACKUPRESET_RELEASE

RCC Exported Constants

HSE_TIMEOUT_VALUE

RCC_FLAG_MASK

RCC Exported Macros

__HAL_RCC_HSI_ENABLE

Description:

- Macros to enable or disable the Internal High Speed 16MHz oscillator (HSI).

Return value:

- None

Notes:

- The HSI is stopped by hardware when entering STOP and STANDBY modes. It is used (enabled by hardware) as system clock source after startup from Reset, wakeup from STOP and STANDBY mode, or in case of failure of the HSE used directly or indirectly as system clock (if the Clock Security System CSS is enabled). HSI can not be stopped if it is used as system clock source. In this case, you have to select another source of the system clock then stop the HSI. After enabling the HSI, the application software should wait on HSIRDY flag to be set indicating that HSI clock is stable and can be used as system clock source. This parameter can be: ENABLE or DISABLE. When the HSI is stopped, HSIRDY flag goes low after 6 HSI oscillator clock cycles.

__HAL_RCC_HSI_DISABLE

__HAL_RCC_HSI_CALIBRATIONVALUE_ADJUST

Description:

- Macro to adjust the Internal High Speed 16MHz oscillator (HSI) calibration value.

Parameters:

- __HSICALIBRATIONVALUE__: specifies the calibration trimming value (default is RCC_HSICALIBRATION_DEFAULT). This parameter must be a number between 0 and 0x20.

Return value:

- None

Notes:

- The calibration is used to compensate for the variations in voltage and temperature that influence the frequency of the internal HSI RC.

__HAL_RCC_HSISTOP_ENABLE

Description:

- Macros to enable or disable the force of the Internal High Speed oscillator (HSI) in STOP mode to be quickly available as kernel clock for USARTs, LPUART and I2Cs.

Return value:

- None

Notes:

- Keeping the HSI ON in STOP mode allows to avoid slowing down the communication speed because of the HSI startup time. The enable of this function has not effect on the HSION bit. This parameter can be: ENABLE or DISABLE.

__HAL_RCC_HSISTOP_DISABLE

__HAL_RCC_MSIKSTOP_ENABLE

Description:

- Macros to enable or disable the force of the Internal Multi Speed kernel oscillator (MSIK) in STOP mode to be quickly available as kernel clock for USARTs, LPUART and I2Cs.

Return value:

- None

Notes:

- Keeping the MSIK ON in STOP mode allows to avoid slowing down the communication speed because of the MSIK startup time. The enable of this function has not effect on the MSIKON bit. The MSIKERON must be configured at 0 before entreing stop 3 mode. This parameter can be: ENABLE or DISABLE.

__HAL_RCC_MSIKSTOP_DISABLE

__HAL_RCC_MSI_ENABLE

Description:

- Macros to enable or disable the Internal Multi Speed oscillator (MSI).

Return value:

- None

Notes:

- The MSI is stopped by hardware when entering STOP and STANDBY modes. It is used (enabled by hardware) as system clock source after startup from Reset, wakeup from STOP and STANDBY mode, or in case of failure of the HSE used directly or indirectly as system clock (if the Clock Security System CSS is enabled). MSI can not be stopped if it is used as system clock source. In this case, you have to select another source of the system clock then stop the MSI. After enabling the MSI, the application software should wait on MSIRDY flag to be set indicating that MSI clock is stable and can be used as system clock source. When the MSI is stopped, MSIRDY flag goes low after 6 MSI oscillator clock cycles.

__HAL_RCC_MSI_DISABLE

__HAL_RCC_MSI_RANGE_CONFIG

Description:

- Macro configures the Internal Multi Speed oscillator (MSI) clock range in run mode.

Parameters:

- __MSIRANGEVALUE__: specifies the MSI clock range. This parameter must be one of the following values:
  - RCC_MSIRANGE_0 MSI clock is around 48 MHz
  - RCC_MSIRANGE_1 MSI clock is around 24 KHz
  - RCC_MSIRANGE_2 MSI clock is around 16 MHz
  - RCC_MSIRANGE_3 MSI clock is around 12 MHz
  - RCC_MSIRANGE_4 MSI clock is around 4 MHz (default after Reset)
  - RCC_MSIRANGE_5 MSI clock is around 2 MHz
  - RCC_MSIRANGE_6 MSI clock is around 1.33 MHz
  - RCC_MSIRANGE_7 MSI clock is around 1 MHz
  - RCC_MSIRANGE_8 MSI clock is around 3.072 MHz
  - RCC_MSIRANGE_9 MSI clock is around 1.536 MHz
  - RCC_MSIRANGE_10 MSI clock is around 1.024 MHz
  - RCC_MSIRANGE_11 MSI clock is around 768 KHz
  - RCC_MSIRANGE_12 MSI clock is around 400 KHz
  - RCC_MSIRANGE_13 MSI clock is around 200 KHz
  - RCC_MSIRANGE_14 MSI clock is around 133 KHz
  - RCC_MSIRANGE_15 MSI clock is around 100 KHz

Return value:

- None

Notes:

- After restart from Reset , the MSI clock is around 4 MHz. After stop the startup clock can be MSI (at any of its possible frequencies, the one that was used before entering stop mode) or HSI. After Standby its frequency can be selected between 4 possible values (1, 3.072, 4 or 8 MHz). MSIRANGE can be modified when MSI is OFF (MSION=0) or when MSI is ready (MSIRDY=1). The MSI clock range after reset can be modified on the fly.

__HAL_RCC_MSIK_RANGE_CONFIG

Description:

- Macro configures the Internal Multi Speed kernel oscillator (MSIK) clock range in run mode.

Parameters:

- __MSIKRANGEVALUE__: specifies the MSI clock range.
  – RCC_MSIKRANGE_0 MSIK clock is around 48 MHz
  – RCC_MSIKRANGE_1 MSIK clock is around 24 KHz
  – RCC_MSIKRANGE_2 MSIK clock is around 16 MHz
  – RCC_MSIKRANGE_3 MSIK clock is around 12 MHz
  – RCC_MSIKRANGE_4 MSIK clock is around 4 MHz (default after Reset)
  – RCC_MSIKRANGE_5 MSIK clock is around 2 MHz
  – RCC_MSIKRANGE_6 MSIK clock is around 1.33 MHz
  – RCC_MSIKRANGE_7 MSIK clock is around 1 MHz
  – RCC_MSIKRANGE_8 MSIK clock is around 3.072 MHz
  – RCC_MSIKRANGE_9 MSIK clock is around 1.536 MHz
  – RCC_MSIKRANGE_10 MSIK clock is around 1.024 MHz
  – RCC_MSIKRANGE_11 MSIK clock is around 768 KHz
  – RCC_MSIKRANGE_12 MSIK clock is around 400 KHz
  – RCC_MSIKRANGE_13 MSIK clock is around 200 KHz
  – RCC_MSIKRANGE_14 MSIK clock is around 133 KHz
  – RCC_MSIKRANGE_15 MSIK clock is around 100 KHz

Return value:

- None

Notes:

- After restart from Reset , the MSIK clock is around 4 MHz. After stop the startup clock can be MSIK (at any of its possible frequencies, the one that was used before entering stop mode) or HSI. After Standby its frequency can be selected between 4 possible values (1, 3.072, 4 or 8 MHz). MSIKRANGE can be modified when MSIK is OFF (MSIKON=0) or when MSIK is ready (MSIKRDY=1). The MSI clock range after reset can be modified on the fly.

__HAL_RCC_MSIBIAS_SELECTION_ENABLE

Description:

- Macros to enable or disable the MSI bias mode selection.

Return value:

- None

Notes:

- By default the MSI bias is in continuous mode in order to maintain the output clocks accuracy. Setting this bit reduces the MSI consumption under range 4 but decrease its accuracy.

__HAL_RCC_MSIBIAS_SELECTION_DISABLE

__HAL_RCC_LSE_GLITCHFILTER_ENABLE

Description:

- Macros to enable or disable LSE clock glitch filter .

Return value:

- None

Notes:

- The glitches on LSE can be filtred by setting the LSEGFON. LSEGFON must be written when the LSE is disabled (LSEON = 0 and LSERDY = 0).

__HAL_RCC_LSE_GLITCHFILTER_DISABLE

__HAL_RCC_MSI_STANDBY_RANGE_CONFIG

Description:

- Macro configures the Internal Multi Speed oscillator (MSI) clock range after Standby mode After Standby its frequency can be selected between 5 possible values (4, 2, 1.33, 1, or 3.072 MHz).

Parameters:

- __MSIRANGEVALUE__: specifies the MSI clock range. This parameter must be one of the following values:
  – RCC_MSIRANGE_4 MSI clock is around 4 MHz (default after Reset)
  – RCC_MSIRANGE_5 MSI clock is around 2 MHz
  – RCC_MSIRANGE_6 MSI clock is around 1.33 MHz
  – RCC_MSIRANGE_7 MSI clock is around 1 MHz
  – RCC_MSIRANGE_8 MSI clock is around 3.072 MHz

Return value:

- None

__HAL_RCC_MSIK_STANDBY_RANGE_CONFIG

Description:

- Macro configures the Internal Multi Speed oscillator (MSIK) clock range after Standby mode After Standby its frequency can be selected between 5 possible values (4, 2, 1.33, 1, or 3.072 MHz).

Parameters:

- __MSIKRANGEVALUE__: specifies the MSIK clock range. This parameter must be one of the following values:
  – RCC_MSIKRANGE_4 MSIK clock is around 4 MHz (default after Reset)
  – RCC_MSIKRANGE_5 MSIK clock is around 2 MHz
  – RCC_MSIKRANGE_6 MSIK clock is around 1.33 MHz
  – RCC_MSIKRANGE_7 MSIK clock is around 1 MHz
  – RCC_MSIKRANGE_8 MSIK clock is around 3.072 MHz

Return value:

- None

__HAL_RCC_GET_MSI_RANGE

Description:

- Macro to get the Internal Multi Speed oscillator (MSI) clock range in run mode.

Return value:

- MSI: clock range. This parameter must be one of the following values:
  – RCC_MSIRANGE_0 MSI clock is around 48 MHz
  – RCC_MSIRANGE_1 MSI clock is around 24 KHz
  – RCC_MSIRANGE_2 MSI clock is around 16 MHz
  – RCC_MSIRANGE_3 MSI clock is around 12 MHz
  – RCC_MSIRANGE_4 MSI clock is around 4 MHz
  – RCC_MSIRANGE_5 MSI clock is around 2 MHz
  – RCC_MSIRANGE_6 MSI clock is around 1.33 MHz
  – RCC_MSIRANGE_7 MSI clock is around 1 MHz
  – RCC_MSIRANGE_8 MSI clock is around 3.072 MHz
  – RCC_MSIRANGE_9 MSI clock is around 1.536 MHz
  – RCC_MSIRANGE_10 MSI clock is around 1.024 MHz
  – RCC_MSIRANGE_11 MSI clock is around 768 KHz
  – RCC_MSIRANGE_12 MSI clock is around 400 KHz
  – RCC_MSIRANGE_13 MSI clock is around 200 KHz
  – RCC_MSIRANGE_14 MSI clock is around 133 KHz
  – RCC_MSIRANGE_15 MSI clock is around 100 KHz

__HAL_RCC_GET_MSIK_RANGE

Description:

- Macro to get the Internal Multi Speed kernel oscillator (MSIK) clock range in run mode.

Return value:

- MSIK: clock range. This parameter must be one of the following values:
  – RCC_MSIRANGE_0 MSI clock is around 48 MHz
  – RCC_MSIRANGE_1 MSI clock is around 24 KHz
  – RCC_MSIRANGE_2 MSI clock is around 16 MHz
  – RCC_MSIRANGE_3 MSI clock is around 12 MHz
  – RCC_MSIRANGE_4 MSI clock is around 4 MHz
  – RCC_MSIRANGE_5 MSI clock is around 2 MHz
  – RCC_MSIRANGE_6 MSI clock is around 1.33 MHz
  – RCC_MSIRANGE_7 MSI clock is around 1 MHz
  – RCC_MSIRANGE_8 MSI clock is around 3.072 MHz
  – RCC_MSIRANGE_9 MSI clock is around 1.536 MHz
  – RCC_MSIRANGE_10 MSI clock is around 1.024 MHz
  – RCC_MSIRANGE_11 MSI clock is around 768 KHz
  – RCC_MSIRANGE_12 MSI clock is around 400 KHz
  – RCC_MSIRANGE_13 MSI clock is around 200 KHz
  – RCC_MSIRANGE_14 MSI clock is around 133 KHz
  – RCC_MSIRANGE_15 MSI clock is around 100 KHz

__HAL_RCC_LSI_ENABLE

Description:

- Macros to enable or disable the Internal Low Speed oscillator (LSI).

Return value:

- None

Notes:

- After enabling the LSI, the application software should wait on LSIRDY flag to be set indicating that LSI clock is stable and can be used to clock the IWDG and/or the RTC. LSI can not be disabled if the IWDG is running. When the LSI is stopped, LSIRDY flag goes low after 6 LSI oscillator clock cycles.

__HAL_RCC_LSI_DISABLE

__HAL_RCC_HSE_CONFIG

Description:

- Macro to configure the External High Speed oscillator (HSE).

Parameters:

- __STATE__: specifies the new state of the HSE. This parameter can be one of the following values:
  – RCC_HSE_OFF Turn OFF the HSE oscillator, HSERDY flag goes low after 6 HSE oscillator clock cycles.
  – RCC_HSE_ON Turn ON the HSE oscillator.
  – RCC_HSE_BYPASS HSE oscillator bypassed with external clock.
  – RCC_HSE_BYPASS_DIGITAL HSE oscillator bypassed through I/O Schmitt trigger .

Return value:

- None

Notes:

- Transition HSE Bypass to HSE On and HSE On to HSE Bypass are not supported by this macro. User should request a transition to HSE Off first and then HSE On or HSE Bypass. After enabling the HSE (RCC_HSE_ON or RCC_HSE_Bypass), the application software should wait on HSERDY flag to be set indicating that HSE clock is stable and can be used to clock the PLL and/or system clock. HSE state can not be changed if it is used directly or through the PLL as system clock. In this case, you have to select another source of the system clock then change the HSE state (ex. disable it). The HSE is stopped by hardware when entering STOP and STANDBY or shutdown modes.

__HAL_RCC_LSESYS_ENABLE

Description:

- Macro to enable or disable the LSE system clock.

Return value:

- None

Notes:

- This clock can be used by any peripheral when its source clock is the LSE or at system in case of one of the LSCOSEL, MCO, MSI PLL mode or CSS on LSE is needed. The LSESYS clock can be generated even if LSESYSEN= 0 if the LSE clock is requested by the CSS on LSE, by a peripheral or any other source clock using LSE.

__HAL_RCC_LSESYS_DISABLE

__HAL_RCC_LSI_DIV_CONFIG

Description:

- Macro to set Low-speed clock (LSI) divider.

Parameters:

- __DIVIDER__: : specifies the divider value This parameter can be one of the following values
  – RCC_LSI_DIV1
  – RCC_LSI_DIV128

Return value:

- None

Notes:

- This bit can be written only when the LSI is disabled (LSION = 0 and LSIRDY = 0). The LSIPREDIV cannot be changed if the LSI is used by the IWDG or by the RTC.

__HAL_RCC_LSE_CONFIG

Description:

- Macro to configure the External Low Speed oscillator (LSE).

Parameters:

- __STATE__: specifies the new state of the LSE. This parameter can be one of the following values:
  - RCC_LSE_OFF Turn OFF the LSE oscillator, LSERDY flag goes low after 6 LSE oscillator clock cycles.
  - RCC_LSE_ON_RTC_ONLY Turn ON the LSE oscillator to be used only for RTC.
  - RCC_LSE_ON Turn ON the LSE oscillator to be used by any peripheral.
  - RCC_LSE_BYPASS_RTC_ONLY LSE oscillator bypassed with external clock to be used only for RTC.
  - RCC_LSE_BYPASS LSE oscillator bypassed with external clock to be used by any peripheral

Return value:

- None

Notes:

- Transitions LSE Bypass to LSE On and LSE On to LSE Bypass are not supported by this macro. User should request a transition to LSE Off first and then LSE On or LSE Bypass. As the LSE is in the Backup domain and write access is denied to this domain after reset, you have to enable write access using HAL_PWR_EnableBkUpAccess() function before to configure the LSE (to be done once after reset). After enabling the LSE (RCC_LSE_ON or RCC_LSE_BYPASS), the application software should wait on LSERDY flag to be set indicating that LSE clock is stable and can be used to clock the RTC.

__HAL_RCC_HSI48_ENABLE

Description:

- Macros to enable or disable the Internal High Speed 48MHz oscillator (HSI48).

Return value:

- None

Notes:

- The HSI48 is stopped by hardware when entering STOP and STANDBY modes. After enabling the HSI48, the application software should wait on HSI48RDY flag to be set indicating that HSI48 clock is stable. This parameter can be: ENABLE or DISABLE.

__HAL_RCC_HSI48_DISABLE

__HAL_RCC_MSIK_ENABLE

Description:

- Macros to enable or disable the Internal multi-speed RC oscillator clock (MSIK).

Return value:

- None

Notes:

- if the peripheral requests its kernel clock in Stop 0 or Stop 1 mode,MSIK is woken up After enabling the MSIK, the application software should wait on MSIKRDY flag to be set indicating that MSIK clock is stable. This parameter can be: ENABLE or DISABLE.

__HAL_RCC_MSIK_DISABLE

__HAL_RCC_SHSI_ENABLE

Description:

- Macros to enable or disable the secure Internal High Speed oscillator (SHSI).

Return value:

- None

Notes:

- The SHSI is stopped by hardware when entering STOP and STANDBY modes. After enabling the SHSI, the application software should wait on SHSI flag to be set indicating that SHSI clock is stable. This parameter can be: ENABLE or DISABLE.

__HAL_RCC_SHSI_DISABLE

__HAL_RCC_RTC_CONFIG

Description:

- Macros to configure the RTC clock (RTCCLK).

Parameters:

- __RTC_CLKSOURCE__: specifies the RTC clock source. This parameter can be one of the following values:
  – RCC_RTCCLKSOURCE_NO_CLK No clock selected as RTC clock.
  – RCC_RTCCLKSOURCE_LSE LSE selected as RTC clock.
  – RCC_RTCCLKSOURCE_LSI LSI selected as RTC clock.
  – RCC_RTCCLKSOURCE_HSE_DIV32 HSE clock divided by 32 selected

Return value:

- None

Notes:

- As the RTC clock configuration bits are in the Backup domain and write access is denied to this domain after reset, you have to enable write access using the Power Backup Access macro before to configure the RTC clock source (to be done once after reset). Once the RTC clock is configured it cannot be changed unless the Backup domain is reset using __HAL_RCC_BACKUPRESET_FORCE() macro, or by a Power On Reset (POR).
- If the LSE or LSI is used as RTC clock source, the RTC continues to work in STOP and STANDBY modes, and can be used as wakeup source. However, when the HSE clock is used as RTC clock source, the RTC cannot be used in STOP and STANDBY modes. The maximum input clock frequency for RTC is 1MHz (when using HSE as RTC clock source).

__HAL_RCC_GET_RTC_SOURCE

Description:

- Macro to get the RTC clock source.

Return value:

- The: returned value can be one of the following:
  – RCC_RTCCLKSOURCE_NO_CLK No clock selected as RTC clock.
  – RCC_RTCCLKSOURCE_LSE LSE selected as RTC clock.
  – RCC_RTCCLKSOURCE_LSI LSI selected as RTC clock.
  – RCC_RTCCLKSOURCE_HSE_DIV32 HSE clock divided by 32 selected

__HAL_RCC_PLL_ENABLE

Notes:

- After enabling the main PLL, the application software should wait on PLLRDY flag to be set indicating that PLL clock is stable and can be used as system clock source. The main PLL can not be disabled if it is used as system clock source The main PLL is disabled by hardware when entering STOP and STANDBY modes.

__HAL_RCC_PLL_DISABLE

__HAL_RCC_PLLCLKOUT_ENABLE

Description:

- Enables or disables each clock output (PLL_P_CLK, PLL_Q_CLK, PLL_R_CLK)

Parameters:

- __PLL1_CLOCKOUT__: specifies the PLL clock to be outputted This parameter can be one of the following values:
  - RCC_PLL1_DIVP: This clock is used to generate an accurate clock to achieve, high-quality audio performance on SAI interface.
  - RCC_PLL1_DIVQ: This Clock is used to generate the clock for the USB FS(48 MHz), the random analog generator (<=48 MHz) and the OCTOSPI1/2.
  - RCC_PLL1_DIVR: This Clock is used to generate the high speed system clock (up to 160MHz)

Return value:

- None

Notes:

- Enabling/disabling Those Clocks can be any time without the need to stop the PLL, This is mainly used to save Power.

__HAL_RCC_PLLCLKOUT_DISABLE

__HAL_RCC_GET_PLLCLKOUT_CONFIG

Description:

- Macro to get the PLL clock output enable status.

Parameters:

- __PLL1_CLOCKOUT__: specifies the PLL1 clock to be output. This parameter can be one of the following values:
  - RCC_PLL1_DIVP: This clock is used to generate an accurate clock to achieve, high-quality audio performance on SAI interface.
  - RCC_PLL1_DIVQ: This Clock is used to generate the clock for the USB FS(48 MHz), the random analog generator (<=48 MHz) and the OCTOSPI1/2.
  - RCC_PLL1_DIVR: This Clock is used to generate the high speed system clock (up to 160MHz)

Return value:

- SET: / RESET

__HAL_RCC_PLL_FRACN_ENABLE

Description:

- Enables or disables Fractional Part Of The Multiplication Factor of PLL1 VCO.

Return value:

- None

Notes:

- Enabling/disabling Fractional Part can be any time without the need to stop the PLL1

__HAL_RCC_PLL_FRACN_DISABLE

__HAL_RCC_PLL_CONFIG

Description:

- Macro to configure the main PLL clock source, multiplication and division factors.

Parameters:

- __PLL1SOURCE__: specifies the PLL entry clock source. This parameter can be one of the following values:
  - RCC_PLLSOURCE_MSI: MSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_HSI: HSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_HSE: HSE oscillator clock selected as PLL clock entry
- __PLL1MBOOST__: specifies the division factor for the EPOD clock This parameter must be a value of
- __PLL1M__: specifies the division factor for PLL VCO input clock This parameter must be a number between 1 and 63.
- __PLL1N__: specifies the multiplication factor for PLL VCO output clock This parameter must be a number between 4 and 512.
- __PLL1P__: specifies the division factor for peripheral kernel clocks. This parameter must be a number between 1 and 128
- __PLL1Q__: specifies the division factor for peripheral kernel clocks. This parameter must be a number between 1 and 128
- __PLL1R__: specifies the division factor for system clock. This parameter must be a number between 1 and 128 (Only division by 1 and even division are allowed)

Return value:

- None

Notes:

- This function must be used only when the main PLL is disabled.
- This clock source (__PLL1SOURCE__) is common for the main PLL1 (main PLL) and PLL2 & PLL3 .
- You have to set the PLLM parameter correctly to ensure that the VCO input frequency ranges from 1 to 16 MHz.
- You have to set the PLLN parameter correctly to ensure that the VCO output frequency is between 128 and 544 MHz(Voltage range 1 or 2) between 128 and 330 MHZ (Voltage range 3) and not allowed for Voltage range 4.

__HAL_RCC_PLL_PLLSOURCE_CONFIG

Description:

- Macro to configure the PLLs clock source.

Parameters:

- __PLL1SOURCE__: specifies the PLLs entry clock source. This parameter can be one of the following values:
  - RCC_PLLSOURCE_MSI: MSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_HSI: HSI oscillator clock selected as PLL clock entry
  - RCC_PLLSOURCE_HSE: HSE oscillator clock selected as PLL clock entry

Notes:

- This function must be used only when all PLLs are disabled.

__HAL_RCC_PLL_FRACN_CONFIG

Description:

- Macro to configure the main PLL clock Fractional Part Of The Multiplication Factor.

Parameters:

- __PLL1FRACN__: specifies Fractional Part Of The Multiplication Factor for PLL1 VCO It should be a value between 0 and 8191

Return value:

- None

Notes:

- These bits can be written at any time, allowing dynamic fine-tuning of the PLL1 VCO
- Warning: The software has to set correctly these bits to insure that the VCO output frequency is between its valid frequency range, which is: 192 to 836 MHz if PLL1VCOSEL = 0 150 to 420 MHz if PLL1VCOSEL = 1.

__HAL_RCC_PLL_VCIRANGE

Description:

- Macro to select the PLL1 reference frequency range.

Parameters:

- __PLL1VCIRange__: specifies the PLL1 input frequency range This parameter can be one of the following values:
  - RCC_PLLVCIRANGE_0: Range frequency is between 4 and 8 MHz
  - RCC_PLLVCIRANGE_1: Range frequency is between 8 and 16 MHz

Return value:

- None

__HAL_RCC_GET_PLL_OSCSOURCE

Description:

- Macro to get the oscillator used as PLL1 clock source.

Return value:

- The: oscillator used as PLL1 clock source. The returned value can be one of the following:
  - RCC_PLLSOURCE_NONE: No oscillator is used as PLL clock source.
  - RCC_PLLSOURCE_MSI: MSI oscillator is used as PLL clock source.
  - RCC_PLLSOURCE_HSI: HSI oscillator is used as PLL clock source.
  - RCC_PLLSOURCE_HSE: HSE oscillator is used as PLL clock source.

__HAL_RCC_SYSCLK_CONFIG

Description:

- Macro to configure the system clock source.

Parameters:

- __SYSCLKSOURCE__: specifies the system clock source. This parameter can be one of the following values:
  - RCC_SYSCLKSOURCE_MSI: MSI oscillator is used as system clock source.
  - RCC_SYSCLKSOURCE_HSI: HSI oscillator is used as system clock source.
  - RCC_SYSCLKSOURCE_HSE: HSE oscillator is used as system clock source.
  - RCC_SYSCLKSOURCE_PLL1CLK: PLL1 output is used as system clock source.

Return value:

- None

__HAL_RCC_GET_SYSCLK_SOURCE

Description:

- Macro to get the clock source used as system clock.

Return value:

- The: clock source used as system clock. The returned value can be one of the following:
  - RCC_SYSCLKSOURCE_STATUS_MSI: MSI used as system clock.
  - RCC_SYSCLKSOURCE_STATUS_HSI: HSI used as system clock.
  - RCC_SYSCLKSOURCE_STATUS_HSE: HSE used as system clock.
  - RCC_SYSCLKSOURCE_STATUS_PLL1CLK: PLL1 used as system clock.

__HAL_RCC_LSEDRIVE_CONFIG

Description:

- Macro to configure the External Low Speed oscillator (LSE) drive capability.

Parameters:

- __LSEDRIVE__: specifies the new state of the LSE drive capability. This parameter can be one of the following values:
  - RCC_LSEDRIVE_LOW LSE oscillator low drive capability.
  - RCC_LSEDRIVE_MEDIUMLOW LSE oscillator medium low drive capability.
  - RCC_LSEDRIVE_MEDIUMHIGH LSE oscillator medium high drive capability.
  - RCC_LSEDRIVE_HIGH LSE oscillator high drive capability.

Return value:

- None

Notes:

- As the LSE is in the Backup domain and write access is denied to this domain after reset, you have to enable write access using HAL_PWR_EnableBkUpAccess() function before to configure the LSE (to be done once after reset). The LSE drive can be decreased to the lower drive capability (LSEDRV = 0) when the LSE is ON. However, once LSEDRV is selected, the drive capability can not be increased if LSEON = 1.

__HAL_RCC_WAKEUPSTOP_CLK_CONFIG

Description:

- Macro to configure the wake up from stop clock.

Parameters:

- __STOPWUCLK__: specifies the clock source used after wake up from stop. This parameter can be one of the following values:
  - RCC_STOP_WAKEUPCLOCK_MSI MSI selected as system clock source and CSS backup clock
  - RCC_STOP_WAKEUPCLOCK_HSI HSI selected as system clock source and CSS backup clock

Return value:

- None

Notes:

- The selected clock is also used as emergency clock for the clock security system on HSE.

__HAL_RCC_KERWAKEUPSTOP_CLK_CONFIG

Description:

- Macro to configure the Kernel wake up from stop clock.

Parameters:

- __RCC_STOPKERWUCLK__: specifies the Kernel clock source used after wake up from stop This parameter can be one of the following values:
  - RCC_STOP_KERWAKEUPCLOCK_MSI: MSI selected as Kernel clock source
  - RCC_STOP_KERWAKEUPCLOCK_HSI: HSI selected as Kernel clock source

Return value:

- None

__HAL_RCC_MCO1_CONFIG

Description:

- Macro to configure the MCO clock.

Parameters:

- __MCOCLKSOURCE__: specifies the MCO clock source. This parameter can be one of the following values:
  - RCC_MCO1SOURCE_NOCLOCK MCO output disabled
  - RCC_MCO1SOURCE_SYSCLK System clock selected as MCO source
  - RCC_MCO1SOURCE_MSI MSI clock selected as MCO source
  - RCC_MCO1SOURCE_HSI HSI clock selected as MCO source
  - RCC_MCO1SOURCE_HSE HSE clock selected as MCO source
  - RCC_MCO1SOURCE_PLL1CLK Main PLL clock selected as MCO source
  - RCC_MCO1SOURCE_LSI LSI clock selected as MCO source
  - RCC_MCO1SOURCE_LSE LSE clock selected as MCO source
  - RCC_MCO1SOURCE_HSI48 HSI48 clock selected as MCO source for devices with HSI48
- __MCODIV__: specifies the MCO clock prescaler. This parameter can be one of the following values:
  - RCC_MCODIV_1 MCO clock source is divided by 1
  - RCC_MCODIV_2 MCO clock source is divided by 2
  - RCC_MCODIV_4 MCO clock source is divided by 4
  - RCC_MCODIV_8 MCO clock source is divided by 8
  - RCC_MCODIV_16 MCO clock source is divided by 16

Flags Interrupts Management

__HAL_RCC_ENABLE_IT

Description:
- Enable RCC interrupt (Perform Byte access to RCC_CIR[14:8] bits to enable the selected interrupts).

Parameters:
- __INTERRUPT__: specifies the RCC interrupt sources to be enabled. This parameter can be any combination of the following values:
  - RCC_IT_LSIRDY LSI ready interrupt
  - RCC_IT_LSERDY LSE ready interrupt
  - RCC_IT_MSIRDY HSI ready interrupt
  - RCC_IT_HSIRDY HSI ready interrupt
  - RCC_IT_HSERDY HSE ready interrupt
  - RCC_IT_PLLRDY Main PLL ready interrupt
  - RCC_IT_PLL2RDY PLL2 ready interrupt
  - RCC_IT_PLL3RDY PLL3 ready interrupt
  - RCC_IT_HSI48RDY HSI48 ready interrupt

Return value:
- None

__HAL_RCC_DISABLE_IT

Description:
- Disable RCC interrupt (Perform Byte access to RCC_CIR[14:8] bits to disable the selected interrupts).

Parameters:
- __INTERRUPT__: specifies the RCC interrupt sources to be disabled. This parameter can be any combination of the following values:
  - RCC_IT_LSIRDY LSI ready interrupt
  - RCC_IT_LSERDY LSE ready interrupt
  - RCC_IT_MSIRDY HSI ready interrupt
  - RCC_IT_HSIRDY HSI ready interrupt
  - RCC_IT_HSERDY HSE ready interrupt
  - RCC_IT_PLLRDY Main PLL ready interrupt
  - RCC_IT_PLL2RDY PLL2 ready interrupt
  - RCC_IT_PLL3RDY PLL3 ready interrupt
  - RCC_IT_HSI48RDY HSI48 ready interrupt

Return value:
- None

__HAL_RCC_CLEAR_IT

Description:

- Clear the RCC's interrupt pending bits (Perform Byte access to RCC_CIR[23:16] bits to clear the selected interrupt pending bits.

Parameters:

- __INTERRUPT__: specifies the interrupt pending bit to clear. This parameter can be any combination of the following values:
  - RCC_IT_LSIRDY LSI ready interrupt
  - RCC_IT_LSERDY LSE ready interrupt
  - RCC_IT_MSIRDY MSI ready interrupt
  - RCC_IT_HSIRDY HSI ready interrupt
  - RCC_IT_HSERDY HSE ready interrupt
  - RCC_IT_PLLRDY Main PLL ready interrupt
  - RCC_IT_PLL2RDY PLL2 ready interrupt
  - RCC_IT_PLL3RDY PLL3 ready interrupt
  - RCC_IT_CSS HSE Clock security system interrupt
  - RCC_IT_HSI48RDY HSI48 ready interrupt
  - RCC_IT_MSIKRDY MSIK ready interrupt
  - RCC_IT_SHSIRDY SHSI ready interrupt

Return value:

- None

__HAL_RCC_GET_IT

Description:

- Check whether the RCC interrupt has occurred or not.

Parameters:

- __INTERRUPT__: specifies the RCC interrupt source to check. This parameter can be one of the following values:
  - RCC_IT_LSIRDY LSI ready interrupt
  - RCC_IT_LSERDY LSE ready interrupt
  - RCC_IT_MSIRDY MSI ready interrupt
  - RCC_IT_HSIRDY HSI ready interrupt
  - RCC_IT_HSERDY HSE ready interrupt
  - RCC_IT_PLLRDY Main PLL ready interrupt
  - RCC_IT_PLL2RDY PLL2 ready interrupt
  - RCC_IT_PLL3RDY PLL3 ready interrupt
  - RCC_IT_CSS HSE Clock security system interrupt
  - RCC_IT_HSI48RDY HSI48 ready interrupt
  - RCC_IT_MSIKRDY MSIK ready interrupt
  - RCC_IT_SHSIRDY SHSI ready interrupt

Return value:

- The: new state of __INTERRUPT__ (TRUE or FALSE).

__HAL_RCC_CLEAR_RESET_FLAGS

Description:

- Set RMVF bit to clear the reset flags.

Return value:

- None

__HAL_RCC_GET_FLAG

Description:

- Check whether the selected RCC flag is set or not.

Parameters:

- __FLAG__: specifies the flag to check. This parameter can be one of the following values:
  - RCC_FLAG_MSIRDY MSI oscillator clock ready
  - RCC_FLAG_HSIRDY HSI oscillator clock ready
  - RCC_FLAG_HSERDY HSE oscillator clock ready
  - RCC_FLAG_PLL1RDY Main PLL1 clock ready
  - RCC_FLAG_PLL2RDY PLL2 clock ready
  - RCC_FLAG_PLL3RDY PLL3 clock ready
  - RCC_FLAG_HSI48RDY HSI48 clock ready
  - RCC_FLAG_LSERDY LSE oscillator clock ready
  - RCC_FLAG_LSECSSD Clock security system failure on LSE oscillator detection
  - RCC_FLAG_LSIRDY LSI oscillator clock ready
  - RCC_FLAG_BORRST BOR reset
  - RCC_FLAG_OBLRST OBLRST reset
  - RCC_FLAG_PINRST Pin reset
  - RCC_FLAG_RMVF Remove reset Flag
  - RCC_FLAG_SFTRST Software reset
  - RCC_FLAG_IWDGRST Independent Watchdog reset
  - RCC_FLAG_WWDGRST Window Watchdog reset
  - RCC_FLAG_LPWRRST Low Power reset

Return value:

- The: new state of __FLAG__ (TRUE or FALSE).
