

# How to use the STEVAL-CCA058V1 training kit for operational amplifiers and comparators

## Introduction

The STEVAL-CCA058V1 training kit is intended for hands-on training on operational amplifiers and comparator-based analog circuits.

You can use the kit in an academic context for students' training, as well as for professionals' training: junior analog engineers, distributors, and customers. It is also useful for a fast evaluation and prototyping of low frequency op amp-based applications.

The STEVAL-CCA058V1 consists of a configurable board, which features the most widely used op-amp-based schematics and applications, and ST op-amps mounted on DIP adaptors.

It should be used with a set of through passive components (resistors and capacitors), and a set of lab instruments (power supply, function generator, multimeter, and oscilloscope).

The kit allows the trainee to experiment the most common op-amp-based schematics. It also allows learning how to choose the most suited op-amp for a custom application. You can find the detailed documentation on guided experiments at www.st.com.

# 1 Getting started

# 1.1 Safety precautions and protective equipment

#### Caution:

All example applications provided with this kit involve 5 V op-amps and comparators. Thus, voltages over 40 V, that can be harmful for the human body, are not meant to be used with this kit. However, even with low voltage, a fire hazard might occur if the current is not limited. Use a power supply with current limitation and limit the current to 100 mA maximum, which should be sufficient for any of the applications shown here.

Danger:

Even with low voltage, electronic components, such as integrated circuits and electrochemical condensers, might explode if improperly biased. Use safety glasses when the board is biased.

#### 1.2 Overview

The STEVAL-CCA058V1 is designed to allow fast and easy setup of many op-amp-based basic circuits and applications.

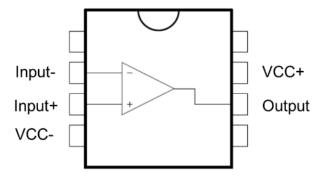

#### It features:

- Schematics and applications based on operational amplifiers and comparators:
  - Follower, inverter, noninverter
  - Filters
  - Low-side current sensing
  - Photodiode transimpedance amplification
- Low cost to high-performance low-voltage operational amplifiers:
  - Rail-to-rail
  - High bandwidth
  - Low offset
  - High output current
  - Low-power

The kit does not include any electronic component, except decoupling capacitors on the power supply network. You need passive through-hole components, that is, resistors and capacitors, as well as jumpers.

To test the kit, use operational amplifiers and comparators with a single DIP-8 pinout as shown below.

Figure 3. DIP-8 single pinout

A set of commonly used STMicroelectronics preamps and comparators is provided.

UM2982 - Rev 2 page 3/26

# 1.3 Hardware requirements

To reproduce the experiments described in this document, you need:

- a dual power supply stabilized, preferably with current limitation;
- a function generator;
- a multimeter;
- an oscilloscope or any other waveform acquisition device.

# 1.4 How to set up an applicative schematic on the board

Step 1. Connect the power supply to the board.

You can choose dual supply (default configuration) or single supply.

Step 1a. For single power supply, short GND and VCC- by adding a jumper on the "J single supply" connector.

You can use a standard laboratory power supply to power the op-amp.

For this supply configuration, a single power supply is sufficient. Its low voltage should be connected either to the VCC- or GND connector.

Important: When using a current-limitation power supply, limit the current to 30 mA to prevent the

destruction of the op-amp, in case the power supply polarity is reversed by mistake.

Step 1b. For dual supply mode, use a dual power supply.

UM2982 - Rev 2 page 4/26

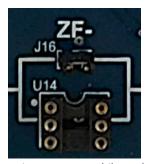

### Step 2. Configure an application scheme.

You can use both the configuration jumpers and the DIP-6 sockets.

**Step 2a.** Use the configuration jumpers to short the electrical tracks.

Figure 4. Configuration jumpers

Step 2b. Use the DIP-6 connectors to connect one or several through-hole components in parallel.

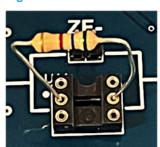

Figure 5. DIP-6 connectors

The simplified scheme below shows the available jumpers and connectors.

Input + Zin+ Zg+ Ziso Output

Note: Single Op Amp

Zioac Load Out

Zf -

Figure 6. STEVAL-CCA058V1 main board - simplified scheme

The two-circuit inputs (positive and negative) and the main output have BNC connectors for AC signal and 4 mm jack connectors for DC signal. The  $V_{REF}$  input and the load output are intended for DC signal only. They have 4 mm jack connectors only. Test points for a multimeter or a scope probe are also available for the circuit inputs and

UM2982 - Rev 2 page 5/26

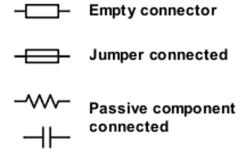

outputs, and for the op-amps (circuit internal nodes).

# 1.4.1 Applicative scheme examples

The following sections show some examples of basic op-amp applications. They illustrate the passive components or jumpers to use, as well as the empty connectors, using the convention shown below.

Figure 7. Configuration conventions for the board schematics

#### 1.4.1.1 Voltage follower

The op-amp is used in a linear regime. The bias of the output is equal to both positive and negative inputs (with a small difference linked to the op-amp error), provided that the input bias is far from the Vcc+ and Vcc- (or GND in the single supply configuration).

Input + Zin+ Zg+ Ziso Output

Zin- Zref- Zg- Single Op Amp Load Out

Zf - Vcc- Vcc-

Figure 8. Connection schematic of the voltage follower

#### 1.4.1.2 Non-inverting configuration

The input bias (applied on Input +) is amplified by a factor determined by the Rg- and Rf- resistors connected at Zg- and Zf-.

$$G = 1 + \frac{R_f - }{R_g - }$$

UM2982 - Rev 2 page 6/26

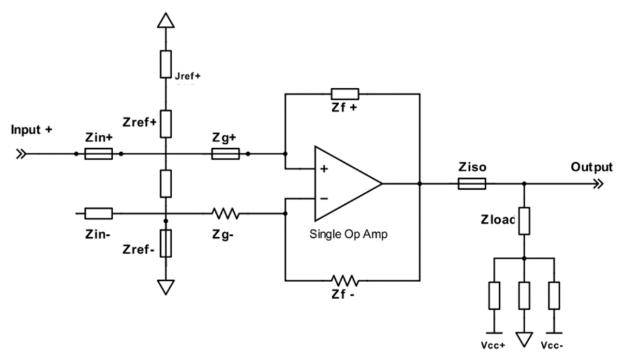

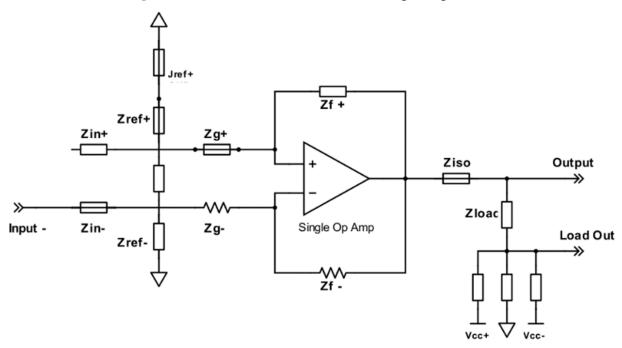

Figure 9. Connection schematic of the non-inverting configuration

#### 1.4.1.3 Inverting configuration

The input bias (applied on Input -) is amplified by a factor determined by the resistors Rg- and Rz- connected at Zg- and Zf-:

$$G = -\frac{R_{f}}{R_{g}}$$

Figure 10. Connection schematic of the inverting configuration

## 1.4.1.4 Differential amplifier

The differential amplifier schematic has two inputs. It mixes the non-inverting and the inverting configurations.

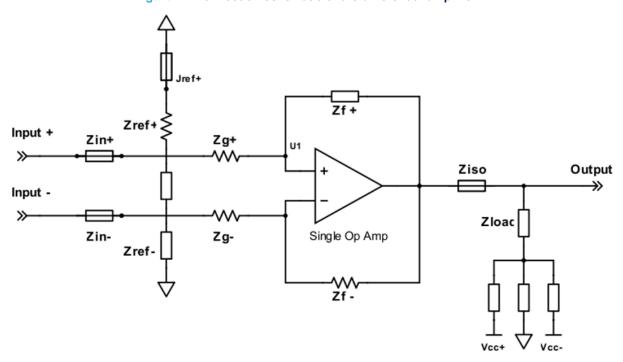

UM2982 - Rev 2 page 7/26

The bias of the output depends on the voltages on the positive and negative inputs, amplified as in the non-inverting and the inverting configurations.

$$V_{out} = \frac{R_{ref\,+}}{R_{ref\,+} + R_{g\,+}} \cdot \frac{R_{g\,-} + R_{f\,-}}{R_{g\,-}} \cdot V_{Input\,+} - \frac{R_{f\,-}}{R_{g\,-}} \cdot V_{Input\,-}$$

Figure 11. Connection schematic of the differential amplifier

### 1.4.1.5 Follower with load and Ziso connector

This schematic is the same of the follower mode, but it adds a capacitive and/or resistive load (Zload connector), and an isolation resistor (Ziso connector).

This configuration allows evaluating the stability characteristics of an op-amp.

For further information on the op-amp stability, see AN2653.

UM2982 - Rev 2 page 8/26

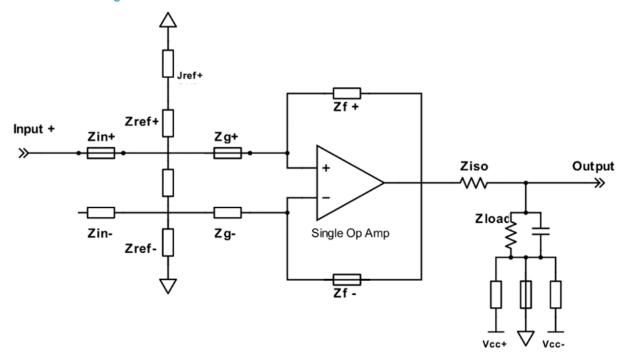

Figure 12. Follower connection schematic with load and Ziso connector

## 1.4.1.6 Comparator

In this configuration, the op-amp is used in a non-linear regime. The output is at high (~Vcc+) if the Vin+>Vin-, or at low (~Vcc- or Gnd in the single supply configuration) if Vin+<Vin-.

Specific op-amps are optimized for this application and referred to as comparators.

For further information on the comparators, see AN4071.

Input + Zin+ Zg+ Ziso Output

Note: The provided HTML State of the provided

Figure 13. Comparator connection schematic

UM2982 - Rev 2 page 9/26

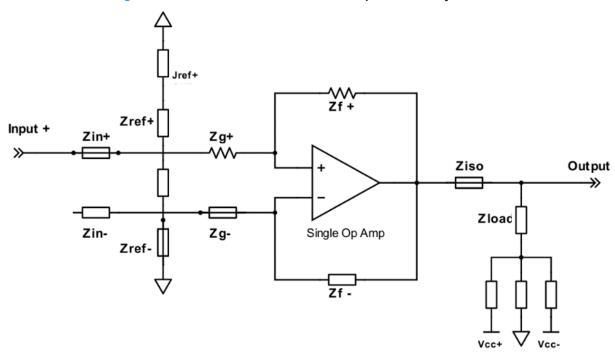

#### 1.4.1.7 Comparator with hysteresis

In this schematic, also called Schmitt trigger, the bias of the Input + determines the output state (high or low). However, the bias thresholds at which the output switches from the positive to the negative state (V+) or from the negative to the positive state (V-) are different. The two resistors (Rg+ and Rf+) connected on Zg+ and Zf+ determine these thresholds as follows:

$$\begin{split} V_{+} &= \frac{R_{g\,+}}{R_{g\,+} + R_{f\,+}} \cdot V_{cc} \\ V_{-} &= -\frac{R_{g\,+}}{R_{g\,+} + R_{f\,+}} \cdot V_{cc} \end{split}$$

Figure 14. Connection schematic of the comparator with hysteresis

# 1.4.1.8 First order low pass filter

This schematic acts as a first order low pass filter. The value of the resistor connected to Zin+ and the capacitor connected to Zdiff determine this filter cutoff frequency.

$$f_c = \frac{1}{2\pi R_Z - C_Z -}$$

This is an inverting circuit. It can have a non-unity gain given by the resistor ratio, similarly to the simple inverting circuit.

$$G = -\frac{R_f - R_g - R_g$$

Second order Sallen-Key type filters cannot be directly implemented on this board, as they use a more complex feedback network.

UM2982 - Rev 2 page 10/26

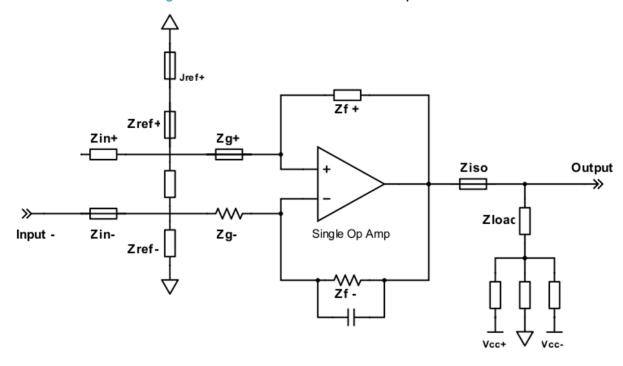

Figure 15. Connection schematic of the low pass filter

# 1.4.1.9 High pass filter

This schematic acts as a high pass filter. The value of the resistor connected to Zg- and the capacitor connected to Zin- determine this filter cutoff frequency.

$$f_c = \frac{1}{2\pi R_z - C_{in} -}$$

This is an inverting circuit. It can have a non-unity gain given by the resistor ratio, similarly to the simple inverting circuit.

$$G = -\frac{R_{f}}{R_{g}}$$

UM2982 - Rev 2 page 11/26

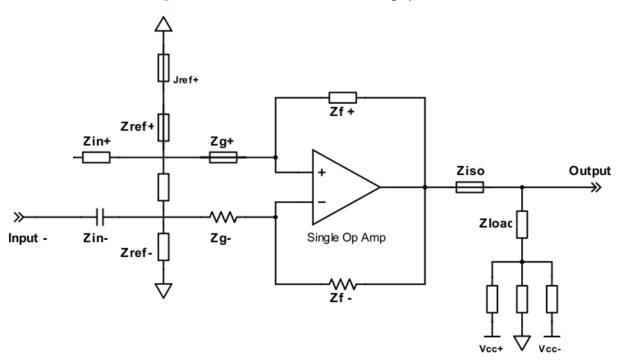

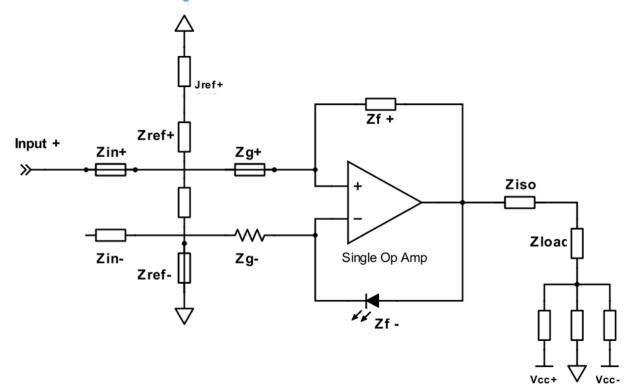

Figure 16. Connection schematic of the high pass filter

## 1.4.1.10 LED driver

You can easily use an op-amp as a current source, as a DC bias controls the current level.

$$I_{led} = \frac{V_{in} + }{R_g -}$$

Figure 17. Connection schematic of the LED driver

UM2982 - Rev 2 page 12/26

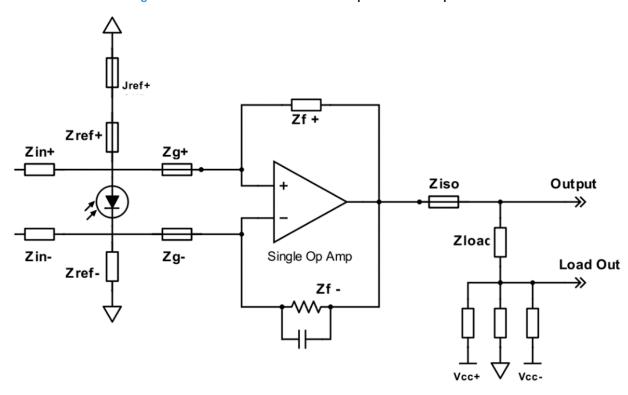

### 1.4.1.11 Photodiode amplification

In this schematic, the op-amp is used to convert the current that a photodiode generates into a voltage signal (transimpedance amplifier).

$$V_{Out} = I_{photodiode} \cdot R_{f}$$

For further details on this application, see AN4451.

Figure 18. Connection schematic of the photodiode amplification

#### 1.4.1.12 Low side current sensing

This is a very common application for op-amps. By interposing a low value resistor (shunt resistor) between the load and the ground, you can measure the current flowing through a load. This method allows you to convert the current into a voltage value. Then, you have to amplify this small voltage value.

In this example schematic, the Input + is connected at the load low side. It converts the load current into a bias, as per the following equation:

$$V_{Shunt} = R_{Shunt} \cdot I_{Load}$$

The shunt voltage is then amplified, similarly to the non-inverting schematic:

$$V_{Out} = \left(1 + \frac{R_{f}}{R_{g}}\right) \cdot R_{Shunt} \cdot I_{Load}$$

# 5 Regulatory compliance information

#### Formal Notice Required by the U.S. Federal Communications Commission

#### **FCC NOTICE**

This kit is designed to allow:

(1) Product developers to evaluate electronic components, circuitry, or software associated with the kit to determine

whether to incorporate such items in a finished product and

(2) Software developers to write software applications for use with the end product.

This kit is not a finished product and when assembled may not be resold or otherwise marketed unless all required FCC equipment authorizations are first obtained. Operation is subject to the condition that this product not cause harmful interference to licensed radio stations and that this product accept harmful interference. Unless the assembled kit is designed to operate under part 15, part 18 or part 95 of this chapter, the operator of the kit must operate under the authority of an FCC license holder or must secure an experimental authorization under part 5 of this chapter 3.1.2.

#### Formal Product Notice Required by Industry Canada Innovation, Science and Economic Development

#### Canada compliance:

For evaluation purposes only. This kit generates, uses, and can radiate radio frequency energy and has not been tested for compliance with the limits of computing devices pursuant to Industry Canada (IC) rules.

À des fins d'évaluation uniquement. Ce kit génère, utilise et peut émettre de l'énergie radiofréquence et n'a pas été testé pour sa conformité aux limites des appareils informatiques conformément aux règles d'Industrie Canada (IC).

#### Formal product notice required by EU

The STEVAL-CCA058V1 kit is in conformity with the essential requirements of the Directive 2015/863/EU (RoHS).
